Social Policy Bonds are one possible way of bring about that realignment. Under a bond regime organizations wouldn't receive funding just because they received it the previous year. Funding decisions would be made by investors who would be rewarded for choosing only the most efficient agencies. The current system allows large corporations to subvert the market and government agencies to monopolise the supply of many public goods and services. Efficiency, effectiveness and the public interest come very low on the list of priorities. A bond regime would be entirely different. It would inextricably tie rewards to outcomes. And those outcomes - in contrast to the current system - would be meaningful to ordinary people, rather than special interests.

### 8.1.3 Large organisations are not human beings (2011-01-11 09:27)

Large organisations aren't human beings. More pointedly, their success does not inevitably mean improvements in human well-being. I am glad that former US labour secretary, Robert

Reich, realizes that fact.

“Corporate America is in a V-shaped recovery.... That’s great news for investors whose savings are mainly in stocks and bonds, and for executives and Wall Street traders. But most American workers are trapped in an L-shaped recovery.” Robert Reich, quoted in [1]Deepening crisis traps America’s have-nots, by Ambrose Evans-Pritchard, ‘Daily Telegraph’, 11 January

In former decades it was perhaps reasonable to identify corporate health with social well-being. But that doesn’t apply now. Government, with its power and responsibility, would do better to target directly social outcomes that are more strongly correlated with well-being than the financial status of large corporations (or what passes for their financial status under a [2]debased accountancy system).

Social Policy Bonds are one way in which governments could target essential elements of social welfare directly. Elements such as: a cleaner environment, universal literacy, better health and housing outcomes. Under a bond regime, governments would define and target such goals, and raise the funding necessary for their achievement. But it would be up to investors in the bonds to work out the best ways of achieving them. Corporations, some of them large and wealthy, might well become larger and wealthier under a bond regime (though [3]new types of organisation can be expected to arise), but if they did they would be doing so only because they are efficient at achieving society’s aims, rather than, as under the current system, their own.

#### **8.1.4 Shambles (2011-01-21 00:40)**

There are two simple facts about climate change that are worth emphasising. First, climate change could devastate animal, plant and human life across the planet. Second, we’re doing nothing to prevent it. Actually, ‘nothing’ might be an overstatement: we’re still encouraging greenhouse gas emissions through [1]subsidies on fossil fuel extraction and consumption. And for all the endless, divisive, bureaucratic wrangling, we’re not actually cutting back global emissions. Elegant so-called solutions, apart from diverting intellectual resources away from the actual problem, attract [2]fraud of the sort that is technically illegal, or are designed to be gamed by the major players.

My role here is not to criticise, but to offer a better solution than those currently on offer. Let’s state another simple fact: if we want to reduce climate change, then we ought to reward people who reduce climate change. Definitions are crucial, but there’s no need to go into detail here. ‘Climate change’ can be defined to include physical, biological and financial

variables (and rates of change of variables), and 'reduce' can be defined in terms of those costs. What is important is to set up systems that will see climate change, however defined, reduced. But how are we to convince people that the inevitable costs of preventing climate change are worth paying? The many vested interests who are willing to take refuge in the scientific uncertainties have largely blocked any meaningful international agreement. Well, one huge advantage of a [3]Climate Stability Bond regime is that it wouldn't need to persuade the vast majority of people that climate change is actually happening. Instead, it transfer the risk of doing too much or too little to those willing to bear it, in return for big rewards if they call it correctly. Another is that whereas scientific uncertainty (and there are some huge ones, over the role of clouds for instance, or methane clathrates) could dramatically undermine the success of the current approach, a bond regime would simply absorb such uncertainty through the market for the bonds. The current approach requires scientists to take a position now on physical and biological relationships that just cannot be identified and quantified. Climate Stability Bonds would adapt to our rapidly expanding knowledge.

It's clear that no better solution is on offer. Resources are going instead into gaming the current approach or defending against climate change - which is something that only rich countries can afford to do (and then, only partially). Kyoto, Cancun and all the rest are a distraction. They are "policy as if outcomes don't matter in the least". They represent payment for activity rather than results. They are doomed to fail, and the outcome will be disastrous for many millions of human beings.

Henderson Bail Bonds (2011-01-21 03:38:31)

I am just not sold on the foregone conclusion that there is such a thing as global warming, but then again, I could be wrong as a lowly bail bondsman.

Ronnie Horesh (2011-01-21 08:18:39)

Thanks for your comment, HBB, and I agree with you. You could be wrong; I could be wrong; the great majority of scientists and policymakers could be wrong. Science is not a consensual process, and it is possible that man-made climate change is not actually happening, or that it might not be disastrous, or that, even if it is happening, we might not be able to do anything to stop it. But I am in the happy position - intellectually - of not needing to have an opinion about what is happening to the world's climate, or any of the other matters. Climate Stability Bonds would be the most cost-efficient way of dealing with climate change *whether we accept the scientific consensus or not and whether climate change is happening or not*. If the market believes it's not happening, then the net outlay by whoever issues Climate Stability Bonds will be close to zero, because the bonds would then be auctioned off for close to their redemption value. The bonds minimise the risk-adjusted costs of taking steps to avoid climate change. Check out my paper on [1]Climate Stability Bonds to see exactly how this works, but if you have any other queries, get in touch again.

### 8.1.5 Accountants shape society (2011-01-24 08:30)

Who, any more, sees social well-being as anything other than a set of numerical variables to be optimised, subject to financial constraints?

Patients are to be told to examine themselves at home and email their GP with the results rather than meeting face to face. They would send in a short message describing symptoms which would be answered by a doctor between appointments or at the end of the working day. [1]Now you must email your GP, Sophie Borland , ' [UK] Mail Online', 24 January

Perhaps because easily quantified units of manufacturing output used to be strongly correlated with well-being, we tend to think that something like Gross Domestic Product per capita is a reliable indicator of social welfare. An extrapolation from the corporate sector seems to be going on. Corporations measure their success almost entirely in terms of financial variables; with considerations such as market share or employee welfare only really entering the picture insofar as they affect the long-term financial figures. Any negative impacts of their activities that can be successfully offloaded onto society or the environment will be - and have been, spectacularly so in recent years by the financial sector. All that matters is the numbers. Extrapolating from this, we tend to think that corporate success equals a society's success. It isn't true though. Apart from the non-market social and environmental costs of corporate activity there is, increasingly relevant, the concentration of the financial rewards into ever fewer hands.

It's up to politicians to articulate society's concerns, to regulate the corporations, and to redistribute according to society's wishes. And it's failing. Even when it tries, as with the UK's National Health Service, it apes the corporations in choosing a narrow range of micro-indicators as a way of measuring success. Increasing a doctor's throughput, measured in terms of numbers of patients dealt with per day is, like targeting hospital waiting lists, a waste of time. These indicators are too narrow and too easily manipulated to do much good. We should be targeting broad health outcomes: things like longevity, infant mortality and Quality Adjusted Life Years. Unfortunately, government takes the current institutional structures as given, and applies a set of accountancy-type objectives to them. The incentives, as with doctors reading emails, are to satisfy pre-determined criteria - to tick boxes and apply algorithms - rather than to consider the overall health of the patient.

A Social Policy Bond regime would be different. Under a bond regime, broad outcomes that are meaningful to real people (as distinct from corporations) would be explicitly targeted. Any institutions that arise as a result would be well advised to subordinate all its activities to achieving these social goals, or it will find its bonds bought up by a more efficient investor.

### **8.1.6 Different or divergent? (2011-01-31 22:16)**

The protests in Tunisia and Egypt are not difficult to explain. Rising aspirations are colliding with the inability and unwillingness of governments to meet them. The interests of the politicians and the other pillars of the establishment (the police, the military) are not different from those of their people but, increasingly, in conflict with them. And there's no mechanism, other than by revolution, by which the widening gap can be closed. So it's not just that people's expectations aren't being met under the current regime; it's that the regime is systemically incapable of aligning itself with those expectations.

It's not that different in the rich countries. Our policymaking is in thrall to special interests; mainly big corporations, trade unions, wealthy individuals, and their lobbyists. Policies that turn out to be counterproductive (to put it mildly) are not just implemented, which would be excusable, but they persist. So we see agribusiness corporations and wealthy landowners in Europe and the US subsidised by taxes on the poor to the tune of billions of dollars annually: not just for a short time during which there is a transition to saner policies, but for decades. Our collective response to the unsustainability of ludicrous policies has been to borrow more money to keep them going; to prop up a corrupt system, at all costs to everyone and everything except the special interests. The special interests are the only winners. The losers are ordinary people, our social environment, and our physical environment.

It doesn't have to be like this. Instead of the special interests dictating policy we could find a way of orienting our politics to society's interests rather than those of the powerful. This is where outcome-based policy in general should play a role. Social Policy Bonds are one way by which all government activity and funding would be subordinated to the greater good. Under a Social Policy Bond regime, government would do what it's good at: articulating society's goals, and raising the revenue for their achievement. These goals would be expressed not, as today, in terms of vague, high-sounding but unverifiable ideals, but in terms of quantifiable outcomes, whose achievement would be inextricably bound to improvements in social and environmental well-being. So, rather than target 'economic growth', say, or GDP per capita, we'd be targeting things like universal literacy, or reduced crime rates, or a cleaner environment. We'd target ends, rather than the supposed means of achieving these ends.

No longer would policy, despite the best intentions of the hard-working people in our government agencies, drift away from the the concerns of ordinary people and align itself with those of large corporations and other special interest groups. Policymaking under a Social Policy Bond regime would be entirely subordinated to society's wishes. Rewards would benefit only those who help make such wishes a reality. Only when the interests of government and people are aligned can we be sure of avoiding north-Africa-style turmoil and social collapse.

## 8.2 February

### 8.2.1 Foreign Aid for Scoundrels (2011-02-04 10:24)

William Easterly writes:

[T]he nations and organizations that donate and distribute aid do not care much about democracy and they still actively support dictatorships. ... [T]he French government continued to aid the Hutu government [of Rwanda] even after the genocide had become public knowledge. [1]Foreign Aid for Scoundrels, William Easterly, 'New York Review of Books', 25 November 2010

How does this happen? One reason is institutional inertia:

Aid agencies exist to give aid, so they must keep the money flowing. The department of an aid agency assigned to help a country may not get a budget next year if its officials don't disburse to the country's ruler this year; so they hand out funds no matter how autocratic he is.

And it's a fact that institutions have objectives that can have little to do with their lofty mission statements. Indeed, their over-arching goal, the one that over-rides all others is that of self-perpetuation. How could it be otherwise? As in biological evolution, considerations such as well-being are important only insofar as they influence survivability. Since funding determines survivability of institutions, and since [2]nobody bothers to check ( pdf ) the performance of institutions, let alone reward them according to their success, the current, corrupt, destructive aid regime is an inevitable result.

This is where Social Policy Bonds could make a difference. Under a bond regime, organizational existence would not be taken as a given. In a neat reversal of the current system, the efficient achievement of a targeted outcome (the welfare of a poor country, say) would determine the structure and nature of the organizations that pursue that goal. If any agency trying to improve the welfare of a poor country's people were inefficient, it would lose funding by investors in the bonds. The structure, composition, and all activities of all agencies would be totally subordinated to the bonds' targeted goal.

Of course the Social Policy Bond principle can be applied to the welfare of people in the

rich countries too, where there is plenty of inefficiency and the system of poor people subsidising the rich is a long-established tradition (see my posts aid for [3]big business, [4]fisheries, and [5]energy and New Zealand's policy of subsidising [6]movie tycoons). It can also be applied to global challenges, such as [7]climate change or, indeed, any [8]catastrophic event.

It won't be though. The Social Policy Bond idea has been in the public arena for more than 20 years now. The level of interest from individuals, the academic world and think-tanks is heartening; but from policymaking institutions - well, the word 'nil' perhaps overstates their enthusiasm for this (or any other) idea that threatens their funding.

### 8.2.2 Say no more (2011-02-12 08:54)

In his dissenting opinion for *Citizens United v. Federal Election Commission*, a case that gave the notion that money equals speech and corporations equal individuals the imprimatur of the Supreme Court, Justice John Paul Stevens went so far as to make a sort of bitter joke out of the whole thing: "While American democracy is imperfect, few outside the majority of this Court would have thought its flaws included a dearth of corporate money in politics." [1] Murdoch Triumphant

### 8.2.3 Social Impact Bonds - progress report (2011-02-15 08:35)

Social Impact Bonds (not to be confused with Social Policy Bonds) were launched in the UK in September 2010. SIBs are similar to Social Policy Bonds in the sense that investors receive higher returns if their social intervention is successful. They are being tried over four years with 3000 UK prisoners at Peterborough prison. The more their reoffending rate falls, the more the backers of the bonds will receive.

Toby Eccles , development director of Social Finance, says it hopes to launch half a dozen such bonds across the country and for a variety of social projects over the next 18 months. Other groups ... are looking to foster similar bond schemes in areas such as cutting the number of children going into care or handling people with long-term health conditions better. "Making these work is complex," says David Hutchison , Social Finance's chief executive. "You have to be able to measure success accurately and work out how much to pay for it and when. Peterborough is relatively easy - people either reoffend within a year or not. [1]Bonds set to help prisoners break with past, by James Boxell and Nicholas Timmins , 'Financial Times', 10 February

I met Toby Eccles in London last June, and we discussed both Social Impact Bonds and Social Policy Bonds. SIBs are definitely a step in the right direction. The idea of rewarding desirable social outcomes (rather than paying people for simply turning up to work), while obvious in theory, is (sadly) revolutionary in practice. Social Impact Bonds have the great virtue of being easier to trial than Social Policy Bonds. But in other ways Social Policy Bonds have the advantage.

The biggest difference is that, compared with SIBs are less tradeable than Social Policy Bonds. There would be no transparent market for them. The composition and structure of the organizations trying to achieve outcomes under a SIB regime are therefore fixed and

pre

-determined. Under a Social Policy Bond regime, on the other hand, the type, structure and composition of organizations working to achieve the target would be subordinate to the most efficient way of reaching it. This means, amongst other things, that broad, longer-term goals could be targeted. Such goals can be more closely aligned with society's wants and needs. Rather than target a relatively narrow indicator (like the re-offending rate of a certain set of people), over a period of a few years, they could target regional or national crime rates over a period of decades.

Nevertheless, I am pleased to see Social Impact Bonds being tried and I hope that their major departure from current policy - rewards that are inextricably linked to relevant performance - is taken up more widely.

SocialGoals.com

## 8.2.5 Black swans (2011-02-28 08:06)

In the Introduction to his book [1] Whoops !, about the 2008 crash, John Lanchester says:

Many bright, literate people have no idea about all sorts of economic basics, of a type that

financial insiders take as elementary facts about how the world works.

Nor can many of us follow the technical debate about climate change or the dangers of [2] strangelets or [3] supervolcanoes .... Along with the esoterica of the financial markets, the complexities and obscurities of the relevant scientific relationships just cannot be unambiguously fathomed by policymakers - or even teams of experts.

That's why I advocate that, instead of attempting the impossible task of trying to identify such relationships and their consequences, policymakers target outcomes instead. We don't have fully to understand the climate change debate to know that it would be to our advantage to avoid climate catastrophe. Nor should we have had to anticipate the myriad derivatives that the finance industry constructed to avoid the derailing of the entire global economic system. It's the outcomes that matter, not how we reach them.

Under a Social Policy Bond regime, we could define the circumstances we want to avoid, and issue bonds that become redeemable only when these circumstances have not arisen for a sustained period. Defining such circumstances would not necessarily be a simple matter. It could involve constructing an index that combines measures of human, animal and plant health, or physical and financial indicators. No, it would not be simple - but it would be preferable to the current policy, which is basically that of reacting to crises only after they have occurred and caused immense, and possibly fatal, damage. For more on using the Social Policy Bond principle to avoid catastrophe, however caused, see my paper on [4]Disaster Prevention Bonds.

On another note, the Economist of 19 February has an article on [5]Pay for Success Bonds (subscription), a US version of Social Impact Bonds. At first glance they suffer from the same (as I see it) weakness as SIBs : they would not be tradable , and so would be limited to fairly narrow, short-term goals whose would-be achievers are known in advance. (See my previous post, on [6]Social Impact Bonds.) These bonds are definitely a step in the right direction, in that they reward successful achievement of social outcomes, rather than merely pay people to undertake ostensibly beneficial activities. But I think that, because they are non- tradable their scope is necessarily limited, and also that, as a result monitoring their success or otherwise might be too costly in relation to their benefits.

## 8.3 March

### 8.3.1 Special interests benefit from obscurity and complexity (2011-03-07 00:38)

John Lanchester writes of the former chief economist of the International Monetary Fund:

[Simon Johnson's] day job involved going into crisis-struck countries and banging heads together to get them to accept reforms as a price of IMF aid. He acquired an extensive experience of countries which had effectively been captured by a ruling elite who governed entirely in their own interests. His startling conclusion about the current crisis is that the US has become of those countries. As the banking sector got richer, its power and influence over US government policy increased - power and influence which the bankers weren't at all afraid to use. John Lanchester , in [1]Whoops!

Or rather 'abuse'. It's becoming a familiar pattern: special interests deploy complexity and obscurity as devices by which they can attract taxpayer funds away from a disengaged public. More regulation seems to be the obvious solution; but that adds to the complexity and obscurity. My suggestion, is, instead, to target outcomes, in such a way that ordinary people engage in policymaking and ensure that rewards are inextricably linked to the public interest rather than, as now, the private interests of those wealthy enough to pay lobbyists and lawyers to manipulate policy for their own purposes.

Social Policy Bonds would do that. One target, for instance, could be the 'sustained avoidance of financial and economic collapse'. Such a collapse could be targeted as an array of financial, economic and social indicators, which would all have to fall within a defined range for a sustained period before the bonds would be redeemed.

More generally, bonds could be issued that targeted any sort of disaster, defined in terms of a combination of, amongst other things, numbers of deaths and serious injuries caused, financial costs, numbers of homeless, and an array of other social, physical and financial indicators. See my paper on [2]Disaster Prevention Bonds. The Social Policy Bond principle though, is a broad one. Essentially, society would decide on what it wants to see, and target the achievement of these goals. It's 'policy as if outcomes mattered', where the outcomes are those that favour society as whole not, as now, a cartel of interest groups and their lobbyists.

### **8.3.2 Providing incentives to prevent humanitarian catastrophe (2011-03-16 07:56)**

We have fairly well-developed markets to insure against financial disaster. [1]Catastrophe bonds, for instance, as well as conventional insurance policies. But financial resources rarely correlate with human life and well-being. So incentives to prevent or alleviate humanitarian disasters are left to the caprice of well-intentioned (usually) governments, or superb charitable organisations, which respond quickly and efficiently to crises. Unfortunately, these efforts are unsystematic. There is probably less emphasis on prevention than there should be and there are no systematic efforts to maximise the humanitarian benefit per dollar spent.

[2]Disaster Prevention Bonds could be one way of bringing the prevention of human suffering into the market, and so injecting efficiency into that goal. Markets these days are associated, rightly, with grotesque income and wealth inequalities, and the pursuit of private goals at the expense of social and environmental amenity. But markets can be made to serve the public good, and the Social Policy Bond principle would be one way of harnessing the market's incentives and efficiencies in the service of society's needs. The contrast between the insurance available for financial disasters as against human disasters is stark and quite tragic. But it is not inevitable.

### **8.3.3 A single quality of life target? (2011-03-23 10:14)**

Narrow social policy targets don't work. Take a goal like "halving the number of deaths from road accidents in the city centre". One response could be for city authorities to make driving attractive in all parts of the city other than the centre, with the same number of deaths occurring outside the target area. Another response (and one which would appeal to drivers in my neighbourhood) would be to encourage driving on the sidewalk, and exclude deaths occurring there from 'road' death statistics.

Even broad goals, such as improved health or educational outcomes, could conceivably be subject to the same manipulation or gaming, under a Social Policy Bond regime. Without very careful targeting, investors in the bonds could make unforeseen, negative trade-offs between societal goals.

Why not then target a single 'quality of life' indicator for the whole of society, taking into account all quantifiable social and environmental objectives: quality of life, physical and mental health, education level, environmental pollution, crime, homelessness unemployment, leisure time and any others? Surely targeting one single aggregated 'social welfare' indicator would be the optimal approach?

The more obvious objection to doing this is the daunting practical problem of defining a meaningful and measurable indicator of social welfare. The second is even more fundamental.

Aiming for an increase in a single social welfare indicator carries with it an assumption that society's needs can be traded off against each other. But for many of the needs for which government usually assumes responsibility such trade-offs cannot be made. For the neediest beneficiaries of government's welfare programmes, a massive increase in priority for, say, health care would be unlikely to compensate for a total withdrawal of government funds from, say, basic education. 'Safety net' programmes in particular are scarcely amenable to trade-offs. In the same way a lowering of the crime rate, say, however welcome it might be, could hardly compensate for the total collapse of a country's physical environment.

So experimentation and continuous refinement of the Social Policy Bond principle are going to be necessary. Issuers, public or private sector, will have to be vigilant to ensure that any particular bond issue does not break the spirit of society's stated and unstated goals, as well as the letter of the redemption terms. Of course, this sort of monitoring is necessary in today's policy environment as well - and it's [1]not often practised.

## 8.4 April

### 8.4.1 Postponing and off-loading catastrophe (2011-04-03 07:24)

It's unlikely governments are going to be the first to implement a Social Policy Bond regime. Some private bodies and government agencies are making tentative first steps along the road to paying for the achievement of favorable outcomes (search for, and see my posts on, 'Social Impact Bonds' and 'Payment for Success Bonds'). But typical efforts to bring about social and environmental goals focus on the tried, tested and (largely) failed approaches. So while there has been a downward trend in violent political conflict, for example, and increases in the aggregate level of human well-being, it's quite likely that present-day successes are being bought at the cost of more extreme calamities in the future. That is certainly how the current and still unresolved world financial and environmental crises seem to be shaping up.

The underlying reasons can probably be found in the too close relationship between government and large corporations, but identifying them is less important than fending off catastrophic risks to human well-being, which could take the form of an unravelling of our complex financial and economic systems, or large-scale warfare, or calamitous environmental disasters.

I've written a short [1]paper about using Social Policy Bonds to reward people who help avoid such catastrophes. Perhaps the people with the strongest financial incentive to issue such bonds are the combination of private insurance companies, national export credit agencies and multilateral bodies such as the World Bank's Multilateral Investment Guarantee Agency which, according to the current [2] Economist (subscription), offer businesses cover against political shocks such as the 'sudden imposition of currency controls, expropriations, conflicts and terrorism, and for governments failing to keep their part of an investment deal,

such a supplying a new factory with electricity.'

It's difficult to get the attention of such bodies. But perhaps even if they did know of Social Policy Bonds they wouldn't be particularly interested. There is huge, tragic, and maybe a growing, mismatch between human suffering and the market. The people who are least able to escape from or adapt to catastrophe of any sort are the ones who cannot afford to buy insurance but who need it most. We could well be seeing not only escalation of problems that aren't dealt with early enough, but the off-loading of these problems onto those least able to bear them. The victims of these escapes from responsibility and are future generations and the poor.

It's unlikely that any coalition of insurance companies or government and multilateral bodies will spontaneously form to mitigate or avoid potential disasters as climate change or, say, large-scale warfare involving poor countries. They have little incentive to do so since the main victims have little market power. My hope is that some combination of philanthropists, non-governmental organizations, and the public will get the ball rolling and together issue Social Policy Bonds that will address the concerns of those who cannot enter the marketplace for conventional insurance.

#### **8.4.2 The masonic option for inefficient organizations? (2011-04-05 08:22)**

Francis Fukuyama writes of the US:

Trade unions, agribusinesses, drug companies, banks, and a host of other organized lobbies often exercise an effective veto on legislation that hurts their pocketbooks . It is perfectly legitimate and indeed expected that citizens should defend their interests in a democracy. But at a certain point this defense crosses over into the claiming of privileges, or a situation of gridlock where no one's interests may be challenged. This explains the rising levels of populist anger on both the Right and Left that contribute to polarization and reflect a social reality at odds with the country's own legitimating principles. Francis Fukuyama , [1]The origins of political order

Exactly, and it applies the world over. Every institution - and I would explicitly include corporations , religious bodies, universities and government agencies in Mr Fukuyama's list - has one over-arching aim: that of self-perpetuation. Given the power of these lobbies, it's no surprise that human beings, that is, even those of us who are members of these bodies, are seeing our quality of life eroded. We might be 'organization men', but our humanity is increasingly denied by the organizations that run the planet. If this sounds far-fetched you need only look at the way our cities are almost entirely subordinated to the needs of the car and its attendant interest groups: car manufacturers, fossil fuel suppliers, the construction industry and all the rest. The interests of society and those of large corporations are not merely different, they are divergent and they conflict.

One way of re-orienting society is to re-jig the incentives. Instead of supporting lobby groups that (usually) start out with benign intentions, we could support those benign intentions themselves. We could learn to express our wishes in terms of desirable social outcomes, rather than allocate resources to groups of people who are paid to achieve them, but who inevitably end up serving the institution they work for rather than its ostensible ends. Social Policy Bonds are a financial instrument that can focus our attention on our social goals and reward the achievement of these goals rather than activities or institutions that might have, in the past, been helpful in bringing them about. My [2]book describes the advantages of a Social Policy Bond regime and how we could gradually introduce them, in ways that divert resources away from current institutions only if they are inefficient.

If inefficient organizations want to survive under a bond regime, they have two clear alternatives: they can become more efficient, in which case holders of Social Policy Bonds will fund them. Or, like the stonemasons who used to build cathedrals, they can change the nature of their organization, become self-funding, and devote their energies to activities other than subverting markets and resisting change at the expense of society.

### 8.4.3 'World targets in megadeaths' (2011-04-15 09:44)

The Economist sums up the conflict in Libya:

Significantly, the earlier chorus of criticism from rebels doubting NATO's stomach for the fight has subsided. Mustapha

Abdulrahman, a rebel spokesman, declared that there had been a "positive change" in the intensity of NATO attacks over the weekend. In short, all sides now seem ready to dig in for the long haul. [1]Libya versus Libya: the Colonel's fake diplomacy, 'the Economist', 14 April

This is the logical outcome of policy driven solely by institutional goals. Does anyone in Nato really think that if they topple Gaddafi the Libyans - or anyone else - will be better off? What exactly is the purpose of this intervention? Is there any objective other than the short-term needs of unpopular politicians and the military? It's a game of "formulate the objective as we go along", conducted at huge expense with funds borrowed from the next generation.

It's also a particularly tragic and visible manifestation of Policy as if Outcomes Don't Matter in the Least; the same idiocy that has led to the poor being taxed to subsidise [2]agribusiness and wealthy landowners, our absolute dependence on fossil fuels, and the desperate fragility of the world financial system - to give just a few examples. It's no longer good enough to assume that the aggregation of government and corporate goals advances human well-being. The planet is no longer big enough to absorb for us to learn from our mistakes, nor do we have

that much time. We urgently need to take over from the politicians and corporations that run our lives, and target goals that are meaningful to ordinary people. We need to subordinate all the actions of the powerful to those goals. And the over-riding goal, the one that we need to target most of all, is survival of the human species. Faced with urgent social and environmental challenges our politicians solemnly decide to inflame obscure, inconsequential tribal squabbles, at huge cost. Madness.

#### **8.4.4 It's broken (2011-04-18 10:15)**

Fareed

Zakaria writes about the US political system:

We have a political system geared toward ceaseless fundraising and pandering to the interests of the present with no ability to plan, invest or build for the future. And if one mentions any of this, why, one is being unpatriotic, because we have the perfect system of government, handed down to us by demigods who walked the earth in the late 18th century and who serve as models for us today and forever. [1]Are America's Best Days Behind Us? , 'Time', 3 March

(To 'pandering to the interests of the present...' I would add '...and the wealthy...') How has this come about? I think it's largely because policymaking is opaque to most ordinary people. It's focused on arcane discussion about laws, organisational structures and institutional funding. All these things are necessary of course, but they should be the by-product of policy geared to the interests of society: what I call outcomes. Opacity and complexity are being exploited - perhaps cynically, perhaps not - in the interests of government and big business, at the expense of small enterprises, the public and the physical environment and, as is becoming ever more apparent, our future.

How to re-orient policymaking so that it focuses on things that are important to people? The essential step is to make it comprehensible, which will encourage greater public participation, and hence buy-in. One way of doing that would be to focus discussion entirely in terms of outcomes. Transparency would generate realistic expectations about what government can and cannot achieve. The notion of trade-offs, absolutely central to politics, would be clear to everyone, not hidden from public discussion.

Social Policy Bonds are one way in which our politics could be re-jigged so as to focus on meaningful outcomes for society as a whole. A bond regime would express its goals in terms of broad social and environmental outcomes, while the market would not only provide best estimates, on a dynamic basis, of their costs, but also reward only the most efficient ways of achieving them. It would represent a radical departure from the existing set-up but, as I explain in my [2]book, a gradual transition could occur, with spending to existing bodies gradually reducing in line with increases in funding allocated to redeeming the bonds.

#### **8.4.5 Where we're at (2011-04-28 04:48)**

The world seems beset by systemic crises: financial, economic, environmental and social. We appear to be approaching limits on all fronts. The overwhelming reaction has been to do what we've been doing before, except more so. In the economic sphere, this means going for growth, as if that will solve all our problems. It won't. The mis-identification of growth with human well-being is clear to most these days: growth takes no account of distribution, leisure time or its externalities ; in particular the environmental and social impacts of growth that is geared entirely to the narrow, short-term indicators of accountants on behalf of senior executives and major shareholders of large corporations. Government, supposedly the major corrective to these negative impacts, has become complicit with the large corporations. The world more and more looks like a contest between government and big business on the one side, and ordinary people and small businesses on the other, with the odds overwhelmingly in favour of the big and global at the expense of the small and local.

If government is going to use its clout, and is serious about doing so for the benefit of ordinary citizens, it would do better to go above the heads of the large corporations. Even if, at one point in history, it made sense to identify the success of big business with that of economy and society as a whole, it no longer does so. That doesn't mean government should actively campaign against big business. It does mean that it should focus directly on the outcomes that it wants for ordinary people, rather than assume that the health of 'the economy' (by which it usually means large corporations ) means a better-off population.

I still have some hope that governments will move towards something like Social Policy Bonds, at least in the long run. Society is so complex and intertwined that any relationship between conventional policy and its outcomes is just too difficult to identify. We see governments doing all sorts of bizarre things that do little except benefit its favoured interest groups while alienating the rest of the population: bombing Libya, doling out massive sums of taxpayer revenues to wealthy landowners and agri-business corporates, subsidising the banks, the fossil fuel industry, piling up nuclear weapons and the rest. It cannot be sustained. My hope is that government, rather than carry on diverging from the wishes of the people it's supposed to represent while ramping up the repression,

will instead begin to express its goals in terms of outcomes that are meaningful to ordinary people, and target them directly.

## 8.5 May

### 8.5.1 Why are we not surprised? (2011-05-05 05:47)

Tom Philpott [1]writes:

During the Bush II administration, I used to groan that the closest thing we had to a concerted policy response to climate change was the federal government's slew of goodies for corn-based ethanol. It was a monumentally depressing situation, because propping up corn-derived fuel is expensive and (despite industry hype) doesn't actually do much, if anything at all, to mitigate climate change - but contributes actively to ecological disasters like the Gulf of Mexico "dead zone." Now, two years into the Obama administration, we still have no concerted policy response to climate change, and the corn ethanol program abides, sucking up resources that could be going to actual green technologies.

What actually determines policy in democracies these days? It's not the long-term good of a nation, a society, or the environment. It's not the needs or wishes of ordinary people. No, nowadays it's essentially the medium-term accountability goals of large corporations, as interpreted by the politicians they pay for. Society's growing complexity and, in this instance, genuine scientific uncertainties, are smokescreens behind which powerful interest groups operate, manipulating markets, funding decisions, and the regulatory environment for their selfish purposes. Sometimes these coincide with broader long-term social and environmental goals. Very often they don't. And, increasingly, as the scale on which government and corporations operate grows bigger, the stakes are higher, and the goals of large organizations - corporations or government agencies - actually conflict with those of society. The distance between policies and their effect is too large, the relationships too complex, the time lags too intricate, for anyone except specialists employed by the largest corporations to understand and exploit. The result is often as Mr Philpott indicates: a trashed environment; and a trashed society.

Social Policy Bonds might be the answer. The democratic process needs to be re-orientated to respond to the needs and wishes of ordinary people, not large organizations. Expressing policy goals in terms of meaningful outcomes, as the bonds would do, would encourage more public participation in policymaking. The bonds would also subordinate all activity to society's goals, rather than to those of the organizations supposedly achieving them. Under a Social Policy Bond regime, organizations might grow and prosper, but only if they are efficient at achieving society's goals - a stark contrast with the current setup.

## 8.5.2 How long have we got? (2011-05-12 05:51)

Only 0.01 percent of all species that have ever existed continue to do so. We happen to be one of them, for now. When [UK Astronomer Royal Sir Martin] Rees looked at the myriad ways in which the present is more perilous than the past in his 2003 book [1]Our Final Hour, he set the odds of human extinction in the next century at 50 percent. [Nick] Bostrom , [an] Oxford philosopher, puts the odds at about 25 percent, and says that many of the greatest risks for human survival are ones that could play themselves out within the scope of current human lifetimes. “The next hundred years or so might be critical for humanity,” Bostrom says, listing as possible threats the usual apocalyptic litany of nuclear annihilation, man-made or natural viruses and bacteria, or other technological threats, such as microscopic machines, or nanobots, that run amok and kill us all. [2]What will happen to us?

, Graeme Wood, 1 May

You might think that we'd be well advised, as a species, to look at these survival probability estimates, and see if we can find ways of increasing them. And it's true that many people are working, sometimes heroically, at ways of doing so. There are quite a few organisations, for instance, that seek to raise awareness of the possibility of nuclear conflagration, and many more that seek to mitigate or prevent natural and man-made calamity. The difficulty I have is that their work is unsystematic, unco-ordinated, and is rewarded in ways that bear no relationship to their success or efficiency. As well, and perhaps more dangerously, there are policies in play that can only accelerate disaster, such as: subsidies to fossil fuel extraction and consumption, the accumulation of weapons of all kinds; and the failure seriously to pursue one of the [3]main goals of the [4]Cairo Population Summit, where 179 signatory countries agreed to provide access to family planning services to all the women who want them. And last, there are ways in which our survival is threatened that are beyond our current knowledge and imagination. Nobody is being encouraged to anticipate them.

In short, we need to re-orient the incentives, and to do so in a coherent manner that rewards the survival of our species against calamities of all kinds. This is where the Social Policy Bond principle can help. The issuers of [5]Disaster Prevention Bonds need have no knowledge of the relative likelihoods of known or unforeseeable catastrophic events. Neither would they have to pre-judge, with our current limited scientific knowledge, the most efficient ways of ensuring our survival. Instead, the bond mechanism could target the sustained avoidance of any - unspecified - catastrophe. It would do so in a way that encourages the exploration and investigation of all threats, known and new, impartially . Policymakers would not (and anyway could not) have to decide on how dangerous each threat is. That would be left to bondholders, who would have powerful incentives to do so continuously . Investors in the bonds would be rewarded only if they can adapt to rapidly changing events and to our ever-expanding scientific knowledge.

This is a stark contrast to the current approach; the one that has led to highly intelligent men and women giving our survival such a baleful prognosis. The people who are

currently working in favour of humanity do so in ways that, while worthy of great respect, are doing so within a system that is heavily weighted to favour the short-term goals of large organisations, including governments, that have little incentive or capacity to care about the long-term future of the whole of humanity. It's very regrettable, and Disaster Prevention Bonds, issued with sufficient backing, could change all that.

### 8.5.3 Philanthropy and outcomes (2011-05-21 19:45)

The Economist writes, in a review of three recent books about philanthropy:

For Mr Buffett, the main reason why giving is harder to do than making money is that in business “you go after the low-hanging fruit”, whereas in philanthropy you are trying to tackle problems that are inherently difficult, such as how to educate demotivated urban kids or end rural poverty.

[1]Giving for results, 'The Economist', 14 May (subscription)

Another of the books argues that:

philanthropists should create systems that force them to hear what may at times be unpleasant truths about the ineffectiveness of their work, and to be constantly challenged to improve.

I think philanthropy could do a lot more if it subordinated all its activity to meaningful outcomes. It's very clear why government has a built-in resistance to doing so: the jobs of public servants at all levels would be at stake. But philanthropists have their own, less pecuniary, incentives to avoid addressing the 'unpleasant truths'. We could speculate about the reasons, but they are less important than the result: philanthropists underachieve, and in doing so they deter philanthropy.

So there's a lot at stake. I think if philanthropists, instead of trying to prejudge the best ways of achieving noble outcomes, were to issue Social Policy Bonds, the efficiency gains would be large enough to make a difference in their own right, and to encourage more outcome-oriented funding, whether by the public or private sector. As another of the books reviewed says:

one of the key lessons is for philanthropists and non-profits to be clear about the outcomes they are trying to achieve— and to measure properly the progress they are making towards those goals.

It sounds an obvious discipline. But neither government nor philanthropists follow it. Social Policy Bonds would change that.

#### **8.5.4 Giving greed a chance (2011-05-22 19:42)**

People sometimes challenge the Social Policy Bond principle because of its reliance on financial incentives - also known as 'greed'. I think they are right to do so. Who wants a society in which the lust for more money dictates every aspect of our behaviour? In which people won't do the right thing for society unless there's a financial incentive involved?

My response is that we have such a society already, in which millions of people perform functions that have little direct social content for the purpose of earning a salary. Within 25 metres of where I am typing this, there is a body piercing salon and a tattoo studio. Within several hundred metres there are old people who could do with a bit more help and company. And within a radius few thousand metres crime blights the lives of hundreds.

People do respond to financial incentives. Our problem is that many of the incentives are in place for people to do things that don't actually help society. And this applies to funds ostensibly in place for social or environmental purposes, not just the world of breakfast cereals and bodily mutilation. Government funding, typically, goes to activities or institutions that, are often only nominally linked to achieving social outcomes. In cases, like fossil fuel subsidies or agricultural subsidies, the net effects of these funds is almost entirely in conflict with [1]rationality

itself, as well as society and the environment. The only beneficiaries are a tiny minority of powerful, well-organized, vested interests. So financial incentives, ostensibly for public purposes, already exist in the form of government funding. At best they are unsystematic and inefficient. At worst, they undermine our social and environmental goals. In all cases, they are uncorrelated to outcomes that are meaningful to ordinary people. Social Policy Bonds would rejig existing incentives in favour of such outcomes. People would, as they do today, respond to the incentives on offer, but under a bond regime they would be rewarded for efficiently achieving social and environmental outcomes. What they do with their rewards is up to them, but there's no reason to believe that they would spend them ignobly.

The fact is that monetary payments needn't corrupt. Many people under the current system do all sorts of socially valuable work in return for salaries that aren't very high. They might do more for higher salaries, or more people might do the same sort of work if there were more cash on offer to achieve, a la Social Policy Bonds, a stipulated social or environmental outcome. Salaries, needless to say, can be used for more than frivolous consumption. They can mitigate poverty, increase leisure time, and raise children. Adding to the numbers working for social goals, or paying more to those who do so efficiently, is not negative or evil.

### **8.5.5 Wish I'd said that (2011-05-28 20:13)**

The [UK] government has now promised to cut greenhouse gases by 50 % by 2027, which means that, with a following wind, the UK could meet its legally-binding target of 80 % by 2050. For this we should be grateful. But the coalition has resolved the tension between green and growth in a less than convincing fashion: by dumping responsibility for the environmental impacts on someone else. The carbon cut we have made so far, and the carbon cut we are likely to make by 2027, have been achieved by means of a simple device: allowing other countries, principally China, to run polluting industries on our behalf. George Monbiot , 'the Guardian', 23rd May

I have been saying this for years. In climate change, as in other social and environmental challenges, narrow targets are useless. They are far too easily evaded or gamed, so that any supposed social problem is shifted away from the scope of explicit targeting. We should be targeting not British greenhouse gas emissions, nor even global greenhouse gas emissions, but climate instability. If we did that by issuing [1]Climate Stability Bonds, we'd be addressing this global, urgent concern with maximum efficiency. Other targets, as is the UK Government's, are likely to be inefficient and ineffective.

## **8.6 June**

### **8.6.1 We need to target long-term goals (2011-06-07 16:45)**

Democratic governments these days devote much of their energy to kicking problems down the road, for solving at some time in the future that's uncertain, but beyond the lifetime of their administration. It's a pattern. Nuclear weapons pile up; budget deficits rise; environmental challenges are evaded.

On reflection, it's not so surprising. The very idea of a stable society, one that can identify with its future members, has been undermined by the pace of technological change and porous borders. We vote for short-term fixes. Young people can't vote, and nor can threatened non-human species.

But we do have moments of clarity and rationality. We know that certain broad outcomes are desirable. Number one, most likely, is the survival of the human race in the face of natural or man-made catastrophe. Others would include the maintenance of a decent financial and physical environment for future generations. Sadly, our political campaigns are focused almost exclusively on who shall govern us for the next few years. We can choose one person over another (or one party over another), on the basis of what they claim to believe and the activities they promise to carry out over their few years in power. The link between politicians' promises and their activities is tenuous. That between their promises and short- or medium-term outcomes even more so. And long-term outcomes - the sort that will profoundly affect the lives of future generations - are rarely anything other than a by-product of the accumulated decisions. Distracted by the short term, we fatalistically surrender discussion of the long term to the religious, the chiliasts and the cultists; few of whom care dispassionately about the well-being of the entire planet, or the whole of humanity.

That's where Social Policy Bonds could enter the picture. Existing political activities could be subsumed within a set commitments to achieve society's broad, long-term goals. Under a bond regime, we could explicitly target such objectives as the survival of human beings and the [1]avoidance of catastrophe. The bonds, because they allow the explicit targeting of such very long-term goals, would shift the focus of politics towards the well-being of future generations. We all know that such a shift is essential, but it's also clear that current politics is rigidly, almost obsessively, concerned with the short term.

### **8.6.2 Government: picking winners, picking losers; who cares? (2011-06-11 19:27)**

But progressive government - as demonstrated by the Obama administration - flunks any real test of fairness. It clearly favors unionized workers over non-unionized workers, just as it routinely favors the biggest and most politically connected corporations over smaller and more entrepreneurial enterprises. Crony capitalism and the practice of kowtowing to the biggest and most politically assertive unions are joined at the hip in this administration.

[1]Gambling Man, Andrew B Wilson, 'The American Spectator', 6 June

True, but if we simply change "unions" in the last sentence to "organizations" this would apply not only to the current US administration, but to virtually every other administration in every country in the world. It's convenient, at every level, for government to act as though the success of big organizations, including its own departments, implies the success of an economy, a society and the government itself. Not so. All organizations, whether they be government agencies, business of any size, religious and education bodies, and - yes - unions, have as their over-arching goal that of self-perpetuation. Even when that goal diverges from or conflicts with the wishes and well-being of society.

There's little to keep bigger organizations honest, especially when they are so big that they can work on other organizations, including government agencies, to manipulate trade, legislation, the market, and the regulatory environment with the goal of preserving their privileges. Government itself is folded into this process, such that unravelling the mess is going to be extremely difficult. A widespread sense of crisis might help, but there are no guarantees that that would lead to anything better, at least in the medium term.

Setting some broad, long-term goals might help. Government, with all its powers and influence, would, I think, be better advised to consult with the public about what's really wanted. Under a Social Policy Bond regime it could target, not only global goals such as dealing with the threat of [2]man-made or natural [3]catastrophe, or minimising the risk of nuclear [4] conflict , but national goals such as improved health and [5]education outcomes.

Instead, for its own petty reasons, it wastes time and scarce resources by, for example and as Mr Wilson points out, acting as an investment managers with taxpayers' money. Investment managers, or gamblers, moreover, who are paid however badly they perform.

### 8.6.3 Government by the rich, for the rich (2011-06-17 19:08)

[1]House keeps farm subsidies, cuts food aid as it passes food and farm spending bill  
'Washington Post', 16 June

This should be no surprise. We have known for decades that [2]farm subsidies are insane; that they transfer income from the poor to the rich and that they do much to destroy the natural environment and animal welfare. But our corrupt political systems are incapable of stopping them. Much easier to cut food aid to those who count for nothing under the current regime: the poor at home and overseas. This is government for the rich by the rich. It makes a mockery of democracy.

If we made policy as if outcomes mattered, such lunacy would not survive. The tiny number of people who benefit from it can do so only because policymaking is an arcane process focused on procedure, funding, structural and institutional arrangements and other concerns entirely removed from those of ordinary people.

That's where Social Policy Bonds would differ: under a bond regime, projects, funding, and activities would all be orientated towards achieving specified social goals. The connection between policy and targeted outcomes would be explicit and inextricable. The public could engage with policymaking, so goals would have greater buy-in. The current farm subsidy regime is a symptom of a much bigger problem: that of the disconnect between policymakers and the people they represent. Social Policy Bonds, with their focus on meaningful outcomes, could re-connect policy with the public.

#### **8.6.4 Subsidising planetary destruction (2011-06-26 15:42)**

The International Energy Agency does valuable work in quantifying the subsidies to fossil fuel production and consumption.

We estimated that consumer subsidies [for fossil fuels] were worth US \$ 312 billion in 2009. In the current economic climate, this is a significant amount of money which could be used to more directly tackle priorities such as poverty alleviation, health or education. Our modelling also showed that if subsidies are reformed by 2020, global energy demand could be reduced by 5%. This has significant implications for energy markets and efforts to combat climate change. International Energy Agency's Senior Energy Analyst Amos Bromhead in [1]conversation with 'Subsidy Watch', April 2011

It's scandalous that these subsidies continue. They transfer funds from the poor to the rich. They do nothing to help the poor that could not be better done by more-targeted assistance. And they subsidise environmental depredation. In this, energy subsidies have much in common with agricultural subsidies, still continuing decades after their [2]lunacy was exposed and quantified. One example from last year:

What could be more outrageous than the hefty subsidies the U.S. government lavishes on rich American cotton farmers? How about the hefty subsidies the U.S. government is about to start lavishing on rich Brazilian cotton farmers? If that sounds implausible or insane, well, welcome to U.S. agricultural policy, where the implausible and the insane are the routine. Our perplexing \$147.3 million-a-year handout to Brazilian agribusiness, part of a last-minute deal to head off an arcane trade dispute, barely even qualified as news .... If you're perplexed, here's the short explanation: We're shoveling our taxpayer dollars to Brazilian farmers to make sure we can keep shoveling our taxpayer dollars to American farmers — which is, after all, the overriding purpose of U.S. agricultural policy. [3]Why the US Is Also Giving Brazilians Farm Subsidies, by Michael Grunwald 9 April 2010

The gap between the governments we have and the people they are supposed to represent hardly looks like closing. Ordinary people, along with planet Earth, are left behind in the policymaking process. We have to put up with whatever comes out of the bargaining between interest groups, be they large corporations, government agencies, trade unions or (so-called) religious bodies. For reasons social, financial and environmental, such a policymaking process cannot last much longer. If we are lucky, there might be time to turn towards making policy as if outcomes mattered.

## 8.7 July

### 8.7.1 Taking command of the long term (2011-07-05 18:43)

Greece has 800,000 civil servants, of whom 150,000 are on course to lose their jobs. The very existence of those jobs may well be a symptom of the three c's, 'corruption, cronyism, clientelism', but that's not how it feels to the person in the job, who was supposed to do what? Turn down the job offer, in the absence of alternative employment, because it was somehow bad for Greece to have so many public sector workers earning an OK living? Where is the agency in that person's life, the meaningful space for political-economic action? She is made the scapegoat, the victim, of decisions made at altitudes far above her daily life - and the same goes for all the people undergoing 'austerity', not just in Greece. [1]Once Greece Goes..., John Lanchester, 'London Review of Books' online, 30 June

We live and work within a policy framework decided by people at high altitude. Or perhaps 'decided' is too purposeful. Policymakers are only a little less victims of the system within which they operate than ordinary workers. They have few definite, long-term objectives to work for. Perhaps the maximisation of economic growth (or growth per head) which, if it considered at all is assumed to generate enough resources to solve every sort of problem - even those it creates. Other guidelines are even more vague or rarely articulated. The avoidance of social upheaval; the avoidance of 'too much' pollution, or unemployment, or crime, or whatever. Because these guidelines are vague, or seldom made explicit, they have the status of declarations of intent. All this means that society's actual long-term guidelines are either decided by default, or subject to the manipulation of the powerful; including large corporations, government agencies, and the largest trade unions.

So we find, and not only in Greece, explosions in public sector employment, and public debt. We'd all be better off society's longer-term goals, including debt levels, were openly debated and made explicit. They need not be absolute, but there would be incentives for

people to achieve them.

Social Policy Bonds, because they are tradeable , could be used to target long-term goals, including guidelines within which, say, debt, or crime, or pollutions must lie. Societal goals, such as limited debt levels, are more stable over time than the supposed ways of achieving them, and we could all benefit if they were targeted explicitly. Outcomes targeted under a bond regime could include those whose origins are uncertain or contested. Just because policymakers don't know all the causes of crime, or climate change, say, does not mean that they cannot explicitly target them and, in effect, contract out the work of identifying cause and effect to a motivated private sector.

### **8.7.2 Targeting GNP: the logical conclusion (2011-07-17 21:57)**

Gross National Product, in the absence of any other explicit indicator, is often targeted implicitly; as if GNP, or GNP per head, indicate anything meaningful to ordinary people. [1]This is one example of what happens when governments insist on targeting GNP.

### **8.7.3 The EU: a top-down, one-size-fits-all institution (2011-07-20 21:33)**

Frank Furedi writes:

From its inception, the EU was an elitist managerial project that was able to construct and promote its agenda without having to respond directly to popular pressure. Decisions are never arrived at through public debate, and the majority of EU laws are formulated by the hundreds of secret working groups set up by the Council of the EU. Most of the sessions of the Council of Ministers are held in private, and the EU's unelected European Commission has the sole right to put forward legislation. [1]Why the EU is so clueless about the Euro crisis, 20 July

It's arguable that global crises require global solutions, and EU-wide crises require EU-wide solutions. But I would argue that solutions need to arise from below, rather than imposed from above. They need to be diverse and adaptive. Big government, while necessary to articulate our goals and to raise the revenue for achievement, is rarely best placed to achieve them. The decision-making bodies of big government, such as those that Mr Furedi writes about, might be well meaning and hard-working, and they might even perform adequately

when a crisis requires a big, one-size-fits-all, top-down solution. But they tend to be remote, and unresponsive to local circumstances and changing events. The entire EU exercise and, in particular, the Euro, are the apotheosis of big, remote government. They might well be neither responsive nor diverse enough to go on for much longer.

It's too late for the EU, but a Social Policy Bond regime would distinguish between the (1) the articulation and revenue-raising part of government, and (2) the achievement of social and environmental goals.

#### **8.7.4 Complexity used to favour the rich (2011-07-23 20:43)**

Government and big business have interests that often conflict with ordinary people and smaller businesses. They habitually use complexity to benefit themselves, at the expense of small, local enterprises and natural persons.

...leading members of the [US] Senate are seriously considering giving the most profitable companies in the world a total tax holiday as a reward for their last seven years of systematic tax avoidance. Hundreds of billions of potential tax dollars would disappear from the Treasury. And there isn't a peep from anyone, anywhere, on this issue. We're seriously talking about defaulting on our debt, and cutting Medicare and Social Security, so that Google can keep paying its current [1]2.4 percent effective tax rate and GE, a company that received a \$140 billion bailout en route to worldwide 2010 profits of \$14 billion, can not only [2]keep paying no taxes at all, but receive a \$3.2 billion tax *credit* from the federal government. And nobody appears to give a \*\*\*\*. What the hell is wrong with people? Have we all lost our minds? [3] Corporate tax holiday in debt ceiling deal: where's the uproar? Matt Taibbi , 22 July

Complexity, obscurity, and just the plain boredom of the policymaking process are being exploited by powerful interests. They can get away with this, because policy is expressed in terms that are so incomprehensible or vague that they deter outsiders - that's those of us who should be in uproar - from getting involved.

Social Policy Bonds would be different. They would target explicit goals that are meaningful to ordinary people: cutting the crime rate, reducing unemployment, reducing pollution, for instance. The public would take an interest because it can understand outcomes. The bonds could close the gap between the public and the policymakers, which is now not only wide, but widening. Perhaps disastrously so.

## 8.8 August

### 8.8.1 Who cares about policy? (2011-08-03 16:45)

Mick Hume writes that political life in the UK:

...becomes less about what you believe in or achieve, and more about how you appear, where you are seen and who you consort with. Personal image and style become all-important. That is why we find ourselves in a bizarre situation where a Tory prime minister can, on a given day, get more stick in the media for refusing to tip an Italian who did not deliver cappuccino to his table than for failing to deliver anything much in the way of a government programme. [1]How British politics became trivial pursuits, Mick Hume, 3 August

Mr Hume talks about our celebrity political culture, which is partly a result of the lack of any ideological underpinnings to political parties. For me, though, ideology is at least as removed from society's well-being as celebrity. In either case, the interests of ordinary people are removed from the political agenda. Politicians are driven by ideology or by their wish to associate themselves with celebrities, either as an end in itself, or as a means of staying in power, or to distract the masses from matters of substance.

Ideology, celebrity, or the interests of the rich and powerful: in every case the drivers of our politics are not delivering meaningful outcomes to ordinary people. Social Policy Bonds, aside from their efficiency, could re-orientate politics entirely towards the achievement of social and environmental outcomes. Under a bond regime, politics would focus on the targeting of such outcomes, their relative priority and their cost. All actions set in train by such policymaking would be subordinated to the achievement of these outcomes. Ideology, celebrity and other nonsenses - currently absurdly important - would be seen, accurately, for what they are: self-indulgences.

### 8.8.2 It's obvious really (2011-08-13 16:44)

It's obvious that governments should spend within their means, shouldn't debase the currency, and shouldn't destroy the environment and social cohesion. But today's policymakers

operate in a fog of obscurity and micromanagement. They are preoccupied with ideology, activities, institutional structures, spending plans, image and news management. In such an environment, it's too easy to lose sight of principles. Attention spans shorten; the focus shifts from the long term and crucial to the short term and flippant. Problems that can't manifest themselves as dramatic tv footage are neglected.

Expressing policy in terms of broad, desirable goals, as Social Policy Bonds do, could get us out of this predicament. We could issue bonds that become redeemable at the end of a sustained period of, for instance, world peace, fiscal continence, contained inflation and unemployment, and low levels of environmental destruction.

It's unlikely to happen. Governments just don't think like that. It's unfortunate that, at a time when governments are big, democratic and influential enough to articulate society's goals accurately and to raise the revenue to achieve these goals, they cannot relinquish their control over how these goals shall be achieved. Instead, they centralise more and more, as if power is an end in itself. Big government doesn't have to be remote, one-size-fits-all, rigid, error-prone and a threat to the well-being of mankind and every other species. But, because it fails to measure success in terms of explicit, meaningful outcomes, that's precisely what it has become.

### **8.8.3 Solitudinem faciunt... (2011-08-16 20:59)**

Jean Bricmont and Diana Johnstone discuss the NATO intervention in Libya:

Despite the efforts of a few isolated individuals, there is no popular movement in Europe capable of stopping or even slowing the NATO onslaught. The only hope may be the collapse of the rebels, or opposition in the United States, or a decision by ruling oligarchies to cut the expenses. But meanwhile, the European left has missed its opportunity to come back to life by opposing one of the most blatantly inexcusable wars in history. Europe itself will suffer from this moral bankruptcy. [1]Who Will Save Libya From Its Western Saviours?, 'Counterpunch', 16 August

There are no guarantees against this sort of madness, but western governments that are focused on bringing about the achievement of a few broad, well-defined, explicit social and environmental objectives would find it awkward to explain how taking sides in Libya could help their society's well-being...let alone that of any other society. It's clear that there's no internal

mechanism to limit the scope of government, whether at home or overseas. Desperately needed is some discipline that would re-orientate government so that it concentrates on outcomes that are meaningful to ordinary people. The accumulation of sovereign debt in the developed countries is the most obvious and ominous symptom; but the pointless, destructive and barely opposed intervention in Libya is a particularly poignant example.

#### **8.8.4 Reason and prejudice (2011-08-28 16:19)**

According to [1]Hugo Mercier , we've been reasoning about reason all wrong. Reasoning is very good at what it probably *evolved* to let us do—argue in favor of what we believe and try to convince others that we're right. [2]Did reason evolve for arguing?, 'Point of Inquiry', 15 August

According to this theory (elaborated in the POI podcast), the function of reasoning is argumentative. If I have understood it correctly it says that we use reasoning to convince others of our beliefs and prejudices. So "reasoning works well as an argumentative device, but quite poorly otherwise." If we accept this theory, what would it mean for policymaking and policymakers? In an age of extreme specialisation, making policy, or choosing amongst alternative policies, will often be done only by perhaps a single person, who will decide not according to reason and logic, but according to his or her unchallenged beliefs. In this respect, the theory is similar to the that of natural selection. The implication of both theories is that policymakers, even experts, should have some humility.

Both theories support my contention that policy approaches should be subordinated to outcomes. Politicians in democratic countries are good at articulating social goals, and good at raising the revenue necessary for their achievement. But they are not so good at working out how to achieve these goals. Even with a public administration degree, they still won't be perfect. They subvert natural selection, by favouring top-down, one-size-fits-all approaches, which are not always appropriate , and by failing to terminate failed approaches. And, if we accept Dr Mercier's theory, they are also likely to favour approaches that accord with their own ideology and a priori beliefs, rather than those that can be supported by evidence.

This is where Social Policy Bonds could help. Many goals are not amenable to the top-down approach. But a bond regime would reward successful outcomes however they are achieved. Governments could set social and environmental goals, without having to think of how to achieve them. That would require some humility, of course, as well as politicians' relinquishing some of their power. For that reason and others it's probably more likely that non-governmental actors - NGOs or philanthropists, for instance - will be the first to issue Social Policy Bonds.

## 8.9 September

### 8.9.1 Subsidising the rich (2011-09-01 17:17)

Or rather, transferring resources from the poor (and the environment) to the wealthier members of society.

The richest 10 per cent of the population receive four times as much public spending on transport as the poorest 10 per cent. [1]Source

It's the usual fare: policy as if meaningful outcomes for ordinary people don't matter.

### 8.9.2 Propping up interest groups: everyone loses (2011-09-06 12:13)

John Kay, explaining the current financial crisis, writes:

The subtle but important distinction between policies that support a market economy and those that support the interests of established large firms was not widely appreciated by policy makers on either right or left. [1]A good crisis gone to waste , 30 August

Governments make this mistake often: they identify the success of the economy with that of large corporations - which often just happen to be big contributors to their party funds. Failing corporations, just like failed policies, are not allowed to expire, but are instead propped up with taxpayer funds. The 'creative destruction' on which our economic system depends, doesn't operate: instead government policy takes over from market discipline. Diversity goes and, with it, the ability of our political and economic system to adapt. What we are seeing now: social, political, environmental and economic crisis, is largely a result of government propping up special interest groups. The short-term beneficiaries are the bosses of big corporations and the visionless politicians who buy them off. The losers are...well...everybody else.

We urgently need to move toward a system that rewards favourable outcomes. Not, as under the current system, those who say they're going to deliver them or who may have delivered those outcomes in the past, but cannot efficiently do so now. That's where a Social Policy Bond regime could help. Only those who actually and efficiently achieve targeted social and environmental outcomes would be rewarded. In stark contrast with the current system their identity would be entirely subordinated to their efficiency and effectiveness.

---

### **8.9.3 All over the place (2011-09-19 19:52)**

With economics as with society and the environment, policymakers are confused. Their only consistent objective seems to be to hang on to power. On issue after issue, whether it's climate change, unemployment, crime or any social or environmental problem, policymakers will choose appearance over reality; the continuation of current policies beyond the point when they become destructive; the placating of powerful interest groups, especially donors to their political party; and the substitution of [1]Mickey Mouse micro-objectives (agreements signed, funding allocated, pamphlets produced) for meaningful outcomes for ordinary people. There need be no conspiracy. Policymakers are simply too busy or too pre-occupied with the short term to consider long-term goals. Kicking the can down the road has become the default mode of operation. Not rocking the boat has become the default, over-arching political objective.

We need to reconnect policymakers with the people they are supposed to represent. The current policymaking mechanism, focused as it is on legislation, arcane discussions about institutional structures and funding, sound-bites and personality, serves only to widen the gap between the government and the people.

One way of bridging that gap might be for all of us to think in terms of the outcomes we want to see from policy, rather than supposed means of achieving them. At the very highest level objectives such as "economic growth" have now become irrelevant to, or even in conflict with, the aspirations of ordinary people. On a crowded planet, with ever more complex social arrangements, something as vague as GDP per capita correlates very little with human well-being. Why not, then target more directly things that really matter: physical and mental health, low crime rates, universal literacy, a cleaner environment? That is what a Social Policy Regime would look like. A few broad - negotiated - social and environmental goals, to which all government-financed activities would be subordinated. People can understand objectives, even if we (those of us who aren't paid lobbyists) are turned off by legal and political processes. Under a bond regime we could engage with policymaking and, crucially, feel that our voices have been heard. Such a policymaking system would, I think, be not only more efficient than the current, failing, mechanism, but also would generate buy-in from the public; something that is essential if we are going to solve the urgent, critical social and environmental problems that we face.

-

Policy as if outcomes mattered  
SocialGoals.com

1. <http://socialgoals.blogspot.com/2009/06/mickey-mouse-micro-targets.html>

---

#### **8.9.4 Policy: for specialists only (2011-09-21 14:07)**

One of the advantages of Social Policy Bonds is that they express policy in terms of meaningful outcomes. This means, as I said in my previous post, that the public can participate in the policymaking process. The benefits of this, in terms of greater public buy-in, are incalculable. Sadly, the current system is moving yet further in the opposite direction. In

[1]After America Mark Steyn discusses the US health care debate:

Through all the interminable health-care "debates" of Obama's first year, did you read any of the proposed plans? Of course not. They're huge and turgid and indigestible. Unless you're a health-care lobbyist, a health-care think-tanker, a health-care correspondent, or some other fellow who's paid directly or indirectly to plough through this stuff, why bother? None of the senators whose names are on the bills ever read 'em; why should you? (page 52)

Exactly so. Any relationship between what you would read and an outcome meaningful to you would be purely coincidental. Policy debate nowadays focusses almost exclusively on institutional structures, funding arrangements, legalisms, with some gestures and symbolic language thrown in.

-

Policy as if outcomes mattered  
SocialGoals.com

1. <http://www.steynstore.com/product88.html>

---

### **8.9.5 The economy's ok; shame about well-being (2011-09-27 10:44)**

From the Economist:

The alarm [in the developed countries] over the threat to jobs from India and China echoes the anxiety about Japan's rise in the 1970s and 1980s. America's economy has survived the shake-up of its steel, electronics and car industries, as have other rich countries. [1]Exporting Jobs , survey of the world economy, 'the Economist', 24 September

If we accept that the "economy" has indeed been able to "survive" then, whatever the "economy" is, it can't have much to do with employment, confidence, social cohesion or indeed anything that correlates with the well-being of the human population. Sadly our leaders are hypnotised by "the economy" and its well-being. They implicitly target things like average GDP per capita, regardless of how it's distributed and the consequences for the physical and social environment. I think we'd all benefit if, instead of fixating on "the economy", we targeted instead outcomes that are meaningful to ordinary people.

-

Policy as if outcomes mattered  
SocialGoals.com

1. <http://www.economist.com/node/21528983>

---

### **8.9.6 Policy as if outcomes are irrelevant (2011-09-27 15:54)**

More from Mark Steyn :

... both the [US] Occupational Safety and Health Administration (OSHA) and the Consumer Product Safety Commission ( CPSC ) were set up by a Congress that didn 't identify a single policy goal for these agencies and "provided no standards whatsoever" for their conduct. So they made it up as they went along. Where do you go to vote out the CPSC or OSHA? [1]After America, page 85

Gestures approved by spin doctors, jobs for cronies, self-delusion: all these are key policy drivers under the current system. Outcomes? Nobody's very interested. Nobody, apart from paid lobbyists, even bothers to follow policymaking , so arcane are the debates, and so removed is our political caste from the people they are supposed to represent (and, as is becoming clear, from reality itself).

A Social Policy Bond regime would at the very beginning refocus attention on the question: what is government for? Policymaking would be about defining and prioritising targeted goals - goals that would be meaningful to ordinary people. That means targeting not organisational structures or funding, not appearances or gestures, but outcomes like reduced unemployment, a cleaner environment, low crime rates.... Things that matter to citizens, in other words. That would be a stark contrast to today's policymaking circus.

## 8.10 October

### 8.10.1 Five jumbo jet disasters a year in the UK (2011-10-06 20:14)

Despite clear improvements in road safety, the annual cost to the UK economy of all [road] deaths and injuries remains significant at around £13 billion (i.e. around 1 % of GDP), with damage-only accidents estimated to cost a further £5 billion. [1]Source ( pdf ), quoted on [2]Man's Greatest Mistake

A shark attack anywhere in the world means instant headlines, as does a plane crash or a terrorist atrocity that kills a few dozen civilians. Rightly so, perhaps, but then we - or rather, policymakers - should make a lot more of the everyday killing that occurs on our roads. By some measures, the UK has the [3]safest roads in Europe but even so, 1850 people were killed in 2010. Road accidents are so routine, or so difficult to film for television, they don't merit much in the way of media attention. Policymakers should do better. The most cost-effective way of saving lives would be to allocate funds across all life-threatening causes, however mundane and unspectacular.

Social Policy Bonds have amongst their advantages that of being able to target such broad goals as longevity. They reward outcomes, not activities. Under the current system, funding for activities that are supposed to improve longevity is allocated according to a range of often spurious criteria, such as media attention, past levels of funding, or the [4]identity of likely victims. A Social Policy Bond regime would allow policymakers to target all threats to longevity (however defined) impartially. This cannot be done under the current system, as funding is allocated to bodies that have little interest and incentive to consider the overall health of the nation. Funding goes to bodies according to criteria that may have little to do with outcomes. It's funding as if outcomes - real outcomes that are meaningful to ordinary people - don't matter.

### **8.10.2 Government by distraction (2011-10-07 20:36)**

Brendan O'Neill writes:

The otherworldly nature of [UK] party conferences is a consequence of some huge political shifts in recent years. It is the hollowing-out of the mainstream parties, their speedy and profound jettisoning of members and grassroots supporters and their subsequent disconnection from the public, which creates today's strange and alien political culture. [1]Meet the PC oligarchy that now rules Britain, 'Spiked', 6 October

Exactly so. At a time when we need maximum public participation and buy-in to policymaking, we have a system that is guaranteed to alienate ordinary people. Much can be explained by our politicians' relentless focus on things that are irrelevant to normal citizens: gestures, sound-bites, institutional structures, prestige projects, quirks of personality, Mickey-Mouse micro-targets, and many other distractions. We lose sight of the big issues: facts like unsustainable levels of government borrowing or the proliferation of nuclear weapons. Who benefits from government by smoke-and-mirrors? Those who can afford to pay think-tanks, lawyers and lobbyists to follow and influence the policymaking process. That means billionaires, big corporations, trade unions and other interest groups - including government agencies. It doesn't mean ordinary people.

Recasting policy in terms of outcomes could close the ever-widening gap between politicians and the people they are supposed to represent. Social Policy Bonds would refocus policy onto outcomes that are meaningful to ordinary people, who would be better able to understand and participate in policymaking. A bond regime would reward only those who help achieve our social and environmental goals. All government-financed initiatives would be undertaken with the aim of achieving these goals as efficiently as possible. And, in stark contrast to the current system, 'creative destruction' would operate: failed projects would be terminated.

### 8.10.3 Social Policy Bonds: absurd (at first sight) (2011-10-17 16:16)

Mark Schmitt , reviewing *The Submerged State: How Invisible Government Policies Undermine American Democracy* by Suzanne Mettler , writes:

We often hope that citizens will be able to deliberate thoughtfully about policy choices, but that is impossible if the policies are shrouded in complexity and in blurred responsibility. ... It is time for a new era of reinventing government, in which the goal is to establish certain clear, unambiguous public functions, and put energy and resources behind them — to row, and not merely to steer.

[1]Row! Row!, Mark Schmitt , 'The New Republic', 4 October

Exactly. This has been my theme for two decades now. Even if you do not think Social Policy Bonds are worth trying, you must surely agree with Mr Schmitt and myself that we, the public, cannot engage with current policymaking because of its complexity, and that it is time for reinventing government in such a way as to "establish certain clear, unambiguous" outcomes. Ok , I have substituted 'outcomes' for Mr Schmitt's "functions" because to me it is outcomes rather than processes that are important, and I think Mr Schmitt would agree with me.

So what about Social Policy Bonds? At first sight, I will admit that they do seem radical. They are likely to mean that the private sector tries to perform broad functions currently undertaken by government: the achievement of health, law and order, or environmental goals, for example. There are dangers in that, some of which I address in my [2]book, others of which might not be anticipated. So I actually don't advocate that Social Policy Bonds be deployed widely. Not immediately, anyway. I do advocate that they be discussed, tried, refined, tried again, and then, perhaps, issued to solve our most urgent national and global problems.

The current system is failing us. Social Policy Bonds would represent a discontinuity in the way we approach policy. They are untried and untested. They use right-wing methods to achieve goals usually articulated by the so-called left. Yes, at first sight, they do seem absurd. But in defence of the Social Policy Bond concept, I call Albert Einstein, who [3]said: "If at first, an idea isn't absurd, then there is no hope for it".

### 8.10.4 Matt Taibbi gets it (2011-10-29 18:53)

Matt Taibbi writes:

Our world isn't about ideology anymore. It's about complexity. We live in a complex bureaucratic state with complex laws and complex business practices, and the few organizations with the corporate willpower to master these complexities will inevitably own the political power.

[1]

Griftopia

This is something I have been saying for years ([2]here, [3]here, [4]here and [5]here, for examples). Complexity has had the effect of excluding ordinary people from the policymaking process. My suggestion is to reformulate policy in terms of outcomes that are meaningful to ordinary people - as distinct from corporations, government bodies or billionaires. Social Policy Bonds would do that, and they would channel market forces into the achievement of these outcomes.

The logical end-point of the alternative - policy made by the rich for the rich - is being played out before us. But even if the political process weren't being subverted by the powerful, our society is so complex that the effects of even well-intentioned policy measures can rarely be identified. Typically, if such identification is attempted at all (which it [6]hardly ever is) there are too many variables, linkages, unquantifiables and time lags to get a handle on cause and effect. As well, there are very few incentives to get policy right. A policy's impact horizon usually extends beyond politicians' time in office, and few bureaucrats work within a system that rewards achievement rather than activity.

A Social Policy Bond regime could change all that. It would create a coalition of people and organizations whose interests were exactly congruent with those of ordinary people, and who would be motivated to monitor continuously how efficient and effective were their initiatives.

## 8.11 November

### 8.11.1 Consult on ends, rather than means (2011-11-12 19:45)

From a letter to the editor of the London Times :

Sir, Your endorsement of the Greek referendum so that the Greek people can determine their own future surprised me. Personally, I will endorse referendums on economic policy once we also put the question of what medicine doctors should use to cure certain illnesses to a public vote. Jacob Williamson, 'The Times', 4 November

Mr Williamson has a point: economic policymaking is now so complex and specialised that consultation with the public might well be a bad idea. On the other hand, harsh austerity measures need quite a lot of buy-in if they are to be successful; the sort of buy-in that might only be possible with public approval.

The answer could be to consult the public on meaningful outcomes, rather than on policies that may or may not achieve them. We understand the ends more readily than the means. When we buy a plane ticket, we are concerned more with the destination than the identity of the pilot or the detailed operation of the plane. Social Policy Bonds are a means by which the public can articulate the goals and priorities of policy. Under a bond regime, social and environmental outcomes would not only be identified and targeted, but also continually costed via the market for the bonds. Referendums about policy goals then would be a meaningful exercise, one that encourage broad engagement with the policymaking process, and the buy-in that's necessary for difficult decisions.

### **8.11.2 Targeting outcomes: there's no alternative (2011-11-17 10:07)**

When it comes to climate change, the uselessness of the current policy approach is plain. The way we do things now is: get the government or some bureaucracy to identify some activity that has an effect, then try to encourage or discourage that activity. In our complex society, that way of doing things is increasingly futile. Take climate change. Current reasoning has it that (1) climate change is caused by man's greenhouse gas emissions and that (2) cutting back those emissions will stabilise the climate . There are huge scientific uncertainties here, but let's move on to step (3) we need to cut back those emissions. So we end up with the Kyoto process, whereby some, but not all, countries say they will cut their emissions. And in the unlikely event that those countries do actually cut their emissions what do we find?

[A] significant and growing share of global emissions are from the production of internationally traded goods and services. Although this finding may follow directly from increases in international trade itself, it could have unintended consequences for climate policy, as it leads to a spatial disconnect between the point of consumption and the emissions in production. [1]Source

or, as Naomi Klein puts it:

the rise in emissions from goods produced in developing countries but consumed in industrialized ones was six times greater than the emissions savings of industrialized countries. [2]Capitalism vs the climate , 'The Nation', 28 November

We're going nowhere on climate change, because we refuse to accept that, if we want to stop the climate changing, we have to target climate change. We have to reward the achievement

of climate stability. What we shouldn't do is exactly what we are doing: using fossilised science to prejudge how we shall achieve climate stability, and building all our hopes and a huge bureaucracy on top of that science only to find that: the science is faulty or outdated and the bureaucracy is failing anyway. In short, cutting back emissions may or may not be helpful but, either way, we're not even doing that.

I really don't think there's a better way of tackling climate change and its consequences than [3]Climate Stability Bonds. Nothing, in the years since my paper was published, has changed my view.

### **8.11.3 Madness (2011-11-30 14:59)**

Who benefits from the Common Agricultural Policy, which consumes 43 percent of the European Union's budget and costs households \$296 per annum ? Well:

The Duke of Devonshire gets £390,000, the Duke of Buccleuch £405,000, the Earl of Plymouth £560,000, the Earl of Moray £770,000, the Duke of Westminster £820,000. The Vestey family takes £1.2m. You'll be pleased to hear that the previous owner of their

Thurlow estate - Edmund Vestey , who died in 2008 - managed his tax affairs so efficiently that in one year his businesses paid just £10. [1]We're all paying for Europe's gift to our aristocrats and utility companies , George Monbiot , 28 November

This insanity has been documented, qualified and widely promulgated continuously for thirty years. It is not the transfers from the poor to the rich that are inexcusable; it is their persistence over three decades and many administrations. Their persistence underlines the inadequacy of the current policymaking approach: there is no self-correcting mechanism for policies that are self-evidently absurd. Current policymaking is so arcane, so inaccessible to ordinary human beings, that only the powerful - individuals, corporations, government agencies or trade unions - have the resources to negotiate it and make it serve their purposes. And their purposes not only differ from those of most people; they conflict with them.

Complex societies don't need to have a complex policymaking process. Government could, as under a Social Policy Bond regime, target a few broad, widely agreed goals, such as better health, universal literacy, lower crime rates and a cleaner environment. Rather than try to achieve these goals itself and distract itself with easily gamed legislation and regulation, government could concentrate on articulating society's goals and raising the revenue for their achievement. Things that government, in fact, can do very well, and which, indeed, only government can do. The actual achievement of our social and environmental goals would best be contracted out to a motivated private sector, where incentives, diverse approaches

and adaptiveness could all serve social purposes.

The Common Agricultural Policy, and the persistence of its lunatic subsidies to the rich at the expense of the poor, is the logical endpoint of the contrary approach, which only the powerful have the time and resources to subvert.

## 8.12 December

### 8.12.1 Half full (2011-12-20 18:42)

It's nearly the end of the year, so time to sum up my view of where policymaking in general and Social Policy Bonds in particular are headed. The latter is easy to summarise: I have had a few expressions of intellectual interest in Social Policy Bonds, but the bond concept remains untested. More generally though, I think the concept of payment for results is gradually gaining ground in government

circles. This is generally a positive trend, though I have reservations. Chief amongst these is that the 'results' targeted are rarely outcomes that are meaningful to ordinary people. More often they are outputs of existing organisations, as measured by criteria intrinsic to that organisation. So results targeted include things like 'savings made' or (increasingly) number of employees sacked. In recent history it has usually been the case that well-meaning intentions to improve social and environmental outcomes founder on the solid, immovable rocks of existing institutions and their ways of doing things.

But I remain optimistic that something like Social Policy Bonds will eventually be issued. One reason is that society and the environment are becoming increasingly complex, so that existing methods are becoming useless. We only need to look at climate change for a spectacular and costly example of failure to manage human affairs. The other reason is that the existing system's failings are becoming obvious to all. Our economic system has been gamed to benefit the one percent - or [1]0.1 percent - and our political systems throw up uninspiring candidates for whom the concerns of most of us and the environment appear well down the list of things to worry about. It's clear that the current system cannot continue. I remain hopeful that someone, somewhere, in the public or private sector, will issue Social Policy Bonds for a worthwhile goal, and enable the concept to be tested, discussed, refined and eventually deployed to solve some of the world's urgent social and environmental problems.

ZenTiger (2012-01-02 09:26:01)

If at first you don't succeed, try, try again. And if you don't succeed then, try a very different approach to promoting the idea.

Is there a charity organisation trying to generate funds that would be able to consider this idea?

A TED style talk to work through a change of perspective?

Ronnie Horesh (2012-01-03 13:05:43)

Hi Zen Tiger and thanks for your comment.

I've tried to interest NGOs and philanthropists in the idea. Unfortunately they are not very interested, or even responsive to my approaches. Philanthropists and their organizations, in particular, just do not reply to my emails; not even an acknowledgement, not once, not ever.

I did email TED offering to speak on Social Policy Bonds, but they didn't respond. I also emailed the speakers at TED on "the Death of Environmentalism". Again, no response.

I will continue to try such approaches from time to time, but my ambition at this stage is the relatively modest one of maintaining my websites and continuing to make my book and papers available as a resource to anyone who is interested. Also, to be available to advise anyone who does take up the idea in my lifetime.

# 2012

## 9.1 January

### 9.1.1 Selective memory (2012-01-08 22:57)

From [1]The Great Derangement, by Matt Taibbi:

[US] national politics was doomed because voters were no longer debating one another using a commonly accepted set of facts.

Life and society are so rich and complex that we can easily extract evidence that supports (or appears to support) virtually any [2]outlandish claim we want to make - or its complete opposite. There are plenty of funds and incentives to make the effort worthwhile. Sometimes these exercises are cynical. But often not. We can see this very clearly when looking at the current financial crisis: respectable commentators put forward coherent arguments for much [3]more, or much less, stimulus spending.

Social Policy Bonds would bypass such arguments and all their attendant cynicism by targeting desired outcomes, rather than what people think, or are paid to say they think, are the means of achieving them. It would be up to holders of the bonds to identify and exploit the relationships between cause and effect, which is so difficult to do in our complex society. By focusing on outcomes, policymakers could concentrate on working out exactly what we want to achieve, rather than get bogged down by the interest groups, vested or not, who have their own agenda.

If this sounds far-fetched, we need look only at climate change to see how the debate has been effectively side-tracked into an expensive and ineffectual irrelevance by doing things the conventional way: trying to prove something to the satisfaction of people who oppose doing anything before taking action. A [4]bond regime would instead be rewarding people for achieving certain specified goals, or a combination of them, which could be expressed as a wide array of physical, financial and social variables. It would be up to the investors in the bonds to work out the relationships, and they would be rewarded for doing so and for continuing to do so , until our goals have been achieved. In this case, as in others, there need be no general (and often impossible to achieve) agreement on the facts before taking meaningful action.

### 9.1.2 The system is rigged (2012-01-11 12:22)

David Brooks asks [1]Where are the liberals?:

Americans...don't trust the federal government. A few decades ago they did, but now they don't. Why don't Americans trust their government? It's not because they dislike individual programs like Medicare. It's more likely because they think the whole system is rigged. .... [R]ent seeking groups are dispersed across the political spectrum. The tax code has been tweaked 4428 times in the past 10 years, to the benefit of interests of left, right and center. 'International Herald Tribune', Asia Edition, 11 January

This malaise is common to all the western democracies. Interestingly, Mr Brooks mentions sugar subsidies, which benefit just a few wealthy individuals, while "imposing costs on millions of consumers". It's the persistence of such subsidies, in the face of decades of evidence pointing out their disastrous economic, distributional and environmental impacts, that makes one despair about whether our governments can ever reform themselves. And, if they can't, then where is the initiative going to come from?

Perhaps the most benign impetus for reform would come from a shift toward rewarding outcomes, rather than, as now, the specific interest groups - public or private sector - that currently seem to run government. Social Policy Bonds would subordinate all government funding to meaningful results. Under a bond regime only the most efficient achievers of social and environmental goals would receive taxpayer funding.

Clearly the current system is losing the consent of the majority of the people it's supposed to serve. Perhaps it's time to try Social Policy Bonds. My [2]book suggests how a transition to a bond regime need not be too drastic, but could be gradually managed.

### 9.1.3 Mickey Mouse micro-targets (2012-01-12 02:53)

Numerical targets, though they can never accurately measure everything of importance, are going to have to play a role in determining the efficiency and effectiveness of policy

instruments. Many of our social and environmental problems can be attributed to (1) the private sector's use of accountancy measures, to the exclusion of anything else, in evaluating its own performance, and (2) the failure of the public sector to use any meaningful numerical targets.

Governments do use plenty of meaning less targets. Here's Theodore Dalrymple:

The Times Educational Supplement is Britain's most important journal for the teaching profession. In the January 6 edition, it described the methods school principals use to deceive the official inspectorate of schools. The inspectorate's reports, in the words of the TES, "are vital checks on the performance of schools, relied on and trusted by parents and those running and working in the system." The precise extent of the principals' cheating is, in the nature of things, difficult to measure. But once the principals know that an inspection is coming, many employ techniques such as paying disruptive pupils to stay home, sending bad pupils on day trips to amusement parks, pretending to take disciplinary action against bad teachers, drafting well-regarded teachers temporarily from other schools, borrowing displays of student work done in other schools, and so forth. It's Gogol's Government Inspector translated to the educational sphere. [1]The Less Deceived, 'City Journal', 10 January

What government should be doing is targeting broad measures that are meaningful to real people. Real people, as opposed to government agencies or corporate accountants. In education government should be targeting, at the very least, functional literacy and numeracy.

-

Policy as if outcomes mattered  
SocialGoals.com

---

#### **9.1.4 New Zealand opts for Mickey Mouse micro-targets (2012-01-19 04:11)**

Cancer patients who need chemotherapy should receive it within four weeks of being assessed, under new [New Zealand] government health targets. The cancer target at present requires hospitals to provide radiation therapy within four weeks of assessment. From July 1, hospitals would also have to ensure that patients needing chemotherapy received treatment within four weeks. [1]Source

It's a shame that the New Zealand Government has learned nothing from other countries' mistakes. Targets like this have nothing to do with the broader health of the population. They will be so manipulated as to become meaningless or, worse, divert resources into (apparent) compliance and away from health care. In the UK, for instance, we have seen ambulances [2]delaying their arrival at hospitals, so that targets for seeing patients within four hours of arrival can be met. It's not difficult to imagine ways in which New Zealand's new chemotherapy target will be similarly gamed, at the expense of people's health. This is the sort of micro-management that did so much to cripple the Soviet Union. Private corporations with a narrow focus on a few accountancy ratios are prone to similar errors. In theory at least

competitive pressure would ensure that the mismatch between targets and reality cannot continue to worsen indefinitely. (In practice, if the corporations are big enough, they subvert government and change the rules.) But when government applies these micro-targets, there's little to bring them back into line. High-sounding, well-meaning experiments like this are rarely terminated.

We need to bring government back to its core focus: if its goal is to improve the health of its citizens, that's what it should target. Let a competitive private sector work out how best to achieve that goal. Government can still set broad health targets, and it can, and should, raise the revenue to achieve those goals. But it cannot possibly keep up to date with science, nor respond adequately to changing events or diverse circumstances. Only something like a Social Policy Bond regime, where people are rewarded for being efficient achievers of meaningful targets, can do that.

### 9.1.5 Japan is different. Oh really? (2012-01-27 14:51)

But the LDP [of Japan] shows the same intransigence that has been its stock-in-trade since it lost power in 2009. It vows to block the tax bill, even though raising the consumption tax has long been a plank in its own policies. [1]Generational Warfare, 'The Economist', 28 January

Once more, we see the unimportance of outcomes to today's politicians. The right policy rejected because it's proposed by the people on the other side. We - that is, the entire democratic world - desperately need a new political system. One that targets outcomes that are meaningful to ordinary people, not politicians, corporates or government agencies. The old system is just not fit for purpose.

-  
Policy as if outcomes mattered  
SocialGoals.com

1. <http://www.economist.com/node/21543544>

---

Anonymous (2012-07-28 14:05:26)

The development of civilization makes democracy and the humanization of society inevitable. The best minds tirelessly look for a new and effective form of government that would adequately represent today's changing society. The solution is near and the necessary resources to establish this form of government are already available in society.

A new multipolar political system with a movable centre of joint decisions.  
[1]<http://www.modelgovernment.org/>

1. <http://www.modelgovernment.org/>

### 9.1.6 The triumph of process (2012-01-30 12:10)

It's a familiar story: in so many policy areas - health, education, the environment, for instance - adherence to process is more highly rewarded than socially desirable outcomes. So we have a blizzard of micro-targets combined with a disintegrating physical and social environment and a disengaged electorate. Policymaking itself is an arcane process, comprehensible only to those who are paid to participate in it or who are lobbyists for powerful interests.

And it's the same in the justice system, at least in the US, where "Six million people are under correctional supervision in the U.S.— more than were in Stalin's gulags." Adam Gopnik explains:

accused criminals get laboriously articulated protection against procedural errors and no protection at all against outrageous and obvious violations of simple justice. You can get off if the cops looked in the wrong car with the wrong warrant when they found your joint, but you have no recourse if owning the joint gets you locked up for life. You may be spared the death penalty if you can show a problem with your appointed defender, but it is much harder if there is merely enormous accumulated evidence that you weren't guilty in the first place and the jury got it wrong. [1]The caging of America, Adam Gopnik, 'New Yorker', 30 January

Mr Gopnik's article goes on to point out that the large falls in US crime rates over the past three decades, especially in New York, have many explanations, few of which could be known in advance.

I think this well-written piece helps make the case for targeting outcomes, as I have advocated, whether or not by using Social Policy Bonds. Society is so complex that a single group of policymakers cannot know in advance with any certainty the underlying relationships between, say, prison sentences and crime rates. Or between spending on schools and literacy. Or between greenhouse gas emissions and the numbers of people killed or made homeless by adverse climatic events. Where cause and effect are clear - as say, between inoculation rates and disease - there is a strong case for government working to achieve a social target. Where it is not there is still a strong case for government setting the target and raising the revenue for its achievement. But, instead of trying to achieve it directly, it would, I think, do better to contract out the achievement to a motivated, diverse and adaptive private sector. Social Policy Bonds are one way in which this division of labour could be carried out efficiently.

Thanks Mike, I've corrected the link.

## 9.2 February

### 9.2.1 Bad Policymaking (2012-02-10 12:47)

Ben Goldacre writes:

[F]or ... assessing causal relationships, intuitions are often completely wrong, because they rely on shortcuts which have arisen as handy ways to solve complex cognitive problems rapidly, but at a cost of inaccuracies, misfires and oversensitivity. [1]Bad Science, Ben Goldacre (page 238)

This becomes a problem for policymaking under the current system, where government is often charged with identifying causal relationships and, if it gets them wrong, the consequences can be calamitous. For murky, complex social, economic and ecological relationships, we need a mechanism other than the one-size-fits-all, top-down approach that is a feature of the current policymaking system (and which can work well, when causal relationships are obvious). Central planning, a catastrophic failure when applied to economies, fails too in policy areas where there is a compelling need for diverse, adaptive approaches.

But central planning is precisely the approach we are taking in tackling extremely complex social and environmental problems: climate change, or warfare, for instance. They seem to be failing in much the same way as in the economy. There's little response to expanding knowledge or to changing circumstances. There's little diversity. Most important, failed approaches aren't terminated. The incentives are to maintain existing institutions, rather than to achieve the stated outcome.

That's where Social Policy Bonds could be a better alternative. They would reward people only if a specified outcome is actually achieved and sustained. A body that issues the bonds doesn't have to have an opinion about what causes a social problem. It just has to reward the people who solve it. Incentives are built into the system: only efficient solutions will be rewarded.

For more about Social Policy Bonds, please download my book (see right-hand column).

Nicholas Popov (2012-02-11 01:35:45)

The new life of Democracy: **New universal political system** and the multipolar model of government of 5 independent political parties with the movable centre joint decisions would put an end to ideological enmity and direct energy of party leaders to benefit whole society. <http://www.modelgovernment.org/en/>

### **9.2.2 Emissions trading not working - who would have thought it? (2012-02-18 05:48)**

No surprises here:

Emissions trading, the European Union hoped, would limit the release of harmful greenhouse gases. But it isn't working. The price for emissions certificates has plunged, a development that is actually making coal more attractive than renewable energy [1]Source

Here's another idea: instead of using fossilised science, and then allowing corporate interests and their friends in government to dictate policy, why not target the outcome that we want to achieve? A more stable climate, defined in terms of some combination of human, animal or plant health indicators. And why not reward people for achieving this outcome, rather than for performing some activities that might, but actually don't, achieve it. See [2]here for more.

### **9.2.3 Should evidence determine policy? (2012-02-19 05:44)**

There seems little to choose between evidence-based policy-making and policy-based evidence-making. See this [1]discussion: "the idea that we've moved from ideology-based policy-making to evidence-based policy-making...is completely misleading, because the evidence-gathering process is itself value-laden." Life is so rich and complex, and the stakes so high, that so-called experts will always be able to find evidence that justifies whichever policies serve the interests of the highest bidder. So my answer to the question in my header is: no. And my suggestion is just as simple: outcome-based policy.

## 9.3 March

### 9.3.1 Social Impact Bonds and Social Policy Bonds (2012-03-06 14:39)

[1]Social Impact Bonds, about which I have blogged [2]before, are a small step in the right direction. (I have had no input into their creation, though I have spoken to their [3]lead developer.) Their best feature is that they target outcomes, rather than activities, inputs, or outputs. To my mind they suffer from the deficiency that they are not envisaged as being tradeable . This means they have to focus on narrow and short-term goals, for which the purchasers of the bonds can expect to hold them until redemption. This in turn means that the arrangements for each issue are more along the lines of contracts whose reporting requirements (monitoring progress toward the goal etc) seem quite burdensome in relation to the intended outcome.

Social Policy Bonds, being tradeable , can target broad, long-term goals, such as peace in the [4]Middle East, or the [5]avoidance of any sort of catastrophe, man-made or not. This is a huge advantage. Targeting outcomes, which both SIBs and Social Policy Bonds do, works better than the current, command-and-control system when we do not know in advance how best to achieve our social and environmental goals. If we target broad, long-term goals there is both: (1) less chance that targeted goals will achieved at the expense of goals that are not specifically targeted, and (2) more scope for investors to explore different ways of achieving these goals and follow and refine the best approaches. As well, reporting requirements will be a lesser proportion of the sums at stake.

Social Impact Bonds, though, are already being issued, while Social Policy Bonds, despite being in the public arena since 1989, have not. As well, I will readily concede that "Social Impact Bonds" is the better name. I was originally going to give my bonds the name "Social Objective Bonds" until one of my colleagues, more worldly than me, pointed out the meaning and widespread usage of the acronym.

### 9.3.2 Entrenching corruption (2012-03-18 14:18)

Matt Taibbi writes:

In a pure capitalist system, an institution as moronic and corrupt as Bank of America would be swiftly punished by the market - the executives would get to loot their own firms once, then they'd be looking for jobs again. But with the limitless government support of Too Big to Fail, these failing financial giants get to stay undead forever,

continually looting the taxpayer, their depositors, their shareholders and anyone else they can get their hands on. [1]Too crooked to fail, Matt Taibbi, 'Rolling Stone', 29 March

Yes, a pure capitalist system would be an improvement on the current model, in that it would respond to people's wishes, rather than the interests of monopolies or government. What we have in the west, more and more, is government that is responsive not so much to the citizens whom it's supposed to represent, but to powerful institutions. These include large corporations, trade unions, or government agencies, including the military. They all have one over-riding goal: self-perpetuation, regardless of the interests of society or the environment. Unfortunately, there is little in the way of self-correction, especially when government gets involved. Indeed, the dynamic works in the other direction: corrupt favouritism entrenches itself along the lines that Mr Taibbi describes. Interests groups whose influence is out of all proportion to their contribution to society benefit from direct subsidy or regulatory manipulation to such an extent that they become wealthy enough to resist any change.

If this sounds far-fetched take a look not only at the Bank of America, but also at farmers and agribusiness in virtually every rich country. The [2]insanity of agricultural support policies has been widely understood and quantified for several decades now. Its persistence is a savage indictment of our so-called capitalist model.

## 9.4 April

### 9.4.1 Policy as if process is the only thing that mattered (2012-04-01 16:12)

Mark Steyn writes about the US healthcare bill:

A 2,700-page law is not a "law" by any civilized understanding of the term. Law rests on the principle of equality before it. When a bill is 2,700 pages, there's no equality: Instead, there's a hierarchy of privilege microregulated by an unelected, unaccountable, unconstrained, unknown and unnumbered bureaucracy. It's not just that the legislators who legislate it don't know what's in it, nor that the citizens on the receiving end can ever hope to understand it, but that even the nation's most eminent judges acknowledge that it is beyond individual human comprehension. [1]Just reading Obamacare cruel and unusual punishment, 1 April

The problem is systemic. The policymaking process is more about the process than about the

policy. And the process itself is arcane and obscure; comprehensible only to specialists and those who can afford to employ them to follow and influence it. Yes, society is complex, and the ways of achieving social goals are similarly bound to be complex. But that does not mean that government has to try to anticipate all these ways and legislate for them. A much more accessible approach would be one that specifies targeted outcomes and rewards people for achieving them, however they do so. Government could then concentrate on what it does quite well: articulating society's goals and raising the revenue to achieve them. If it issued Social Policy Bonds, it could then contract out the actual achievement of these goals to the private sector. As well as the efficiency benefits of channeling market forces into the achievement of social and environmental outcomes, there would be the buy-in that would come from a public that understands a relatively simple policymaking process, including necessary limitations and trade-offs involved in targeting a range of social goals. What we have now is policy as if process is the only thing that mattered. What we need - urgently - is policy as if outcomes mattered.

#### **9.4.2 Finance as a source of good in society (2012-04-11 21:26)**

It's been a fallow time for Social Policy Bonds, but today Professor Robert Shiller of Yale University mentions the concept in the Huffington Post . It's the eighth of his [1]Ten Ways Finance Can Be a Force for Good in Society.

Professor Shiller also mentions Social Policy Bonds in his recent book

[2]Finance and the Good Society.

#### **9.4.3 Why have Social Policy Bonds gone nowhere? (2012-04-15 07:48)**

A correspondent asks about Social Policy Bonds:

Given how interesting [the] idea is and how much high-level attention it's received (e.g., from the likes of [Professor Robert] Shiller), what would you say are top 2-3 reasons that it has not been implemented?

I answered along the following lines:

1. The concept works best on a larger scale: that is where efficiency gains are maximised as there is more scope to shift resources between different projects and different

approaches. This makes it difficult to test on a small scale in a way that would encourage uptake of the concept. For instance, Social Policy Bonds issued by one local authority would be very unpopular if one effect would be that polluters or criminals simply transfer their activities from one city to another. Bonds targeting cancer mortality rates might end up raising total mortality rates. For similar reasons, the advantages of the concept would probably be most marked over over long time periods, which again makes testing tedious.

2. Its chief proponent, until now at any rate, has been me. I have little status in the academic, business or bureaucratic world. Most people of influence would (understandably, I guess) be disinclined to take seriously any ideas originating in such a source; especially ideas that have never been tested, or at least advocated by people with more status and credibility. One instance: I have not once received a single reply, not even an acknowledgement, to my numerous emails to philanthropists, or organizations for philanthropists, or journals for philanthropists. No doubt they are swamped by emails from all sorts of people, and they have powerful filtering algorithms.

3. ...which is really (2) restated: tried, tested and failed is a better tactic for anybody in a large organization to follow. The incentives these days are to follow due process and tick boxes rather than to achieve results. The costs of trying something very new that might fail are higher than those of replicating existing approaches, even if they are doomed to fail. I think this applies within NGOs as well as government agencies.

I find that the idea generates enthusiastic support from individuals (including Prof Shiller who first wrote to me back in 1997 and senior members of governments of New Zealand and other OECD countries), but also that such support does not influence the larger systems within which the individuals operate, which rarely reward performance.

Policy as if outcomes mattered  
SocialGoals.com

---

#### **9.4.4 Designing institutions? (2012-04-17 20:52)**

Again and again, we prefer to design systems, laws, regulations and institutions that will, we hope (or pretend to hope) bring about certain outcomes. So:

The root problem of decarbonizing energy supplies, climate change, and many other aspects of environmental sustainability is the lack of institutions to reconcile the conflicting incentives of people involved in national democracies and other governments, globalization, and environmental sustainability. [1] What will it take to save the Earth? , Joel E Cohen, 'New York Review of Books', dated 26 April (subscription)

and again:

The difficult challenges of our energy future include, first, designing and creating institutions that adjust the incentives of globalization and national governments ....  
(ibid)

I disagree. I think the composition, structure and activities of an organisation should be not a precursor to, but a consequence of the way it achieves its goals. Designing institutions smacks of self-indulgence when facing urgent, potentially catastrophic challenges. Far better to reward the solution of our problems, whoever carries them out and however they do so, as would happen under a Social Policy Bond regime. Many of our problems are unprecedented in scale, and our knowledge of them and potential solutions is rapidly expanding. Designing institutions in such circumstances will most likely be a waste of time; a laborious, contentious and divisive process that can easily be derailed, corrupted or endlessly delayed by vested interests opposed to any real change. (See also this earlier [2]post.)

## 9.5 May

### 9.5.1 What happens when targets aren't transparent? (2012-05-12 15:30)

Social Policy Bonds rely on the targeting of the use of robust, quantifiable, broad indicators of social and environmental well-being. But there is another criterion: transparency. Our targets must be made explicit and broadly acceptable. If not agreed on by everybody, they must at least be meaningful enough for the public to understand what they mean, and participate in their formulation. The alternative, as with any other policy instrument, is that they will be corrupted, which means they will benefit one interest group at the expense of society as a whole. A particularly pernicious example of what happens when targets aren't made explicit is given in the the China section of the current *Economist*:

[U]nder the Communist Party's system of cadre evaluations, local officials are graded on the basis of a series of internal targets that have little to do with the rule of law. The targets are meant for internal use, but local governments have sometimes published them on websites, and foreign scholars have also seen copies. The most important measures are maintaining social stability, achieving economic growth and, in many areas, enforcing population controls. Cadres sign contracts that spell out their responsibilities. Failure to meet targets can end a cadre's career. Fulfilling them, even if it means trampling laws to do so, can mean career advancement and financial bonuses. [1]*Suppressing dissent*, 'the Economist', 11 May

There's probably little alternative to the growing use of numerical targets in today's society's with all their complexities and time lags. While I'd prefer to channel market forces into the

achievement of our social goals we can, failing that, at least strive to make sure that these targets are consistent with the rule of law and visible to all of us.

## 9.5.2 Self-entrenching corruption (2012-05-13 19:58)

Our current political systems are quite simple to understand. Corporations, government agencies and, indeed, any organisation, have as their over-riding goal that of self-perpetuation. With government at all levels looming so large, the bigger organisations find that trying to influence government in their favour is one of the most effective ways of achieving their prime goal. Most often this happens at the expense of society or, via borrowing, the next generation, or the environment. Everybody's doing it, it seems, so it would actually be a dereliction of duty for any leaders of these organisations not to do it. Unfortunately, this system is self-entrenching. Only a really big shake-out can do anything about it - and such shake-outs bring their own problems.

A Social Policy Bond regime would be different. New organisations would come into being that would be entirely subordinated to society's explicit social and environmental goals. They would survive and thrive only by being efficient at achieving these goals. Their structure, composition and activities would all be secondary issues: subordinate to their goal-achieving initiatives. In short, we shall have [1]a new type of organisation. And that's exactly what we need. Here is one tiny but typical of the current system subverts has corruption built into it:

The claim that it would be cheaper for Greece to send every rail passenger to their destination by taxi was ... first made by Stefanos Manos, the former Greek finance minister, in 1992. Manos used the railway system to illustrate what he saw as gross public sector waste. ... He says it was an off-the-cuff remark but about right. "I knew the number of passengers and I made a brief estimate of what it would cost to send them from Athens to the north of Greece and I decided it was quite obvious it would be cheaper to send them there by taxi rather than train."

The conclusion?

... Mr Manos is correct if there are more than two passengers in each taxi. [2]Source

### 9.5.3 Social Policy Bonds: an alternative to fatalism (2012-05-18 16:47)

Discussing climate change Malcolm Bull writes:

Perhaps we should just acknowledge the problem, try not to exacerbate it too much and hope for the best. That, after all, is what most people have decided to do about the nightmare of the previous generation, nuclear weapons, and there is no reliable means of quantifying whether nuclear war is more or less likely than severe climate change, or whether its effects would be more or less destructive. The real question is whether such fatalism is ethically defensible. [1]*What is the rational response?* Malcolm Bull, 'London Review of Books', dated 24 May

I disagree. I think we can and should do more than be fatalistic about climate change and indeed nuclear conflict. Yes, there are huge uncertainties about what is going on; and yes the political difficulties of particular causes of action appear insurmountable: Al Gore, quoted in the same article, says 'the minimum that is scientifically necessary' to combat global warming 'far exceeds the maximum that is politically feasible'. But just to sit back and watch what happens? We can do better than that. We could,

for example, issue [2]Climate Stability Bonds, which would reward the achievement of a stable climate, however we define it and however our goal is achieved. We don't need to know in advance how people will go about preventing climate change or dealing with its effects. We can't know, because our scientific knowledge of what's happening and of potential solutions is expanding rapidly. But we can give people incentives to explore these possibilities and to put resources into the most promising ones, and that is what a Climate Stability Bond regime would do.

Climate change is a huge and urgent challenge, whose scale, uncertainties and implications, as Mr Bull indicates, overwhelm our existing policy mechanisms. But rather than simply wait passively for whatever will be, we could be raising funds to back Climate Stability Bonds and so give incentives for people actively to address the problem. And, in fact, the same applies to [3]nuclear conflict.

#### **9.5.4 Mickey Mouse micro-targets are everywhere (2012-05-22 18:36)**

✖

Social Policy Bonds are about setting coherent, broad, explicit and meaningful quantifiable targets, and injecting market incentives into the reaching them. They are not to be confused with the current system, which is increasingly about setting incoherent, narrow targets that are also meaningless in that they do not represent what society actually wants to achieve. I've blogged before about these; [1]here and [2]here, for instance. "Teaching-to-the-test" is another woeful example of the same thinking, driven as it is by politics and conflict between interest groups. Here, the interests of schoolchildren and society at large are over-ridden. Diane Ravitch writing about the US "No Child Left Behind Policy" says:

NCLB has compelled schools everywhere to focus solely on reading and mathematics, the only subjects that count in deciding whether a school is labeled a success or a failure. NCLB has turned schooling into a joyless experience for most American children, especially in grades three through eight, who must spend weeks of each year preparing to take standardized tests.... NCLB and Race to the Top have imposed on American education a dreary and punitive testing regime that ... demoralizes the great majority

of teachers,  
who would prefer the autonomy to challenge their students to think critically and creatively. This dull testing regime crushes the ingenuity, wit, playfulness, and imagination that our students and our society most urgently need to spur new inventions and new thinking in the future. [3]*Do Our Public Schools Threaten National Security?*, 'New York Review of Books', dated 7 June

So what goals would I want to see a Social Policy Bond regime establish for education? Nothing more than a goal of *universal* literacy and numeracy at age 15, say - something that appears to be [4]beyond the current regime. And a bond regime wouldn't stipulate which institution or people would achieve that goal nor how they would achieve it. In literacy, in education and in so many other areas of public policy we need to explore diverse approaches that can adapt themselves to changing circumstances. Teaching-to-the-test does exactly the opposite.

- 
- The first published paper on Social Policy Bonds is now available on the web [5]here. It was published in 1988 and was presented at the New Zealand branch of the Australian Agricultural Economics Society, in Blenheim, New Zealand earlier that year.

## 9.6 June

### 9.6.1 Why make the bonds tradable? (2012-06-05 20:01)

A critical feature of Social Policy Bonds is that they are tradeable. In this they differ from [1]Social Impact Bonds. There are several advantages in the bonds' being tradeable:

1. Tradeability encourages the targeting of broad social goals that might require a long time to be achieved. How so? People would buy the bonds only if they expect to make a profit on them. If they're not tradeable, that means they'd have to hold them to redemption to make a profit. That in turn means that would-be investors would want any targeted goal to have a realistic chance of being achieved within their time horizon, which might be quite short, and certainly well within a single lifetime. And that means no targeting of things like ending global conflict, or slashing crime rates, or making meaningful inroads into climate change etc. Of course, incremental targets (cutting crime by 2 percent) might be targeted by such bonds, but that's messy and that sort of reduction could be achieved by chance. Most likely, if the bonds weren't tradeable, you'd get very narrow objectives, such as those being targeted by Social Impact Bonds (in the UK), like reducing the recidivism rates of people leaving one of the UK's prisons. That's fine and laudable, but it is limited. And because it's so limited, with limited opportunities for shifting resources to and from different projects, different approaches, and varying them as circumstances change, so too are the advantages of a bond regime, which are most marked when we do not specify *how* certain goals shall be achieved, but leave that up to bondholders to explore and investigate all the options. If we think of it from the bondholder's point of view: we want payback within, say, five years. We're not going to undertake much research or try any different approaches unless they have a very short lead time and are almost guaranteed to work. There is little scope for experimentation and trying totally new approaches, or for long-term research in that sort of policy environment.
2. When we have such small objectives, the costs of monitoring progress toward or away from their achievement is going to be a higher proportion of the total administrative costs than they would under a regime that could target broader goals. It's almost as easy (or not much more difficult) to monitor national crime indicators, say, as to look at the behaviour of group of a few hundred specific ex-prisoners in one part of the country over several years.
3. Another crucial reason why the bonds should be tradeable is because the people best placed to achieve a targeted objective will change over time. Most social and environmental goals will require multiple steps before they are reached. The people who are best at step one will not necessarily be those who are best at step two and all subsequent steps. We cannot even specify in advance what step one, or indeed any step, will entail; still less can we identify those best placed to take these steps. If the bonds are tradeable, that's fine; the market for Social Policy Bonds will ensure that the bonds are always in the hands of the most efficient operators. If the bonds are not tradeable, then we have something not sufficiently dissimilar from the way social policy is currently implemented: government identifies some organisation, often one of its myriad own agencies, and pumps money into it. If this agency is paid for performance (as in Social Impact Bonds), it has an incentive to perform well - which is an improvement on the way things are usually done. But if, as so often, *one or all* of the steps necessary to resolve the targeted problem optimally lie beyond the imagination or competence of that agency, then we are going to be stuck with current (woeful) levels of under-achievement in social and environmental policy. Social Policy Bonds have the advantage in that they not only do not stipulate *how* society's goals are to be achieved, but they also leave the selection of those *who* shall achieve these goals to the market, rather than high-up people in government

or elsewhere. These people might be competent in their field, hard working and well intentioned, but nevertheless incapable of or unwilling to contract the best people for the job. In contrast, the market for Social Policy Bonds would favour the most cost-effective operators *at every stage* on the way to achieving social goals.

4. If the bonds weren't tradeable, no would-be investors would monitor progress toward the achievement of the targeted goal. All the monitoring would have to be done by the backers of the bonds. There would be no market for non-tradeable bonds, so there would be no bond price nor changes in bond price to indicate how close the objective is to being achieved. That backers of the bond would have to be more diligent about monitoring than under a tradeable regime, where the market price of the bonds would do much of the monitoring work on behalf of the backers until the objective were close to being achieved. My [2]book goes into lengthy detail about the information conveyed by market prices for Social Policy Bonds and their fluctuations, all of which would be lost if the bonds weren't tradeable. Such information would be extremely valuable to policy makers, and to society as a whole.

Performance Bonds (2012-09-01 12:32:35)

At times, the surety tries to establish that the owner (clearinghouse in case of the financial sector) did not comply with the technical conditions of a bond to avoid paying the compensation. If the surety succeeds in proving this, the owner may have to settle for the least expensive remedy to the problem.

### **9.6.2 Incentives to offer incentives (2012-06-15 14:20)**

Social Policy Bonds inject incentives into every stage of every process needed to achieve a social goal: the bonds are tradeable, which means they are worth most to those who believe they can do the best job of achieving social goals most efficiently. If someone else thinks they can be more cost-effective, they will bid more for the bonds, and buy them from less efficient investors. The incentives under a bond regime cascade down from the bondholders to everybody whom they contract to help achieve the targeted goal. To put it simply: the bondholders have incentives to offer incentives to everybody who works for them.

This is the opposite of the current system where, if we have a large organisation within which some people experiment and find an improved approach, the system itself doesn't

supply sufficient incentive to propagate that approach. So, the current *Economist*, discussing a successful innovation shown to work in one of the many hospitals run by UK's National Health Service:

[T]he main reason innovations do not spread is that the NHS has no mechanism for ensuring they do, or for rewarding the inventive. The service is centrally funded and emphasises the universality of its care rather than its results. Such a system is likely to prove better at controlling costs than at encouraging good ideas to thrive. [1]From *petrol to prescriptions* (subscription) the 'Economist', dated 16 June

### 9.6.3 What do we want? (2012-06-17 17:00)

The *Economist*, in an article about planetary boundaries, discusses climate change. Do we want to see a reduction in greenhouse gas emissions, or should we focus on "radiative forcing" - the increase in energy delivered to the surface of the Earth over time, largely as a consequence of extra greenhouse gases?

Greenhouse gases are, however, only a problem because of their effect on radiative forcing. If that could be reined back inside [1 watt per square metre above pre-industrial levels] by other means, then the CO<sub>2</sub> limit [of 350 ppm] would no longer pertain.

And that might be possible by spraying reflective particles into the upper atmosphere, to bounce sunlight back into space. Such a radical scheme would have all sorts of disturbing side effects, with political ones quite possibly outweighing environmental ones. It is by no means clearly the right thing to do. But it might be. [1]*Boundary conditions* (subscription), 'the Economist', 16 June

What does 'right thing to do' mean in this context? What do we want to achieve? The current policymaking environment allows us to avoid or muddle answers to this question. The result

is ad hoc policy, decided on the fly, or not decided at all: just the aggregated effect of private- and public-sector interest groups working towards their own ends.

We need to do better than this. A [2]Climate Stability Bond regime, at the outset, would compel us to clarify what we want to achieve. My suggestion is that we target simultaneously an array of physical, social, biological and financial variables. All targeted variables would have to fall into a specified range, for a sustained period, before the bonds would be redeemed. The variables could include the obvious ones, such as temperature, rate of change of temperature, sea level etc, but also such indicators as numbers of people killed or made homeless by adverse climatic events, species migration, species extinction, ocean acidity, insurance costs and insurance payouts. No longer would we focus (or pretend to focus) on one particular variable ; a bond regime would be versatile enough to target any number of quantifiable variables at the same time. Clarity over exactly what we want to achieve is essential if we are serious about actually achieving it. It's a tragedy that in this, and other, policymaking areas, we end up adopting *de facto* targets and subordinate all our policymaking to them. And that applies whether it's greenhouse gas levels - or gross domestic product per capita.

#### 9.6.4 Bypassing governments (2012-06-23 12:45)

It's unfortunate that most of us think the default agency for solving society-wide problems is government. In the west, we are lucky to have (for the most part) well-meaning people behaving ethically and in society's best interests. Even then, they often get it wrong, nor do they have powerful incentives to be efficient. But most people live under much worse governments, and bypassing them is not only more efficient: it's the only way things will ever get done.

Malaria is a global, devastating disease that adversely impacts both the health and economic productivity of numerous countries, especially those in sub-Saharan Africa.....However, [owing] to various interventions, such as insecticide-treated bed nets, residual indoor insecticide spraying, and effective medications, the toll of malaria deaths has somewhat declined in the last decade. This turnaround is in part due [to] initiatives undertaken in the private sector, since governmental programs in that region are fraught with disorganization and a lack of a public health

infrastructure. [1]Private sector helps in fight against malaria, American Council on Science and Health, 22 June

Just because we look to governments to improve health outcomes doesn't mean they will be good at doing so. In many countries, tragically, they will stand in the way. The backers of Social Policy Bonds that target the health of people in developing countries wouldn't need to form a judgement as to whether governments are likely to be helpful or otherwise: the way the market for the bonds works would ensure that only the most efficient operators, whomever they may be, will be rewarded for doing so. If bypassing inefficient or corrupt governments is the best way of improving the health, then that is what bondholders will do.

## 9.7 July

### 9.7.1 "Seeing Like a State" (2012-07-07 22:06)

I haven't read [1]*Seeing Like a State: [2]How Certain Schemes to Improve the Human Condition Have Failed*, by James C Scott, published in 1999. (There is a good review of it [3]here.) The description on the Amazon page sums it up:

Centrally managed social plans misfire, Scott argues, when they impose schematic visions that do violence to complex interdependencies that are not - and cannot - be fully understood. Further, the success of designs for social organization depends upon the recognition that local, practical knowledge is as important as formal, epistemic knowledge. The author builds a persuasive case against "development theory" and imperialistic state planning that disregards the values, desires, and objections of its subjects. He identifies and discusses four conditions common to all planning disasters: administrative ordering of nature and society by the state; a "high-modernist ideology" that places confidence

in the ability of science to improve every aspect of human life; a willingness to use authoritarian state power to effect large-scale interventions; and a prostrate civil society that cannot effectively resist such plans.

I've argued similarly in the past. Our current way of solving social and environmental problems is, in essence, centrally managed. The result is something like a [4]policy monoculture, and the results are predictably lamentable. But the important distinction to make is that between centrally planned outcomes and centrally managed ways of achieving them. We all want to see reduced poverty, the ending of violent political conflict, and universal literacy, for examples. Government does a good job at articulating our wishes in these and other areas. But centrally planning the ways of achieving these goals just will not work. We need diverse, adaptive solutions; ones that take into account circumstances that vary with time and space. Central planning can't do that and the results of its failure are widespread and tragic.

Which is why I advocate Social Policy Bonds. Under a bond regime we would set goals and contract out their achievement to people motivated to investigate and implement the only the most efficient projects. These projects would adapt to changing circumstances, and be sensitive to local conditions. Under a bond regime, the complex interdependencies that Scott writes, which cannot be understood by government, *need* not be understood by government. Instead, via an automatic system of cascading incentives, Social Policy Bonds would encourage diverse, adaptive initiatives that would contribute to achieving our large-scale - even global - goals.

## 9.7.2 The state doing what it does best (2012-07-11 21:41)

Tony Judt:

We have freed ourselves of the mid-twentieth century assumption—never

universal but certainly widespread—that the state is likely to be the best solution to any given problem. We now need to liberate ourselves from the opposite notion: that the state is—by definition and always—the worst possible option. quoted by Zadie Smith in [1]*The North West London Blues*, 'New York Review of Books', June 2012

The state does do some things very well. Democratic states are good at articulating society's social and environmental goals, and at raising the revenue necessary to achieve them. Where it often fails is in achieving these goals efficiently. Partly this is because government employees are rarely paid according to how successful or efficient they are in achieving social outcomes. Social Policy Bonds could transcend this limitation. They would allow government to contract out the achievement of society's goals to the private sector, while still defining these goals, targeting them, and paying for them. The state would be relinquishing some of its power, particularly its often-abused power of patronage, in issuing Social Policy Bonds, but it would be doing so in the service of better outcomes for all.

A bond regime could also encourage the efficient targeting of global problems; something that is rarely done effectively under the current system. We could look to governments or supra-national bodies to target such universally desired goals as an end to [2]war, the mitigation of natural or man-made [3]disasters, including [4]climate change. It is probably governments - and only governments - that could raise the funds necessary to solve such huge and urgent problems. They are trying, but largely failing, to achieve our goals deploying the tools currently available. But, if they collectively backed Social Policy Bonds targeting our global problems, they might be much more successful.

### **9.7.3 An alternative to doing nothing (2012-07-20 15:41)**

Bill McKibben summarises progress on reducing greenhouse gas emissions:

Last month the world's nations, meeting in Rio for the 20th-anniversary

reprise of a massive 1992 environmental summit, accomplished nothing. [1]*Global warming's terrifying new math*, Bill McKibben, 'Rolling Stone', dated 2 August

And again:

everyone at the Rio conference renewed their ritual calls for serious international action .... The charade will continue in November, when the next Conference of the Parties (COP) of the U.N. Framework Convention on Climate Change convenes in Qatar. This will be COP 18 - COP 1 was held in Berlin in 1995, and since then the process has accomplished essentially nothing.

No surprises here. Mr McKibben writes eloquently of the financial disincentives for governments and energy companies to do anything to cut greenhouse gas emissions. It's one policy area where there's insufficient scientific proof to persuade political parties to take actions that adversely affect the people who make contributions to their election campaigns. More precisely: the relationship between imposing a carbon tax (say) and benefiting human, animal and plant life is too indirect to persuade policymakers that it's in their interests to do anything beyond paying thousands of bureaucrats to fly round the world drafting meaningless documents. Our current policymaking system lets governments off the hook if they can point to uncertainties in the scientific relationship between cause and effect: in this case, between cutting greenhouse gas emissions and an improved environment. Sure, politicians might privately be quite convinced by the evidence but, if it's not obvious to everyone, they are unlikely to take action that brings long-term benefits to society while imposing upfront costs on themselves and their supporters.

Here's another suggestion. If we want to do something about cleaning up the environment, let's pay people to clean up the environment. If we want to tackle climate change, let's (after defining exactly what we want to achieve) tackle climate change. We need to target outcomes, rather than wait decades for government to agree on what's required and then make policy that might, or might not, do something to achieve it. What is important is not *how* our urgent social and environmental problems are solved, but *that* they are solved. Social Policy Bonds are one way of getting government to focus on what we as a society actually want to achieve and out of the business of identifying genuinely (or not) difficult scientific and social relationships. The first is something that democratic governments can actually do quite well. The second is something that they do badly, whether because coming to a consensus about most scientific and social relationships is unachievable, or because of their incompetence or self interest.

Climate change is quite possibly such a huge and urgent challenge that we can't wait

for politicians to be persuaded that they have more to gain by dealing with it than by pretending to deal with it. If the world's governments collectively issued [2]Climate Stability Bonds it would be motivated bondholders, not motley interest groups, who would decide what needs doing and how best to go about doing it. Governments - and taxpayers - could relax in the knowledge that if, in fact, the doubters are right, and there's no climate change problem, then the way the market works would ensure that costs to society are minimised. And, if there is a problem, investors in the bonds would have incentives to explore and implement the most cost-effective ways of solving it. They would do all this in ways that take account of our rapidly expanding scientific knowledge - something that no government can do. By targeting outcomes, rather than the supposed ways of achieving it, a bond regime would be more efficient than any other policy mix. Perhaps even more important, a bond regime would compel government to do its duty and address big, urgent problems, rather than, as now, get away with pleading uncertainty and doing nothing.

#### **9.7.4 It's all about control (2012-07-22 20:53)**

Tony Blair admits Labour didn't fully understand complex financial sector [1] source

Quite. Unfortunately his Government behaved as though it *did* understand the financial sector. Even more unfortunately, governments everywhere behave as though they understand everything: climate change, agriculture, education, housing, health, transport, crime, war and all the rest. Government so often doles out subsidies, regulates or deregulates, or otherwise tries to control complex systems that it does not, and cannot, understand. Some relationships between cause and effect are easy to understand and manage: that between paying for primary education and literacy, for example, or between organising rubbish collection and human health. But in so many other areas government is well out of its depth.

Social Policy Bonds would remove the need for government to identify in advance the extremely obscure relationships between cause and effect that are ever more a feature of our complex society. Instead of "picking winners" such as the financial sector and lavishing implicit subsidies on it, government could instead target outcomes that are meaningful to ordinary citizens - basic health, literacy, housing and health outcomes, say - and let others do the endless, and endlessly difficult, task of identifying the important links between activities

and outcomes. A Social Policy Bond regime would enable government to do something that it's actually quite good at: articulating society's wishes and raising the revenue to achieve them. But the actual achievement is something that, as is becoming clearer, is best left to people who are paid according to their effectiveness and efficiency, rather than how well they can convince the politicians that they are doing something useful.

## 9.8 August

### 9.8.1 Who needs political parties? (2012-08-04 17:42)

Given that keeping your seat means spending a fortune on television advertising and other forms of campaigning, changing your views on a matter of great interest to your sponsors is likely to be political suicide. [1]*Stop this culture of paying politicians to deny climate change*, George Monbiot, 2 August

Mr Monbiot is referring to seats in the US Senate, but the principle applies to all the democratic countries and to issues other than climate change:

[A] political system which imposes no effective cap on campaign finance leads inexorably to plutocracy: governance on behalf of the richest people and corporations.

Perhaps our system of representative democracy can be fixed, and perhaps reforming the way political parties are financed is one way of doing it. But, just as likely, the problem is intrinsic to politics in which parties dominate. Every institution, whether it is a political party, government agency, religious body, university or whatever, has as its over-arching goal that of self-perpetuation. It can easily be persuaded to evade or subvert its stated objectives for the cash necessary to stay in existence. We could try tinkering with the way political parties are financed, or we could try something different:

Under a Social Policy Bond regime organizational structures, and the people within them, would be entirely subordinated to outcomes. And people would decide directly on the outcomes they

wanted to achieve. Consider our current system: people vote for individual politicians who say they will do certain things that may or may not achieve certain outcomes - usually safely in the long term. (But [2]who monitors progress?) These people's careers usually depend, individually or as members of a political party, on some source of external funding. The scope for manipulation of these would-be politicians is obvious. So why not have people vote directly for outcomes, rather than people who, if they are made to justify their actions at all, can get away with vague promises that their decisions will at some indefinite point achieve some unquantified and uncosted goal?

Social Policy Bonds wouldn't distract ordinary people by issues such as personalities or short-term activities: they would focus our attention exclusively on outcomes and their costs. We could target such goals as the avoidance of disasters caused by [3]climate change (or [4]anything else) without having to try to keep up to date with our rapidly expanding scientific knowledge. We should not even have to decide on which institutions would best be able to achieve our goal: the way the bonds work would reward only the most efficient projects, or combination of projects, whatever they are and whoever initiates them. And perhaps just as importantly, wealthy individuals or corporations would find that the way to become even wealthier would be to direct their resources into achieving society's broad, long-term goals, rather than their own narrow, short-term interests.

## 9.8.2 Campbell's Law (2012-08-11 22:00)

The more any quantitative social indicator is used for social decision-making, the more subject it will be to corruption pressures and the more apt it will be to distort and corrupt the social processes it is intended to monitor. [1]Campbell's Law

I've blogged before about [2]Mickey Mouse micro-targets. Such targets are in common use today, and they obey Campbell's Law because they are so narrow that people can fulfil them in ways that conflict with society's best interests. Broader objectives, a feature of Social Policy Bonds, would help, because then people would have fewer opportunities to withdraw resources from the fulfilment of untargeted social goals to goals that are targeted. Broader

goals also reduce the relative costs of monitoring compliance. But even so, it is best to think of metrics that actually are, or are inextricably correlated with, what we actually want to achieve. There are some things you can do to minimise the risk of gaming the system. For example: if our target is universal literacy in a country, we could take reading tests at a random sample of 50 out of a possible 1000 locations in that country. Similarly for pollution or crime, for examples. There might be other ways of targeting metrics without specifying in advance exactly what they are, so that people have to do the job, rather than game the system, in order to profit from holding Social Policy Bonds. But there will probably always be a need to see that people are complying with the spirit, not just the letter, of any target. That said, some targets would be pretty difficult to game: for instance, the goal of having no people killed by a military nuclear explosion over the next thirty years.

### 9.8.3 Should teachers be paid? (2012-08-17 19:16)

Charles Ferguson, discussing the activities of people gaming the US financial system, writes:

we seem to have reached an unhappy position in which a substantial fraction of our most intelligent and articulate citizens either sit at Bloomberg terminals or jet around the world in very expensive tailor-made suits “ding deals” that, judging by the recent record, have no purpose except to put more money in their own pockets, and that on a net basis are economically detrimental to the rest of the population.

Charles H Ferguson, *[1]Predator Nation*, May 2012

Surely we can do better than that? People sometimes argue that Social Policy Bonds are a means by which investors make money out by doing what they should be doing anyway. It is true that some wealthy bondholders could become even more wealthy by first buying Social Policy Bonds, then doing something to achieve the targeted objective, then selling the bonds. If that seems reprehensible, it is far better than the reality that Mr Ferguson describes above.

It might not even be that individuals will amass huge fortunes under a bond regime, even if they do successfully achieve society's goals and profit from their bondholding. The way the market for Social Policy Bonds works would mean that excess profits could be bid away by competitive would-be investors.

The market would convey a huge amount of information, *openly*, that will indicate the constantly varying estimated costs of moving towards a targeted goal.

The sums of money at stake might be huge, particularly for Social Policy Bonds that target apparently remote, national or global goals, but there's no particular reason to assume that, in the long run, it would be shared out any less equitably than, say, teachers' salaries. Those are other examples of people making money by undertaking a socially useful activity. There are perfectly logical arguments against paying for teaching or nursing services but they don't sound very convincing these days.

#### **9.8.4 The US election: who cares? (2012-08-25 16:07)**

Who cares about the US election circus? More from *Predator Nation*:

[An] effective response to internal industrial decline [in the US] and foreign challengers required major changes in American government as well as industry. It required major improvements in the educational system, aggressive pressure to force incompetent industries to reform, ... and a variety of regulatory changes. But those measures had no focused, powerful, well-financed interest group to lobby for hem.  
Charles H Ferguson, [1]*Predator Nation*, May 2012

What did those powerful interest groups decide to do? Mr Ferguson continues:

...to start using money to get what they wanted. But only what they wanted, individually - not what the country as a whole needed. Indeed, what was good for their company's profits was quite often bad for the nation.

Most voters probably know, at some level, that the politicians have not the slightest interest in the long-term well-being of the nation and its citizens or, rather, that they cannot afford to rule as if they have. The problem is self-reinforcing. It cannot reform itself. The people and the politicians live in different worlds and those worlds are moving away from each other.

Despite recent interest ([2]here for instance), I have no illusions about the likelihood of Social Policy Bonds being issued by national governments, but I will continue to put the idea forward as a possible solution. A bond regime would target outcomes that are meaningful to ordinary people: things like better health, lower pollution, or [3]reduced risk of disasters, however caused. By focusing relentlessly on outcomes, rather than the current array of vague or unspecified targets, the bonds could *shame* governments into catering to the needs of all their citizens, rather than the wealthy and powerful. That's because governments would have explicitly and publicly to declare the outcomes that the bonds would target. And, because political debate would centre on these outcomes, rather than activities, outputs, funding arrangements, laws, regulations, personalities and hairstyles, it's far more likely that ordinary people would participate in the policymaking process.

Under a bond regime we, the non-powerful, general public could still, as we are now doing, acquiesce in our tax payments being used to bail out a corrupt financial sector, or subsidies huge industrial and agricultural conglomerates and [4]fossil fuel extraction and consumption. But, in that unlikely event we'd at least be doing so with our eyes open. Even that would be an improvement over the current system built, as it is, on deception.

## 9.9 September

### 9.9.1 Barnacles (2012-09-04 20:53)

From *the Economist*

Modern governments play a much larger role in the economy than the ancient Greeks or the founding fathers could have imagined. This makes political leaders a huge source of patronage, in the form of business contracts, social benefits, jobs and tax breaks. ...[T]hese goodies are highly valuable to the recipients but the cost to the average voter of any single perk will be small. So beneficiaries will have every incentive to lobby for the retention of their perks and taxpayers will have little reason to

campaign against them. Over time the economy will be weighed down by all these costs, like a barnacle-encrusted ship. The Greek economy could be seen as a textbook example of these problems.

One answer could be to take fiscal policy out of the hands of elected leaders, just as responsibility for monetary policy has been handed to independent central bankers. [1] *Democracies and debt* (subscription), 'The Economist', 1 September

And not only the Greek economy. It is not so much the existence, but the *persistence* of these barnacles that is the biggest indictment of the way we currently run things. In important respects they are self-entrenching: the more favoured are certain interest groups, the more resources they have to lobby against withdrawal of their special privileges. It's true that one reason for their persistence is because 'the cost to the average voter of any single perk will be small'. Another reason is that the cost to the voter of understanding what's going on is large. Current policymaking is incomprehensible to outsiders. It's very difficult to trace the vague statements about policy goals to actual policies, and no easier to identify links between policies and outcomes. Only people who are highly motivated will make the effort to do so. Whether such obscurity is deliberate is not that important. (Though I suspect it largely is where enormous subsidies and tax breaks for wealthy landowners and large corporations are concerned.) More important is: what to do about it?

One answer might be to express policy in terms of goals that are meaningful to ordinary people. Instead of talking about, for example, the institutional structures for health care, for instance, or funding arrangements, we should talk about national (or global) health care outcomes and ensure that whatever agencies are set up, and whatever their activities, they are all aimed at achieving these outcomes. Similarly with education, housing, crime or pollution or whatever. What is important is not who achieves our goals, nor how they do so, but that they have sufficient incentives to do the job.

A Social Policy Bond regime would immediately refocus our attention on our social and environmental goals. Under a bond regime we could target long-term, broad, societal goals, and reward those who are most efficient at achieving them. Because of the way the bonds work, it would be the disinterested market, rather than politicians who would make these decisions. Would people still opt to transfer wealth, as we do now, from the working poor to the ultra-rich? Unlikely, but if we did we'd at least be doing so with our informed consent. That in itself would be an improvement over the current policymaking environment.

### **9.9.2 Middle East Peace Bonds (2012-09-15 23:20)**

*This is a short, updated, and so far unpublished, piece on applying the Social Policy Bond principle to conflict in the Middle East*

## *Peace in the Middle East: giving self-interest a chance*

I have no solution to the anxieties and potential catastrophes facing Israel, nor to the wider problems facing the citizens of all the Middle Eastern countries. What I offer instead is a means to encourage people to find solutions. Everybody has their own ideas about what should be done. I offer a way of channelling resources into those ideas - but only if they are effective and efficient.

## *Incentives*

Where we are now: rockets are daily fired into Israel; we might well be on the brink of a nuclear calamity; and the entire region is a seething cauldron of every sort of hatred: ethnic, confessional, sectarian and gender.

Most ordinary people in the region, given time to reflect and the freedom to express their opinions would like nothing more than to see an end to the violence in the region. But there are too many people with a vested interest in keeping conflict going. They include the men of religion, the ideologues, and many of the politicians and bureaucrats. The international agencies and the military, whatever their intentions, aren't exactly helping either. There are also, of course, the more nakedly financial incentives on the 'defence' industries and their beneficiaries in government, to fuel the fear of conflict. Well-meaning idealists on all sides do what they can, but their efforts are relentlessly undermined by the powerful people and institutions that want them to fail.

*Peace above all*

Perhaps it's now to time to give people incentives to create and sustain peace, rather than conflict.

For my proposal to work we need a verifiable definition of peace, which will probably consist of an array of conditions that have to be satisfied and sustained. These could include:

.

a much-reduced number of people killed in conflict;

.

a much-reduced level of terrorist events, or military incursions;

.

no use of nuclear weapons.

Under my proposal, investors in the bonds would be rewarded once these, and other agreed conditions had been satisfied and sustained for, say, 30 years.

We need to be just as single-minded as the arms merchants and fanatics in wanting peace to the exclusion of *everything*, which might mean putting aside feelings of fairness, justice and history, except insofar as they help our cause. Being single-minded about our goal doesn't mean that we simply pick the one project that we think will work and go for that. The circumstances that fan the flames of conflict vary radically from place to place and over time. No one solution, nor even an array of solutions will work all the time. We need a system that will encourage those projects that are most efficient for their time and place, and that will terminate projects when they become inefficient. In short, we need diverse, adaptive solutions.

And we need a way of promoting peace that can modify or circumvent people's uncooperative or obstructive behaviour. We need to mobilise the interests of the far greater number of people who want peace. We need to find a way that can co-opt or subsidise those people in positions of authority and power who want to help, and at the same time bypass, distract, or otherwise undermine, those opposed to our goal.

Ideally too, we would use market forces. Markets are the most efficient means

yet discovered of allocating society's scarce resources, but many believe that market forces inevitably conflict with social goals: accentuating extremes of wealth and poverty, for example, or accelerating the degradation of the environment. So it is important to remind ourselves that market forces can serve public, as well as private, goals.

### *Middle East Peace Bonds*

My suggestion is that philanthropists perhaps with governments and other interested organisations and individuals, collectively raise a large amount of money, put it into an escrow account, and use these funds to redeem a new financial instrument: Middle East Peace Bonds. These would be sold by auction for whatever they would fetch. They would be redeemed for, say, £100 000 each only when all the conditions for peace, as defined by the issuers, had been satisfied and sustained. Importantly, the bonds would make no assumptions as to *how* to bring about greater peace. Nor would they make any assumptions as to who would hold the bonds or carry out peace-creating projects. Those decisions would be made by investors in the bonds. Unlike normal bonds, Middle East Peace Bonds would not bear interest and their redemption date would be uncertain. Bondholders would gain most by ensuring that peace is achieved quickly.

### *Trading the bonds*

Middle East Peace Bonds, once floated, must be readily tradable at any time until redemption. The operation of such a 'secondary market' would be critical to the working of the bond mechanism. Many bond purchasers would want, or need, to sell their bonds before redemption, which might be a long time in the future. With tradability,

these holders would be able to realise any capital appreciation experienced by their holdings of Middle East Peace Bonds whenever they choose to do so. Tradability would make the bonds a more attractive investment in the first place, and allow us to target an outcome as remote as peace in the Middle East, that will probably take longer to achieve than any bondholder's investment horizon.

As the bonds are traded, they will tend to flow towards those who can do most to help reduce the violence. In fact, though, an actual flow of bonds would not be necessary. Large bondholders might simply decide to subcontract out the required work to many different agents, while they themselves held the bonds from issue to redemption. The important point is that the bond mechanism would ensure that the people who allocate the finance had an incentive to do so efficiently and to reward successful outcomes, rather than merely to pay people for undertaking activities. At the limit we can conceive of just one single buyer of all the bonds. If this buyer were determined to hold on to the bonds until redemption, then the bonds would function as a sort of performance-related contract, with the backers paying only when the objective had been achieved. The buyer could contract out most, or all, of the work required to achieve the objective, with the incentives given by the bonds for speedy accomplishment cascading down from the bondholder to those subcontracted to do the work of reducing the violence.

Too large a number of small bondholders could probably do little to help achieve peace by themselves. If there were many small holders, it is likely that the value of their bonds would fall until there were

aggregation of holdings by people or institutions large enough to initiate effective peace-building projects. As with shares in newly privatised companies the world over, Middle East Peace Bonds would mainly end up in the hands of large holders, be they individuals or institutions. Between them, these large holders would probably account for the majority of the bonds. Even these bodies might not be big enough, on their own, to achieve much without the co-operation of other bondholders. They might also resist initiating projects until they were assured that other holders would not be free riders. So there would be a powerful incentive for all bondholders to *co-operate with each other* to help bring about peace in the Middle East. They would share the same interest in seeing targeted objectives achieved quickly. So they would share information, trade bonds with each other and collaborate on conflict-quelling projects. They would also set up payment systems to ensure that people, bondholders or not, were mobilised to help build peace. Bondholders would either trade bonds, or make incentive payments to ensure that any proceeds from higher bond prices, or from redemption, would be channelled in ways most likely to end the violence. Large bondholders, in co-operation with each other, would be able to set up such systems cost-effectively.

Regardless of who actually owned the bonds, aggregation of holdings, and the co-operation of large bondholders, would ensure that those who helped build peace were rewarded in ways that *maximise the reduction in violence per unit outlay*.

So, in contrast to today's anaemic, short-term, tried, tested and failed approaches, a Middle East Peace Bond regime would stimulate research into finding ever more cost-effective ways of achieving peace. Indeed, bondholders would be in a better position than governments to undertake a range of peace-building initiatives. They have the freedom as well as the incentive to try innovative approaches. They might, for example, finance sports matches between opposing sides, promote anti-war programmes on TV, set up exchange schemes for students of the opposing sides. They might even facilitate intermarriage

between members of the opposing communities, or try to influence the financial supporters of conflict outside the region to redirect their funding into more positive ways. They could offer the Palestinians and the citizens of neighbouring Arab countries different forms of aid, including education and scientific aid, and measures aimed at providing a secular education for all Arab citizens.

Bondholders could lobby, or work with, the Israeli and Arab governments to, say, give a higher priority to peace studies in schools, but they could also develop peace-teaching projects of their own. While immediate peace might not result, much more could be done to enhance the prospect of peace in the future. Bondholders could, for instance, make strenuous efforts in Israel and the neighbouring countries to have some mixed classes of Jewish and Palestinian children at kindergarten and school. Both groups could be given the chance of spending time with each other. At the very least, bondholders might think, there should be opportunities for the younger people from both sides of the conflict to meet, discuss, argue and form friendships.

Some powerful people in governments, religious institutions or militant organisations would resent the targeting of such objectives by external agencies in this way. But, while under the current system they can oppose peace in ways that attract support, under a Peace Bond regime, they would have *openly* to declare their opposition to peace itself. It is precisely this focus on the outcome of peace –

rather than activities or institutions – that would help strengthen the coalition working to achieve it. We could broaden the definition of peace to include not only numbers killed or injured, but other quantifiable goals, such as the amount spent on defence in the region, the results of surveys of people's fears and anxieties, or net migration rates. For the bonds to be redeemed, all goals shall have to be achieved and sustained.

By appealing to people's self-interest, Middle East Peace Bonds are likely to be more effective than conventional efforts aimed at reducing violence. In channelling market forces into the achievement of this objective the bonds could bypass or even co-opt the corrupt or malicious people in government or elsewhere who stand in the way of peace.

In today's emotional climate decision-making is too often reactive. It is too easily swayed by those with a propensity for violence or those who benefit from it, whether financially or emotionally. Governments can evade or deflect

censure on grounds of communal affiliation or patriotism, because the adverse effects of their policies are difficult to relate to their cause. Middle East Peace Bonds would focus on an identifiable outcome and channel market efficiencies into exploring the ways of achieving it. They could be the most effective means of achieving the peace that the people of the Middle East yearn for and deserve.

### **9.9.3 Who cares about patients? (2012-09-18 21:27)**

Marty Makarty discusses the US health care system:

A host of new studies examining the current state of health care indicates that approximately one in every five medications, tests, and procedures is likely unnecessary. What other industry misses the mark that often? Others put that number even higher. Harvey Fineberg, M.D., president of the Institute of Medicine and former dean of the Harvard School of Public Health, has said that between 30 percent and 40 percent of our entire health-care expenditure is paying for fraud and unnecessary treatment. Marty Makary, [1] *Are hospitals less safe than we think?*, 'Newsweek', 17 September

We shouldn't really be surprised. The disconnect between the decision-makers and ordinary people is about as wide in medicine as it is in education, justice or politics the world over, which is to say: vast. This gap is filled by middlemen: lobbyists, government agencies with their own agenda, and other vested interests representing big corporations or purporting to represent labour. Outcomes that matter to ordinary people are a long way down the list of priorities for these organisations. Marty Makary's article later points out that there is information readily available that would see appalling doctors and surgeons struck off... but it's not made available to those who would benefit from it. Instead, hospitals, just like every institution, whether it be a government agency, corporation, trade union, or church, have as their over-arching goal that of self-perpetuation. The interests of the people they are supposed to serve are incidental. And the predictable result, in medicine as in other areas of social and environmental policy is tragedy and waste. Our impotence in the face of big government and powerful organisations leads to alienation and cynicism about the whole political process.

Social Policy Bonds could close the gap between policy and outcomes that actually benefit ordinary people. Instead of having to satisfy organisations with deceptive names that promise to get things done, a bond regime would reward only the successful achievement of meaningful outcomes; however they are achieved and whoever achieves them. In the world of medicine, enlightened governments (or philanthropists or non-governmental organisations) would issue and back bonds that are redeemable only when broad health outcomes (perhaps expressed as an index of longevity, infant mortality, Quality Adjusted Life Years, etc) have been achieved and sustained.

## 9.10 October

### 9.10.1 Opaque by design (2012-10-01 19:57)

Peter Boone and Simon Johnson discuss Japanese, US and European policymaking:

We all have political systems that have figured out how to promise far more than can be repaid, and how to work with the financial sector to opaquely transfer resources to powerful groups—at a cost, it is often said, to be paid by future generations. Increasingly, however, it appears that future generations will not be the only ones harmed by our decisions; we are already feeling the negative impact. ....The era of large-scale, uncontrolled financial booms and busts—last seen in the 1930s—is back. [1]*The next panic*, 'The Atlantic', October

The key word here is 'opaquely'. I often talk about the efficiency and effectiveness of Social Policy Bonds. But perhaps just as important is the bonds' transparency. Currently policymakers can - indeed must - express their decisions as vague declarations of intent, backed up by funding programmes for favoured bodies, be they government agencies or other interest groups. Often these bodies have edifying names, which makes the disinterested non-specialist think that there is some causal, positive relationship between, say, funds given to a government department for 'Development' or 'Overseas Aid' and the well-being of ordinary people in the poor countries. Or that funds disbursed by ministries of agriculture

do something to help struggling farmers. It's nonsense of course, but it continues because it's opaque. If our governments openly stated that, for instance, the big beneficiaries of their agricultural support programmes would be wealthy landowners and massive [2]agri-business corporates, even the least politically engaged citizen would have to take note.

Issuers of Social Policy Bonds couldn't get away with this subterfuge or the sort that Messrs Boone and Johnson describe. Transparency and accountability are built into a bond regime, as surely as they are excluded from the current policymaking apparatus. The financial, economic, social and environmental crises we face today are largely a result of scaled-up gaming of the system by powerful interest groups including, again, government itself. The losers are the vast majority of ordinary citizens and future generations.

We need something like a Social Policy Bond regime, which would target meaningful outcomes: outcomes that ordinary people can understand and in whose development they can participate. If

outcomes were built into policymaking, as they are with Social Policy Bonds, the corrupt policies of recent decades would never have been discussed, let alone implemented. Instead of focusing on arcane legislative processes, esoteric structural arrangements and hidden funding arrangements - which appear designed to turn off all who aren't paid to follow them - a bond regime would encourage public participation in the policymaking process. This is an [3]end in itself (pdf), as well as a means of bringing about the [4]buy-in that will become increasingly necessary as our social and environmental challenges become more urgent.

### 9.10.2 Metrics for peace (2012-10-05 20:03)

[1]Middle East Peace Bonds, or [2]Conflict Reduction Bonds, are all very well, but how are we to define what we mean by 'peace'? The conventional definition doesn't necessarily mean human well-being, or the absence of the threat of war. There was no open conflict during the Cold War, for instance, but it wasn't exactly a stable, beneficial state of existence.

Fortunately, Social Policy Bonds are versatile, in that they can target an array of goals, each of which has to be satisfied if the bonds are to be achieved. Furthermore of these goals

can take the form of a range of values, within which an outcome must fall for the bonds to be redeemed. Moreover, since our goal is for a sustained period of peace, that condition can also be embedded in the targeted outcome.

Experts and the public could come up with the necessary and sufficient conditions for a benign peace. Here are some suggested starting points:

- Numbers of people killed in armed conflict
  
- Spending and military strength

Military strength is an estimate of both military personnel and military equipment. The rationale for including this measure is similar to that for including military expenditure: it represents both the opportunity cost of resources lost to the life-enhancing parts of the world economy, and it is an indicator also of the potential for violence, and so an indicator of human insecurity or anxiety. While estimates of materiel could be subject to the same imprecision as spending on armaments, numbers of military personnel might be easier to quantify for targeting purposes in some regions of actual or potential conflict.

- Mass media indicators of impending conflict

Social Policy Bonds aiming at peace could also target events that are likely to lead to war, such as efforts to gain public support. There appears to be strong evidence (see *Getting to war: predicting international conflict with mass media indicators*, W. Ben Hunt, University of Michigan Press, 1997) that the underlying intentions of governments can be accurately gauged by a systematic analysis of opinion-leading articles in the mass media, regardless of the relative openness of the media in question. Such analysis allows the prediction of both the likelihood of conflict and what form of conflict - military, diplomatic or economic - will occur. This sort of indicator could be useful as a target where military conflict has not begun, but appears possible, and where other data are scarce.

There are going to be problems with accurate assessment of all these measures, but they are unlikely to be insurmountable.

### 9.10.3 Reducing poverty (2012-10-12 19:48)

According to the [US] Congressional Budget Office, in 1979 over half of all federal social spending went to the poorest fifth of households. Now it is only 36 %. [1]*The rich and the rest*, 'The Economist', 13 October

There's nothing new about capture of taxpayer spending by [2]wealthy individuals, corporations or the middle class, but its scale, persistence and degree of entrenchment make it less of a mildly corrupt, [3]disguised, way of delivering largesse to favoured interest groups, and more of a threat to our entire social system. Perhaps we need to return to first principles. If we want to provide a safety net for the poorest households, then we need to reward people who provide a safety net for the poorest households. If we are in government we don't try to second-guess *why* households are poor, or how best to relieve their poverty. We, as government, are hopeless at such tasks. We don't have the imagination, nor the capacity to adapt to changing circumstances or to the myriad varying conditions within our geographical remit. What we are good at doing and what, indeed, only government can do well is (1) to articulate exactly what we want to achieve when it comes to reducing poverty, and (2) raise the revenue to achieve that goal.

That's where Social Policy Bonds that reward the reduction of poverty come in. Governments (or indeed anybody: see [4]here) can undertake to redeem Social Policy Bonds for a high, specified sum, only when the poverty goal has been reached and sustained. We don't need to concern ourselves with *how* investors in the bonds will achieve our goal. Bondholders will have incentives to explore and implement the most effective, efficient ways of reducing poverty, taking full account of events and local circumstances. As important, and unlike many government interventions, they will have incentives to terminate failed projects. And, if they

see their funds being diverted to the already better-off, as happens with so many government programmes all over the rich world, then they will see their bonds being bought by those who are better equipped to do the job that government has set them. Social Policy Bonds would lead to the setting up of [5]organisations whose goals are identical with those of society. We don't know what form, structure or activities these organisations will assume - but we don't need to. We do know that they will prosper only to the degree that they achieve social goals efficiently and effectively. It's a big departure from the current system, which seems to reward those who are best at gaming the system, and it's one that is necessary and well overdue.

#### **9.10.4 Playground psychology as a policy driver (2012-10-15 19:31)**

The drivers of policy have little to do with outcomes. Perhaps the most important drivers are vested interests - government agencies, large corporations, trade unions, churches etc - whose over-arching goal is always self-perpetuation, which sometimes coincides with the interests of their members. Given the stakes, an even more worrying policy driver is playground psychology. Discussing how the US became embroiled in Vietnam, Frederik Logevall writes:

As Democrats, JFK and LBJ felt the need to contend with the ghosts of McCarthy and the charge that they were 'soft on Communism'. Frederik Logevall, quoted by Jonathan Mirsky in *[1]A debacle that could have been avoided* (subscription), 'New York Review of Books, 25 October

John Kay writes about decision-making in business and politics:

I once thought that however thin the public arguments for large corporate transactions, there was probably some serious analysis going on behind the scenes. Just as I once thought that whatever nonsense politicians might talk on public platforms, more substantive discussion took place when they retired to their offices. But closer acquaintance with business and politics dispelled both illusions. What you see and

hear is more or less what there is. When I was sometimes employed to explain the economic rationale for a corporate transaction, I discovered that it was rarely useful to ask the principals why they were doing it. Usually you just heard those familiar clichés. Sometimes you got closer to the truth, sniffed the testosterone, glimpsed the inflated egos. [2]Source

Until we subordinate all policymaking to meaningful outcomes, as would happen under a Social Policy Bond regime, this demented way of making policy is set to continue, with all its calamitous consequences. See also my post: [3]How policy is made.

### **9.10.5 Don't rely on government (2012-10-28 17:12)**

Don't rely on government to sort things out, nor to be the first to target outcomes as a policy priority, as against staying in power and disbursing funding to favourite lobby groups. Who in the private sector might be interested in privately issued Social Policy Bonds, and why?

- Philanthropists  
and others who are cash-rich but time-poor and have high ideals that can be expressed as quantifiable social and environmental objectives. They could collaborate and issue their own Social Policy Bonds, setting up an escrow account for funds to redeem them. Less wealthy people – ordinary members of the public – could be asked to swell this account by depositing their contributions into it. Philanthropists and their organizations, without exception, resolutely ignore my emails, but one lives in hope.
- Organizations in the private sector already involved in trying to achieve the targeted objective. They could seek funding from holders of the relevant Social Policy Bonds, who, if they believe these organizations' activities are efficient will find it worthwhile to help finance their existing projects.

- People could set up new organizations specifically to buy the bonds, work towards the targeted objective, and sell their bonds once they have risen in value.

## 9.11 November

### 9.11.1 The unimportance of being right (2012-11-03 19:56)

From [1]1493: *Uncovering the New World Columbus Created*, by Charles Mann:

Provincial, county, and village officials [in present day China] are rewarded if they plant the number of trees envisioned in the plan, not whether they have chosen tree species suited to local conditions (or listened to scientists who say that trees are not appropriate for grasslands to begin with). Farmers who reap no direct benefit from their work—they are installing trees that do not produce fruit, cannot be cut for firewood, and supposedly stop erosion miles from their homes—have little incentive to take care of the trees they are forced to plant. The *entirely predictable* result is visible on the back roads of Shaanxi: fields of dead trees, each in its fish-scale pit, lining the roads for miles. “Every year we plant trees,” the farmers say, “but no trees survive.” (page 230, my emph asis )

It’s not only in China. Everybody makes mistakes, but we have political systems that [2]don’t look back on obviously failed experiments and learn from them. Very often instead they pump more scarce resources into them, afraid of admitting to themselves and others that there’s something wrong with their policymaking process. Perhaps the politicians and bureaucrats believe that the system in which they are so invested must not be seen to be faulty. It might, then, be questioned. Whatever the reason, the consequences are dire.

Social Policy Bonds would change that paradigm. They would reward successful, efficient ways of achieving society’s social and environmental goals. They would stimulate diverse, adaptive approaches, in stark contrast to the uniformity that afflicts government programmes in the west as well as in China. Crucially, under a bond regime, failed experiments would be

terminated: their proponents would have every incentive to administer the axe themselves, freeing up resources to investigate better approaches, with their sole guiding principle that of being more efficient in achieving society's targeted goal.

### 9.11.2 Ending war (2012-11-06 20:00)

Contrary to the common perception, political alliances during civil wars are not formed along immutable religious, ethnic or linguistic lines.... [1]How civil wars ev [2]olve, Peter Dizikes, MIT News Office, reviewing 'Alliance Formation in Civil Wars', by Fotini Christia

In other words, there's nothing intractable about these, or any other conflicts. Solutions are possible. The challenge is to put in place incentives to solve conflict, rather than create it. We can't expect the United Nations, NATO or any other government-backed initiative to help us here. We need diverse, adaptive approaches; ones that cannot be corrupted or undermined by interest groups of any kind. We need, in short, to issue [3]Conflict Reduction Bonds.

### 9.11.3 Health, impartiality, and Social Policy Bonds (2012-11-12 21:25)

At a global or national level, Social Policy Bonds could target a combination of health indicators, including longevity, infant mortality and Quality Adjusted Life Years. One contribution to their enhanced efficiency in comparison with current health programmes would be their impartiality:

[A]t least 55 percent of people with lung cancer [in the US] either never smoked or no longer smoke; some quit decades ago. And yet, because lung cancer is generally associated with smoking, and smoking is an addiction and something only “morons” and “idiots” (to use Tea Party terminology) would ever, ever do, lung cancer does not get anything like the research funding from the National Institutes of Health that other cancers get, relative to the number of deaths it causes. There are no telethons or star-studded Hollywood galas, no race for the lung cancer cure, none of those weirdly cheerful “awareness” campaigns. Even the afflicted and their families tend to stay quiet—the stigma is too great. [1] *The You’re-on-Your-Own Society*, Katha Pollitt, ‘The Nation’, dated 26 November

A Social Policy Bond regime would not discriminate between different causes of ill health, unless explicitly mandated to by qualifications to the bonds’ redemption terms. Apart from being more recognizable as a fairer system of resource allocation, a bond regime’s greater freedom to shift resources between different health programmes, and its incentives to do so, would lead to better outcomes with the same resources. See also this [2]previous post.

#### **9.11.4 Peace in the Middle East (2012-11-15 20:03)**

Don’t laugh!

*Here is a short and, despite my best efforts, as yet unpublished, article on applying the Social Policy Bond principle to conflict in the Middle East.*

Peace in the Middle East: giving self-interest a chance

Cards on the table: I have no solution to the anxieties and potential catastrophes facing Israel, nor to the wider problems facing the citizens of all the Middle Eastern countries. What I offer instead is a way of encouraging people to find effective and efficient solutions.

Decades of negotiations and initiatives have failed. Rockets are daily fired into Israel, we might well be on the brink of a nuclear calamity, and the entire region is a seething cauldron of every sort of hatred: ethnic, confessional, sectarian and gender.

Most ordinary people in the region, given time to reflect and the freedom to express their opinions would like nothing more than to see an end to the violence in the region. But there are enough powerful people with a vested interest in keeping conflict going. They include men of religion, ideologues, politicians and bureaucrats. There are also, of course, the weapons merchants and their corrupt beneficiaries in government. Well-meaning idealists on all sides do what they can, but their efforts are overwhelmed and relentlessly undermined by the powerful people and institutions that want them to fail.

Peace above all

We need to give people and organizations of all kinds the incentives to create and sustain peace, rather than conflict.

We also need a verifiable definition of peace, which will consist of a combination of conditions that have to be satisfied and sustained. These could include:

.

a much-reduced number of people killed in conflict;

.

a much-reduced level of terrorist events, or military incursions;

.

no use of nuclear weapons;

- mass media incitements to violence.

We also need to focus exclusively on our goal of peace, which might mean putting aside feelings of fairness and justice, except insofar as they help our cause.

And we need ways of promoting peace that can modify or circumvent people's uncooperative or obstructive behaviour; ways that can co-opt or subsidise those people in positions of authority and power who want to help, and at the same time bypass, distract, or otherwise undermine those opposed to our goal.

Ideally too, we would deploy market forces. Markets are the most efficient means yet discovered of allocating society's scarce resources, but many believe that market forces inevitably conflict with social goals: accentuating extremes of wealth and poverty, for example, or accelerating the degradation of the environment. So it is important to remind ourselves that market forces can serve public, as well as private, goals.

### Middle East Peace Bonds

My suggestion is that philanthropists perhaps with governments and other interested organisations and individuals, collectively raise a large amount of money, put it into an escrow account, and use these funds to redeem at some future time a new financial instrument: Middle East Peace Bonds. These would be sold by auction for whatever they would fetch. They would be redeemed for, say, £100 000 each only when *all* the conditions for peace, as defined by the issuers, had been satisfied and sustained.

Importantly, the issuers of the bonds would make no

assumptions as to *how* to bring about greater peace. The circumstances that fan the flames of conflict vary radically from place to place and over time. No one solution, nor even an array of solutions will work all the time. The bonds instead will stimulate diverse, adaptive solutions.

Nor do we need to know *who* would hold the bonds or carry out peace-creating projects. Those decisions would be made by would-be investors in the market for the bonds. Unlike normal bonds, Middle East Peace Bonds would not bear interest and their redemption date would be uncertain. Bondholders would gain most by ensuring that peace is achieved quickly. As the prospects for peace brighten, the value of the bonds will rise.

## Trading the bonds

Middle East Peace Bonds, once floated, must be readily tradable at any time until redemption. Many bond purchasers would want or need to sell their bonds before redemption, which might be a long time in the future. With tradability,

these holders would be able to realise any capital appreciation experienced by their holdings of Middle East Peace Bonds whenever they choose to do so.

The bonds will be worth more to those who believe they can do most to help reduce the violence, who will then own most of the bonds. Large

bondholders might decide to subcontract out peace-building projects to many different agents, while they themselves held the bonds from issue to redemption. The important point is that the bond mechanism will ensure that the people who allocate funds have incentives to do so efficiently and to reward successful outcomes, rather than merely pay people for undertaking activities.

Too large a number of small bondholders could probably do little to help achieve peace by themselves. If there were many small holders, it is likely that the value of their bonds would fall until there were aggregation of holdings by people or institutions large enough to initiate effective peace-building projects. As with shares in newly privatised companies the world over, Middle East Peace Bonds would mainly end up in the hands of large holders, be they individuals or institutions. Between them, these large holders would probably account for the majority of the bonds. Even these bodies might not be big enough, on their own, to achieve much without the co-operation of other bondholders. They might also resist initiating projects until they were assured that other holders would not be free riders. So there would be a powerful incentive for all bondholders to *co-operate with each other* to help bring about peace in the Middle East. They would share information, trade bonds with each other and collaborate on conflict-quelling projects. They would also set up payment systems to ensure that people, bondholders or not, were mobilised to help build peace. Large bondholders, in co-operation with each other, would be able to set up such systems cost-effectively.

Regardless of who actually owns the bonds, aggregation of holdings, and the co-operation of large bondholders, would ensure that those who invest in the bonds are rewarded in ways that *maximise their effectiveness in bringing about peace*.

So, in contrast to today's short-term, tried, tested and failed approaches, a Middle East Peace Bond regime would stimulate research into finding the

most cost-effective ways of achieving peace. Indeed, bondholders would be in a better position than governments to undertake a range of peace-building initiatives, having more freedom to try innovative approaches. They might, for example, finance sports matches between opposing sides, promote anti-war programmes on TV, set up exchange schemes for students of the opposing sides. They might try to influence the financial supporters of conflict outside the region to redirect their funding into more positive ways. They could offer the Palestinians and the citizens of neighbouring Arab countries different forms of aid, including education and scientific aid, and measures aimed at providing a secular education for all Arab citizens.

By appealing to people's self-interest, Middle East Peace Bonds would be more effective than conventional efforts aimed at reducing violence. In channelling market forces into the achievement of this objective the bonds could bypass or even co-opt the corrupt or malicious people in government and elsewhere who currently benefit from conflict.

Middle East Peace Bonds would focus on an identifiable peace outcome and channel market efficiencies into diverse, adaptive ways of achieving it. They might sound implausible and radical but - let's be frank - the alternatives are leading us into the abyss.

### 9.11.5 Creative self-entrenchment (2012-11-27 20:17)

The much-vaunted creative destruction that is supposed to underpin the wealth-generating bits of our economy fails to operate where government is concerned. Rather than terminate failed policies, government has powerful incentives to buy off the vested interests grown already rich from its largesse. Twelve years ago I [1]wrote about the corrupt, insane agricultural policies of the rich world. At that time, the way these policies transfer wealth from the poor to the rich, their waste, their disastrous effects on the environment and animal welfare; all were well known and quantified, not least by the OECD - and had been for years. Yet, as George Monbiot eloquently points out, these policies persist:

It is a source of perpetual wonder that the people of Europe tolerate this robbery. Farm subsidies are the 21st century equivalent of feudal aid: the taxes mediaeval vassals were forced to pay their lords for the privilege of being sat upon. [2]*The fat of the land*, 26 November

There is [3]no systematic mechanism (pdf) for getting rid of discredited policies. If they are run by government, or any other monopoly, ludicrous policies are more likely to persist, at great cost to the rest of society, than be discontinued. They enrich powerful people, who use a small proportion of government's own largesse to lobby against their withdrawal. This is self-entrenchment and, as government accounts for every more of society's spending, it has hugely distorting, wasteful effects on our economy.

We need instead a system that will terminate failed policies. One that will supply incentives for people to solve problems, rather than to turn up for work for organisations that claim to solve problems. That is where Social Policy Bonds could come in. They would create a coalition of interests whose sole raison d'être would be to achieve society's goals as efficiently as possible. The bonds would stimulate diverse, adaptive solutions to our social and environmental problems, and they would do so regardless of the identity or provenance of the investors. Under a bond regime, in stark contrast to today's politicians and bureaucrats, people would lose their own money if they persisted in failed projects.

### 9.11.6 Screening is not a valid policy goal (2012-11-30 21:37)

In the absence of broad, clear, coherent policy objectives, we unfortunately default to Mickey Mouse micro-objectives that sound convincing, but whose achievement has little or nothing to do with social goals, and can even conflict with them. Narrow objectives are more likely to be gamed in this way, because resources can more readily be shifted from a similar goal that doesn't happen to be targeted. That is one of the reasons why, unlike with the well-publicised Social Impact Bonds, I have always insisted that Social Policy Bonds be tradable. (See [1] here for an explanation of this logic.)

X

Here's another example of a Mickey Mouse micro-objective which, after enough time has elapsed to prove its worthlessness, is at last being questioned:

Can we please stop using screening mammography as measure of how well our health care system is performing? That's beginning to look like a cruel joke: cruel because it leads doctors to harass women into compliance; a joke because no one can argue this is either a public health imperative or a valid measure of the quality of care.

## 9.12 December

### 9.12.1 Health and Social Policy Bonds (2012-12-03 23:01)

An interesting discussion here, on Ben Goldacre's book, [1] *Bad Pharma: a Manifesto to Fix the Pharmaceutical Industry*. My contribution reads:

Here's another idea: government targets broad, explicit health goals: a combination of longevity, Quality Adjusted Life Years and other impartial data. It issues and backs a large number of tradable non-interest bearing bonds, redeemable for (say) \$1m each once the target health goals have all been achieved and sustained. That way government rewards successful initiatives for improving health (including, but by no means limited to, new drugs) regardless of how these initiatives work, or who implements them. Government still articulates society's broad desired health outcomes, and still raises the revenue for their achievement. But it contracts out the achievement to a motivated private sector in a way that rewards success, and only success. This sort of bond, which are an application of Social Policy Bonds, would stimulate diverse, adaptive ways of achieving goals and refocus efforts on the long term.

### 9.12.2 Another climate change shambles (2012-12-04 22:04)

Practically half of the EU's renewable energy currently comes from wood and wood waste ... but a lack of sustainability criteria for measuring its environmental impact is stoking fears of a hidden carbon debt mountain. [1] *Source*

This highlights the flaw of using anything other than outcome-based policy for relationships that we just do not yet understand. Under the current system our politicians, preoccupied as they with things like the economy, identify 'renewable' as good, and burning trees as 'carbon neutral'. The result:

If living wood is simply burned for energy, a temporary carbon debt can be created until CO<sub>2</sub> emissions caused by the release of all the carbon it has absorbed, and the loss to the carbon sink, are compensated for by fully-grown replacement trees. Climate scientists say that this time lag can run over many decades

- sometimes centuries - causing environmental tipping points to be reached in the interim that render any expected eventual carbon savings moot.

This is what happens when we rely on our well-meaning, overworked, distracted or scientifically challenged politicians and bureaucrats to craft a policy that is supposed to anticipate our rapidly expanding knowledge. We are relying on them to identify a relationship - that between energy source and climate change - amidst myriad variables, using current science. Then we assume that they have tackled the problem. They haven't.

Here's another idea: target what we actually want to achieve. If it's a reduction in fossil fuel use, target that. If it's climate change, [2]target that. Contract out the identification of the relevant relationships to people who are motivated to get the answer right and to adapt to our rapidly expanding scientific knowledge. We can best do that for long-term, complex goals by issuing Social Policy Bonds.

### **9.12.4 Ticking boxes is not the same as achieving goals (2012-12-18 20:09)**

Josie Appleton, of the UK's Manifesto Club, reads 'a lot of child protection policy documents':

They are often hundreds of pages long, yet I have never seen a proposal that would prevent a paedophile from getting access to children. Instead, there are all sorts of rules – rules about how you transport children to football matches, rules about how you take photographs, rules about late pick-up policies for when the parents don't turn up on time to take their kids home from some activity or other. So there is this morass of bureaucracy, yet there's not one identifiable useful functional element within it. What you have then really are rules for the sake of rules. [1]*Why everyday life is tied up in red tape, 'Spiked', 18 December*

It's the triumph of process over outcomes. Ticking boxes has become more important than achieving society's goals. Avoidance of litigation becomes the guiding principle. Compliance with procedure is what matters. We see this in so many policy areas: from climate change to health care, where it takes the form of [2]defensive medicine.

Society is increasingly dominated by government and big business. As Ms Appleton suggests, bureaucrats have as their goal the proliferation of rules and ensuring compliance with them. Politicians have the *de facto* goal of maximising Gross Domestic Product. And the private sector goal of maximising profits as measured by accountants, and ignoring any non-market negative impacts of their activities. In a crowded, complex world, with so many time lags and linkages, these goals are increasingly irrelevant to those of ordinary people. Worse, they often conflict with them.

Social Policy Bonds could realign the interests of government and big business with those of society. Instead of processes that are supposedly aimed at achieving outcomes, government would target the outcomes themselves. At the global level, it could target the negative impacts of [3]climate change. At the national level, it could target *meaningful* [4]health outcomes. A bond regime would encourage government to do what it does well: articulate society's goals and raise the revenue to achieve them. Where the current system goes awry is in government's trying to identify the processes that will lead to certain outcomes. In a complex, changing world, it cannot often do this effectively. So it's prone to listen to lobbyists for groups whose interests rarely coincide with those of society. The gap between government and people grows. Social Policy Bonds could close that gap.

### 9.12.5 Incentives to sell off fountain pens (2012-12-21 21:18)

Academic research has suggested that human rights treaties either [1]do not improve human rights at all or do so [2]very little, for a limited group of treaty rights, and among a select group of countries, not the worst offenders. [3]*Why the U.S. Shouldn't Sign On to Empty Human Rights Treaties*, Eric Posner, 'Slate', 21 December

No surprises here. Not that different from the Kyoto process either. Motivation is important: but we need systems that supply motivation to achieve meaningful outcomes, not to sign useless treaties while grandstanding at the United Nations. Against what metrics are the current thug regimes tested for meaningful human rights *outcomes*? None of course. Perhaps we could persuade some genuine philanthropists to issue Human Rights Bonds, on the Social Policy Bond principle.

We'd need to devise reliable targets for human rights, raise some funds, then issue Human Rights Bonds that would be redeemable once our human rights targets had been achieved. Not very glamorous perhaps, and no possibility of [4]selling off the pens used to sign meaningless treaties. But a Human Rights Bond regime could hardly be less effective than the current corrupt system.

### 9.12.6 Review (2012-12-31 19:20)

A relatively good year for Social Policy Bonds. There has been some interest in the novel concept of paying-for-results in social policy through the concept of [1]Social Impact Bonds (a watered-down version of Social Policy Bonds). In April Professor Robert Shiller of Yale University suggest Social Policy Bonds as one of his [2]*Ten Ways Finance Can Be a Force for Good in Society*. This was taken up [3]here, for instance, and, in oral form, [4]here, and has generated more views of this blog and my home [5]site and some email correspondence.

One reason why no Social Policy Bonds have yet been issued is that their advantages over conventional policy are most marked on a large scale and for long-term or ambitious objectives. For such goals, diverse, adaptive approaches need to be researched, tried on a small scale, refined and implemented. The bonds, being tradeable, allow for and encourage such experimentation. There are few other ways of supplying explicit, transparent and stable incentives to bring about [6]world peace, for instance, or to mitigate natural or man-made [7]disasters. National goals, too, are amenable to a Social Policy Bond approach. Reducing [8]crime, for instance, or improving [9]health are goals that require multiple, adaptive solutions, rather than the one-size-fits-all, top down, reactive or fossilized approach characteristic of our current efforts.

For all such goals, people need to be motivated to shift resources, keep their eyes on the long term (though with incentives to achieve success in the short term) and, crucially, terminate failed approaches. For smaller goals, where relationships between cause and effect are readily identified and acted upon, conventional policy, if the incentives are right, can work. Social Policy Bonds issued on a trial basis to achieve such goals might just see problems exported to areas outside the bondholders' remit. But for national or global goals, which mean dealing with vastly complex linkages and time lags, Social Policy Bonds, I am convinced, are the way forward.

# 2013

## 10.1 January

### 10.1.1 Fund goals, not research bodies (2013-01-10 19:04)

One of the problems with the current ways we go about solving social problems is the uniform way in which we approach them. This is largely because we have handed over to government the responsibility for dealing with an ever larger number of them. As scientific research funding becomes increasingly dominated by government there is a growing danger that it too will suffer from the same approach, wherein there's little room for dissidence, for questioning the consensus.

But science - real science - isn't a consensual process. Government is inherently uniform, top-down and one-size-fits-all in its approach. It stifles diversity. In the private sector, diversity and creative destruction are essential for generating wealth. Similarly in science: failed hypotheses must be seen to fail and allowed to die, not kept on life support with funding supplied by politicians who depend on vested interests, the status quo, for their tax revenue or campaign funding.

Perhaps research funding needs to be determined by, and integrated into, our broad, long-term, social goals. So instead of funding research into, say, cutting back carbon dioxide emissions with the aim of preventing climate change, we should fund the prevention of climate change. If we issued [1]Climate Stability Bonds, then people would have incentives to find the most cost-effective ways of stabilizing the climate. That could mean funding scientific research into cutting back carbon emissions, but that decision would be made by people motivated to find the most efficient ways of achieving the overall goal. Not, as at present, by bureaucracies, academic, national and international, whose interests appear to range from, at best, securing more funding for themselves to, at worst and in the time-honoured way of most global aid, transferring funds from the poor in the rich countries to the rich in the poor countries.

Under a Social Policy Bond regime, where activities are entirely subordinate to society's

desired outcomes, people would have incentives to investigate hypotheses that at first sight seem far-fetched (see [2]here for one example), even if they would prove unpopular if proven. And once they *are* proven they would have incentives to act on that knowledge ... rather than [3]conceal it.

### 10.1.2 'It's me or the puppy': the importance of buy-in (2013-01-15 19:57)

*Dear Virginia,* My six-year-old son nagged me so much for the past year I gave him a puppy for Christmas. He loves it and so do I but my partner (not his dad) hates it. ... Yours sincerely, Esther

*Virginia says,* Obviously, if you just inflicted this puppy on the household at Christmas without giving your partner a say in the matter, I can understand why he might be pissed off. If nothing else, it would make him feel small and out of control, in the same way as if you'd moved your mother, say, into the spare room to live there for 10 years, without prior discussion. To bring in an animal - which is like a member of the family, or should be - without consulting all family members first is an incredibly thoughtless thing to do. ... [1]*Virginia Ironside's dilemmas: it's me or the puppy,* 'The Independent' [London], 15 January

Buy-in is important, whether it's the politics of the household or the country. Democracies, when the function well, secure buy-in by allowing people to vote for different parties. The supporters of the losers know they have been consulted and, ideally, accept with good grace that they were given the chance to influence the outcome but were outvoted. Unfortunately, nowadays there isn't much linkage between what a ruling party says and what it does, and there are extremely obscure relationships between what it does and what actually happens. The result? We don't have buy-in; the gap between politicians and people widens, giving rise to cynicism and despair.

Social Policy Bonds could close that gap. Instead of politics and electioneering being about personalities, sound-bites, stated intentions, or vague notions of a messianic future,

they would focus exclusively on outcomes. Outcomes, that is, that are meaningful to ordinary people, the voters. 'Growing the economy' is not an end in itself, nor is per capita Gross Domestic Product a reliable indicator of well-being. Another example: spending more on prisons or police is not the same as rewarding people for cutting the crime rate. Signing up to the Kyoto process is not the same as helping people cope with adverse climatic conditions.

In these cases, and many others, we see the interests of the political class - politicians and bureaucrats alike - diverging from those of ordinary citizens, or even conflicting with them. Under a Social Policy Bond regime, however, people would vote for comprehensible, meaningful outcomes, rather than who will control insufferably arcane processes of interest only to powerful vested interests and their lobbyists. As such, we'd be more inclined to participate in the policy-making process. We'd have a role, if we wanted it, in setting costs and priorities. In short, even if policies hardly changed at all and were opposed by the same numbers of people, we'd have more buy-in than at present. When we face such urgent and complex challenges the additional buy-in that we can get by consulting people about meaningful social and environmental targets, might prove crucial. It makes for happier people in both households and nations. Puppies would be better off too.

### 10.1.3 Kyoto is doomed (2013-01-22 20:52)

From the *Economist*:

On January 15th ... the most comprehensive study of black carbon yet conducted was published in the *Journal of Geophysical Research: Atmospheres*. It concluded that the stuff was the second-most-damaging greenhouse agent after CO<sub>2</sub> and about **twice as bad for the climate as had been thought until now**. The implications are profound. [1]*Global warming: the new black*, the 'Economist', 19 January, [my emphasis]

Indeed. If we are serious about tackling climate change, we should reward people for tackling climate change, not for taking steps that, based on science stuck in the 1990s, *might* do something about climate change.

The climate, like many social concerns, is too hard for anyone fully to understand. Making policy on the basis of limited knowledge is what we do all the time. It's unavoidable. But, when we trying to solve huge, urgent problems and when our knowledge of the important scientific relationships is almost negligible, it is idiotic to waste resources on initiatives - like cutting greenhouse gas emissions (or, rather, pretending to) - that are just as likely to be irrelevant as helpful.

Which is why I advocate targeting outcomes, rather than the supposed means of achieving them. If climate change is seen as an urgent problem, and if we genuinely want to do something about it, we should acknowledge that our scientific knowledge is seriously deficient and instead of rewarding people for undertaking government-improved activities we should reward them for, yes, actually reducing climate change. Under a [2]Climate Stability Bond regime, we could define our climate goals as an array of physical, social, and financial conditions, all of which have to be satisfied for a sustained period before the bonds are redeemed. We'd be rewarding people for achieving society's targeted outcome, however they did so. Crucially, these people would have incentives to investigate, start, adapt or terminate their initiatives, or those they finance, in line with our rapidly expanding knowledge of the myriad variables that influence the climate. The entire Kyoto process, as the quote above shows, is spectacularly inadequate in this. It is doomed to fail.

## 10.2 February

### 10.2.1 Betting against extinction? (2013-02-02 20:22)

George Monbiot writes:

The gambling company Ladbrokes has been offering odds on the conservation status of various fish species. Until last night it was taking bets on mackerel; recently it has encouraged people to punt on the survival prospects of stocks of yellow fin tuna, swordfish and haddock. You can, if you wish, gamble on extinction. [1]*Betting on extinction*, 1 February

The article is upsetting to read, though hardly surprising, but I will point out one unlikely potential plus. Suppose a group of wealthy non-governmental organizations, philanthropists and concerned members of the public got together and gambled *against* extinction? If the odds were decent and they raised a large enough bet then...

Then ...we would have, in effect, a Social Policy Bond which would pay up the specified fish species did not become extinct. The bettors would have an incentive not just to wait passively and watch what happens to the fish, but actively to finance projects that would keep the species going. Such projects could tackle the problem of over-fishing with far more vigour and success than the current shambolic system. The bettors could lobby governments for more effective controls; they could bribe fishers to take early retirement, or train them to do something else. They could produce educational videos aimed at convincing consumers and children about the benefits of alternative sources of protein. Unlike the current system, the bettors would be strongly motivated not just to make reassuring but vapid gestures in the right direction, but actually to do something to combat species extinction.

### **10.2.2 Gun deaths: closing the gap (2013-02-05 15:56)**

"Twenty tiny coffins have again put the NRA [National Rifle Association] on the defensive", Tim Dickinson writes:

In the wake of the Sandy Hook massacre ... public support of new gun-control laws is overwhelming. Today, 92 percent of the country support background checks for gun buyers, and 63 percent support limiting the capacity of gun magazines. [1] *The NRA vs America*, 'Rolling Stone' dated 14 February

How does it happen in a democracy that policy is so different from the interests of ordinary people? Mr Dickinson supplies the answer:

Like every other element of today's modern conservative machinery, the NRA works in the background to expand corporate power - while pretending in public to advance the interests of the little guy. The NRA continues

to put forward its members as the face of the organization. But dues from members bring in less than half of the association's yearly expenses....

I'd quibble only with the word 'conservative': it seems to me that policymakers of all kinds are essentially beholden to broadly defined corporate interests, which are often wildly different from those of the people they claim to represent. Our policymaking process is so opaque, so arcane and long-winded, that only those with plenty of cash can afford to pay someone to follow and influence it. The rest of us - normal people, that is, the 92 percent to whom Mr Dickinson refers - have to be satisfied with vague noble-sounding declarations of intent. It's an almost inevitably corrupt process, and it's not working.

One way of closing the gap between policymakers and ordinary people would be to focus exclusively on outcomes, rather than the supposed means of achieving them. That would happen under a Social Policy Bond regime. Instead of drawing esoteric and futile legislative distinctions between types of gun or gun magazines, we would issue Gun Death Control Bonds that would reward what we actually want to achieve: a massive reduction in the number of gun deaths. Investors in the bonds would find their own ways of reducing gun deaths. They would have incentives to explore, investigate and implement a diverse array of approaches, which could include lobbying for regulatory change, but could also include such ideas as subsidising biometric controls on guns or gun cabinets; showing of broadcasts showing the benefits of gun-free societies; setting up youth clubs in the poorest parts of inner cities; or any of a vast array of other approaches that could and should be tried rather than resign ourselves to an annual death toll in the US of [2]32000 (pdf) or more.

The current policymaking process, in gun control as in everything else, works in favour of large organisations, be they corporations, trade unions, religious bodies or government agencies. These organisations have interests that at best differ from, and at worst conflict with, those of ordinary people. Expressing policy goals in terms of meaningful outcomes, as with Social Policy Bonds, is one powerful way of getting people to take an interest in the policies that are being made in our name.

### 10.2.3 Overcentralisation and the commons (2013-02-15 22:16)

The Archdruid has it right:

The more distance between the managers and the commons they manage, the more likely failure becomes, because two factors essential to successful management simply aren't there. The first of them is immediate access to information about how management policies are working, or not working, so that those policies can be adjusted immediately if they go wrong; the second is a personal stake in the outcome, so that the managers have the motivation to recognize when a mistake has been made, rather than allowing the psychology of previous investment to seduce them into pursuing a failed policy right into the ground. Those two factors don't function in an overcentralized system.

[1] *The center cannot hold*, 'The Archdruid Report', 6 February

Overcentralisation is a difficult problem to solve under the current ...overcentralised regime. It's not at all obvious when and how to intervene to stop it happening, nor who should do so (as some of the commenters on the Archdruid's post say). Perhaps Social Policy Bonds can solve the problem: instead of trying to work out the optimal level of centralisation for any social or environmental intervention, it would seem simpler to target a specific outcome, reward the most efficient ways of achieving it, and let the market for the bonds determine who makes decisions and at what level of aggregation. A bond regime would encourage diverse, adaptive solutions of that an overcentralised bureaucracy cannot - and would be likely to see as a threat. In short, Social Policy Bonds would deal with the problem of overcentralisation quite neatly.

### 10.2.4 Galactic rhetoric (2013-02-16 22:19)

Mark Steyn, quoting President Obama, writes:

"Let's cut in half the energy wasted by our homes and businesses over the next 20 years." What does that even mean? How would you even know when you've accomplished

that "goal"? What percentage of energy used by my home and business is "wasted"? In what sense? Who says? Who determines that? Is it 37 percent? 23 percent? So we're going to cut it down to 18.5 percent or 11.5 percent by 2033, is that the "goal"? [1]*Magical Fairyland budgeting*, 16 February

Our political discourse is infested with these grandiose-sounding, but meaningless 'goals'. Their purpose is simple: to deceive. As Mr Steyn points out they are meaningless to ordinary people and unverifiable by design. Politicians can get away with such pronouncements only because we, the voters, are not encouraged to think in terms of outcomes. Policymaking has become a public relations exercise coupled to arcane legalistic debates about funding arrangements and institutional structures. Only vested interests and their paid lobbyists can stomach engagement with the real purpose of policymaking. The rest of us have to be content with the high-flown vapid rhetoric of the front men.

There is another way. Social Policy Bonds would recast policymaking in terms of outcomes that are meaningful to ordinary people. Instead of Mickey Mouse micro-targets that lose all meaning when we focus on them, a bond regime would agree on broad social and environmental outcomes, and reward people who achieve them. Because these outcomes would be meaningful and quantifiable, a wider public could engage with the policymaking process - an end in itself as well as a means toward securing more buy-in. Take the energy 'goal' that President Obama is talking about in the quote above: under a bond regime we'd ask ourselves, and have to ask ourselves: what do we really want? Is it a reduction in wasted energy? A reduction in wasted fossil fuel energy? A reduction in fossil energy use per unit GDP? Perhaps it would be better to target for reduction the negative impacts of energy use? These are questions which should be the subject of legitimate debate by all of us and under a bond regime they would be. Under the current system they aren't. Instead we are served up with a baleful combination of galactic-sounding rhetoric dreamed up by Public Relations experts, and real-world policies designed by and for entrenched interest groups. Any correlation with policies that benefit ordinary people is entirely coincidental.

### **10.2.5 Corridors are not wards (2013-02-26 22:40)**

Theodore Dalrymple writes:

I remember a manager in the hospital in which I worked before my retirement, with no medical or even nursing qualifications, prowling the wards to look for patients who could be hurried home so that beds would

become available for patients who would otherwise break the government's four-hour rule, that is to say the rule that no patient should wait more than four hours after the decision to admit him had been taken. The concern that patients should not have to wait for more than four hours was not for their sake, of course, but merely so that the central government could claim that it was improving services, and so that the hospital could claim to have met its target. In the event the target was met by the simple expedient of redesignating hospital corridors as wards, satisfactory all round - except for the patients, of course. [1] *A healthcare system suffocated by bureaucrats*, Theodore Dalrymple, 'Standpoint' (online only), Jan/Feb

The well-being of a large, complex society, is inevitably going to mean giving priority to numerical indicators. In the absence of meaningful, broad indicators of well-being, we instead default to the targeting of deeply flawed accountancy measures (like Gross Domestic Product) and a plethora of meaningless micro-targets, like those about which Mr Dalrymple writes. It's not working.

A Social Policy Bond regime would bring some much-needed clarity to the hugely important task of defining, and prioritising, the essential elements of societal well-being. We could all participate in such an exercise. We all understand outcomes, and we can all have an opinion about which broad social and environmental outcomes are the most important to ourselves and society. That's a stark contrast with the current policymaking system, which in most countries is now largely under the control of the few interest groups who can afford to pay specialists to understand, manipulate and subvert the democratic process in their favour.

## 10.3 March

### 10.3.1 Almost there (2013-03-11 20:08)

More on [1] Social Impact Bonds in the *Economist* of 23 February. I've posted about SIBs and compared them to Social Policy Bonds in previous posts ([2] here, for example). I'm glad to see the concept of payment for performance enter social policy. The flaw, though, remains that SIBs don't appear to be tradable and so, under a SIB regime, as the *Economist* says:

Projects which take many years to have an effect (the impact of

pre-school education on university admissions, say) will not interest investors.

I have outlined my reasons for advocating tradability of the bonds [3]here. It does appear, I'm pleased to say, that there are bodies interested in making a secondary market for SIBs.

When I first came up with the idea of Social Policy Bonds one of my colleagues told me that I was 20 years ahead of my time. He was almost right: it's been 25 years. This [4]long pdf contains my first published paper on the subject and is dated 1988.

### 10.3.2 Impartiality and health care (2013-03-30 20:04)

Chrystia Freeland writes:

[T]he muscle of the philanthro-capitalists is such that they can sometimes unintentionally distort the social safety nets of entire nations. That has been a complaint in some African countries, where the richly funded, relentlessly focused Gates programs on AIDS medicine and tuberculosis and malaria vaccines have lured local doctors and nurses away from providing desperately needed, but less glamorous, everyday care. Chrystia Freeland, [1]*Plutocrats: the rise of the new global super-rich and the fall of everyone else* (page 91), October 2012

Which is why it's best to target social and environmental outcomes that are as broad as possible. Unfortunately, even under the, presumably, less idiosyncratic government-run systems of health care, expenditure is heavily influenced by

groups of medical specialists with little incentive or capacity to see improvements in the *general* health of the nation as an objective. As a result, funding of these specialities depends to a great and varying extent, on the strength of their lobby groups or on their public profile, rather than on what would best meet the needs of society. At one time the British national health care system's terminal-care budget: 95 percent of this is allocated to the 25 percent of the UK's population who die from cancer, and just 5 percent to the 75 percent who die from all other causes. (

Source: *Alternative endings*, 'Radio Times' (UK), 13 July 2002. This was the subject of a British Channel 4 television documentary *Death: you're better off with cancer*, broadcast on 16 July 2002.)

A Social Policy Bond regime would target broad indicators of healthcare; probably including measures of longevity and [2]Quality Adjusted Life Years.

Apart from overcoming the biases of wealthy individuals or interested agencies, including government bodies, a bond regime would also see that the rational allocation of resources would not be undermined by high-profile events. Another UK example: in the aftermath of a tragic rail disaster in London that resulted in the deaths of 40 people the UK Government came under considerable pressure to order the installation of an automatic braking system for trains that go through red signals. Cold calculations showed that this would cost around \$21 million for each life that the system could be expected to save. This is around five times the figure that the UK Treasury used as its benchmark valuation of a human life, which means that if the government had succumbed to pressure to install the automatic

braking system it would have diverted funds from more cost-effective life-saving projects, and so caused the loss of more lives than it would have saved. A Social Policy Bond regime that had as its objective the maximising of the number of lives saved per government dollar would not waver in the face of spectacular one-off events.

## 10.4 April

### 10.4.1 'Renewable' is not an end in itself (2013-04-05 20:27)

*The Economist* writes about the problems of burning biomass (mainly wood and crop residues) as a source of renewable energy in Europe:

[T]he ideal of a biomass plantation that is harvested only at the rate at which it grows back is not always met. Even when it is, such plantations displace other ecosystems that would themselves have sucked down carbon. Processing and transporting the wood to the place where it is burned requires energy that may well come from non-renewable sources. [S]ome biomass programmes could end up emitting more carbon than the fossil fuels they are being subsidised to replace. The underlying problem is the reverence accorded to renewable energy itself. Greens like it for various reasons: independence from fluctuating fuel prices, rural employment, sustainability, as well as low carbon emissions. But as the sorry state of biomass shows, not all renewable-energy technologies are good at achieving all those aims. Nor are all those aims worth spending scarce public money on. [1] *Bonfire of the subsidies*, the 'Economist', dated 6 April

This is what happens when instead of targeting climate change itself we focus instead on trying to limit greenhouse gas emissions; or rather, those gases thought in the 1990s to be the causes of climate change. If we want to achieve environmental outcomes, I think we'd do better to target these outcomes directly, rather than have government - heavily influenced as it is by interest groups - identify the ways of achieving them. A congenial climate, along with many other environmental and social goals, is too complex to be reduced to a set of simple invariant relationships of the sort that government can identify and encourage or discourage.

Social Policy Bonds would instead identify desirable outcomes and reward people for achieving them, however they do so. A bond regime would see investors automatically adapt to changing circumstances and our ever-expanding knowledge about the relevant scientific relationships. If burning biomass were to create more environmental problems than it solves, investors in [2] Climate Stability Bonds would soon focus on better ways of achieving society's climate target. It would see 'renewable' and other high-sounding adjectives as *possible* means towards society's ends, rather than as ends in themselves.

### 10.4.2 It's all too complicated (2013-04-14 19:42)

Our financial system has become as complicated as our social and physical environments. All are too complicated and too rapidly changing for ordinary people ever to understand fully so, by default, hugely important policy decisions are made by people who are at best, under-informed or, at worst heavily influenced by the campaign funding contributions of

vested interest groups. We aren't going to see a reduction in complexity; not in our social and physical environments. There are just too many variables and time-lags, combined with rapidly changing circumstances and growing knowledge of scientific relationships. Politicians can readily escape or deflect censure even for their worst policies, because the relationships between cause and effect are too delayed or obscure to identify unambiguously. The incentive to get long-term policy right is correspondingly diluted.

Social Policy Bonds don't require a prior knowledge of cause and effect. Instead, they start from broad, desirable social and environmental outcomes. Say we want to increase society's physical well being, defined as some agreed, weighted combination of objective indicators, such as longevity, Quality Adjusted Life Years, etc. It would not then be up to policymakers to establish, rule on (or obscure), say, the relationship between burning coal and lung disease, or between a new drug and its net benefit; instead our politicians would, in effect, contract out the achievement of society's health goal to a motivated coalition of investors, with powerful incentives to reward the most efficient ways of improving society's health and, crucially, to terminate the least efficient.

Health, like a robust financial system and a benign physical and social environment, *is* too complicated for anybody to understand. But, rather than resign ourselves to cynicism and despair, we could adopt some or all of the most salient features of a Social Policy Bond regime: a focus on desirable outcomes in the form of broad, quantifiable, goals; and the channelling of market incentives into their achievement.

### **10.4.3 Obesity is like poverty or climate change: there's no obvious cause (2013-04-24 23:00)**

Everyone thinks he or she understands obesity. Believe it or not, this is one of the harder medical conditions to comprehend. Why? Obesity is a combination of several factors: physics, biochemistry, endocrinology, neuroscience, psychology, sociology, and environmental health, all rolled up into one problem. Robert H Lustig, *[1]Fat chance*, December 2012

Obesity is much like any social or environmental problem. There's very little point in government picking a particular theory or approach and backing it with taxpayers' funds. There's no obvious causal relationship. The best government, or any interest group can do, is to stimulate diverse approaches that adapt over time to changing circumstances and our expanding

scientific knowledge.

It wasn't always like that. In health care it's now widely accepted and has been clearly shown that, for example, decent sanitation is essential for good physical health. Society and the environment were, generally, less complex in those days. But there is a lot more complexity now. Government would do better, when dealing with very complex concerns, to target outcomes, rather than the supposed means of achieving them.

Social Policy Bonds allow government to do this in ways that channel market forces into socially useful directions. When it comes to obesity, government should think clearly about what it wants to achieve, then reward those approaches that most efficiently achieve it. It might be that obesity itself is not a problem, but rather a marker of other health problems, as Dr Lustig says in his book. In that case, government should directly target those health problems for solution.

A Social Policy Bond regime would not prejudge the ways of tackling complex health problems. It would focus entirely on society's health goals and put in place a system of cascading incentives rewarding those who achieve them in the most cost-effective ways. For more information, check out my book or other papers, which can be freely downloaded from my [2]Social Policy Bonds website.

#### **10.4.4 Policymaking and journalism: it doesn't matter if you're wrong. (2013-04-26 20:33)**

John R MacArthur writes:

What's the use of being right, in journalism or politics? I gave a lot of thought to this question during the tenth anniversary of the American-British invasion of Iraq, and I've come to the conclusion that being right is not much use at all, at least as far as career advancement goes. [1] *No reward for being right on Iraq* , John R MacArthur, 'Harper's Magazine, 18 April

Incentives are important, and they needn't be monetary. Unfortunately, our current political system, beset as it is by its own complexities as well as those of society, does not reward success or punish failure consistently enough to filter out stupid policies. Mr MacArthur quotes Scott Ritter: "Everybody who lied about the [Iraq] war got rewarded because they played the game." Exactly so. When it comes to looking back at evaluating policies - something that's [2]rarely done - few people are rewarded in their lifetime for being right. Amongst politicians loyalty counts for far more.

Social Policy Bonds would change that. They reward people not for who they are, what they say or for whom they support, but for achieving society's explicit goals. Society's limited resources would be channelled into the achievement of these goals, transparently and impartially. Politicians couldn't get away with insane, disastrous policies; instead they would, under a bond regime, be limited to what they do best: articulating society's goals and raising the revenue for their achievement. Efficient approaches would be rewarded by the way the market for the bonds works. Inefficient approaches would receive little funding and be terminated - something that rarely happens under current policymaking systems. Under a bond regime, successful achievement of society's goals is the top priority. Under the current system it hardly features at all, as Mr MacArthur's poignant article makes very clear.

## 10.5 May

### 10.5.1 Cyprus (2013-05-08 21:23)

James Meek report in g ,  
from Cyprus, quo tes  
Panikos Demetriou,  
holder of an account at a Cypriot Bank:

'We have 56 MPs,' he said. 'Forty of them are solicitors. Everything that goes on in Cyprus is with their consent. If they didn't want the tax dodgers and the laundered money, they would have done something about it years ago. I've been here seven years and I've yet to see a tax dodger or anyone from the stock exchange come up before a judge so we can say: "This is the man, he's behind bars." Not one person. Nobody gets punished in Cyprus. Nobody gets punished and the same thing is going to happen this time round. At the end of the day they punish the ordinary person.'

James Meek, [1]*the Depositor Haircut*, 'London Review of Books', 9 May

It's for the best that lawyers engaged in legal proceedings should be pre-occupied with process, rather than outcomes. But making policy is - or should be - different from conducting legal cases or making laws. Perhaps because outcomes play only a rhetorical role in our policymaking, lawyers typically make up a large proportion of policymakers, and debate about policy revolves around things that matter to lawyers: process, structures, funding arrangements.

...Or precedent; a process that was satirised by Francis Cornford in Cambridge a century ago in *Microcosmographia Academica*:

*The Principle of the Dangerous Precedent*

is that you should not now do an admittedly right action for fear you, or your equally timid successors, should not have the courage to do right in some future case, which, *ex hypothesi*, is essentially different, but superficially resembles the present one. Every public action which is not customary, either is wrong, or, if it is right, is a dangerous precedent. It follows that nothing should ever be done for the first time. ( Q uoted [2]here, in relation to Oxford University, by John Kay.)

Tried, tested and failed will win every time under these circumstances. Ticking boxes becomes a substitute for innovation, adaptation and diverse approaches.

Social Policy Bonds could re-orientate policymaking so that outcomes would play the central role: outcomes that are meaningful to ordinary people, so that we could, if we wished,

participate in the policymaking process. Or, at least, we could understand it, so that it could not be hijacked, Cyprus-style, to serve the interests of a corruptible elite.

### **10.5.2 The dog's breakfast that is Kyoto (2013-05-13 20:45)**

George Monbiot laments our failure to cut back greenhouse gas emissions:

The European Emissions Trading Scheme, which was supposed to have capped our consumption, is now, for practical purposes, dead. International climate talks have stalled; governments such as ours now seem quietly to be unpicking their domestic commitments. Practical measures to prevent the growth of global emissions are, by comparison to the scale of the challenge, almost non-existent. [1]*Via dolorosa*, George Monbiot, 10 May

Attempts to cut back greenhouse gas emissions were always doomed to fail. And, in the form that they have taken, they deserve to. Why? Several reasons:

The causal relationship between emissions and climate is too obscure, scientifically and (largely) hence politically. Nobody's going to take serious action when the relationship between cause and effect is so difficult to pin down. All the costs of emission cutbacks are upfront. All the supposed benefits are uncertain and, if they ever do arise, it won't be until decades into future. At a time when our scientific knowledge of the existence, causes and effects of climate change is expanding rapidly, Kyoto and the attendant nonsensical emission trading schemes rely on science that was fossilized in the 1990s. Perhaps it was all an elaborate conspiracy designed specifically to do distract us while allowing the continued exploration for

and exploitation of fossil fuels. A few windmills and higher electricity bills notwithstanding, that's basically the sum achievement of Kyoto and the millions bureaucrat-days that have been spent on the climate change issue.

A [2]Climate Stability Bond regime would have been different. For a start, it would not assume that climate change is happening; it would not assume that if it is happening it's caused my man; and it would not have as its goal the cutting back greenhouse gas emissions. Instead it would start by specifying what exactly are our climate-related goals, all of which would have to be achieved before taxpayers lose a penny. Our climate goals would include physical, biological and financial measures of the world's climate and its impacts, all of which would have to fit into specified ranges in, say, the years 2030, 2040 and 2075, before the bonds would be redeemed. The bonds would stimulate diverse, adaptive approaches, that would stimulate and continuously respond to our rapidly growing knowledge of the climate. Despite the very long term goals of a bond regime, people would still be rewarded along the way, by doing what they can to achieve our climate goals and so benefiting from the consequent increase in the market value of their bonds.

Incentives matter. The incentives under the current system are, as Mr Monbiot has discovered, to misdirect the public and scour the planet for fossil fuels. Climate Stability Bonds would instead reward people for doing whatever we can to prevent climate change and its depredations. Because the targeted outcomes of a bond regime would be meaningful to ordinary people, they would generate participation in, and buy-in to, the approaches adopted by investors in the bonds.

The contrast with the current dog's breakfast of failed regimes is total.

### **10.5.3 Economic growth is not a valid goal (2013-05-15 16:11)**

In April the British Government's new Chief Scientific Adviser, Sir Mark Walport, set out his priorities his first major public speech since taking office. His 'five key themes' for scientific advice in government are:

1. Ensuring that scientific knowledge translates to economic growth;

2. Strengthening infrastructure resilience for the engineered world of transport, energy, the built environment and telecommunications and also the natural world;
3. Underpinning policy with evidence;
4. Harnessing science for emergencies; and
5. Providing advocacy and leadership for science. [1]

*Source*

It's the first that causes me most concern (as it does [2]George Monbiot). It reflects and amplifies the widespread view that economic growth is an end in itself. But economic growth, especially as measured by Gross Domestic Product (or GDP per capita), is not an end in itself. It is an indicator of economic activity. As a measure of well-being it is deeply flawed. It does not distinguish between helpful and harmful economic activity. It puts no value on any activity that bypasses the monetary economy. So it ignores leisure time, the environment, crime, health, and other things that are meaningful to natural persons. Crucially too, it ignores how the economic output it purports to measure is distributed within society.

The more than minimal fraud is in measuring social progress all but exclusively by the volume of producer-influenced production, the increase in GDP. J K Galbraith, 'The Economics of Innocent Fraud', Penguin Books, 2004.

This identification of societal well-being has permeated the thinking of our politicians, officials and now, it seems, our top scientists. We are just not in the habit of formulating policy goals in terms of outcomes that are meaningful to ordinary people. So, by default (or by conscious fraud), GDP per capita has become the de facto indicator of social well-being. We need to think urgently about changing this.

—  
Policy as if outcomes mattered  
SocialGoals.com

1. <http://www.csap.cam.ac.uk/news/article-sir-mark-walport-set-out-his-priorities/>
2. <http://www.guardian.co.uk/commentisfree/2013/may/14/oxford-university-takes-shell-funding>

#### 10.5.4 Think: meaningful outcomes (2013-05-17 23:06)

In our large and complex societies policymakers are, inevitably, using numerical indicators in an effort to target well-being. But these indicators are often deeply flawed. My previous post pointed out some of the flaws in the use of GDP per capita as a measure of social well-being. But there is also a proliferation of useless micro-targets, as this excerpt from the UK's *Daily Mail* makes clear:

##### How offences can vanish

High-profile and politically sensitive crimes, such as robbery and burglary, are reclassified. For example, a robbery may be transformed into 'other theft' or a burglary called criminal damage. Shockingly [*sic*], some offences are recorded as 'no crime' because there is no direct evidence. A mobile phone owner may not be able to prove it was stolen so it is written down as 'lost'. Frontline police representatives suspect many victims do not bother to report crimes because their local police station is closed. Others no longer insure household goods and therefore do not report losses. [1]*Daily Mail*, 16 May

A Social Policy Bond regime would require us to be clear about what we actually want to achieve. We would formulate policy in terms of meaningful, verifiable outcomes, rather than vague, vapid sentiment, or, as in this example, targets that can easily be gamed or manipulated. This would be inherent in the way the bond regime operates. The benefits of expressing policy goals in such terms would be equally clear: more transparency, stability, efficiency, public participation and, therefore, public buy-in.

#### 10.5.5 Yes, outcomes are relevant, aren't they? (2013-05-24 22:06)

The current *Economist* [1]writes:

More than perhaps any government in the world, America's pays doctors to do stuff, rather than keep people well. That has to change.

Yes, quite. Outcomes matter. It's a shame it's taken so long for people to realize that. For a short piece on how the Social Policy Bond principle can be applied to health, see [2]here.

## 10.6 June

### 10.6.1 Ingenuity is not in short supply (2013-06-04 19:36)

What stimulates human ingenuity of this sort?

Like casino designers' spatial strategies, their ambient strategies treat affect not as something passive or static, but as an active and dynamic capacity that can be harnessed and guided in lucrative directions. A study titled *Effects of ambient odors on slot-machine usage in a Las Vegas casino* found that slot revenue rose by a full 45 percent in a gambling area where machines had been subtly treated with a certain pleasing odor while remaining static in another area that had been treated with a different but equally pleasing odor. The author speculated that certain aromas produce an 'affective congruence with the situational context," encouraging longer play..

Source: [1] *Addiction by Design: Machine Gambling in Las Vegas*, Natasha Dow Schull, August 2012

Or this:

In thousands of labs across the planet, medical researchers are trying to find the cause of, and cure for, obesity. They examine genes, chemical exposures and metabolic pathways. They experiment with

amphetamines, anticonvulsants, probiotics. Some of this research is funded by the companies that make and sell the food that makes us fat. In thousands of other labs across the planet, food scientists and marketers are working on ways to make you eat more. They employ highly sophisticated psychological and physiological research to this end; they examine the effects of colour, unit size, price, texture, packaging and advertising on human desire. Look around you: who is winning? [2] *Fat City*, Karen Hitchcock, 'The Monthly', March

Human ingenuity can be channelled in all sorts of ways; the two examples above show how significant quantities of high-quality mental resources are channelled into producing goods and services that generate short-term, financial, benefits for corporations, while imposing heavy costs not only on wider society but also on the targeted individual consumers.

The people who do this targeting aren't evil. They raise families, take out mortgages, pay taxes and no doubt volunteer at school sports days. They are simply part of a system that rewards, more than anything else, activities that benefit a corporation in ways that can be calculated by the accountancy profession.

It's a crazy system. Of course, we don't want a society that tells corporations what to do, and there will always be a role for regulating their activities. But couldn't we give incentives for people and corporations to generate long-term benefits for wider society? Why must society be largely driven by those transactions that are captured by corporations' trading accounts or balance sheets?

A Social Policy Bond regime would instead target society's long-term goals. It would lead to the setting up of corporations whose goals would be entirely congruent with those of society. Instead of paying people to spend their working lives implanting odours into slot machines, we could redirect their ingenuity into solving some of our social and environmental problems. We don't suffer from a shortage of ingenuity; we suffer, and some of us suffer grievously, from a system of perverse incentives, which directs our ingenuity into activities that have little social merit. Social Policy Bonds could re-orientate those incentives: the implications of building a motivated coalition of people who, necessarily, will want to achieve society's wider goals and whose rewards will depend on how well they do so, are immense.

### 10.6.2 Self-interest and social goals: inevitably in conflict? (2013-06-12 16:17)

Some people don't like the idea of using market incentives to solve social problems. The motivation for such opposition might be patch protection, or a more general suspicion of any radical new approach. But some of it centres on the apparent conflict between the values of the market and a vision of social justice.

These arguments need to be addressed. The fact is that markets *have* been abused, and that the 'markets' and their efficiencies have been used to justify ludicrous accumulations of wealth for activities of little or negative social merit, at the expense of ordinary people.

It's true that corporations are self-interested; further, their interests are very narrowly defined, largely by the accountancy profession. Corporations are less interested in free markets, and more interested in doing whatever is necessary to ensure their survival. If that is at the expense of free markets, or most of a corporation's employees, or the environment, or society in general, then that is not the corporation's concern. Cleaning up after a corporation's rampage is something that is done by governments, if at all. Corporations, as they grow bigger, will do what they can to corrupt and undermine markets and manipulate the regulatory environment in their favour - all to the cost of wider society. The reckless activities of the financial institutions who siphoned off the financial benefits of their activities and socialized the enormous costs are only the most spectacular example of this anti-social behaviour. So people are right to be cynical about the benefits of so-called markets.

But self-interest can do good things, and if we re-jig the incentives we can

channel it into

the public good. In economic theory, and on all the

evidence, markets are the best way of allocating society's scarce resources. It

is unfortunate that, largely for historical reasons, we leave the achievement of social goals to the

sort of command-and-control mechanism that is often inefficient (and can also be abused).

A Social Policy Bond regime would probably see some enrichment of corporations, new or existing, but only as a side-effect of their achieving society's agreed social and environmental goals. It could lead to the creation of entirely new organizations, dedicated to finding and implementing the most efficient solutions to our social problems. The bonds are all about building a coalition of motivated investors whose self-interest would be exactly congruent with those of society. If these investors fail to achieve society's goals, their bonds will lose value and they will receive nothing. If they achieve society's goals efficiently they will benefit. Much of this benefit will take the form of salaries for employees of these corporations. It is very like paying people to be teachers: in some societies this would be seen as sacrilegious, but we recognise today that, however idealistic they or their employers might be, teachers need to earn a salary.

A Social Policy Bond regime represents a new departure: rewarding people for achieving society's long-term goals, and doing so in a way that encourages efficiency and effectiveness and punishes incompetence. Sadly, this has never been tried before. In the long run, the existence of this unambiguously socially beneficial way of accumulating wealth could make it easier to raise the tax rates on other profitable, but less edifying activities.

Aligning self-interest with social justice could generate huge benefits, and it would be a shame if these were to be denied to the people who need them most for reasons of ideology or because market forces in general, rather than their abuse and manipulation, have been discredited in the eyes of well-intentioned policy makers.

### **10.6.3 Evidence-based policymaking (2013-06-23 15:49)**

John Bridgeland and Peter Orszag write about evidence-based spending decisions. It's a form of data mining, and has been applied to baseball "...replacing scouts' traditional beliefs and biases about players with data-intensive studies of what skills actually contribute most to winning" but "is just as applicable to the battle against out-of-control health-care costs."

Based on our rough calculations, less than \$1 out of every \$100 of government spending is backed by even the most basic evidence that the money is being spent wisely. As former officials in the administrations of Barack Obama (Peter Orszag) and George W. Bush (John Bridgeland), we were flabbergasted by how blindly the federal government spends. In other types of American enterprise, spending decisions are usually quite sophisticated, and are rapidly becoming more so: baseball's transformation into "moneyball" is one example. But the federal government—where spending decisions are largely based on good intentions, inertia, hunches, partisan politics, and personal relationships—has missed this wave. [1] *Can Government Play Moneyball*, 'the Atlantic', July/August

It's encouraging that, after wasting billions of dollars in programs that do little other than subsidise the lifestyles of opponents of their removal, the US Government is looking at a more rational basis for allocating funding. The authors concede that change in this direction will be difficult:

Still, linking evaluation to program funding will be tough, as both of us have seen in practice, again and again. One thing that is essential to a more results-driven government is holding politicians accountable for their support of failing programs. Interest groups regularly rate politicians on their adherence to a particular perspective. What if we had [an index] easily accessible to voters and the media, that rated each member of Congress on their votes to fund programs that have been shown not to work?

OK; certainly an improvement on the dogs' breakfast that is the current policymaking environment. But we could, perhaps, envisage a system that doesn't require politicians to react to information in ways that conflict with their own interests? A Social Policy Bond regime would do this, because it would contract out the development and implementations of programmes to investors in bonds targeting a social goal. It would take resource-allocation decisions out of the hands of government, and put them into the hands of entrepreneurs, with no inherited resistance to change.

A Social Policy Bond regime would have other advantages over the system advocated by Messrs Bridgeland and Orszag. The evidence-gathering wouldn't be prone to corruption and gaming, as there would be no vested interests to keep happy. And it would be done on a dynamic basis, not as a one-off exercise designed to set policy for an indefinite number of years into the future.

Still, it's encouraging to read about evidence-based policymaking. The authors refer to a non-profit organization called Results for America, which is advocates for it. See [2]here for more.

#### **10.6.4 Institutionalised hypocrisy (2013-06-30 21:13)**

"The role of citizens, of Christians, of humanity is to take care of each other, but not for Washington to steal from those in the country and give to others in the country."

These are the words of [US] tea party Congressman Stephen Fincher of Frog Jump, Tennessee [who] argued passionately in favor of ...gut[ting] the federal food stamp program by over \$20 billion and push[ing] an estimated two million people—mostly retirees and poor families with kids—further into poverty and hunger.

The reason? Rep. Fincher is a Crusader for small government...but he's also one of the biggest welfare queens in his home state of Tennessee. According to federal subsidy data compiled by the Environmental Working Group, [1]Stephen Fincher has personally [2]cashed in on \$3.5 million in federal farm welfare payments (aka agricultural subsidies) since 1999. Fincher's average welfare payout comes out to \$300,000 annually—200 times bigger than the \$1,586.40 an average family in Tennessee receives in food stamp benefits a year. [3]*Small Government, Huge Hypocrite*, Yasha Levine, nsfwcorp, 28 June

And so it goes on. It's 35 years since the corrupt insanity of farm subsidies was obvious to informed undergraduates; 30 years since the huge cost of these subsidies began to be accurately quantified and promulgated...and yet they persist. Our policymaking system just does not have the mechanisms to terminate failed policies if they are backed by large corporations and, especially, if they take money from the poor to give to the rich. The rich, that is, who can afford to pay people to follow our arcane policymaking process and manipulate policy for the benefit of their paymasters.

We'd stand a better chance of achieving social goals if we clarified policymaking by targeting outcomes: meaningful outcomes that ordinary people can understand, engage with, and influence. One of the advantages of a Social Policy Bond regime is that it would do exactly

that: target explicit, transparent, meaningful outcomes and reward people who achieve them. The complexity and obscurity of today's policymaking procedures work in favour only of the corrupt and the hypocritical.

## 10.7 July

### 10.7.1 A better way of becoming rich (2013-07-06 21:59)

A Social Policy Bond regime could have many advantages over the ways in which we currently try to achieve social goals. These include, most obviously, efficiency, stability (of policy objectives), transparency leading to greater public engagement and buy-in.

A less obvious benefit of a Social Policy Bond regime is that they would be a means whereby private gain would be strongly, visibly and inextricably correlated with public benefit. Some bondholders, whether institutions or individuals, would start out rich and, if their bonds rose in value, would become richer. But working successfully to achieve desired social goals would most probably be seen as a laudable way of acquiring wealth. There are intangible benefits from having people or institutions grow rich in this way. There are many disaffected people who, in some cases no doubt justifiably, view with suspicion or alarm the very high incomes or profits of corporations engaged in activities of little obvious net social or environmental benefit. They are also unconvinced that 'trickle-down'

occurs to any meaningful degree. Wealth, in these people's eyes, must inevitably result from exploitation, either of other people or the commons

. Social Policy Bonds would shift this worldview and, by helping people take a more positive view of the act of earning an income and accumulating wealth, could make for a more cohesive society.

A socially

acceptable way of becoming wealthy would also make it more politically feasible to tax less socially desirable ways more heavily – not an end in itself, but a means of raising more tax revenue for redistribution or increasing the number and quality of public goods

and services. Corporations,

to ensure their own survival, would move out of activities that are financially profitable, but socially and environmentally destructive.

I have posted before about how

Social Policy Bonds could bring about [1] a new type of organization: one whose structure, composition and activities would be entirely subordinated to the goals that society wants to achieve. In doing this, a bond regime could bring about the gradual, but perhaps necessary, demise of corporations whose long-term negative impacts, simply because they do not register in today's markets, substantially outweigh their positive contribution to society.

## 10.7.2 Issuers and purchasers? (2013-07-18 18:01)

A correspondent asks: *Who do you see as the most likely issuers and purchasers of bonds ?*

My reply goes like this:

Governments are unlikely to be the first to issue Social Policy Bonds. "Tried, tested and failed" will always be preferable to governments than something radical that might not work. Nor are NGOs or other foundations, as they are currently configured, likely to get involved with buying Social Policy Bonds themselves. I envisage brokers filling the gap between the backers of the bonds and the people carrying out goal-achieving activities. If the bond issue is big enough, these brokers would act as investment companies: allocating funds to those bodies that, in their view, are carrying out the most efficient goal-achieving activities. They could do this with their own funds or, possibly, borrow on the strength of any anticipated appreciation of the bonds they hold. Social entrepreneurs and NGO's could make presentations to these brokers in an effort to convince them that their activities are leading to, or will lead, to the fastest appreciation of the bond price. They might have to do this on a continuing basis (every five years, say) for long-term goals.

There are broad social and environmental goals for which there is potentially a huge coalition that, under a bond regime, could actually put up funds to get things done. People might be more happy to contribute towards a specific, beneficial social outcome, rather than to a charity or to a government that has its own ideas about how to spend taxpayers' money. As well, most existing bodies have relatively specific objectives, compared to those that would be best served by the Social Policy Bond approach.

Take something like universal literacy in the Middle East and Asia. Most people would like to see this. We might not feel strongly enough to join a specific organisation or to give funds to one of the numerous organisations that are trying to bring about this outcome (or claim to be doing so). But some people do already give to such charities, and they and new contributors could well give more if they know that their funds will be used to reward successful achievement of universal literacy, rather than activities or

institutions that may not be very efficient. The great merit of focusing on outcomes with Social Policy Bonds is that it will enlarge the range of beneficial goals that can be targeted and, with ingenuity, achieved. Unlike under the current system, people will not be put off targeting and financing the solution of problems just because nobody currently knows how best to do so.

Or take a goal for a developed country: improving the health of the nation's population. Currently in the UK, for instance, this is mostly financed by taxes. In my [1]book I discuss how we could follow a transition pathway away from funding institutions that are supposed to improve health, and towards funding the health outcome itself. With this objective the bonds would (gradually) replace the current ways of allocating funding (government fiat, basically) with more rational ways. Whoever buys the bonds would have powerful incentives to allocate funds to the most efficient health-improving bodies. We cannot know in advance who these bondholders would be, especially as they themselves would be subject to the same pressure to be continuously efficient as the bodies to whom they allocate funds. At some point, it will be profitable to set up these companies whose sole job is to do this resource allocation efficiently. We cannot even know the structure and composition of these bondholder [2]investment companies: these will be subordinate to the goal itself.

As I say, government itself is not going to take the lead with issuing Social Policy Bonds targeting national health. But there are goals, like the literacy one, or world peace, or reduced crime rates etc, about which there is a very wide consensus and towards which people will contribute, even from their after-tax income, if they can be sure, as in a bond regime, that only successful efforts will be rewarded. There is a much wider consensus over such outcomes than there is about the bodies that, today, are allegedly achieving them. Many who would not dream of donating to the United Nations, or to pay more tax so that health services can be improved, would happily give to fund the outcomes that these bodies are supposed to be achieving. '

The issuers of these bonds would not resemble current foundations. What I envisage is that people concerned about, say, literacy in the Middle East, would raise awareness of the problem or rather tap into people's existing concerns about the problem, and raise donations to be used to back literacy bonds. (They could undertake to return funds if their specified goal is not achieved.)

In short: the goals

best targeted by a Social Policy Bond regime are broad and long term, and likely to attract support from a very wide range of people such as philanthropists and the public who might be more prepared to fund outcome-achieving goals, especially because only efficient actors will be rewarded and also perhaps because if the actors fail, then their donations could be returned. Existing bodies might or might not get involved in some stage of this process, whether as consciousness-raisers or as recipients of funding from the new bodies that I envisage would be created to allocate funds. Would these new bodies just spontaneously come into being? Not initially, perhaps, but with sufficient funds from whatever source backing the bonds, and if the bonds fall in price as a result of the absence of such bodies, then there will be motivation to create these bodies, whose sole job will be to allocate funds to efficient goal-achieving activities and bodies.

The important thing is to have sound objectives that will generate lots of support and are broad and otherwise a good fit with the Social Policy Bond concept. Then it will be in some entrepreneurs' interest to create resource allocation bodies. We can no more identify the nature and identity of these organisations than we can the activities they will promote, but there is no real need to do that.

So, to sum up: the issuers of the bonds (until governments get involved) are likely to be concerned individuals, philanthropists and existing charitable bodies, who would use their own funds and solicit public donations to back the bonds. I envisage bondholders (after some initial trading) mostly to be new organisations along the lines of investment companies, who will back whatever they think are the most efficient activities at any time. Of course, and interestingly, for large enough issues, a government itself may buy Social Policy Bonds backed and issued by concerned groups outside its country, and then do something to bring about (say) improved literacy in their country.

### 10.7.3 Procedures or outcomes? (2013-07-26 19:47)

Freddie de Boer, in a review of Jaron Lanier's [1]*Who owns the future?* writes about the United States (and other countries), which he calls 'proceduralist':

A proceduralist views society not in terms of a necessary goal (say, happiness and opportunity for all its members) but instead as a set of rules that it must follow—because they are natural, because they stem from the Western tradition, because they comport with human behavior, because they follow God's law, depending on whoever is justifying the current procedure. If these rules are followed, no injustice needs to be redressed. Rules can be discarded or changed if their intent is found to be problematic, but outcomes can be good or bad without issue. Problems arise only if the rules are broken. ...

But what happens when established procedures lead to unsustainable or immoral consequences, such as widespread and persistent unemployment? The [US] employment crisis reveals a conflict between the procedures of democratic capitalism, which ensure certain rights but promise nothing else, and the logic of the American social contract, which justifies the social order by assuring citizens that they can trade work for material security.

Talk of social contracts is passé in an America obsessed with technocapitalist visions of a prosperous future. ... This has led to an embrace of proceduralism by those true believers who want an app economy to be the engine of capitalism. And such people rule the world.

The problem for proceduralists is that social contracts exist for a reason. It turns out that there are, actually, certain outcomes that society must ensure if it is to go on functioning.

Exactly so; and for many of us, society is becoming less efficient at ensuring these outcomes. The negative impacts of corporate activities have become larger or less equitably distributed; a larger proportion of the benefits is accruing to a tiny, powerful and self-entrenching elite. Real median salaries [2]aren't increasing by much, relative to the costs of a middle class life. One way of dealing with this might be a negative income tax: a payment to every citizen regardless of their employment status ([3]here is a UK proposal). That might help mitigate the worst impacts of unemployment but the sums don't look encouraging.

A second way, of course, would be a Social Policy Bond regime. This would give priority to outcomes, rather than procedures, and it is those outcomes that would underlie a new social contract. They would be agreed, explicit outcomes that are meaningful to ordinary people: ends in themselves rather than the means to ends on which policymakers currently focus. In comparison to a bond regime, proceduralism is too random and its failures too big and fast-moving for government bureaucracies to do much about. Social Policy Bonds would subordinate all social spending, and much corporate activity, to welfare-enhancing goals. Policy, indeed, as if outcomes for real human beings, mattered.

## 10.8 August

### 10.8.1 Goals for education (2013-08-02 19:49)

A correspondent has kindly drawn my attention to President Obama's [1]accreditation reforms for higher education, as outlined in his State of the Union address. There is much that seems of merit to me in these reforms, but these reforms have encouraged me to think more broadly about education.

My premise is that policymakers should target, above all, social and environmental outcomes. As with other variables, like income say or, more to the point, literacy, at the basic level there is a strong correlation between something measurable and human wellbeing. So, for instance, we can measure functional literacy quite well, and the outcome of 100 percent literacy is a worthwhile one to target. In this vein, I was pleased to see that President Obama proposed programs to provide early

education for four-year olds from lower-income households. There are also measures to encourage higher graduation rates from high school. At these levels there is a strong correlation between attendance at an educational facility and real, meaningful outcomes.

But things are much more complicated at higher levels of education. We really need to think about what sort of outcomes we want. Some social outcomes result only indirectly from education and, under a Social Policy Bond regime, we'd do better to target those outcomes themselves. For example, it would be more efficient to target unemployment directly rather than indirectly through the educational system.

Under a Social Policy Bond regime we could do that explicitly, and investors in Unemployment Reduction Bonds (or Employment Maximisation Bonds) might well decide that the school system needs some sort of overhaul to meet the targeted goal.

This indicates how I think about targeting the supposed means toward achieving an employment target via such things as "graduation rates, costs, average amount borrowed etc" that are the focus of President Obama's reforms. These are less ends in themselves than supposed means to an end (or various ends). All [2]our experience tells us that such narrow, short-term, top-down, goals can - and will - easily be gamed or manipulated or will just not end up doing what they are supposed to. Obama's reforms concentrate heavily on strengthening the regulation of institutions. This might be praiseworthy, but I'd much prefer to see fewer administrative fixes and more targeting of specific broad outcomes, which, under a bond regime, would motivate investors in to make their own decisions about how best to achieve them. We need diverse, adaptive solutions of the sort that government just cannot manage. Government, under a bond regime scheme, would still ultimately subsidise or pay for the achievement of these goals, and raise the revenue for their achievement, but it would contract out the actual achievement to investors.

As happens so often with government everywhere, President Obama's proposals take the existing institutions as a given. They take the existing institutional framework as a given too. (I suspect Obama's healthcare proposals suffer from the same problem.) In the long run I think we'd do better to think carefully about our real goals and target those specifically. I think these would include high employment, universal literacy, lower crime rates, better physical and mental health and a few others. Education is, in my view, a means to those ends - and

others, less easily specified which perhaps should not be a government remit at all.

So...Obama's proposals for higher education reform are undoubtedly well meaning, and arguably positive, given the existing framework. But the existing framework should be challenged. Giving existing institutions more targets might well do some good, but I see them as entrenching the existing, and increasingly questionable, institutional structure at a time of rapid social and technological change. Instead of micro-managing the current system we need to clarify exactly what outcomes we, as a society, want to see, and which ones we think government can legitimately and usefully target, and which it can't.

### **10.8.2 Social Impact Bonds: not very exciting (2013-08-11 23:20)**

Toby Eccles earlier this year [1]asked why uptake of [2]Social Impact Bonds hasn't been spectacular. SIBs, you may recall, are similar to Social Policy Bonds, but they aren't tradeable.

And because SIBs are not tradeable, objectives have to be [3]narrow, and so will fail to capture the public imagination. Also Mr Eccles says, '[g]overnment likes to know who it's dealing with' and this, to me, is another problem with SIBs: they take current institutions, with their agendas, hidden or otherwise, as a given.

Tradeability makes Social Policy Bonds wholly different. With tradeability people can make a profit without holding the bonds until the targeted goal has been reached. So with Social Policy Bonds we can target broad, long-term goals that:

- appeal more to the public. With Social Policy Bonds goals such as universal [4]literacy or [5]world peace can be targeted. But with SIBs they are as unimaginably unrealistic policy goals as they are they are under the current system; and
- therefore are far more likely to be issued and backed by bodies *other than government*, including the public.

### **10.8.3 Violence: incentives work (2013-08-21 17:54)**

'People say that problems cannot be solved by the use of force, that violence, as the saying goes, is not the answer.' So writes Benjamin Ginsburg:

That adage appeals to our moral sensibilities. But whether or not violence is the answer depends on the question being asked. For better or worse, violence usually provides the most definitive answers to three major questions of political life: statehood, territoriality, and power. Violent struggle—war, revolution, terrorism—more than any other immediate factor, determines what nations will exist and their relative power, what territories they occupy, and which groups will exercise power within them. [1] *Why violence works*, Benjamin Ginsburg, 'Chronicle of Higher Education', 12 August

As a result:

[M]ost regimes are the survivors or descendants of a thousand-year-long culling process in which those states capable of creating and sustaining powerful militaries prevailed, while those that could not or would not fight were conquered or absorbed by others. Similarly, when it comes to control of territory, virtually every square inch of inhabited space on the planet is occupied by groups that forcibly dispossessed—sometimes exterminated—the land's previous claimants.

So violence isn't something that just happens: we are violent because it gains us territory

and other resources. As such, it's amenable to change. That's where Social Policy Bonds can play a part. Like many other social and environmental problems violent political conflict has many causes and, quite possibly, looking for those causes and trying to deal with them is not going to be the most efficient or quickest way of shrinking the role of war or civil war in world affairs. The best, most cost-effective ways might well mean innovations of a sort that hasn't been attempted yet, or that offend our sense of justice but are much less bloody than current methods: bribing tyrants to fly away to their own private luxury island, with full security for them and their families, for instance.

Nobody knows what will be most efficient, though we can be pretty sure that the current system, which pays people for undertaking edifying-sounding but ineffectual activities, is doomed to fail. (Think: climate change.) Perhaps it's now time for world governments or, more likely, opposition parties, NGOs and other interested groups to form a coalition and issue [2]Conflict Reduction Bonds, which will reward what we actually want to achieve: world peace. A coalition of interested parties, perhaps with the help of philanthropists, could invest a large sum, and call for contributions from the public. It could then issue bonds redeemable for something like \$1million each once current levels of violent political conflict have fallen by, say 50 percent. Yes, we'd need to discuss how exactly to define exactly what we mean, and how to monitor progress toward our goal. But once that's done, we'd have, in effect, contracted out the achievement of peace to a motivated group of investors, whose structure, composition and initiatives are entirely subordinated to that goal. They might buy the bonds for a very low price, reflecting the market's view that reduction in political violence are hard to achieve and necessarily will take a long time to appear.

As with our biggest environmental problems, so our biggest social problem, political violence, is going to need an array of diverse, adaptive approaches if we are going to solve it. The current system is too cumbersome, monolithic and slow moving to work at anything like the speed, scale and efficiency that we need. The incentives to create mayhem are plentiful. Unless a Conflict Reduction Bond regime (or something like it) comes into being, world peace will remain as utopian and distant a goal as it is today.

#### **10.8.4 Ordinary people? Who cares? (2013-08-24 23:32)**

What happens when entrenched interests dictate government policy:

For most of modern history, your health care was a matter between you and your doctor. Since World War II, in much of the developed world, it's been between you, your doctor, and your government. In America, it's now between you, your doctor, your government, your insurer, your employer, your insurer's outsourced health-care-administration-services company . . . Anybody else? Oh, let's not forget [the Inland Revenue Service], which, in the biggest expansion of the agency in the post-war era, has hired 16,500 new agents to determine whether your hernia merits an audit. [1]*Obamacare's Hierarchy of Privilege*, Mark Steyn, writing about the US Affordable Care Act, 'National Review Online', 23 August

This is truly policy as if outcomes are irrelevant, unless the outcomes targeted are those that improve things only for policymakers and bureaucrats, at the expense of the rest of the population. It's policy dictated by the needs and bargaining power of existing institutions. It has nothing to do with the well-being of the rest of the population.

If politicians were genuinely concerned about healthcare they'd measure success in terms of health outcomes. Who knows? They might even reward people on the basis of how well they achieve these outcomes. And if they wanted to channel market interests into the improvement of their citizens' health they might, eventually, issue [2]Health Bonds. I'm not holding my breath: I think it's more likely that such bonds would first be issued by non-governmental actors; people not beholden to existing public- or private-sector interests.

### 10.8.5 Nothing new (2013-08-26 21:05)

Despite its radical-sounding novelty, there's nothing really new here:

The UN Security Council should assign itself the power to put a \$50 million bounty on the head of a tyrant, defined as someone who is subject to an International Criminal Court (ICC) indictment for war-crimes/crimes against humanity and is a serving head of state. [1]*Holding tyrants personally accountable*, Philosopher's Beard, 23 August

The Philosopher is writing about conflict in Syria and thinks he knows how best to end it. Of course, it's possible Bashar al-Assad of Syria were to die soon, then one particular conflict in

Syria would diminish or even end. But it's not at all certain, and the Philosopher has about as much chance of being right about his particular brand of intervention as are policymakers generally.

Here's an idea: if we want to end any particular conflict, then let's pay people to end that conflict, rather than to do what we think, in our ignorance, at this moment, *might* end that conflict. Actually, I'd rather pay people to end *all* the conflicts in Syria - and elsewhere - for all time, and to do so legally. [2]Here's how that might happen.

## 10.9 September

### 10.9.1 Surveillance (2013-09-08 19:02)

It's a familiar, but disastrous, train of thought: government perceives a problem, government thinks it knows the cause of the problem, government pumps resources into the agencies that allegedly deal with the alleged cause of the problem. So we have, for instance, not-very-effective overseas aid agencies, bloated militaries, corrupt farm support policies and, now, Stalinist surveillance bodies on which the US spends [1] \$80 billion a year. These agencies are self-entrenching. They have in common the power to resist reform that lavish government funding gives them. But the security industry has another weapon it can deploy to keep enriching itself: fear.

Only forty years removed from the blackmail-tinged reign of J. Edgar Hoover, the NSA [US National Security Agency] has developed an image which implies the agency is vacuuming up more than enough incriminating phone records, emails and text/sext messages to politically torpedo any rank-and-file congressman, should that congressman step out of line. And here's the thing: for all the agita intelligence officials express about new disclosures, those disclosures illustrate the sheer size and scope of government surveillance. That doesn't weaken the NSA - on the contrary, it serves to politically strengthen the agency by constantly reminding lawmakers that the NSA 1) probably has absolutely everything on them and 2) could use that stuff against them. [2]*Saying Boo To A Ghost: It's No Secret Why Congress Fears Crossing The NSA*, David Sirota, NSFWCORP, 22 August (link expires in 48 hours)

Here's another idea: why not decide what we really want to achieve - not as a government, but as a society - and target that? If we want to reduce the number of people killed by random acts of violence, why not issue Social Policy Bonds that target such a metric and reward people for working within the law to reduce terrorist acts. Perhaps we might think more broadly, and decide that we want to reduce all premature deaths, however caused. In which case, we could issue [3]Health Bonds. Either way, we'd have a debate about exactly what we want to achieve, without having every aspect of our behaviour surveilled and recorded by government and its private sector contractors. Something which is quite possibly illegal, and which [4]no ordinary people actually want.

### **10.9.2 Policy as if party politics is the only thing that matters (2013-09-11 18:58)**

Elizabeth Drew writes about US politics:

In 2009, for the first time, defeat of the incoming president in the next election became the opposition party's explicit governing principle. If that meant blocking measures to improve the economy, or preventing the filling of important federal offices to keep the government running, so be it. Wrecking became the order of the day. Confrontation became the goal in itself. Now the rightward trend in Republican politics is feeding on itself, becoming even more extreme until the preposterous becomes conceivable. [1]*The stranglehold on our politics*, Elizabeth Drew, 'New York Review of Books' dated 26 September

It's the logical outcome of a political system subordinated entirely to existing institutions. Every organization - political, religious, educational or whatever - has as its over-riding aim that of self-perpetuation. In their resistance to reform the biggest and most powerful of these organizations do great damage. Sadly, the record of the sort of revolution needed to release the stranglehold of organizations as dominant as the two US political parties is not encouraging.

Here's another approach: instead of organizing our policymaking around the whims and caprices of political parties and their principal funders, why not focus on society's needs? And reward people who help achieve them? That is the underlying principle of Social Policy Bonds. Under a bond regime, [2]organizations would no doubt come into being, but their structure, composition and all their activities would be entirely subordinated to the social and environmental outcomes that people want to see. The current system is broken. Party politics has taken over, at the expense of society. I have no doubt that change will occur; let's hope it's along the lines of a Social Policy Bond regime, which would channel market incentives into the achievement of society's goals, rather than those of the political party dinosaurs.

### 10.9.3 The curse of party politics (2013-09-21 19:50)

It lasts for generations. Helen Epstein writes about Dr Sara Josephine Baker of the New York City Health Department:

In her first year at the Bureau of Child Hygiene, Baker sent nurses to the most deadly ward on the Lower East Side. They were to visit every new mother within a day of delivery, encouraging exclusive breast-feeding, fresh air, and regular bathing, and discouraging hazardous practices such as feeding the baby beer or allowing him to play in the gutter. This advice was entirely conventional, but the results were extraordinary: that summer, 1,200 fewer children died in that district compared to the previous year; elsewhere in the city the death rate remained high. The home-visiting program was soon implemented citywide, and in 1910, a network of "milk stations" staffed by nurses and doctors began offering regular baby examinations and safe formula for older children and the infants of women who couldn't breast-feed. In just three years, the infant death rate in New York City fell by 40 percent, and in December 1911, *The New York Times* hailed the city as the healthiest in the world. Articles about Baker's lifesaving campaigns appeared in newspapers from Oklahoma to Michigan to California. In the late 1910s, she and other reformers drafted a bill to create a nationwide network of home-visiting programs and maternal and child health clinics modeled on the programs in New York. But the American Medical Association (AMA)—backed by powerful Republicans averse to spending money on social welfare—claimed the program was tantamount to Bolshevism.

[1]*The Doctor Who Made a Revolution*, Helen Epstein, 'New York Review of Books', 26 September

And three generations later?

Today, nearly every other industrialized nation on earth provides some form of guaranteed support to families with young children. That America still does not is considered by many to be a national disgrace.

Once ideologues grab the reins of government, any notions of doing the best for society or even of rationality, are liable to be lost for ever. There's no inevitable reason why the aggregated interests of ideologues, corporations or powerful organizations of any kind are going to add up to a society that cares about the well-being of the majority of the population. Perhaps the next stop for the US is [2]a banana republic?

Here's another idea. Instead of making policy on the basis of ideology, or the short-term interests of powerful organizations, why not target outcomes? Outcomes that are meaningful to ordinary people - as people, rather than members of one interest group or another. Explicit, transparent outcomes that we can all understand and all participate in formulating and so buying into. That could be done with Social Policy Bonds, which could target broad, long-term social goals about which we could all be consulted and with which most of us would agree. *How* these goals were to be achieved would be a matter for motivated investors in the bonds, rather than politicians and their corporate or ideological paymasters. People would be rewarded for achieving social goals, rather than siphoning off government funds for their own narrow, short-term interests at the expense of everyone else.

It's a long way from where we are now, summed up by George Monbiot:

Our elected representatives look increasingly marginalised. Unable or unwilling to assert themselves against corporate power, media magnates and spies, they have been reduced to a class of managers, doing as they are told by their sponsors and lobbyists, seeking to persuade their constituents that what is good for big business and unelected agencies is good for everyone. [3]*Law of the landed*, 19 September

#### **10.9.4 Kludgeocracy (2013-09-25 20:39)**

Steven M Teles writes eloquently of the complexity and incoherence of US policy:

A "kludge" is defined by the Oxford English Dictionary as "an ill-assorted collection of parts assembled to fulfill a particular purpose...a clumsy but temporarily effective solution to a particular fault or problem." The term comes out of the world of computer programming, where a kludge is an inelegant patch put in place to solve an unexpected problem and designed to be backward-compatible with the rest of an existing system. When you add up enough kludges, you get a very complicated program that has no clear organizing principle, is exceedingly difficult to understand, and is subject to crashes. Any user of Microsoft Windows will immediately grasp the concept. "Clumsy but temporarily effective" also describes much of American public policy today. [1]*Kludgeocracy in America*, 'National Affairs', Fall 2013

And, indeed, much of the public policy of most countries, and of supernational agencies too. I won't summarise Professor Teles' excellent article, which is required reading, except to mention some of his suggested cures for kludgeocracy. These include procedural changes aimed at increasing the power of the congressional majority leadership at the expense of committees, shifting the 'micro-design' of policies away from Congress and towards the government agencies actually implementing the policies; and handing entire policy areas, such as health or education to the states or to the federal government - but not to both. As Professor Teles writes:

Few of the reforms sketched out above have much of a chance of being enacted at the moment, since the institutions and practices they propose to alter are too deeply entrenched to remove quickly.

...and I share his pessimism about that. Of course, a Social Policy Bond regime would be even more radical and, if we are to depend on government to initiate it, even less probable. But we don't need to wait for government. Social Policy Bonds can be issued by anyone with enough funds to finance their redemption, or with sufficient ability to raise these funds from bodies such as non-governmental organizations, philanthropists or ordinary citizens.

If that were to happen, and the Social Policy Bond approach were to prove successful in achieving social goals, it's not that difficult to imagine government itself changing, along the lines that Professor Teles and most of the rest of us would like to follow: towards open, explicit, costed, efficient and effective solution of our social problems.

### **10.9.5 Target crime, not recidivism (2013-09-28 23:47)**

I've done a short piece on my main website about why I think Social Policy Bonds [1]must be tradeable. In this they differ crucially from [2]Social Impact Bonds. Because they can't be traded, SIBs must target fairly narrow objectives, and ones with relatively short lead times. This makes them easier to try out and, unlike Social Policy Bonds, SIBs have actually been issued. In the US and the [3]UK SIBs have been issued that target recidivism. There are numerous problems with this, most of which are discussed by Theodore Dalrymple, who also succinctly points out their most important flaw:

The public wants to be protected against crime, not against recidivism... [4]*What Does It Mean To 'Punish' Syria?*, Theodore Dalrymple, 'Library of Law and Liberty', 8 September

Tradeability sounds esoteric, but it's not. It's a fundamental distinction, and one with large consequences: under a Social Policy Bond regime we can target exactly what we want to achieve; under a SIB regime we can aim at solving only narrow problems that are short term in nature. This means that they [5]fail to capture the public imagination and perhaps even more importantly, lend themselves far more readily to being gamed or manipulated. My hope is that

they don't discredit the whole notion of channelling self-interest into the achievement of broad social and environmental goals.

## 10.10 October

### 10.10.1 Nobody asked us (2013-10-05 19:14)

John Lanchester, having seen the UK's [1]GCHQ files, writes about the UK:

...we're moving towards a new kind of society. Britain is already the most spied on, monitored and surveilled democratic society there has ever been. This doesn't seem to have been discussed or debated, and I don't remember ever being asked to vote for it. [2]*The Snowden files: why the British public should be worried about GCHQ*, John Lanchester, 'The Guardian', 3 October

This is just one critical decision about how we live that is made without reference to voters. Politicians can get away with almost anything they want under the guise of 'national security', just as they can by citing 'economic growth'. Nobody questions these claims, because the relationships between them, the policies they generate, and the outcomes of these policies are too complex, and too bedevilled by time lags, to identify clearly. Once started, the policies create institutions that have sufficient lobbying power to resist reform and grow endlessly.

How would a Social Policy Bond regime deal with 'terrorism'? Most probably, we'd get some perspective on the matter. As Mr Lanchester points out:

Since 9/11, 53 people have been killed by terrorists in the UK. Every one of those deaths is tragic. So is every one of the 26,805 deaths to have occurred on Britain's roads between 2002 and 2012 inclusive, an average of 6.67 deaths a day. ... This means that 12 years of terrorism has killed as many people in the UK as eight days on our roads.

It's not for me to try to divine society's preferences about *how* we die. But suppose that, away from the aftermath of a terrorist incident, when cool heads prevail, we value a life lost in a road accident - or any other cause - as highly as a life lost to a terrorist incident. We might then decide that instead of creating a vast, expensive, intrusive bureaucracy to reduce premature deaths by a trivial amount, we'd want to channel society's limited resources more efficiently. In that case, we'd issue Social Policy Bonds that target something like 'the avoidance of premature deaths', or an aggregated measure of longevity, perhaps expressed in terms of [3]Quality Adjust Life Years.

Regardless of how much we weight a death due to road accidents against a death due to terrorism, a Social Policy Bond regime would ensure that our preferences are made explicit and transparent, and that our resources would be allocated according to our preferences. Something that obviously, and ominously, is not happening today.

### 10.10.2 Mental health (2013-10-08 19:36)

Spiked's Tim Black [1]asks lecturer and psychiatrist Joanna Moncrieff "'Why are there so many more people being given a diagnosis that demands the prescription of powerful antipsychotics?'

Moncrieff is quick to answer: 'That's an easy one - it's the pharmaceutical industry.'

That's probably part of the answer. But as the discussion continues it's clear that societal changes are another, possibly more significant, reason.

The withering of old forms of informal social life, the corrosion of the traditional mechanisms of support and struggle, be they based in politics or faith, [have] left the individual in a potentially more helpless position.

Dr Moncrieff sums it up: 'We've become a much more atomised society ... one in which suffering and difficulties are located increasingly not in the social world but in the individual. So previously, if someone was depressed, not happy, not coping with life, that was a social or a family problem. But now it's the individual that needs to be rectified rather than the system around them.'

I know a lot less than Dr Moncrieff or Mr Black about psychiatry and mental health. But my concern is, I think, relevant. It is that we do not have the institutional structures in place that will identify major causes of suffering as they change over time and *then do something to alleviate it*. Instead we have institutions whose sole concerns are, essentially, self-perpetuation and self-enrichment; any overlap between achievement of their goals and solution of society's problems is coincidental.

Yes, we have drug companies, whose motives and methods are increasingly [2]at odds with society, but who are powerful lobbyists and capable of influencing the regulatory environment in their favour.

But social atomisation involves more than drug companies: it probably has much to do with town planning, transport policy, immigration policy, government welfare schemes and much else besides. The point is that *we do not have incentives in place that will encourage people to investigate these - and other possible - causes and do something about them*. The reverse, in fact: our *de facto* and default targeting of GDP as the greatest social goal, and the short-term interests of corporations and politicians, mean that social atomisation is hardly seen as a problem. Big pharma benefits from depression, after all, and it's certainly not in the interests of powerful corporations to question things like the apotheosis of the car or *coercive* [3]multiculturalism.

In today's policymaking environment it's more profitable to treat depression, however ineffectually, with pills than to look for long-term, possibly more edifying solutions, that could threaten the narrow interests of corporations and their clients in government. It's highly likely that those corporate interests are doing much to create depression in the first place, and it's even more likely that it's in nobody's interest to find out for sure.

A Social Policy Bond regime would work differently. It would certainly not take today's institutional structure as a given. It would take a serious look at mental health, depression and social atomisation and construct reliable metrics that could be targeted for reduction. Investors in Mental Health Bonds would themselves benefit by looking at *all* potential causes of and solutions to problems like depression and doing whatever is required to alleviate them. In doing so, their interests and those of wider society would merge - in stark contrast to today's policymaking world.

### 10.10.4 Metrics must be broad (2013-10-28 00:41)

Social Policy Bonds rely heavily on targeting measures of social and environmental well-being. That's a potential problem. Sue Halpern is writing about algorithms and metrics in a different context, but what she says applies to policymaking on behalf of any but the smallest population:

But the real bias inherent in algorithms is that they are, by nature,

reductive. They are intended to sift through complicated, seemingly discrete information and make some sort of sense of it, which is the definition of reductive. But it goes further: the infiltration of algorithms into everyday life has brought us to a place where metrics tend to rule. This is true for education, medicine, finance, retailing, employment, and the creative arts. [1] *Are we puppets in a wired world*, Sue Halpern, 'New York Review of Books', dated 7 November

The potential problem is that the metrics we use in policymaking might not correlate with societal well-being. Unfortunately, the alternative to a coherent, explicit, considered use of metrics in national policymaking is our current system, which features the unsystematic and *de facto* use of incoherent metrics that are too narrow and short term in their scope to bring about a rational allocation of resources. Applying broad, meaningful metrics to the health sector, say, is going to be far more efficient and welfare-enhancing than targeting a particular disease, just because the scope for efficiency gains is far bigger when resources can shift between different activities according to where they will be most cost effective.

The other problem with narrow metrics, however well meaning, is that they can easily be gamed. Thus:

Yet indicators of maternal health [in Laos] are worse than in Cambodia ... and levels of malnutrition are atrociously high. To make things look not quite as bad, NGO types say, the government deliberately went around feeding children in villages monitored by the UN for the Millennium Development Goals—until it was found out. [2] *The future of Laos: a bleak landscape*, 'The Economist', 26 October

### 10.10.5 SPBs, SIBs and SOBs (2013-10-31 03:39)

It's probably too early to say whether the doubts being [1]expressed about Social Investment Bonds (SIBs) are fatal or not, but one thing is clear: at best the bonds will function like performance related contracts. An improvement on most current government approaches,

perhaps, but in terms of ambition and potential for real change SIBs fall far short of Social Policy Bonds. They aren't tradeable, which sounds like a mere technical detail but in fact severely limits how useful they can be. I've outlined why [2]here, so in this post I'll just concede that Social Impact Bonds is a better name than Social Policy Bonds.

I'm reminded about why I chose the name Social Policy Bonds by the website linked to in the first link, above. It's a [3]long pdf, which documented the meeting at which I first publicly presented the bond concept, in 1988. I'd originally used the name Social Objective Bonds, until a colleague read my draft paper and told me exactly what the acronym meant and how widespread it was.

## 10.11 November

### 10.11.1 No surprises here (2013-11-07 12:41)

The United Nations says it is "less and less likely" that global greenhouse gas emissions will be low enough by 2020 to stop the atmosphere warming beyond the internationally-agreed safety threshold - 2°C above its pre-industrial level. A report by the UN Environment Programme says current undertakings by world governments to cut emissions fall short of that goal, and emissions "continue to rise rather than decline". [1]Source

No surprise. If world governments were serious about doing something to moderate climate change, they'd reward people who help moderate climate change. Instead they have agreed on an elaborate, expensive, divisive and ineffectual policy of hand waving. The relationships are too obscure, or can be made to appear so: cutting greenhouse gas emissions *might* reduce climate change. But it might not. Even if it does, any benefits are likely to be minuscule. The costs are immediate, the benefits obscure and remote. It's not happening and it's not going to happen.

There'd be more popular support for targeting climate change directly. Under a [2]Climate Stability Bond regime we could define our goal in ways that encompass an array of

indicators: physical, biological, financial, so that all targeted conditions would have to be satisfied and sustained before taxpayers become liable. We could choose to target goals including the reduction of casualties from adverse climatic events - something that ordinary people can understand and with which we can identify.

Apart from being comprehensible, the other big advantage of a bond regime is that it would channel resources into where they will be most effective at achieving our climate targets. It would encourage diverse, adaptive approaches, of the sort that Kyoto, with its fossilized science, cannot. And we are going to need diverse, adaptive approaches: the scientific relationships are too uncertain, and our knowledge expanding so rapidly, that any approach that focuses exclusively on just one variable (like the concentration of the few compounds identified as greenhouse gases twenty years ago) is going to fail. And it would fail even if it enjoyed support that took the form of actually doing something about it.

### **10.11.2 A world safe for high-frequency trading (2013-11-12 06:22)**

Our boundless ingenuity, our immense technological knowledge: where are they being directed? Towards solving the problems that plague humanity? I refer to things like the piling up of nuclear weapons, catastrophic environmental disasters, murderous religious fanaticism.... Well, no. Some, perhaps, most, of our best brains are going into answering this sort of question:

How will regulations impact the way traders are capturing alpha? Would there be restrictions that can possibly harm algorithmic trading? ... What is the outlook for the markets when all participants engage in the arms race of super smart algorithms? Where will institutional and retail investors find opportunities? Conversely, could we imagine a world without high-frequency trading?

Yes, we are all relieved to know that the [1]High Frequency Trading Leaders Forum 2013 - you know, the one that 'Every Trader and Quant in London is Talking About' - is to be held in London on 5 December. These traders and quants are some of the most brainy people there are. [2]Hitched up to supercomputers these geniuses make a lot of money for themselves and their employers.

I can't condemn these people, whatever the net results of their collective actions. These people are reacting rationally to the incentives on offer. It's the incentives that are perverse. If people can make enough cash to bring up a family by shaving off one millisecond per financial transaction more than the next guy, then that is what they will strive to do. It just strikes one as sad that we don't have systems in place that would channel these bread-winners' undoubted immense ingenuity into more socially useful activities.

That's where Social Policy Bonds come in. Their [3]tradability means that a bond regime can target broad, long-term goals that require diverse, adaptive approaches the nature of which we cannot currently conceive. The existing policymaking system deals with these goals, which include things like [4]avoiding catastrophic disasters, [5]stabilising the climate or even improving world or national [6]health, haphazardly, if at all.

Of course, quants and other high-earners possibly do contribute more to tax revenues than ordinary people - especially if they are badly advised. But, as we can see, governments generally don't do a great job at deploying this revenue to deal with long-term, large-scale problems, like [7]avoidance of conflict or climate change. Again, their incentives to do so are minimal and mostly focus on [8]power; retaining it, or acquiring more of it.

A Social Policy Bond regime would allow us to target broad global and national goals explicitly, while channeling the market's efficiencies into the best use of our limited resources. Given that the survival of the planet itself is [9]under threat, I think the case for such targeting is a strong one, even if we have to give up high-frequency trading to get there.

### **10.11.3 The great divergence (2013-11-15 12:11)**

Only 40 % of citizens in the mostly-rich countries of the Organisation for Economic Co-operation and Development expressed confidence in their national governments in 2012, down five percentage points from 2007. [1]*Eroding trust in government*, 'The Economist', 15 November

Brazilian Roberto Unger is a leading political philosopher and an advocate of progressive politics. He has taught at Harvard Law School for about 40 years and US President Barack Obama was one of his students in the 1980s. "There is no project in the United States responsive to the needs and aspirations of the broad working class majority of the country," said Mr Unger. [2]*Obama's law professor on his failures as president*, Quote from BBC 'Hardtalk' programme, 15 November

It's not really surprising. Our governments have every incentive to respond more to corporate donors than to ordinary people. Big business and government have interests that grow [3]ever further apart from those of the public and small businesses. They can get away with this because policymaking focuses on funding, institutional structures, legalistic debate and arguments about inputs, outputs or activities. Everything except meaningful outcomes in fact.

There is another way. A Social Policy Bond regime would subordinate all debate and decision-making to outcomes: what social and environmental goals should we be aiming for, and how much are they worth? These answers to these fundamental questions, ignored by the current system, would inform every project, every initiative and activity, launched under a bond regime. Apart from the incentives and efficiencies that the market for Social Policy Bonds would stimulate, the aims of the bonds would be explicit and clear to everybody. People might disagree about their relative priority, but they would know exactly what their government was trying to accomplish. Ordinary people could participate in policymaking and would engage with the inevitable trade-offs that have to be made when it comes to allocating society's scarce resources.

As a result, and crucially, we'd buy in to policy goals; perhaps not wholeheartedly but

certainly more than we do today. Without such buy in, it's difficult to see how our governments, with their priorities so different from ours, are ever going to engage with the crucial social and environmental problems of our time, let alone solve them.

#### 10.11.4 The great divergence, continued (2013-11-19 12:54)

It's not just that our western democratic governments stand apart from ordinary citizens, but that the gap grows every larger. Jim Newell writes about a US Senator, Jim DeMint, who is retiring to head up a think tank:

The whole curious DeMint affair bespeaks the ongoing shift of power in Washington away from the people's business—and toward the ideological donor class.... At places like CAP, AEI, Heritage, and many of the other approximately 1,812 American think tanks, policy studies are still part of the operation, but their most vital public role is to act as partisan hacks for whichever side of the major-party duopoly they're associated with. And the conservative think tanks are now reliable dispensers of ideological discipline on the right: they do exactly what is best in the short term for the Republican Party at all times and punish anyone who dissents. [1]*Good Enough for Government*: [2][3]*Work Conservatism in the tank*, Jim Newell, 'The Baffler', No. 23

Perhaps this sort of patronage-based corruption is built into any sort of policymaking system with which ordinary people cannot identify, whether that happens because government is too big, too remote, or its machinations too obscure. A government acting on a large scale

need not necessarily be remote from or unconcerned with the well-being of its citizens. There are essential projects that require such a government: sanitation for example, or other major infrastructural works. But it does seem to be inevitable that interest groups, including big business and government agencies, interpose themselves between people and their government taking advantage of public funds in ways that are damaging to the public interest, self-enriching and therefore - because money buys votes - self-entrenching. Once that happens, elections become ever less meaningful; ordinary people become alienated from the political process and cynical. Or worse.

One way of reconnecting people with the policymaking process might be direct democracy; frequent referenda along Swiss lines. Another might be to become familiar with expressing all policy goals in terms of outcomes that are meaningful to ordinary people, and to reward achievement of these outcomes, *whoever achieves them and only once they have been achieved and sustained*. By doing this, we could avoid today's corrupt favouritism of corporations or government bodies and de-emphasise the roles of political parties and their supporting donors and ideologues. Worthy though these aims might be in themselves, an outcome-based regime would, more positively, stimulate diverse, adaptive solutions to our urgent and large-scale social and environmental problems.

That's where [4]Social Policy Bonds could enter the picture. They offer a way of achieving outcomes that rewards efficiency in achieving social goals above all other considerations. They inject market incentives into the solution of our social problems, impartially, with cost-effectiveness being the sole criterion for one approach being rewarded rather than another. A bond regime, because it would be efficient at achieving social goals, and because its aims and means would be comprehensible to people other than politicians, bureaucrats, corporate lobbyists and think tank ideologues, could close the ever-widening gap between citizens and their government.

### **10.11.5 Damn foolish things (2013-11-28 07:21)**

Thomas Laqueur reviews *The Sleepwalkers: How Europe Went to War in 1914*, by Christopher Clark:

Many actors (the crowned heads of Europe, military men, diplomats, politicians and

others), each with their own objectives, acting as rationally and irrationally as humans are wont to act, made decisions that foreclosed on others and collectively led the world into an unimaginable and un-imagined war. [1]Some damn foolish thing, Thomas Laqueur, 'London Review of Books', dated 5 December

Millions of ordinary people had a vital interest in World War One not happening. Even when multiplied by what might have been thought a very low probability of its actually occurring, this should have represented a strong coalition in favour of peace. But there was no way this overwhelming wish for peace could have expressed itself. In those days the disconnect between policymakers and ordinary people was even wider than it is now. Calamitously, war broke out as the accumulated result of the perceived short-term interests of a tiny group of monarchs, aristocrats and generals.

The situation hasn't changed that much. Short-term goals predominate still amongst politicians and the military. Corporations have more power than monarchs and aristocrats these days, but are at least as adept at ignoring or manipulating public opinion. To paraphrase Otto von Bismarck: it's no stretch to imagine a catastrophic war breaking out nowadays over some damn fool thing in the East China Sea, or the Korean peninsular or the India/Pakistan border or ....

One way of making effective our wish to avoid another calamity would be to issue [2]Conflict Reduction Bonds. Governments, philanthropists, NGOs or ordinary members of the public could all contribute to the funding of such bonds, which would be redeemable only after a sustained period of no major political conflict. In so doing, we would monetise our wish for peace, and act as a counterweight to the forces that, deliberately or not, propel countries into catastrophic wars or civil wars. There's nothing inevitable about war: it happens because people react, if not rationally, at least humanly, to the incentives on offer. Conflict Reduction Bonds, by rewarding people for achieving peace, could tip the scales in the other direction, and lead to what must surely be one of mankind's most noble goals: the ending, for all time, of war.

## 10.12 December

### 10.12.1 You can't prove it (2013-12-08 14:04)

Climate sceptics are finding it ever harder to persuade the public that the climate

isn't changing. So now some are turning to a more last-ditch line of attack: even if climate change is happening, it's not worth worrying about. [1] *Causes for climate concern*, 'New Scientist', dated 7-13 December

If you're a politician, there's a genuine problem with climate change, as with many other environmental and social concerns: you can't do anything until cause and effect have been proven; and sometimes not even then. And that's supposing that you want to do something. When you don't really want to do anything, then obviously nothing will be done, except maybe you will perform some elaborate, expensive gestures, like participating in conferences, subsidising so-called green technologies (for a few years), and transferring token amounts of cash from taxpayers in the rich countries to rich people in the poor countries. Meantime, the challenge goes unmet.

[2] Climate Stability Bonds could be the answer. Governments - or whoever actually wants to deal with climate change - could issue them without having to prove that climate change is actually happening, without knowing what's causing it, and without knowing what the best solution to it is going to be. The bond issuers would, in effect, be contracting out the discovery of what's happening, and how best to deal with it, to the market. And the market would have every incentive to be impartial and efficient about every aspect of the climate change challenge. That's a total contrast to the current policymaking environment, in which powerful interests can influence the interpretation and presentation of the science and policymaking. It's just not a rational way of dealing with the problem and it just might be leading us all into catastrophe.

### 10.12.2 Targeting well-being (2013-12-11 13:52)

Unfortunately the industry that has mushroomed around type 2 diabetes measures success in approvals for new drugs, revenue earned, and money raised, not in suffering avoided or lives saved. [1] *Sugar Nation*, Jeff O'Connell, 2011

It's the same at the level of national and international government. In the absence of coherent, explicit, policy goals that have been debated openly and bought into, we have accepted that corporate goals and a motley array of vague indicators, such as GDP per capita, or economic

'growth' as our default objectives. There might have been a strong correlation between the aggregation of such goals and societal well-being in the past, the society was less interlinked, the negative impacts of economic activity were less significant, less well known, or easier to escape. But for today? It's not good enough.

We need not only to target explicitly, broad indicators that are inextricably linked to social and environmental well-being; we need also to discuss them, and to engage the public with them so that, while we might not all agree on society's priorities, we can buy into them, and attempt to change them within a coherent and inclusive policymaking environment.

In short, we need to target outcomes; outcomes that are meaningful to ordinary people. That's where Social Policy Bonds can enter the picture. Yes, they channel market forces into the achievement of social outcomes - which makes them efficient. But as important is that they focus our boundless human ingenuity on things that matter: all the broad components that make up social and environmental well-being. We can do better nowadays than to hope that 'success' will appear as a by-product of the targets pursued by a motley array of corporations, politicians and other interest groups.

I've been updating the SocialGoals.com website. Comments or suggestions, on this or any other aspect of Social Policy Bonds, are welcomed.

---

### **10.12.3 Transcending institutional decay (2013-12-18 09:50)**

I won't discuss Professor Francis Fukuyama's long piece on *The decay of American political institutions* in detail. I think that the problem he discusses - the divergence of politicians from the electorate - applies to most of the western democracies, though the specific causes differ. The essay does confirm to me that any policymaking that does not reward explicit, verifiable outcomes, is doomed to fail. Even if the proponents of a policy are well-meaning, programmes that focus on institutions, structures, activities, inputs or outputs will inevitably be gamed or manipulated, especially at the national (or supra-national) level.

So, when it comes to bribery and corruption:

The law bans only the market transaction, not the exchange of favors. The latter is what the American lobbying industry is built around. ...

[1] *The Decay of American Political Institutions* ,

Francis Fukuyama, 'The American Interest', 8 December

Exchange of favours is only one of the myriad ways in which political institutions decay, but it is representative.

Pluralist theory holds that the aggregation of all these groups contending with one another constitutes a democratic public interest. But due [*sic*] to the intrinsic over-representation of narrow interests, they are instead more likely to undermine the possibility that representative democracy will express a true public interest.

'[T]hey' here refers to the US public sector trade unions, but it could stand for any interest group.

There is a further problem with interest groups and the pluralist view that sees public interest as nothing more than the aggregation of individual private interests: It undermines the possibility of deliberation and ignores the ways in which individual preferences are shaped by dialogue and communication.

Quite so. It also crowds out the likelihood that people will think beyond their identity as members of their group

. Perhaps more seriously, it also takes existing ways of doing things as a given, which is almost a definition of decay.

The answer? I think we need to re-orientate policy debate around outcomes; broad, meaningful outcomes that will engage ordinary people in the shaping of individual preferences 'by dialogue and communication'. Arcane legalistic discussion about structures and funding excludes people who aren't lawyers, politicians, lobbyists or academics, but that is the system we have today. If we could instead talk about outcomes - such as universal literacy, or reduced crime rates, or better health - then we could do so in debates that people can understand and in which we can participate.

Social Policy Bonds would allow the targeting of broad outcomes, whose achievement would transcend, in both time and purview, the compass of existing institutions and interest groups. Current ways of addressing war, or 'defence', say, focus almost exclusively on military spending or on treaties and coalition-building that do little to discourage war itself. *Our current system doesn't supply meaningful incentives to create a world in which violent political conflict comes to an end.*

That is where a Social Policy Bond regime could enter the picture. For more, see this [2]short article, or this [3]longer one, both on the [4]SocialGoals.com website.

#### **10.12.4 The case for non-ideological policymaking (2013-12-27 15:47)**

At the end of a long review of the recent book US Federal Reserve Board ex-chairman Alan Greenspan, Robert Solow writes:

The Alan Greenspan I admired was a pragmatic central banker who was able to believe both the data and his eyes and to ignore the people who already knew the answer without looking. The author of this book makes a show of both, but not really. His eyes are too often closed and he seems to be listening to another voice, with quite conventional opinions, coming from somewhere stage right. [1] *Alan Greenspan Is Still Trying to Justify His Bad Decisions: What the maestro doesn't understand*, Robert M Solow, 'New Republic', 16 December

If you are making policy, subscribing to an ideology is something of a cop-out, but very tempting all the same. Enormous quantities of data available to policymakers match the increasing complexity of our society and environment. As individuals, we cannot deal with these phenomena. In the face of so much complexity, it is so much simpler just go with our prejudices. That's one reason we ought to subordinate policy not to ideology, but to outcomes. And that applies to any social or environmental problem with multiple causes and where a multiplicity of solutions need to be tried, refined and either terminated or promoted. In the developed world, most policy issues are that complex - the goals of monetary policy included.

Social Policy Bonds target explicit, transparent and meaningful goals, and they make rewards contingent on achieving those goals. By contracting out the achievement of social goals to the market, they maximise the efficient use of our scarce resources. A government that targets social goals, clearly and publicly, would have little use for the sort of ideologically driven policies propagated by Mr Greenspan. Monetary policy, under a Social Policy Bond regime, would instead be one means of achieving agreed social goals, rather than a way of confirming existing (and quite peculiar) prejudices in the mind of a single individual, however smart.

# 2014

## 11.1 January

### 11.1.1 We need to talk about outcomes. Oh, and the future of this blog. (2014-01-04 12:55)

Discussing the 'intellectual viability' of TED talks, Benjamin Bratton concludes:

At a societal level, the bottom line is if we invest in things that make us feel good but which don't work, and don't invest in things that don't make us feel good but which may solve problems, then our fate is that it will just get harder to feel good about not solving problems. [1]*We need to talk about TED*, Benjamin Bratton, 'The Guardian', 30 December

Exactly. To put it another way: we need to talk about outcomes.... Rather than how advocates for particular policies perform, or institutional structures, or glamorous projects, or the short-term financial interests of private- and public-sector agencies. Unfortunately our entire political system, and the complexity of society, have allowed policymakers to get away with looking after the interests of corporations and other favoured bodies, rather than the ordinary people they are supposed to represent.

Social Policy Bonds would see policymaking start from first principles: what do we actually want to achieve?, and then reward people for actually achieving our goals, rather than merely for turning up to work for organizations whose names *suggest* they want to achieve these goals but are far more concerned with their own self-perpetuation.

-

Is there anyone actually out there? This blog has been going for nine years now, and recent months have seen zero comments posted. Viewer numbers according to Google rarely go into three figures and Social Policy Bonds, though they have had some media attention in

recent years, aren't really advancing in ways that encourage me to continue with this blog. That said, perhaps there are readers via RSS or on mobile platforms whose views don't register with Google. If you have an opinion on the future of this blog one way or the other, I'd be grateful if you get in touch. You can email me directly and pseudonymously if you prefer, via the links on this page: <http://socialgoals.com/blog-contact-me.html>. Thanks.

Unknown (2014-01-13 21:25:24)  
Hello Ronnie,

I am here and I very much appreciate this blog (just found it today). I also greatly appreciate your work and perspective. I am currently working on a set of posts for AllAnalytics which I would like to do in a factual, compelling and thoughtful manner. I think that the engagement of data analysts and professionals in this discussion will be very meaningful. Many times the quiet, diligent unsung heroes—data analysts can seize the political and policy-making day if objectivity and non-partisan attitudes prevail. I look forward to further discussion—Wendy Willbanks Wiesner

Ronnie Horesh (2014-01-14 06:51:06)

Many thanks Wendy, I'd be very keen to discuss the potential role of data analysts with you. Why not get in touch via direct email? I won't give my email address here because of spam, but there are links on this page of my website: <http://www.socialgoals.com/blog-contact-me.html>. I look forward to hearing from you. Regards, RH

Mike Linksvayer (2014-01-20 20:55:07)

I read every post, mostly in a feed reader. I hope you keep blogging – or publishing in some public venue, if this blog isn't the right place.

Ronnie Horesh (2014-01-21 03:38:40)

Thanks Mike, much appreciated.

crasch (2014-02-14 19:16:56)

I'm an irregular reader, but I often check back, and I continue to pitch the idea to people in Silicon Valley.

Ronnie Horesh (2014-02-15 16:13:28)

Thank you crasch.

### **11.1.2 GDP and war (2014-01-18 13:51)**

Theodore Dalrymple puts it succinctly:

An increased GDP, however distributed, is perfectly compatible with a deteriorated, even much deteriorated, way of life: and, presumably, a lowering of GDP is compatible with an improved, even a much improved, way of life. [1]*Of GDP and happiness*, 'Library of Law and Liberty', 2 January

Unfortunately, in the absence of any coherent other targets, increasing Gross Domestic Product (or GDP per capita) become the de facto objective of most democratic governments. But, as an end in itself, GDP has numerous flaws. Its targeting institutionalises our confusion between ends and means. Economic growth should not be end in itself. At best, it is a means towards certain ends. Growth in GDP implies only a growth in economic activity. It does not distinguish between helpful and harmful economic activity. It puts no value on any activity that bypasses the monetary economy. So it ignores leisure time, the environment, crime, health, and other contributors to well-being that are meaningful, or even essential, to natural persons.

We urgently need goals that are far less randomly tied to human and environmental well-being. I make some tentative suggestions in [2]my book and on SocialGoals.com. Hand-in-hand with meaningful targets goes a sensible way of achieving them. Our current systems are failing in both respects, and the failures are becoming too spectacular to ignore for much longer. In these increasingly dire circumstances, Social Policy Bonds could be an answer. Under a bond regime, policymaking would be something with which ordinary people could engage. The bonds would target meaningful goals, with which we could all identify. These goals would be ends - targets inextricably linked to well-being - rather than real or supposed means towards achieving them. The bonds would inject the market's incentives and efficiencies into the achievement of our goals. And because they reward the achievement of our goals, rather than activities, they do not rely on our knowing how our ends are to be achieved or who will achieve them. This means that we can target problems, like war, that we have no idea (yet) how to solve.

One thing seems certain: however remote a [3]World Peace Bond regime seems now, a world without war within our current, corrupt, haphazard system, is even less likely.

### **11.1.3 Arguments on both sides (2014-01-23 13:28)**

There are two things you can always say if having dosed off in a meeting at work and you're nudged awake to find people staring at you, waiting for your contribution. One is "it's not

black or white, it's a continuum". The other is "there are arguments on both sides".

Reading about subjects like low-carb diets, or medications intended to treat psychiatric conditions of, of course, climate change, I'm struck not so much by the controversies and seemingly valid arguments on both sides of fundamental questions, but *by the absence of systems that would impartially encourage accurate, definitive resolution of the fundamental problems*. So much about the way we deal with major challenges is now about defending positions, rather than looking for truth. One would hope that the arc of history combined with Darwinian processes would tend toward the settling of arguments as to whether, say, low-carb diets are helpful or harmful. We often assume that something like the scientific paradigm will inevitably resolve these issues. Perhaps it will, but there are problems with this. First, that the defending of entrenched, but harmful, wrong positions adds to the sum of human misery, perhaps on a large scale over a long time. Second, that we may reach tipping points, beyond which even if the right side eventually wins the argument against entrenched opposition, it's too late or costly to change the rate at which the damage is being done.

If there is significant wealth or status - individual or collective - or control at stake, we can be sure that there will be people virulently defending at least two sides of a policy discussion. Sometimes these sides and their biases are easy to identify: big pharma, big oil. Sometimes not: government agencies, non-governmental organizations of every sort. In many instances these bodies will genuinely believe in their case, in others, they won't.

But it doesn't really matter. The point is that, for many policy decisions, the stakes for society are too high for the debate to be determined by interest groups or ideologues, and their paid mouthpieces. We need some way of making policy that is independent of vested interests.

That's where focusing on outcomes - rather than supposed means of achieving them - becomes important. Under a Social Policy Bond regime, policymakers wouldn't start out weighing the arguments for, or against, say, doing something about climate change or whether people should eat more fat and less sugar. They would instead determine which broad outcomes we want to see. And these outcomes would be goals that are meaningful to ordinary citizens, who could therefore participate in the policymaking process. It would be up to bondholders to work out whether the supposed means of achieving society's goals entail favouring one interest group or another, or neither. Their motivation would be to achieve society's targeted goal at minimum cost and as quickly as possible. The most efficient bondholders will be rewarded the most, and it is they, acting in their own self-interest to establish as best they can, *impartially*, the actual scientific relationships that will advance them most cost-effectively on the road to maximising not only their own profits, but also society's well-being. Impartiality and truth-seeking, motivation and efficiency: these are all

built into the very structure of a Social Policy Bond regime.

Unfortunately, the lack of uptake of the Social Policy Bond principle, after it has been in the public arena for 25 years, could be interpreted as a symptom of the same problem: the power of vested interests to resist anything that could threaten their position.

## 11.2 February

### 11.2.1 Another useless indicator creeps in (2014-02-01 08:51)

Social Policy Bonds embody two main principles: targeting outcomes; and the use of markets to achieve these outcomes most efficiently. Even if discussion of Social Policy Bonds just leads to a rational discussion of which outcomes we want to achieve, then my work on the bonds would not be in vain.

I've discussed the futility of over-narrow objectives before, when discussing [1]Social Impact Bonds. (See also why I think the bonds [2]must be tradeable.) But broad indicators too can, by default, become *de facto* targets, and they can be similarly flawed; by which I mean that they are not inextricably linked to society's well-being. We have a tendency not to think through the implications of certain indicators: the biggest one is [3]GDP. But another that is creeping into policymaking discussion is five-year survival rates for cancer. The *Economist* casually slips it into an article about managing health care:

Deciding where to seek treatment might seem simple for a German diagnosed with prostate cancer. The five-year survival rate hardly varies from one clinic to the next....  
[4]Need to know, 'the Economist', 2 February

But the five-year survival rate is meaningless:

[1]n

the U.S. prostate cancer is being diagnosed earlier, a lead-time bias, and the cancer is being over diagnosed, that is, a pseudodisease is detected" in the form of screening-detected abnormalities that "meet the pathologic definition of cancer but will never progress to cause symptoms in the patient's lifetime." [5]Source ( Scroll down to *Incorrect metrics.*)

The article in the *Economist* ends:

[D]octors ... have long focused on clinical outcomes such as infection and re-admission rates. But by thinking about what matters to patients, providers can improve care and lower costs at the same time.

Exactly so. We need to be focusing on broad, meaningful indicators of well-being, such as Quality Adjust Life Years, and target those, rather than casually accept the use of flawed measures such as five-year survival rates.

### **11.2.2 The system's broken (2014-02-09 06:50)**

The *Economist* discusses the US Farm Bill, passed on 4 February:

[M]ore than 10,000 policyholders received over \$100,000 from crop-insurance subsidies in 2011. The new bill tries to cap the amount that any one farmer can receive; but if the weather is bad, it could lead to higher payouts than planned. Taken together, these subsidies distort behaviour and trade in unhelpful ways. They have created products that make no economic sense

in the rest of the world, such as making sugar from corn. As a penalty for keeping cotton subsidies in place, the World Trade Organisation's rules require the American government to pay \$147m a year to compensate farmers in Brazil. [1] *A trillion in the trough*, 'The Economist', 8 February

It's the persistence *for decades* of these economically and environmentally disastrous policies that indict our entire policymaking system. Yes, policymakers will make mistakes; all the more reason why we should have systems in place to ensure that failed policies are terminated. But instead, we have the systems that ensure that appalling policies become more and more entrenched because of political inertia, because they subsidise resistance to their termination, or because they become capitalised into high asset values that would create genuine but temporary hardship if they were withdrawn. Governments have a long history of meddling in agriculture; they persist even though it's been known for decades that they are, to put it kindly, [2]irrational.

And corrupt. The *Economist* continues:

How could Congress write such a law? One answer can be found in the register of political donations. The ten members of the House, nine Republicans and one Democrat, who accepted most money from agriculture lobbyists took in an average of \$225,000 in political contributions during 2013, according to Open Secrets, which tracks donations—almost as much as some farmers received in return.

Not much is black or white in politics and policymaking, but as P J O'Rourke put it *twenty-three years* ago (in [3]Parliament of Whores):

I spent two and a half years examining the American political process. All that time I was looking for a straight forward issue. But everything I investigated - election campaigns, the budget, lawmaking, the court system, bureaucracy, social policy - turned out to be more complicated than I had thought. There were always angles I hadn't considered, aspects I hadn't weighed, complexities I'd never dreamed of. Until I got to agriculture. Here at last is a simple problem with a simple solution. Drag the omnibus farm bill behind the barn, and kill it with an ax.

### **11.2.3 Greenhouse gases, recidivist rates, cholesterol, and the one percent (2014-02-17 08:56)**

What do greenhouse gas emissions, recidivist rates and cholesterol readings have in common? They are all surrogate indicators; that is, they are things that governments target, thinking (or pretending to think) that by doing so they are benefiting society.

They aren't. Whether the associated loose thinking - or just plain dishonesty - originates in government or in the people who pay governments to shape the regulatory environment in their favour, surrogate indicators have little to do with human well-being.

Perhaps we need to ask in whose interest it is that we target things like greenhouse gas emissions, or recidivist rates or cholesterol readings? Surely, if we want to reduce the adverse impacts of climate change on humans and the environment, we'd be better off, with all the scientific uncertainties, to target [1]reductions in those negative impacts? Similarly, if we actually want to reduce crime rates, why don't we target crime rates rather than recidivist rates, which have very little, [2]if anything, to do with crime? And if we want to target physical health, why don't we reward improvements in physical health, rather than encourage the mass ingestion of statins, whose long-term effects are [3]nebulous at [4]best and [5]dangerous at worst?

One reason that I am a less-than-enthusiastic supporter of [6]Social Impact Bonds is that they are targeting recidivism rates. Their targeting of an indicator that has nothing to do with things that matter to ordinary people risks discrediting the whole idea of channeling the market's incentives and efficiencies into the public good. We have had plenty of recent and disastrous experience of financial instruments being gamed to death, with calamitous effects on ordinary hard-working citizens. So we need to be very careful about introducing new financial instruments. There is, unfortunately, every reason to be cynical. Bankers, consultants, the financial services sector, big corporations, government agencies and even non-governmental organizations all have made lots of money doing things that are purportedly in the public interest, but in fact have done nothing for ordinary people.

That is why I suggest that Social Policy Bonds target only metrics that *are*, or *are inextricably linked to*, indicators of societal well being. The bond mechanism allows for that sort of targeting, because it does not specify *how* our goals shall be achieved, nor *who* shall achieve them. Unfortunately, without that sort of guarantee, there is every reason to expect that the well-meaning targeting of rhetorically persuasive but flawed indicators will continue to enrich only the one percent.

#### 11.2.4 Nobody's perfect (2014-02-22 16:00)

Freeman Dyson reviews *Brilliant Blunders*, by Mario Livio, "a lively account of five wrong theories proposed by five great scientists during the last two centuries." The examples Livio writes about:

give for nonexpert readers a good picture of the way science works. .... Wrong theories are not an impediment to the progress of science. They are a central part of the struggle. .... The five chief characters in Livio's drama are Charles Darwin, William Thomson (Lord Kelvin), Linus Pauling, Fred Hoyle, and Albert Einstein. Each of them made major contributions to the understanding of nature, and each believed firmly in a theory that turned out to be wrong..... [W]rong ideas can be helpful or unhelpful to the search for truth. No matter whether wrong ideas are helpful or unhelpful, they are in any case unavoidable. [1] *The case for blunders*, Freeman Dyson, 'New York Review of Books' dated 6 March

Even more so in social policy, where underlying relationships change over time and are rarely independent of the psychic makeup of the principal actors and stakeholders. We need to encourage diverse approaches to our social problems, and ones that can adapt when they are seen to be inefficient or counter-productive. As with science, though, social policy practitioners, be they politicians, bureaucrats, academics or members of think-tanks, frequently commit their egos - and public funds - to deficient theories or ideologies.

The chief difference between science and other human enterprises such as warfare and politics is that brilliant blunders in science are less costly.

Quite: when great scientists commit themselves to wrong ideas the costs can be high, but when politicians do so they can be calamitous.

Social Policy Bonds would penalise failed or inefficient pseudo-solutions to our social problems, and reward only the most cost-effective ways of achieving our social goals. Bondholders would be motivated to terminate failing projects and divert funds into only the ones that are cost effective. If they don't do this quickly enough, others would bid more for the bonds than they are worth to the current holders. The bonds, being tradeable, would always be in the hands of people who are motivated to be efficient. Commitment to wrong theories would be penalised in immediate, pecuniary ways - a stark contrast with the current policymaking system, within which failed policies, instead of being terminated, often receive more and more funding in an effort to shore up vested interests.

## **11.3 March**

### **11.3.1 Place your bets (2014-03-03 12:39)**

What is government for? Obviously, it's for distributing taxpayer funds to those who are most in need:

The much-anticipated first film of "The Hobbit" trilogy [could] gross about \$3 billion. So how much taxpayer money, would you guess, did Warner Bros. Entertainment Inc. need to produce the films based on the J.R.R. Tolkien book? The answer is

zero. The studios are investment companies, and the films are almost certain to be immensely profitable. But now you aren't thinking like a studio. The real question is: How much taxpayer money can Warner Bros. demand from the government of New Zealand to keep production there (rather than, say, in Australia or the Czech Republic)? That answer turns out to be about \$120 million, plus the revision of New Zealand's labor laws to forbid collective bargaining among film-production contractors, plus the passage of three-strikes Internet-disconnection laws for online copyright infringement, plus enthusiastic and, it turns out, illegal cooperation in the shutdown of the pirate-friendly digital storage site Megaupload and the arrest of its owner, Kim Dotcom. [1]*Kill the Hobbit Subsidies to Save Regular Earth*, Joe Karaganis, 'Bloomberg View', 4 December 2012

The Government is talking up lavishing taxpayers' dollars on Avatar sequels - but the Treasury has already panned the spending as a turkey. As part of the deal announced yesterday by Prime Minister John Key, two fellow ministers and Avatar director James Cameron, the movies' producers will get at least \$125 million in taxpayers' money in return for spending at least \$500m making the films in New Zealand. [2]*Critical Eye on Avatar Deal*, Ben Heather, 17 December 2013

This is government as an investment company: thinking it knows how best to gamble with other people's money. Or it's a desperate attempt by politicians to associate themselves with something glamorous, at the expense of the millions of people who aren't as photogenic, so must pay for government and its whimsical bets. Either way, doling out millions to rich corporations is irresponsible at best, corrupt at worst. Governments can get away with this because they don't formulate policy in terms of outcomes. In our currently policymaking environment it's quite acceptable for politicians to act on the basis that, for instance, cutting back greenhouse gases will solve the climate change problem, or that building more roads will boost economic growth or, indeed, that boosting economic growth will enhance people's well-being.

The days when easily identifiable cause-effect relationships were significant enough to drive policy effectively and efficiently are gone. Society is too complex, the time lags too great, the linkages too murky, for that to work any longer. A better alternative would be to target outcomes, and let motivated people work out how best to achieve them, through adaptive, diverse approaches. A Social Policy Bond would do this and, as well, inject the market's incentives and efficiencies into every stage of every such approach.

For more details, see the SocialGoals.com website which, if you haven't been there recently, has been polished a bit, and now includes, on [3]this page, links to pdf files of all the chapters in my book.

I suppose things could be worse. Well, they are worse: as well as distributing scarce funds from the poor to the rich, government takes from taxpayers to subsidise the destruction of our environment. It makes our involuntary donations to Warner Brothers look like enlightened policy:

The UN Development Programme says rich countries should switch some of the staggering \$35 billion a year they spend subsidising fishing on the high seas (through things like cheap fuel and vessel-buy-back programmes) to creating marine reserves—protected areas like national parks. [4]*In deep water*, 'The Economist', 22 February (subscription)

### **11.3.2 No excuses (2014-03-11 14:18)**

"National Security", "family farms", "international aid" and now "climate change": a small sample of concepts that become corrupted by government and used to justify transfers of resources from the poor to the rich.

Under the current policymaking regime, politicians can get away with using phrases like these to justify setting up departments and initiating activities that sound as though they will help deal with a problem, but end up shoring up vested interests. They can do this because they absolutely refuse to reward the achievement of explicit, agreed, meaningful outcomes. Instead they channel funds into organizations whose names suggest to the naive that they are striving to achieve an outcome or deal with a problem. These can be government agencies, supra-national government organizations, or large and favoured corporations.

This came about largely because setting up bureaucracies for many social and environmental problems was originally the most efficient way of solving them. Society was less complex, the linkages less intricate, the time lags shorter. The nature of, responsibility for, and solutions to, our most glaring problems were often easier to identify than nowadays.

But times have changed. Nobody today can identify how to achieve world peace, though the need to do so is probably greater than at any time in history. Nobody really knows how to tackle climate change: the much-vaunted greenhouse gas explanation may or may not be totally wrong, and anyway cutting emissions might not be the best solution or, more likely, might just be one of many necessary approaches.

Yet we persist in attempting to solve problems only after a single cause has been identified. Once that happens, the response of government is to channel resources into bodies and activities that ostensibly deal with the cause of the problem, but whose own existence depends on failing to be efficient at doing so. Somewhere along the way, accountability is lost. So to help 'family farms' taxpayers and consumers spend billion on higher food prices to [1]support wealthy landowners. 'National security' has become an excuse for mass surveillance, the setting up of an embryonic police state, and ruinously expensive accumulation of weapons systems. 'International aid' is a [2]byword for corruption and waste.

Climate change looks like going the same way: becoming an excuse to set up massive bureaucracies that will allegedly cut greenhouse gas emissions - or what were thought to be greenhouse gas emissions back in the 1990s.

With Social Policy Bonds, there's no excuse for this sort of deception. Instead of vaguely targeting 'terrorism', or 'climate change', or 'rural poverty', we can specify exactly what it is we want to achieve. So if there is a societal consensus that poor people should pay more for their food so that enormously wealthy landowners can afford a second helicopter, we could choose to do exactly that. But if we actually want to [3] help poor people, or to alleviate the problems caused by adverse [4]climatic events, or to achieve [5]world peace, then we can issue Social Policy Bonds that reward people only when they have achieved these goals. We do not have to wait until cause and effect have been identified; nor till the optimal solutions have been found. Under a Social Policy Bond regime it would be bondholders who would do all that; and the more efficient they are at doing so, the more they will be rewarded. Diverse, adaptive approaches are going to be necessary to solve our most urgent social and environmental problems. The current policymaking environment stifles such approaches. A Social Policy Bond regime, in contrast, would encourage them.

### **11.3.3 Insanity (2014-03-15 18:16)**

From *Bloomberg Businessweek*:

Global fuel subsidies cost as much as \$1.9 trillion a year.... In 2011, US subsidies for petroleum products were more than 2 percent of GDP. ...

Egypt spends 9 percent of [its] GDP to keep gasoline prices low. ... The IMF says 61 percent of gasoline subsidies goes to the richest 20 percent of citizens, who own cars.... [1] *Why fuel subsidies in developing nations are an economic addiction, and The cheap fuel trap*, Brendan Greeley, 'Bloomberg Businessweek', dated 17 March

What is it about our policymaking system that perpetuates this insanity? It's clear that the fossil fuel industries are powerful and so can lobby effectively for the subsidised extraction and consumption of their products. And we might not have known, at first, what we know now: that these subsidies transfer funds from the poor to the rich, accelerate the destruction of our environment, and are extremely wasteful. But now that we do know...what then? It's the persistence of these insane subsidies, in the face of decades of evidence of the social and environmental damage they do that is the biggest indictment of our current policymaking system.

Policies as crazy as these get implemented because they sound quite plausible. Reducing the cost of fuel, say, 'stimulates the economy, which creates jobs and benefits everybody'. Nobody bothers to ask why, if we are intent on giving out scarce resources to favoured groups, we don't give them directly to the people we say are going to benefit: poorer people, let's suppose, who can then make their own decisions about the sort of society they want to live in. Our current system takes some plausible-sounding relationship and makes it the basis of policy. That can work well when social and environmental relationships are easy to identify and don't change much over time. It works less well when we are talking about much more complex, intricate relationships, with thousands of variables and time lags. To reduce the negative impacts of climate change, for instance, or to bring about world peace: these are beyond the scope of any organization that first identifies (or claims to) a relationship between cause and effect and then formulates policy accordingly.

The better alternative is to target outcomes directly, and let motivated people work out the best ways of achieving them. These ways will vary dramatically over time and space, the more so for bigger goals. A Social Policy Bond regime would not only target these outcomes and reward people for achieving them; it would also inject the market's incentives and efficiencies, ensuring that they would be achieved in the most cost-effective ways possible.

The old way of making policy has been corrupted, such that we cannot even discontinue our most obvious, spectacularly stupid and destructive subsidy schemes. It's time to target outcomes directly, and contract out the achievement of our social and environmental goals to people who will be rewarded, not because they are powerful or smart or well connected, but because they achieve society's goals most efficiently.

-  
Policy as if outcomes mattered

#### **11.3.4 Bad Policymaking (2014-03-27 08:27)**

Ben Goldacre writes in *[1]Bad Pharma* (2013):

[1]It's possible for good people, in perversely designed systems, to casually perpetrate acts of great harm on strangers, sometimes without ever realising it. The current regulations - for companies, doctors and researchers - create perverse incentives; and we'll have better luck fixing those broken systems than we will ever have trying to rid the world of avarice.

Dr Goldacre is discussing the medical profession, but his point applies to any regulatory system. In medicine, as in so many other policy areas, the complexity and obscurity of relationships between cause and effect make it easy to generate outcomes that are suboptimal at best

and murderous at worst. Where large sums of money are at stake, the manipulation of a regulatory environment creates the means by which the minor tendency towards avarice (or, more politely, self-interest) of the few can be leveraged against the well-being of the many. Systems are put in place to deal with the problem when it becomes too obvious to ignore. But they themselves are subject to hijacking and gaming by the beneficiaries of the current regulatory environment. In short, we have *no mechanisms to terminate failed policies*, especially those that create or enrich powerful interest groups, including those who genuinely believe they are acting for the good of wider society.

We need to subordinate policymaking to society's needs, not those of interest groups whose over-arching goal, despite all their good intentions, vision statements and lofty idealism, is self-perpetuation. If one doubts this, one need only continue reading *Bad Pharma*, to see that universities and ethics committees deny doctors the opportunity to see crucial data from the many medical trials that result in unfavourable outcomes for the pharmaceutical industry. Even worse:

So universities and ethics committees may have failed us, but there is one group of people we might expect to step up, to try to show some leadership on missing trial data. These are the medical and academic professional bodies, the Royal Colleges of General Practice, Surgery and Physicians, the General Medical Council, the British Medical Association, the pharmacists' organisations, the bodies representing each sub-specialty of academia, the respiratory physiologists, the pharmacologists, the Academy of Medical Sciences, and so on. These organisations have the opportunity to set the tone of academic and clinical medicine, in their codes of conduct, their aspirations, and in some cases their rules, since some have the ability to impose sanctions, and all have the ability to exclude those who fail to meet basic ethical standards. We have established, I hope, beyond any doubt, that non-publication of trials in humans is research misconduct, that it misleads doctors and harms patients around the world. Have these organisations used their powers, stood up and announced, prominently and fiercely, that this must stop, and that they will take action? One has: the Faculty of Pharmaceutical Medicine, a small organisation with 1,400 members. And none of the others have bothered. Not one.

Dr Goldacre speaks about the British environment, but there's nothing unique to the UK about his analysis.

So what can Social Policy Bonds do about this systemic failure to put the interests of ordinary people against those of powerful corporations and regulatory bodies?

Continuing with the example of medicine, Social Policy Bonds would target *directly and*

*explicitly* that which the pharmaceutical industry, the professional bodies and the policymakers who create the regulatory environment all say they are trying to improve: the health of society. Government would continue to raise funds for the improvement of society's health, but instead of dispensing these funds in ways that benefit organizations that are supposed to put society's interests first would only those who achieve society's health goals. It would issue [2]Health Bonds, redeemable only when these goals have been achieved and sustained. The goals would be broad and transparent, comprehensible to ordinary people and so not subject to the smoke-and-mirrors manipulation that features so prominently within our current framework. The bond mechanism would ensure that only activities that actually help achieve our health goals would be rewarded.

A Health Bond regime would be a drastic change from any existing health care system. In [3]my book, which is freely downloadable from my website, I describe how we could move gradually from current systems to such a regime. Health Bonds would lead to a [4]new type of organization: ones whose interests are entirely congruent with those of society. The current system, as Dr Goldacre makes inescapably clear, is broken to the extent that it kills many of the people it's supposed to benefit. I propose instead that we revolutionise health policy by putting the interests of ordinary citizens above those of vested interests.

## 11.4 April

### 11.4.1 Metrics for peace (2014-04-12 20:03)

Social Policy Bonds have their most marked advantage over conventional policy when trying to solve complex solutions for which there is no single, knowable, solution. Climate change (or some of its impacts), crime, or infant mortality in the poorest countries are examples of such problems, as too is violent political conflict: war or civil war.

For issuers of [1]World Peace Bonds, or [2]Middle East Peace Bonds the challenge is not how to achieve peace - that will be left to bondholders - but how to define it in such a way that its achievement will robustly and verifiably have brought about societies in which most of us would be happy to live.

A start would be to issue bonds that would become redeemable when there has been no nuclear explosion that kills more than, say 100 people before 1 January 2050. We could of course issue bonds targeting nuclear peace for decades beyond that date. Similarly, we could target sustained periods of peace relative to today's world: bonds that would become redeemable if the annual numbers of people killed in conflict fall below 50 percent of the average levels from 2007-2012, say, for a period of 10 years.

But a ruthless and powerful dictator could impose those sorts of peace by simple blackmail. We could perhaps therefore combine our main peace goal with other conditions that will have to be satisfied for the bonds to be redeemed. These could include broad quality of life indicators, including the well-being of all communities in a population. It might also be worthwhile to classify as outcomes such essentials for war as weapons, or the sums spent on them, or the number of men and women under arms, and target these for reduction too. We might also want to target attitudes of people towards people of different countries, ethnicities or religions, in ways that will discourage politicians and others from provoking conflict.

Feeding into such attitudes, or possibly as another target to be considered by bond issuers might be to encourage intermarriage between communities that are currently antagonistic. For most governments, advocating or even discussing such an idea would be political suicide. But for holders of Middle East Peace Bonds, for example, it would merely be another tool that can choose to use or not, depending on their view of how effective it will be. Under a bond regime targeting the end of violence between communities in conflict, no official programme of sponsored intermarriage need be contemplated. Bondholders, though, could do, or cause to be done, things that governments cannot do. There would be no sinister motives underlying their actions; their motive, clear and comprehensible to all, would be explicitly mercenary with no sinister overtones: to raise the value of their bond holdings. As human beings, most of us agree that anything that resolves conflict peacefully and at a bearable cost should be encouraged. Apart from fanatics, even the devout on both sides of most conflicts, away from public fora and in their cooler moments, would put human survival above ethnic purity or identity politics. Even a little intermarriage between two warring factions could go a long way.

Most likely, under an enlightened Peace Bond regime, intermarriage, rather than being directly encouraged, would be the happy outcome of a range of projects aimed at increasing informal contacts between two sides of a conflict, including such trustbuilding measures as lower barriers to trade, school exchange visits, or mixed sports teams. One of the benefits of the Social Policy Bond concept is that it can stimulate actions like these including, if necessary, the direct sponsoring of intermarriage, or the birth of mixed-ethnicity children which, if governments were to undertake them directly, would be met by near universal disdain and opposition.

### **11.4.2 Non-random incentives for world peace (2014-04-17 18:47)**

The average person is now roughly 20 times less likely to die violently than the average person was in the Stone Age. [1]*The Slaughter Bench of History*  
Ian Morris, 'The Atlantic', 11 April

How did this come about? According to Professor Morris:

For most of our time on earth, we have been aggressive, violent animals, because aggression and violence have paid off. But in the 10,000 years since we invented productive war, we have evolved culturally to become less violent—because that pays off even better.

I can't argue with Professor Morris. Human beings are rational, and respond rationally to the incentives on offer. It's tragic, though, that the incentives not to prosecute war seem to have come about quite randomly; through experimentation over millennia with every sort of conflict, fought with ever-improving technology, at calamitous human cost.

I think we can do better - and we should. Instead of relying on the slow, random and painful process of learning through direct experience, we could actively create or magnify the incentives for peace. We could, simply, make a conscious, deliberate decision to increase the

incentives for people to avoid war.

How? We could apply the Social Policy Bond principle to violent political conflict. We could issue [2]World Peace Bonds or, say, [3]Middle East Peace Bonds. We don't have to know *how* people who invest in these bonds will use their expected returns from bondholding to reduce the chances of conflict breaking out. Nor do we need to know *who*, exactly, will buy the bonds and undertake peace-building activities. What we *would* do, by issuing Peace Bonds, is motivate people who are currently pre-occupied with other, probably less socially beneficial, concerns, to get involved in peace-building and explore, refine and implement the most efficient ways of ending war.

War has been a curse for generations and remains an existential threat: the full title of Professor Morris's piece excerpted above is: *How war created civilization over the past 10,000 years—and threatens to destroy it in the next 40*. Peace Bonds could generate bigger incentives to end war far less randomly and at lesser human cost, than through the the current process of random blundering accompanied by painfully slow, fitful, learning; a process that may yet culminate in unrestrained nuclear conflict with the deaths of millions.

### 11.4.3 Mickey Mouse targets: gargantuan impact (2014-04-24 16:14)

From *The Economist*:

Like almost every other local government in China, Xianghe's has an urbanisation target: 60 % by 2017, up from around 50 % today and ahead of the national target of 60 % by 2020. Since the global financial crisis in 2008, governments have been hardening such objectives as a way of stimulating growth, and have been borrowing heavily to meet them. [1]*Emerging from the shadows*, 'The Economist', 19 April

Targets such as these, including especially the universal (apart from perhaps in [2]Bhutan) and much-revered *de facto* target of governments everywhere, Gross Domestic Product, are Mickey Mouse in conception and in their relationship to ordinary people's well-being, but not, unfortunately, in the impact they have on us all. They are top-down targets, favoured by the

political caste and their functionaries. They become the sole focus of bureaucrats' attention to the exclusion of anything else. When it comes to urbanisation in China, the impacts are socially and environmentally disastrous: local governments scramble to meet the targets by throwing peasants off the land they and their families have been farming for generations. One result, *The Economist* continues, is...

...the rampant urban sprawl encouraged by local governments' ability to seize rural land at will. Such unrestrained expansion may work in parts of America where there is plenty of empty land (albeit at a cost to the environment and often to the quality of life). In China, where urbanisation has forced around 40m farmers off their land over the past three decades, usually with little or no compensation, it will not.

There's a stark contrast between the *ad hoc*, spurious, almost random nature of targets like urbanisation rates, and the serious negative impacts they have on everyone other than the people who dream them up.

People who make policy for large societies need to rely on some sorts of numerical indicators of society's goals and how quickly we are reaching them. But indicators and targets should be well thought out and as consensual as possible. They should be in themselves, or be inextricably linked to, things that we actually want to achieve. In other words, they should not merely have (perhaps) been associated with social well-being in the past. They should be outcomes that are meaningful to ordinary people, because that's what matters most and that is what will encourage people's engagement with policymaking and hence buy-in to policies that affect us. Mickey Mouse indicators like urbanisation, or GDP are just not good enough. They speak of a growing and dangerous alienation of rulers from ruled.

#### **11.4.4 Democracy in danger (2014-04-26 21:54)**

Multivariate analysis indicates that economic elites and organized groups representing business interests have substantial independent impacts on U.S. government policy, while average citizens and mass-based interest groups have little or no independent influence. [1] *Testing Theories of American Politics: Elites, Interest*

The authors came to this conclusion after reviewing answers to 1779 survey questions asked between 1981 and 2002 on public policy issues. They broke the responses down by income level, and then determined how often certain income levels and organised interest groups saw their policy preferences enacted.

There's little prospect of this changing so long as policymaking is conducted in terms of things that alienate ordinary people. Sometimes our politicians speak eloquently of lofty, high-minded goals whose time lines stretch so far into the future that they can be sure they will not be held accountable for their failure to realize them or that are otherwise unverifiable because they are just too vague. More often, though the stated goals of policy have to do with dollars spent, institutional structures and composition, legalisms, regulations or outputs - all of which are too arcane, complex and obscure for anyone other than lawyers, lobbyists and ideologues to follow closely. The only people who understand policymaking today are those who are paid to do so, and the only people who influence it are those who have the millions of dollars necessary to pay them. These are Gilens' and Page's 'economic elites and ... business interests'. They continue:

When a majority of citizens disagrees with economic elites and/or with organised interests, they generally lose. Moreover, because of the strong status quo bias built into the US political system, even when fairly large majorities of Americans favour policy change, they generally do not get it.

Yes, our societies are complex and highly aggregated. But people's goals are far more easily articulated than the alleged means of reaching them. One solution to the problem described by Gilens and Page, and felt by almost everyone, could be to express policy goals in terms of outcomes that are meaningful to ordinary people. Things like pollution levels, crime rates, poverty rates, literacy standards. There wouldn't be universal agreement about target levels and priorities, but there would be engagement by the public in the policymaking process. With such engagement, there would be influence and buy-in.

A Social Policy Bond regime would start by expressing our social and environmental goals in terms that people can understand and influence. Government, instead of trying to guess how best to achieve our goals (which it is not good at doing) would instead concentrate on articulating society's goals and raising the revenue for their achievement (both of which democratic governments can actually do quite well). The other essential element of a Social Policy Bond regime is to inject the market's incentives and efficiencies into the achievement of our social goals - something that rarely happens nowadays. (For more, see my SocialGoals.com

website.)

The alternative? Gilens and Page conclude:

Americans do enjoy many features central to democratic governance, such as regular elections, freedom of speech and association and a widespread (if still contested) franchise. But we believe that if policymaking is dominated by powerful business organisations and a small number of affluent Americans, then America's claims to being a democratic society are seriously threatened.

## 11.5 May

### 11.5.1 Social goals: neither barmy nor simplistic (2014-05-07 16:49)

Yves Smith does us all a service in exhuming and [1]refuting Milton Friedman's claim that "corporations exist to maximise shareholder value". Friedman wrote, in 1970:

That responsibility is to conduct the business in accordance with their desires, which generally will be to make as much money as possible while conforming to the basic rules of the society, both those embodied in law and those embodied in ethical custom.... [2]*The Social Responsibility of Business is to Increase its Profits*, 'The New York Times Magazine', 13 September 1970

Perhaps that was believable back in 1970. Since then, it's become clear that the basic rules of society are there to be manipulated or ignored in pursuit of corporate earnings. As Mr Smith reminds us, corporations pursue corporate goals, rather than those of shareholders. Nevertheless, Mr Smith concludes:

Friedman's simplistic, barmy idea found fertile ground. And it became self-reinforcing as executives learned to use it to line their wallets. The long-lived, difficult to displace but not lavishly paid corporate chieftain was over time supplanted by wildly overpaid straight-from-central-casting CEOs. Why worry overmuch about longevity if you can rake it in a 3 to 5 year tenure? .... So again, repeat after me: "maximizing shareholder value" is an idea made up and promoted by economists, starting with Milton Friedman and his Chicago School cronies. And like many ideas that came out of the Chicago School, the public as large has suffered from treating a soundbite like a serious policy proposal.

All true and important. But perhaps the deeper and broader problem is the mismatch between metrics that become targets, and the well-being of society.

My hypothesis is this: In an older, less complicated, world the correlation between an accountant's view of a corporation and that corporation's success would be strong. So too would be the correlation between the success of a corporation and its contribution to social well-being. Since those days, as population has grown, as society has become more complex, and as our more basic needs have been more satisfied (largely thanks to the activities of these corporations), the correlations have become weaker. A corporation's success can have negative, non-market, impacts on the environment about which we feel more strongly. Its activities and products or services can contribute very little to social well-being, or even detract from it.

All this is not to deny that there are a lot of *positive* externalities arising from corporate activity. My point is that we have no systemic means of encouraging corporations to, in Friedman's words, conform to the basic rules of society. If a corporation creates havoc in the social or physical environment, then we rely on government to put a stop to it: but often this is too little, too late, partly because of inevitable time lags, partly because government relies on corporate taxes, and partly because big business and government are just too close and corporations find it easy to subvert or ignore those basic rules.

Accountants' measures of success are less and less reliable indicators of social well-being. And the single over-arching accountancy-derived metric is that of Gross Domestic Product (or GDP per capita) which is explicitly or implicitly targeted by almost all governments (except, probably, that of [3]Bhutan).

We need new targets; targets that correlate strongly with society's real aspirations. Targets that reinforce conformity with existing and enhanced basic rules; that countervail current

incentives to subvert or ignore them.

That's where Social Policy Bonds could enter the arena. The bonds would act as a meta-system, into which corporate activity would fall. They would target broad social and environmental goals and reward people for achieving them. They would reduce the incentives for corporations, and their friends in government, to aim for goals that satisfy accountants as distinct from, or against, society and the environment. It's time we moved on from identifying the narrow, short-term goals of big business with those of ordinary members of society. They aren't identical; they can conflict, and they might even be diverging.

## 11.5.2 Subsidising planetary destruction: et tu, Australia? (2014-05-14 21:48)

Divabat on metafilter summarises Australia's 2014-15 budget:

[1]Amongst the casualties: [2]television, [3]young people (and [4]the organisations that help them) and [5]old people, [6]tech startups, [7]postgraduate students, [8]people with disabilities and anyone [9]seeking medical care, [10]foreign aid, [11]Indigenous people, [12]the arts, [13]renewable energy, and [14]the environment. However, if you are in [15]defence, [16]mining, or [17]Indonesian immigration, you should be fine.

Yes, the [18]fuel tax credit scheme for heavy diesel vehicles will continue. This is [19]worth about US \$2bn in taxpayer subsidy to big mining corporations.

### **11.5.3 Eradicating war without blueprints (2014-05-19 21:10)**

Richard English writes:

[T]o pursue the eradication of war would be as naïve as to pursue human or moral perfection; the effective curtailment of particular wars, or specific war-time brutality, almost certainly depends instead on recognizing our appalling capacity for (and even our historical tendency towards) justifying and practising violent atrocity. ...

For the prospect of establishing human behaviour along lines guided too closely by idealized blueprints probably exaggerates human capacity for improvement. [1] *Modern War*, Richard English, 2013

I don't agree with the first clause; 'naive' implies that eradicating war will be impossible to achieve. I do agree that being 'guided too closely by idealized blueprints' will, in itself, not be sufficient to eradicate war, though it might be one necessary approach. This is where the

Social Policy Bond principle enters the picture: we aim to eradicate war; we raise funding to achieve that goal, but we do not ourselves draw up blueprints as to how to achieve our goal, nor do we try identify who might best achieve it. Instead we issue [2]Conflict Reduction Bonds (or [3]Middle East Peace Bonds, or [4]World Peace Bonds). These are no idealized blueprints: they are means by which motivate people to solve mankind's most grievous social problem.

Much that is good in this world has come about almost randomly, often as a by-product of some persons' pursuit of short-term financial gain. Or only after calamitous experience and exhaustion. I think we can do better: we can supply incentives for people to achieve social goals and let the market - the best way of allocating resources ever discovered - decide which approaches are best and which should be terminated. Idealized blueprints won't always work and, as Mr English also says, "most of our attempts to set out prophylactic measures and structures against modern war have seemed (and continue to appear) frequently doomed to blood-spattered failure." But sometimes, some of these approaches and institutions do actually work. A bond regime would encourage people to persist in those circumstances, and to explore, and refine other approaches too. I don't think that's naive.

#### **11.5.4 The moral case for tax avoidance (2014-05-22 21:32)**

George Monbiot writes about Scotland's deer-stalking estates and grouse moors:

Though the estates pay next to nothing to the exchequer, and though they practise little that resembles farming, they receive millions in farm subsidies. The new [1]basic payments system the Scottish government is introducing could worsen this injustice. [Andy] Wightman calculates that the ruler of Dubai could receive £439,000 for the estate in Wester Ross he owns; the Duke of Westminster could find himself enriched by £764,000 a year; and the Duke of Roxburgh by £950,000. [2]*I'd vote yes to rid Scotland of its feudal landowners*, George Monbiot, 'the Guardian', 19 May

It's not so much the wastefulness of such subsidies, nor the environmental devastation they wreak, nor even the lunacy of taking money from ordinary people to subsidise wealthy

aristocrats and monarchs. Rather, the issue is the *persistence* of such stupid, corrupt policies, which have hardly changed in the several decades since they were first exposed and their impacts quantified. We have no systems in place to act on the voluminous evidence of their disastrous (for more than 99 percent of the population) effects. This is one big disadvantage of making policy as if outcomes are irrelevant: nobody has incentives to terminate failed policies. Instead, the beneficiaries of lucrative-but-stupid policies, have every incentive to oppose their withdrawal, and the means by which to do so.

Mr Monbiot goes on to describe the visual impacts:

The hills in many parts look as if they have been camouflaged against military attack, as they have been burned in patches for grouse shooting. It is astonishing, in the 21st century, that people are still allowed to burn mountainsides – destroying their vegetation, roasting their wildlife, vaporising their carbon, creating a telluric eczema of sepia and grey blotches – for any purpose, let alone blasting highland chickens out of the air. Where the hills aren't burnt for grouse they are grazed to the roots by overstocked deer, maintained at vast densities to give the bankers waddling over the moors in tweed pantaloons a chance of shooting one.

## 11.6 June

### 11.6.1 Targeting human devastation (2014-06-04 21:02)

I've [1]posted [2]before [3]about the flawed nature of what has become, by default, society's *de facto* indicators of success: Gross Domestic Product (or GDP per capita) and its rate of growth. In the absence of any targets that are actually correlated with societal well-being, GDP has been enshrined as *the* target, par excellence, by which our governments measure their progress. It's highly misleading at best, for reasons I've outlined previously, so it comes as no great surprise that on 22 May:

Istat, Italy's statistical body ... will from October ..include drug trafficking, prostitution, and alcohol-and-tobacco smuggling in its economic-output numbers.... In fact, then as now, Italy was merely one of the first countries to announce its compliance with international accounting standards. Reporting illegal economically productive activity in which all parties take part voluntarily is required under EU rules known as the European System of Accounts.... [4]*Sex, drugs and GDP* , 'the Economist', 31 May

Well why not? It's no more illogical than doing what we have been doing for decades: assuming that economic activity generates societal well-being - an assumption that is increasingly at odds with reality.

We urgently need to target *explicitly* things that we actually want to achieve: universal literacy, for instance, world peace, or even the survival of the human race. In the absence of such targets, the vacuum is filled by that grotesque proxy for success: Gross Domestic Product. It's a shambles.

### 11.6.2 Foundations of bone and sand (2014-06-09 20:58)

Twenty-five years after the world first moved to protect the ozone layer, British scientists have found three new potentially damaging gases in the atmosphere. While they do not expect the gases to do much damage to the ozone layer, think they may add to global warming. [1]*Threat from new gases found in air* , Alex Kirby, 4 June

For years now I've been railing against building policy on fossilised foundations. To put it briefly, government does not know how best to achieve society's goals. When it looks at climate change it relies on science done in the 1990s; its policy is to cut back on greenhouse gas emissions - or rather, those gases identified as greenhouse gases more than 15 years ago. But what if, as I've been [2]asking for not quite 15 years, the science is wrong? Or outdated? The policymakers, true to form, have no answer except to continue building on crumbling foundations.

When society is changing so rapidly, when our scientific knowledge is expanding at an ever-increasing rate, then policy should target outcomes, rather than the supposed means of reaching them. A Social Policy Bond regime would do this. It would encourage diverse, adaptive approaches to whatever it identifies as the problems arising from, in this example, climate change. Our current policymaking system cannot adapt. It puts the interests of current organizations, be they public or private sector, first, and if it does build new organizations, it does so on ossified foundations.

### 11.6.3 Biodiversity (2014-06-23 21:35)

How much biodiversity do we want? It's unfortunate that we even have to ask this question, but until we answer it we're likely to see more and more extinctions, along the lines described by [1]Elizabeth Kolbert. Biodiversity is difficult to measure but, again unfortunately, unless we do, and somehow set quantifiable targets, we shall lose it at a high rate as habitat loss and other mankind-induced environmental changes continue apace. Biodiversity, along with other unquantified but crucial contributions to quality of life is something else that is being sacrificed by default in pursuit of an ever-higher Gross World Product; our *de facto* over-arching target.

How would a Social Policy Bond regime address biodiversity? We could target it quite directly, using a combination of proxies such [2]indicator species, and areas (and contiguity) of land and sea set aside for conservation. We could also target for reduction the negative impacts of *loss* of biodiversity.

Myself, I'm no expert in these matters. But there are experts who, if we were motivated, could be brought into a discussion, culminating in biodiversity goals and priorities in ways that maximize society's well-being per dollar spent.

It's not being done, partly because our policymaking is stuck with a system that doesn't allow governments to set goals unless they also achieve them - something that, when it comes to complex, long-term, goals, requiring adaptive, diverse approaches, they cannot do well.

The Social Policy Bond principle is different. Under a bond regime governments - or any wealthy group of people, corporations, or non-governmental organizations - could set goals as lofty and long-term as a world of maximum biodiversity (however it's defined), and reward the people who achieve these goals. We need now, more than ever, diverse, adaptive approaches to challenges such as biodiversity loss or, for that matter, violent political conflict; huge threats, but ones that are largely ignored in pursuit of goals whose *only* virtue is that they can be measured by accountants.

#### **11.6.4 Er ... we meant wind-powered cars (2014-06-26 18:25)**

*The Economist* urges cuts in greenhouse gas emissions with this compelling argument:

Moreover, high temperatures do not affect only outdoor workers. [A] study found that a week's worth of outside temperatures over 32°C cuts production in car plants by 8 %. [1]*The costs of doing nothing*, *Economist*, dated 28 June

Wow, this climate change business is serious: we must cut back on greenhouse gas emissions - and quickly - or we could see big falls in the numbers of cars being produced!

### **11.7 July**

#### **11.7.1 War and peace, and GDP (2014-07-11 23:46)**

Readers interested in a meta-solution to the conflicts in the Middle East could do worse than read my short piece on [1]Peace Bonds. Defining peace in terms robust enough for our

purposes might not be easy, but the necessary thinking will help clarify exactly what we want to achieve. As in many other policy areas, there are plenty of statistics already being gathered and with some verification and supplementation a combination of them could be targeted by a Peace Bond regime. See, for instance, [2]this site, for some indicators that we could target.

On another note, David Pilling asks: [3]has GDP outgrown its use? As I have repeatedly posted ([4]here, for instance), the answer is an unqualified yes.

### 11.7.2 New procurement in Barcelona and Philadelphia (2014-07-26 22:02)

Christopher Swope writes about changes in procurement in the cities of Barcelona and Philadelphia:

Typically when cities buy goods or services, they spell out in strict detail exactly what it is they want to buy. But that level of specificity stifles innovation, because it restrains the inventiveness of companies who might bid on the work. It also limits the pool of bidders to established companies familiar with the sort of solution the tender asks for. Barcelona's less proscriptive approach turns the old system on its head. Rather than laying out exactly what it wants to buy (say, bike lockers), Barcelona is laying out six problems it wants to fix (such as reducing bike theft). [1]How Barcelona and Philadelphia Are Turning Procurement Upside Down, citylab, 18 July

Anyone familiar with Social Policy Bonds will see the similarity: specify outcomes, rather than the supposed means of achieving them:

Responses could involve buying things, but they might also suggest new services, regulatory changes or any other means of accomplishing the goal.

Excellent - as far as it goes. This procurement system will stimulate diverse, innovative solutions. The difference, and it's a big one, between this mechanism and Social Policy Bonds, lies in how these various possible solutions are decided upon and rewarded.

It appears that after gathering together various diverse possible approaches, a selection is made, presumably of those approaches deemed (I'm not clear by whom) to be the most promising. And the reward?

Anyone around the world with a creative idea, including startup companies or even individuals, has a shot at a contract and all the market legitimacy that comes with that.

It's an improvement over the current system, but in comparison with Social Policy Bonds, I think it has weaknesses:

- The selection of the most promising approaches might be open to favouritism, image, or corruption - in short, qualities that have little to do with efficiency. More seriously, it's a one-off selection, made under circumstances that will be very likely to change so as to make the selection sub-optimal.
- Once the selected approaches are made and implemented, there seems to be no further discipline: the team working on the selected approaches has little incentive to be or remain efficient. They've won the contract; there's every incentive to sit back and relax.

Things would be different under a Social Policy Bond regime, whereby bondholders, that is those who are charged with implementing solutions, can continue to reap the rewards of doing so only if, in the eyes of motivated competitors, they are the most cost-effective provider of solutions. There is a continuous incentive on bondholders to be efficient. If they are seen to be inefficient, their bonds will be worth more to operators who think they can be more efficient, who will then buy them.

Also, under a bond regime, taxpayers (or whoever else backs the bonds) lose nothing if the specified goal isn't achieved. And if the goal *is* achieved, rewards will tend to be distributed to bondholders according to the contribution they make to achieving it, and their efficiency in doing so. All this makes a Social Policy Bond regime more versatile than this new procurement initiative, and one more capable of achieving larger, more remote goals, for which a single, unvarying, combination of operators is unlikely to remain at all times the team best placed to achieve society's goals efficiently.

## 11.8 August

### 11.8.1 Public service reform (2014-08-07 22:40)

The *Economist* talks about public service reform:

But voters, and thus politicians, are especially intolerant of civil-service inefficiency nowadays. One prompt is austerity. Another is technology, which is changing not only how public services are delivered—think of “massively open online courses” in education—but also the way they can be measured. Social networks enable users to grumble about hospital waiting-times and mathematics results. Perhaps the biggest pressure is the passing of time: private-sector workers are incredulous as to why civil servants should escape the creative destruction that has changed other offices around the world. [1] *Mandarin Lessons*, 'the Economist', 9 August 2014

Quite. Why is it that the achievement of social goals remains (largely) a government monopoly? No good reason, other than vested interests and highly successful patch protection.

The *Economist* goes on to talk about pay and the need for long-term, strategic thinking. Politicians love to restructure and re-prioritize, to tinker with funding, and to appoint placemen in powerful positions. The remedies the journal suggests include better pay, reduced security for top public service positions and, perhaps, appointing some overlord who takes an exceptionally long-term view.

I have another suggestion: target broad, meaningful outcomes, and let a motivated market decide on organizational structures, composition and the projects they undertake. Under a Social Policy Bond regime there might or might not be 'destruction' of such organizations, as envisaged by the *Economist* and as occurs in a well-functioning private sector, but such destruction is a means not an end. Social Policy Bonds would ensure that any such destruction would occur only if it were truly 'creative' in the sense of better achieving society's goals, as defined in the redemption terms of the Bonds.

It's likely that a [2]new type of organization would result: one subordinated to the efficient achievement of meaningful social and environmental outcomes rather than, as now, the caprice of powerful interests, be they government or private sector.

- 

### **11.8.2 Wisdom (2014-08-24 22:05)**

I've long [1]argued that social policy needs institutions that must be subordinated entirely to broad, meaningful outcomes. Instead, we have institutions whose over-arching purpose is self-perpetuation. Francis Fukuyama writes, wisely in my view:

The very stability of institutions, however, is also the source of political decay. Institutions are created to meet the demands of specific circumstances, but then circumstances change and institutions fail to adapt. One reason is cognitive: people develop mental models of how the world works and tend to stick to them, even in the face of contradictory evidence. Another reason is group interest: institutions create favored classes of insiders who develop a stake in the status quo and resist pressures to reform.

[2]*America in Decay*The Sources of Political Dysfunction, Francis Fukuyama, 'Foreign Affairs', September/October

The current regime takes existing organizations as a given. Debate centres around their funding, composition, remit and structure. A Social Policy Bond regime would instead fund

outcomes, and let bondholders decide on the optimal organizational form; one that, especially for remote social goals, would - or just as importantly - could change shape, size, and the projects it supports, constantly, in response to changing circumstances and our expanding knowledge.

[M]any [of the US's] political institutions have become increasingly dysfunctional. A combination of intellectual rigidity and the power of entrenched political actors is preventing those institutions from being reformed. And there is no guarantee that the situation will change much without a major shock to the political order.

Exactly. Social Policy Bonds would target outcomes directly, and let motivated bondholders and would-be bondholders compete *continuously* to decide how best to achieve them. Intellectual rigidity under a bond regime would be penalised. Efficiency would be rewarded. All in stark contrast to the system not only in the US, but in much of the rest of the world.

### **11.8.3 Who cares about outcomes? (2014-08-27 20:18)**

Politicians are skilled at doing the exact opposite of what they make us think they're doing. The policymaking process in the public mind is a tedious discussion of organizational structures, organizational funding, and regulation. The tedium is so ingrained that few of us take a deep interest unless we're being paid to. It's probably deliberate, at some level. So when politicians [1]say

they want to cut back on subsidies paid for fossil fuel consumption, it shouldn't really shock us that not only are such subsidies still being paid, they're actually increasing. The International Energy Agency tells us that:

The IEA's latest estimates indicate that fossil-fuel consumption subsidies worldwide amounted to \$544 billion in 2012, up from \$523 billion in 2011, with subsidies to oil products representing over half of the total. [2]*World Energy Investment Outlook 2014*, IEA, June 2014

As pointed out [3]here, this is four times the level of aid given by the OECD's Development Assistance Committee ( \$134 billion in 2013).

## 11.9 September

### 11.9.1 When government should step back: higher education (2014-09-06 21:47)

Marina Warner writes:

[T]here is a central contradiction in the [UK] government's business model for higher education: you can't inspire the citizenry, open their eyes and ears, achieve international standing, fill the intellectual granary of the country and replenish it, attract students from this country and beyond, keep up the reputation of the universities, expect your educators and scholars to be public citizens and serve on all kinds of bodies, if you pin them down to one-size-fits-all contracts, inflexible timetables, overflowing workloads, overcrowded classes. [1]*Diary*, Marina Warner, 'London Review of Books' dated 11 September

Quite. There are some easily quantifiable benefits of education, such as universal literacy and numeracy, but not many. Government can and should target such goals and it could also usefully target attendance at approved educational establishments for children up to the age of 16 or 18. But when it comes to higher education, government should perhaps step back; it could still fund institutions if there's a public will for it, but there is a strong case for making its funding conditional only on certain minimum standards, rather try to apply the narrow, accountancy-based, short-term goals that are a feature of the business world. The demand for tertiary education is relatively informed; students relatively mobile. Government in this, and other policy areas, needs to exercise some humility. Diversity of funding sources, as between government and other sources, and within government, would also be helpful. I've done a short piece [2]here on how an outcome-focused Social Policy Bond regime could approach education.

An update: released today (8 September) is a [3]report done by the charity Save the

Children, which says, referring to the UK: "The most comprehensive study of pre-school and primary school-aged children in a generation found disadvantaged children are the worst affected, with four in ten not reading well by the age of 11."

### **11.9.2 Is global health overmedicalised? (2014-09-26 22:13)**

*Are we overmedicalising global health?* is the title of a recent [1]podcast by Dr Jocalyn Clark, who has also written an [2]article (which I haven't read) on the subject. It's a great question, and one that needs answering. My suspicion is that, as in other policy areas, approaches are too much determined by existing institutions and their outlook and goals. These goals don't always coincide with those of society; sometimes they could even be in conflict with them. In global health, Dr Clark says, there is:

...a medicalisation of these global health problems which occurs when global health issues, which are so strongly linked to poverty and inequity, instead get defined and framed in medical terms and then the solutions developed for them are similarly medicalised.

As society becomes more complex, relationships between cause and effect in physical and mental health, and also in crime, environmental well-being, illiteracy and many other areas, become less easy to identify. But current approaches rely largely on government institutions to make a stab at identifying these relationships and then try to do something to influence them and so improve outcomes. For simple relationships, this can work well and, indeed, government might be the only organization that can deal with certain social and environmental problems. But for complex relationships, especially those that vary markedly over space and time, approaches that rely on government are going to be inefficient at best and in conflict with wider goals at worst. We need, instead, to subordinate institutional structures, outlook and goals to outcomes. And these outcomes must be broad, societal outcomes, rather than those articulated by existing institutions.

'Health care is but one determinant of health', says Dr Clark, rightly. Targeting broad health outcomes would be a more reliable way of achieving health goals than, as is done now, framing health goals in terms of existing institutions and existing approaches. One solution might be to adopt the Social Policy Bond principle and issue [3]Health Bonds, which would inject market incentives into the achievement of our health goals and reward whoever achieves these goals, whoever they might be, and however they might do so.

### **11.9.3 Bertrand Russell anticipates Social Policy Bonds (2014-09-27 21:40)**

[1]Bertrand Russell (1872-1970) wrote:

There is one peculiarly pernicious application of the doctrine that human nature cannot be changed. This is the dogmatic assertion that there will always be wars, because we are so constituted that we feel a need of them. .... If political organization were such as to make war obviously unprofitable, there is nothing in human nature that would compel its occurrence, or make average people unhappy because of its not occurring. Exactly the same arguments that are now used about the impossibility of preventing war were formerly used in defence of duelling, yet few of us feel thwarted because we are not allowed to fight duels. *An outline of intellectual rubbish*, first published 1943, from 'The Basic Writings of Bertrand Russell', Routledge Classics 2009

Incentives are important and so too is belief that we can end war. Of course, nobody knows how to end even a single conflict, but much human progress has happened serendipitously, with no overall plan. I think we can do better than that, and issue [2]Conflict Reduction Bonds, for instance, which supply incentives for people to find ways of ending conflict that we cannot know in advance. The causes of war are many, complex and volatile. No organization as currently structured can possibly anticipate and address them. We need [3]new types of organization that have incentives to research, adapt, and address all likely causes of war. War and any form of violent political conflict are too important to be left to government or the generals.

## 11.10 October

### 11.10.1 GDP versus mental well-being (2014-10-16 21:29)

I posted [1]recently about how a the framing of healthcare issues as medical problems can lead to sub-optimal outcomes, drawing on the work of Dr Jocalyn Clark. I suspect it's symptomatic of a broader problem.

Western societies are built around the assumption that a healthy economy will either solve all our problems, or allow us to do so. In this sense, we are framing all our problems as economic. Now a successful economy does actually solve many of our problems, but there are parts of our economy that if successful, actually are in conflict with our goals as human beings.

Part of the problem is the definition of success that we use. Almost always we mean the accountants' definition of success: economic activity: Gross Domestic Product, which is equivalent to the volume of money times the velocity of circulation. GDP, or GDP, *per capita* has become the *de facto* goal of society. A higher GDP means a higher potential to achieve all our goals, we reason. Even if much of its gains are concentrated in relatively few pairs of hands, and even if certain generators of GDP create negative impacts, a higher GDP means we can compensate the losers - even if we don't actually do that.

There's a big flaw in this, similar to that which Dr Clark identified: we are framing all our social problems as economic ones. Very often this framing is not explicit: it's part of who we are and the society we live in.

In my work on Social Policy Bonds, I've attempted to make clear that economic growth is not actually an end in itself, but a means to various ends that it would be more efficient to

target directly. If, for instance, we want to reduce crime, then we'd do better to reward people for reducing crime rather than simply increasing the funding of bodies that are supposed to be fighting crime. The Social Policy Bond framing allows for all sorts of experimentation with non-conventional ways of reducing crime. Under our current system there are few funds systematically given to help people run youth centres in areas of high youth unemployment. Under a bond regime, people would have incentives to fund such centres in places doing so would maximise the reduction in crime per dollar outlay.

So far, so (relatively) conventional. But suppose our problems have little to do with resources, or even with the allocation of scarce resources, *but with economic activity itself*? Take the recently highlighted (in the UK) studies showing that loneliness is a big and growing problem for both [2]young and [3]old. Loneliness and alienation are to some degree a product of our economic system, which is entirely dependent on specialization of labour. As well, consumption of goods and services is, along with government spending and investment, one of the drivers of GDP. We have a society with an over-arching, and not always explicit, imperative to buy things. We maximize GDP by buying things for ourselves, rather than sharing. Government can also contribute to social alienation by, for examples, [4]subsidising [5]environmental destruction, or encouraging *without consulting the public* mass unselective immigration with a view to keeping wages low and property values high (or to help it retain power or simply out of [6]spite). Government looks at its own accounting flows, and knows well that increasing economic activity raises its tax revenues.

Our current system, then, is inherently geared to the monetisation of just about everything. A Social Policy Bond regime could actually subvert such a system. It could undermine the transactional way of conducting our affairs, and encourage other, less mercenary activities, *where those would be the most efficient and effective ways of reaching our actual, explicit, goals*. Doing so would not be its goal, but it could arise out of the goals we specify which would, one hopes, be more congruent with society's real goals than our current implicit goal of ever-increasing economic growth. There's an obvious paradox: a bond regime would pay people to achieve our goals, but if achieving our goals requires the cessation of payments and the ending of a transaction-based activity, *then under a bond regime that is exactly what will occur*. Bondholders have incentives to look for the most efficient ways of achieving our goals, regardless of whether they involve money flows or not. Under the current policymaking system, with its perverse incentives and its over-arching goal of maximising the number of transactions (so raising GDP), it is extremely unlikely to occur. The bias under the current system is always towards more transactions, more money flows and so more alienation and loneliness. And what is our society's default response to loneliness and depression? To increase economic activity still further: by manufacturing and marketing powerful [7]drugs.

A well-specified Social Policy Bond regime would target for improvement reliable indicators of mental well-being. The effects of doing so, we cannot anticipate. But the possibilities are as immense as they are apparently paradoxical: the bonds, utterly dependent on financial flows as they are, could reverse the extreme specialisation of our society, the extreme individualistic nature of our consumption patterns, and the entirely transactional way in which

we more and more see the world.

## 11.11 November

### 11.11.1 Measureable versus immeasurable goals (2014-11-08 10:50)

Theodore Dalrymple writes:

[W]e suffer nowadays from an unease in talking about what cannot be easily measured, such as life expectancy. If I say something that would once have seemed perfectly obvious, such as that loneliness is undesirable, someone will demand the evidence. Life expectancy can be measured; and we are inclined to believe that what can easily be measured must be more important than what cannot. The result is a lot of pseudo-thought. [1] *'Hell is other people?'*, Theodore Dalrymple, 'Salisbury Review', 20 October

In our large, complex societies, government bodies have enlarged their role and largely supplanted families, extended families, and communities in supplying a range of welfare services to a large proportion of their populations. Increasingly, and of necessity, government relies numerical indicators to manage its resource allocation.

But this use of indicators is relatively recent, unsystematic and unsophisticated. Few indicators are targeted explicitly for a sustained period: the targeted range of inflation is a rare

exception, as is the coherent range of indicators presented in the UK Government's attempt to tackle poverty. Other indicators, such as the length of [2]hospital waiting lists, don't measure what matters to people or are prone to manipulation. Even when numerical goals are clear and meaningful they are rarely costed, they are almost always too narrow, and they are largely chosen to mesh in with the goals and capabilities of existing institutional structures. Those broad targets that are targeted with some degree of consistency tend to be economic aggregates, such as the inflation rate, or the rate of growth of Gross Domestic Product — which appears to be *de facto* indicator par excellence of rich and poor countries alike. But GDP's shortcomings as a single indicator of the health of an economy are [3]well known.

What would a Social Policy Bond regime, though, say about those things that cannot readily be measured, like loneliness? In the absence of objective, [4]reliable indicators of mental well-being perhaps the best approach would be for government to step back and target only those quantifiable indicators or goals that are inextricably linked to those sorts of well-being that we can measure. But that would not be enough: some government activities aimed at, to take our current discussion, lengthening life expectancy could well increase loneliness. Think, for instance, of government support for roads, which [5]may well have the effect of both lengthening life expectancy and increasing loneliness.

Facing this dilemma, I have a response, rather than an answer. A Social Policy Bond would set policy targets by consensus. People understand outcomes more than the means of achieving them, and so could and would participate in the policymaking process, including the setting and relative priority of social goals. There would be more buy-in to policy, which [6]itself might go some way toward relieving the negative impacts of certain decisions. There's no perfect solution, but a bond regime, because of this additional opportunity for public participation that it offers, and because it forces clarity over exactly what we want to achieve as a society, could help to resolve conflicts between measurable and immeasurable goals.

### **11.11.2 Solution aversion (2014-11-24 07:13)**

From 'Duke Today':

A new study from Duke University finds that people will evaluate scientific evidence based on whether they view its policy implications as politically desirable. [1]*Denying Problems When We Don't Like the Solutions* , 'Duke Today', 6 November

I think this echoes a more general finding that we use reasoned arguments to justify prior beliefs, rather than base our beliefs on reason. What does this mean for policymaking? That we'd do best if (1) we are *explicit and transparent* about the outcomes we, as a society, want to see, and then (2) subordinate all activities, government or private sector, to those outcomes. Any other way of doing things, as in the current system, will bring about ... well, what we see now: the corruption of the policymaking process in the service of the not-always-well-hidden agendas of the rich and powerful. So 'helping small farmers' becomes corrupted into [2]massive taxpayer-funded welfare for the [3]very rich and agribusiness. 'Affordable transport' becomes[4] massive subsidies to the fossil fuel industries. Misbehaving five-year olds are re-interpreted as a [5]new market for the pharmaceutical industry. Even more wasteful, stupid and dangerous: 'being strong' becomes massive expenditure on so-called 'defence' and the acquisition of nuclear weapons.

If we want to support the very wealthiest and most powerful individuals and corporations, why don't we explicitly set out to do so? Why don't political parties promise that when they get into power they will divert resources from the relatively poor to the enormously wealthy? Could it be that such resource transfers would be unpopular?

The answer of course is 'yes', so views about issues such as climate change, or nutrition, or whether depression (for instance) is a chemical imbalance, or whether more armaments improve social well-being are the subjects not of reasoned debate based on the best available information, but means to ends that are usually sectional and mercenary. Interest groups act on what they believe are their narrow interests; their minds are made up, and they take whichever side of a genuine debate best serves their agenda.

It's a haphazard and destructive way of making policy. Social Policy Bonds offer a better approach: let society determine which broad social and environmental goals it wants to see achieved and their relative priority. Government and private-sector bodies would then be rewarded for doing what they can to achieve these goals: and they would have incentives to see and *evaluate the scientific evidence in terms of how best they can serve society's interests*, not their own. It might not sound revolutionary, and indeed it shouldn't be. But it is.

Dennis Mansell (2014-11-25 11:47:31)

Is the Duke study not also an affirmation of cognitive dissonance theory? We believe what we *did before* not just prior beliefs.

At the same time, this is the power of Social Policy Bonds - they bypass a need for an ethical decision prior to action. Instead, you take an action, seemingly for your own gain, and when asked later for your reasons, you have a great ethical story to fall back on.

Ronnie Horesh (2014-11-28 08:04:00)

Thanks Dennis. I agree with both your points. Your second is a reversal of what usually happens, but I can see that some would take that route, and why. RH

### **11.11.3 The book: Kindle version (2014-11-26 11:18)**

The definitive book on Social Policy Bonds, about 60 000 words in length, is now [1]available on Kindle for approximately US \$4.00.

## **11.12 December**

### **11.12.1 Thinking strategically and taking responsibility (2014-12-09 16:25)**

Garret Hardin, in his essay 'The Tragedy of the Commons', wrote:

[N]atural selection favors the forces of psychological denial. The individual benefits as an individual from his ability to deny the truth even though society as a whole, of which he is a part, suffers. [1]*The Tragedy of the Commons*, 'Science', **13**, December 1968

Governments supposedly serve society's interests by regulating and taxing individual and corporate activities that are essentially self-serving. It's a process that evolved over time and, while flawed, has proven evolutionary advantages over central planning. And, perhaps because central planning as practised by the Soviet Union and others has been totally discredited, our governments seem to have relinquished their role of thinking strategically on behalf of their citizens. They are subject to the same biases and incentives to deny the truth as individuals. Whether it's environmental disaster, or nuclear catastrophe, or less spectacular but just as grievous impacts of man's inhumanity to man, or financial crises or whatever, our governments take the easy route of waiting for things to happen and then reacting.

It's inefficient at best, and could be calamitous at worst. Society is so interlinked and complex that major disasters of some sort are inevitable - and extremely difficult to foresee. But government should not then deny the real possibility that these events will occur: it could, and should, think strategically and on behalf of society. By issuing Social Policy Bonds it could reduce the likelihood of disasters, say, without trying to involve itself in how and when they are likely to occur.

For example: I'm reading Eric Schlosser's [2]*Command and Control*, which tells alarming tales of accidents and blunders that came close to bringing about catastrophe. It's quite disturbing how little incentive the people in control, *at all levels*, had to think about the potential impacts on society rather than on themselves or the organization of which they were part. Social Policy Bonds that would be redeemed only after, say, 30 years of a complete absence of nuclear explosions, accidental or not, would be one way of giving people incentives to avoid such a disaster. A bond regime targeting such unforeseeable but plausible scenarios would make them less likely to occur and would do so as efficiently as possible. And by issuing [3]Disaster Prevention Bonds government would be doing what it's supposed to do: looking out for all its citizens' interests by directing people's ingenuity into socially useful ends.

### **11.12.2 Et tu, academia? (2014-12-21 08:35)**

There are sound reasons for being disdainful of quantitative targets in policymaking - something that forms the very basis of Social Policy Bonds. But, perhaps unfortunately, in our highly aggregated, complex, societies, the alternative to targeting broad, explicit and, most important, *meaningful* goals is to target narrow, opaque goals that are devoid of meaning in that they do nothing to improve social well-being.

I've blogged before about the proliferation and futility of such Mickey Mouse micro- ([1]here and [2]here for instance) and macro-targets ([3]here and [4]here). So it's disappointing, though not surprising, that the academic world is following the trend. See [5]here, for instance, to read about cash for citations. Or [6]here, for how to find "outfits that offer to arrange, for a fee, authorship of papers to be published in peer-reviewed outlets. They seem to cater to researchers looking for a quick and dirty way of getting a publication in a prestigious international scientific journal."

If we are going to combine financial incentives with numerical targets then we need to make absolutely certain that those targets are, or are inextricably linked to, robust indicators of social well-being. The alternative? Well, it is what we have now: indicators defined not by society, but by vested interests within organizations who suspect that broad, meaningful indicators would threaten their way of doing things, their status, or indeed their existence.

# 2015

## 12.1 January

### 12.1.1 Anti road rage (2015-01-09 12:18)

George Monbiot [1] writes about city planning in England, and the lack of playing space for children: "In the places built 10 or 20 years ago, there's plenty of shared space, but almost all of it is allocated to cars." It's sad how little input ordinary people have into the layout of our towns and cities, and it's tragic that subordinating our entire way of living to motoring (as distinct from motorists) has had such negative consequences for our physical and mental health. People from the new world travel for thousands of miles to experience, for a week or two, vibrant, safe cities that invariably were developed before motoring became important. There's no reason people shouldn't live in the sort of suburbs or satellite towns against which Mr Monbiot inveighs if that is what they want to do, but there are good reasons why such lifestyles shouldn't be heavily subsidised; indeed, so heavily subsidised that any alternative has become forbiddingly expensive or dangerous for the middle classes. What are these subsidies? As well as subsidised to oil extraction and consumption, there is, essentially, [2] free parking. And the costs of accidents, injuries and the damage done to mental health by roading are, of course, borne by the entire population.

Once a particular lifestyle has received subsidies for many years it's very difficult (though [3] not impossible) to withdraw them. As well, cause and effect are difficult to identify and far more difficult to translate into meaningful political action. That is where Social Policy Bonds might offer a way forward. Under a bond regime we could target things that are not amenable to direct government action: things like the [4] loneliness of the elderly, or the broader physical and mental health of an entire population. We cannot know in advance what are the best ways of achieving such targets. But a motivated coalition of investors holding bonds targeting these goals is far more likely to achieve them than a ruling political party beholden to its friends in big business and government. If holders of bonds targeting such goals decided that the best way of enabling people to live fulfilling, healthy lives is to make everyone dependent on cars, then that is what they will do. But they would only do so if that is what the evidence told them. For myself, I suspect that there is no such evidence, and it's a catastrophe that governments the world over are acting as though there were.

## 12.2 February

### 12.2.1 Dog food or doomsday (2015-02-12 06:10)

*A longer version of a previous posting:*

It's a puzzle to me how we have created regimes that allow financial incentives to operate creatively in interesting but ultimately not very important aspects of our lives - advertising dog food, for example - while ways of dealing with the most serious determinants of mankind's well-being rarely reward efficiency. So employees of companies selling dog food have sales and revenue targets to meet, stringent deadlines, and they are offered meaningful incentives backed up by robust reporting and analysis systems to monitor progress and so achieve maximal dog food market penetration. In contrast, responsibility for what you might think should be major priorities for homo sapiens is given over to the dead hand of government or brave, well-meaning, hard working but under-resourced non-governmental organizations.

What are these priorities are? Most of us would probably give a high rating to things like avoiding the deaths of many millions of people in a nuclear exchange. Or the ending of any violent political conflict of the sort that, amazingly, in the 21st century, still kills, maims or makes homeless countless thousands of us around the globe. Or minimising the deaths caused by natural disasters, or pandemics.

Climate change too: it's no different from other potential catastrophes in that we don't know when or how it will strike. The most fortunate amongst us can insure against some of the financial costs of some adverse climatic events. But even there, markets cannot fully redress the balance. The uninsured, whether uninsurable or not, cannot be compensated at all. Markets are even less capable of addressing the more global calamities of nuclear war, or large-scale violence.

Some years ago I came up with the Social Policy Bond idea, which aims to channel market incentives into the achievement of social goals. Much of this idea has been taken up by governments worldwide, in the form of Social Impact Bonds. But SIBs leave out one crucial aspect of the Social Policy Bond principle: tradeability. When the bonds are tradeable on a secondary market, we can greatly enlarge their scope, because we do not have to specify which organizations shall achieve our goals, and because we can target goals that might be too remote to interest existing organizations.

Take something that has recently made the news: nuclear catastrophe. As the members of the Bulletin of Atomic Scientists shift the hands of their doomsday clock to three minutes to midnight, where are the incentives that will mobilise large numbers of us actually to do something to avoid the doom represented by midnight? There aren't any - we're all doing better by devoting our ingenuity to selling dog food.

The answer could be Social Policy Bonds. Targeting nuclear catastrophe they would be backed by governments, NGOs, philanthropists and anybody with a strong interest in human well-being. Floated on the open market they would become redeemable for, say, \$1m each only after a thirty-year period during which no nuclear explosion takes place. Floated on the open market, they might fetch just \$10000 each, if the market thinks the probability of thirty years' nuclear peace is low. But these bonds would be tradeable: their value would rise and fall according to how likely people think the peace target will be reached.

Initial investors would buy the bonds and do whatever they can to increase that probability. Even helping existing ways of monitoring nuclear material might see the value of their bonds double. Others, with expertise in different areas, would buy their bonds and do what they can to raise the value of the bonds still further. At every stage, the bonds would be in the hands of those most able to bring about nuclear peace. The bondholders' goal is exactly congruent with society's: *they make money only by achieving society's goal*. At every stage of every process required to achieve that goal, incentives will motivate people to be as efficient as possible.

Rather than encourage endless speculation about what projects will make the world more peaceful the bonds would, in effect, contract out the achievement of world peace to the market. They would encourage a wide range of *adaptive* projects, whose sole criterion for funding would be that they would raise the probability of world peace being achieved. In this way, the governments and others who back the bonds would do what they are best at: articulating society's goals and raising the revenue for their achievement. At the same time, the market would be doing what it is best at: allocating resources as efficiently as possible.

If nuclear peace sounds too lofty a goal, then we could start by aiming for something like peace in the Middle East. The same principle would work for natural disasters or climate change. In every case, we'd be rewarding the successful achievement of a sustained, desirable outcome, without - as now - distracting ourselves by self-indulgent irrelevancies such as who shall achieve it and how they shall do so. It is a shame to me that few people seem to think along these lines.

### **12.2.2 Rewarding the rich and the dead (2015-02-15 03:40)**

From *the Economist*:

According to the [United States] Government Accountability Office, between

2007 and 2011 Uncle Sam paid some \$3m in subsidies to 2,300 farms where no crop of any sort was grown. Between 2008 and 2012, \$10.6m was paid to farmers who had been dead for over a year. ... [W]ith crop prices now falling, taxpayers are braced to be fleeced again. [1] *Milking taxpayers*, 'the Economist', 14 February

When government makes so many policy interventions, some of them are going to be bad. A working, viable, democratic, accountable and transparent policymaking system would, we'd hope and expect, weed out bad policies or, with judicious regulation and further intervention, convert them into better policies. But our current policymaking system is incapable of doing that. Instead, bad policies become worse policies, because rather than have mechanisms for getting rid of them they create interest groups who resist change and, as recipients of taxpayer funds, can afford expensive lobbyists to make these policies permanent features of the political landscape.

So it is with agricultural policy, not only in the US, but in almost all of the developed countries. Forty years ago, for instance, the stupidity of the European Community's Common Agricultural Policy was well established and widely discussed. But very little has changed. These policies hurt consumers in the developed countries by raising food prices. They reward intensive farming with devastating effects on the environment and animal welfare. They penalise third-world countries by putting up barriers to their agricultural exports. They cost billions of dollars and their only beneficiaries, apart from the bureaucrats who administer them, are agribusiness corporates and wealthy landowners. From the same article:

American farm subsidies are egregiously expensive,

harvesting \$20 billion a year from taxpayers' pockets. Most of the money goes to big, rich farmers producing staple commodities such as corn and soybeans in states such as Iowa.

I [2]wrote about all this 15 years ago. Worth repeating and emphasising is that our policymaking system does not correct its errors. Instead, appallingly wasteful policies persist because they enrich people who lobby against their removal. We have a system that cannot correct errors but rather entrenches them. The current system, in brief, is dysfunctional.

A better alternative would be to focus on outcomes, and reward people for achieving them. People understand outcomes, and policies under an outcome-oriented system would not be subject to the smoke-and-mirrors manipulation that saw measures taken to 'protect the family farm' be transmuted into subsidies for agribusiness and billionaire landowners - alive and dead. Agriculture, of course, is not the only sector that government policy has corrupted in ways that hurt ordinary people, though it is one of those with the longest history of government intervention. Our failure to correct our policy mistakes in agriculture speaks volumes about how unfit is our current policymaking system.

### 12.2.3 Two sorts of self-interest (2015-02-23 06:21)

If men were actuated by self-interest, which they are not — except in the case of a few saints — the whole human race would cooperate. There would be no more wars, no more armies, no more navies, no more atom bomb. Bertrand Russell, [1]*What Desires Are Politically Important?*, 1950

Our current policymaking system gives undue priority to emotion, whim, and concerns that make for effective television footage. So our politicians give arguably too little attention to huge, important challenges that move too slowly for television, such as the piling up of armaments, climate change, the [2]diversion of resources from the poor to the rich, and threats to the family and social cohesion. Our short-term, reactive self-interest is largely ideological, concerned more with shoring up our world view and creating bonding opportunities with people who think the same way than with solving the world's social and environmental problems. It's determined largely by a dangerous combination of emotion coupled with abstract intellectual

thought. It concerns itself with the immediate, which means a focus on what can be done now rather than outcomes. And what can be done now to solve most social problems is inevitably the source of endless heated and destructive debate because our problems are so complex.

We should build into our policymaking system the fact that there is far more consensus over the sort of outcomes that we as a society want to see than there is over the supposed means of achieving them. The societal self-interest that Russell implicitly identifies - the sort that is beneficial to all of humanity - could then take over from the narrow, fear-based self-interest that animates so many of the world's political (and military) decisions.

Social Policy Bonds would encourage us to make the distinction. A bond regime would make decisions about society's long-term goals on the basis not of what government can do now or where it should allocate its funds, but on what needs to be done. This would take the ideology and emotion of how things shall be done and who shall achieve them. Social Policy Bonds could then target effectively those universal social goals that are currently either not being targeted, or not being achieved, or from which we actually moving away. A world of peace, for instance, or a world that seeks to prevent or mitigate catastrophes of any sort. *For more on the Social Policy Bond principle and its applications see [3]SocialGoals.com*

#### **12.2.4 Demented (2015-02-26 15:12)**

The [UK] government's health policy reached new levels of absurdity last October, when it was announced that GPs would be paid £55 for every diagnosis of dementia they could enter in a patient's notes. [1]*Cash for Diagnoses*, Gavin Francis, 'London Review of Books' dated 5 March

I'm convinced policymakers have no idea how to specify societal goals. They don't seem to realize that goals that are narrow and short term can, and most likely will, conflict with those that are broad and long term. So it is with the nonsense described by Mr Francis. From where might the initiative for such incentive payments arise? Mr Francis points the finger:

This debacle is just the latest example of a medical culture, promoted by successive governments over the last twenty years, that rewards over-diagnosis and the prescription of drugs over personalised, professional care.

Our governments seem incapable of looking after society's interests. They seem to think that doing what they can to meet the demands of the most powerful lobby groups, including government agencies, is equivalent to looking after the interests of all their citizens. It isn't.

A Social Policy Bond regime would be quite different. It would target and reward meaningful improvements in the health of the entire population. It would take a long-term view, and could do so because it would focus exclusively on its target outcomes. It would reward the people who achieve our health goals *whoever they are and however they do so*. For more on how the Social Policy Bond principle could be applied to health click [2]here.

## 12.3 March

### 12.3.1 Tried, tested and failed (2015-03-06 05:06)

Concluding a piece about the growing dangers arising from nuclear proliferation *the Economist* says:

But for now the best that can be achieved is to search for ways to restore effective deterrence, bear down on proliferation and get back to the dogged grind of arms-control negotiations between the main nuclear powers. [1]*The unkicked addiction*, 'the Economist', dated 7 March

My question is twofold: who will do the searching and what incentives will they have to get it right? On present trends we can be pretty sure that responsibility for a nuclear exchange-free

world will fall to nationalist politicians, corrupt bureaucrats (national or United Nations), well-meaning bureaucrats (same) or well-meaning, dedicated but underfunded people working for non-governmental organizations. The same people, in short, who have collectively brought us, let's be factual, to the brink of nuclear catastrophe.

It's not just the identity of these people that's the problem; it's also that they have little financial incentive to maintain nuclear peace. They are not paid according to performance. So they have little incentive to explore innovative ways of forestalling proliferation or use of nuclear weapons that might do a better job than the existing, tried tested and failed methods.

I can't suggest 'ways to restore effective deterrence' but I can suggest a way that would encourage others to find such ways, and reward those that are successful. We could issue bonds that become redeemable only after a sustained period - thirty years, say - of nuclear peace. It would be up to the resulting coalition of motivated bondholders to explore the best ways of taking all the steps necessary to bring about that goal. These would probably include measures that existing bodies, because of their status or their short time horizons, do undertake nowadays, including, for example, building trust between schoolchildren of all nationalities and religions. Approaches encouraged by such [2]Conflict Reduction Bonds would be diverse, because one single approach will not work, and adaptive, because the most effective measures are likely to change with time. *For a longer essay click [3]here, and for the application of the Social Policy Bond principle to the Middle East click [4]here.*

### **12.3.2 The role of government? To extract revenue (2015-03-22 20:23)**

David Graeber began this piece by writing about Ferguson in the US, and the criminalisation, in the US, of violations of administrative codes:

Almost every institution in America—from our corporations to our schools, hospitals, and civic authorities—now seems to operate largely as an engine for extracting revenue, by imposing ever more complex sets of rules that are designed to be broken. And these rules are almost invariably enforced on a sliding scale: ever-so-gently on the rich and powerful (think of what happens to those banks when they themselves break the law), but with absolute Draconian harshness on the poorest and most vulnerable. [1]*Ferguson and the Criminalization of American Life*, David Graeber, 19 March

I don't think this should greatly surprise us. Government, like any other big organization, has as its one over-arching goal that of self-perpetuation. Like churches, trade unions, universities or any other institution, governments usually start out meaning well, and are staffed by hard-working and, often, individually ethical employees. But at some point the organization's stated objectives are forgotten and we end up with scenarios similar to that which Mr Graeber describes. Government bodies don't face the discipline of markets or competition and if they limit their corrupt behaviour to the less powerful, they can get away with it indefinitely.

Social Policy Bonds are a means by which any organization trying to achieve social goals will always be focused entirely on those goals. The very structure and composition of the organizations would be determined, dynamically, by their need to achieve society's goals as efficiently as possible. And it is *society's* goals that they would be achieving: their own goals, including that of self-perpetuation, would be subordinated to those goals set by society and targeted by Social Policy Bonds. It's a stark contrast between a bond regime that articulated society's wishes and rewards those who achieve them, and today's world, in which even those bodies charged explicitly with looking after the public interest end up in conflict with it. Or, as Mr Graeber concludes:

Most  
Americans no longer feel that the institutions of government are, or

even could be, on their side. Because increasingly, in a very basic sense, they're not.

### **12.3.3 Diversity and biodiversity (2015-03-31 19:34)**

Jonathan Franzen writes about biodiversity and whether the emphasis on climate change is diverting worthwhile effort and resources away from conservation. He visits Costa Rica and looks at conservation efforts in the northern dry-forest region of Guanacaste:

The question that most foreign visitors to Guanacaste ask is how its model can be applied to other centers of biodiversity in the tropics. The answer is that it can't be. Our economic system encourages monocultural thinking: there exists an optimal solution, a best conservation product, and once we identify it we can scale it up and sell it universally. As the contrast between Amazon Conservation and the A.C.G. [Área Conservación de Guanacaste] suggests, preserving biological diversity requires a corresponding diversity of approach.

[1]*Carbon Capture: Has climate change made it harder for people to care about conservation?*,

Jonathan Franzen, 'New Yorker', dated 6 April

This is something I've been advocating for years: to solve our biggest, most complex social and environmental problems we urgently need diverse, adaptive approaches. Social Policy Bonds would encourage such approaches in ways that current policy cannot. Yes, we need some high-level direction as to which objectives we should pursue, and yes, we need some broad system of revenue raising to finance the achievement of some of these goals. But we do not need top-down, one-size-fits-all, programmes based on fossilised science that have been tried, tested and (for the most part) failed. The world is too complex for that.

A Social Policy Bond regime would reward those who achieve such long-term goals as maintaining or increasing biodiversity, without stipulating how these goals shall be achieved.

Government, or a group of governments or non-governmental bodies or philanthropists could work together to articulate society's goals and raise revenue for their achievement. But the actual achieving would be done by bondholders (or people paid by bondholders) who would be motivated to form a coalition of interests entirely devoted to achieving society's goals with maximum efficiency. This coalition would probably vary in composition and structure over time, as would the projects it initiates. But at any one time, the market for the bonds would ensure that only the most efficient programmes will be implemented.

## 12.4 April

### 12.4.1 Anything but outcomes (2015-04-14 16:56)

Social and environmental problems are complex. Faced with these problems we delegate much of the responsibility for solving them to government. And how do those lucky enough to be given the chance of choosing who shall govern us go about it? One thing we don't do is look dispassionately at each political party's past record and choose on that basis. Even the experts [1] don't do that. So how do we make our selection at the ballot box? We listen to promises by politicians about their *stated* spending priorities - inputs, in other words. Or we focus on the appearance of each candidate, or how well they come across on television. Now there's identity politics, as Brandan O'Neill writes:

If you want to see how small politics has become in the 21st century, just look at Hillary Clinton's [2] chucking of her hat into the 2016 US presidential race. Or better still, look at the response to her unveiling of her presidential ambitions, the chorus of cheers and whoops that greeted her decision to make hers a gender-focused, grandmotherly, womanish campaign, in which, as one excited observer puts it, sex - as in biology, not raunch - will form a 'core plank' of Hillary's stab for the White House. What this speaks to is the suffocating extent to which the politics of identity, the accident of who we are, the lottery of our natural characteristics, is now paramount in the political sphere, having violently elbowed aside the old politics of ideas, and substance, and conviction.

Hillary's presidential launch confirms that, in the space of just seven years, identity has become pretty much the only game in the town

of politics. [3]*The rise of Hillary and the death of politics*, Brendan O'Neill, 'Spiked',  
13 April

I'm not as cynical as Mr O'Neill. I'm not a great supporter of ideas or conviction in politics - not if they don't relate to 'substance' or, as I'd put it, meaningful outcomes. The fact is that not only do we not look at a politician's or a party's past record; often we cannot. There are too many variables, too many linkages and too many time lags for us to be able fully to evaluate past performance. Identity politics is a symptom of that problem, rather than a cause.

My solution? Social Policy Bonds. Agree on a set of broad outcomes, such as universal [4]literacy, improved general [5]health, reduced [6]crime rates or, on a global scale, the elimination of [7]violent political conflict (war and civil war), or [8] catastrophe, whether natural or man-made. Then issue bonds that will reward people for solving these problems, however they do so. In short, target outcomes and don't focus too much on the identity or media performance of people who promise to spend taxpayer revenue on our behalf. Rely, instead, on a motivated coalition of bondholders, who will have every incentive to subordinate all their activities to the achievement of society's targeted goals.

## 12.4.2 What really matters? (2015-04-22 17:55)

What really matters to voters? You might think, as I, naively, used to, that it's outcomes. But our politics and our policymaking process are almost entirely concerned with spending, institutional structures, legalisms, outputs or activities, all of which have very little bearing on outcomes that are meaningful to ordinary citizens. Come election time candidates and their handlers routinely emphasise almost everything except outcomes when canvassing for votes: the personality, gender, ethnic origin or social class of the would-be politician, or how they perform on television. I have proposed Social Policy Bonds as a way of subordinating all our politics and all our politicking to broad, meaningful outcomes, which would be more amenable to public participation and therefore help bridge the widening gap between politicians and the people they are supposed to represent. A mistake?

Recent US research shows that:

[M]any average voters with strong party commitments – both Democrats and Republicans – care more about their parties simply winning the election than they do either ideology or issues. Unlike previous research, the study found that loyalty to the party itself was the source of partisan rivalry and incivility, instead of a fundamental disagreement over issues. [1] *Study: Most partisans treat politics like sports rivalries, instead of focusing on issues*, University of Kansas, 15 April

Maybe then the Social Policy Bond concept, which focuses primarily on outcomes, is too idealistic? I think not. I believe that we, the voters, think of politics as a game only because our governing elites have made the policymaking process so arcane, long-winded and boring that only large institutions — public- and private-sector — can afford to pay people to understand and manipulate it. Naturally then, for our entertainment, we focus on whether our team, Democrat or Republican, Labour or Conservative, left or right will win their game, but the real game is government and big business versus the electorate. That match is too one-sided to generate much excitement.

---

Mike Linksvayer (2015-04-22 22:21:34)

Reminds me of / further evidence for Robin Hanson's dictum "politics isn't about policy" (rather about signalling affiliation and status, if I recall correctly).

One partial solution is to get people to affiliate with/commit part of their identity to the ability to self-doubt and go with the data and give status to people who seem to do so. Of course this mostly means people with such commitments will just rationalize whatever affiliation/status seeking they would do anyway as following the data, but maybe sometimes it will be a nudge in the right direction, like science.

### **12.4.3 Immigration to Europe (2015-04-29 09:03)**

The large numbers of people trying to migrate on flimsy boats from Africa to Europe are not all poor and desperate. The cost of arranging these trips is beyond the means of most. Many of the people on these boats would be entrepreneurs in their own countries if there were even a slight prospect of a better life there. So why isn't there? Why do they leave their culture,

their families, their support network and pay large sums to criminals to arrange a very chancy, unpleasant trip to countries that certainly don't want them (to put it mildly).

Not the whole explanation, but a large part of it, are the corrupt, insane European Union trade policies including especially the Common Agricultural Policy which, by subsidising farm production in Europe and imposing formidable barriers to imports has made it very difficult for the food-rich African countries to step onto the first rung of the economic development ladder. Europe adopted the same policies with respect to tropical products and textiles, all at the behest of their own powerful farm lobbies and corporations.

So what did they expect? By creating 'fortress Europe' the Eurocrats exported poverty and instability to poor countries. At the same time they give a few million dollars of funds collected from taxpayers in 'aid' and [1]expect these countries to be grateful. And they act concerned when, after decades of kicking these countries off the development ladder, they are besieged by Africans looking for a better life. It would be unhelpful, childish and arrogant to say 'I told you so', so I won't say it even if it's true - [2]which [3]it [4]is.

## 12.5 May

### 12.5.1 Stupid incentives reward stupid behaviour (2015-05-01 20:23)

David Simon goes a long way toward explaining why policing in Baltimore has gone awry:

How do you reward cops? Two ways: promotion and cash. That's what rewards a cop. If you want to pay overtime pay for having police fill the jails with loitering arrests or simple drug possession or failure to yield, if you want to spend your municipal treasure rewarding that, well the cop who's going to court 7 or 8 days a month — and court is always overtime pay — you're going to damn near double your salary every month. On the other hand, the guy who actually goes to his post and investigates who's burglarizing the homes, at the end of the month maybe he's made one arrest.

It may be the right arrest and one that makes his post safer, but he's going to court one day and he's out in two hours. So you fail to reward the cop who actually does police work. But worse, it's time to make new sergeants or lieutenants, and so you look at the computer and say: Who's doing the most work? And they say, man, this guy had 80 arrests last month, and this other guy's only got one. Who do you think gets made sergeant? And then who trains the next generation of cops in how not to do police work? I've just described for you the culture of the Baltimore police department amid the deluge of the drug war, where actual investigation goes unrewarded and where rounding up bodies for street dealing, drug possession, loitering such – the easiest and most self-evident arrests a cop can make – is nonetheless the path to enlightenment and promotion and some additional pay. [1]*Baltimore's Anguish: Freddie Gray, the drug war, and the decline of "real policing."*, David Simon, 29 April

Two points I would make.

One: in our complex society we are going to have to target quantitative indicators. To do so effectively these indicators need to be meaningful to ordinary people must be, or must be *inextricably linked to*, improvements in well-being. The alternative to such indicators are the sort of Mickey Mouse, micro-targets that motivate the Baltimore police to maximise the number of arrests they make or, for instance, keep patients in UK ambulances hovering outside hospitals so that they can meet a 'seen within 4 hours of entry into hospital' micro-target.

Two: incentives are important. People — even well-intentioned and hard-working people — will react to incentives; and if these incentives are to carry out stupid activities that conflict with society's well-being, then they will carry out those activities and we shall see a decrease in society's well-being. It's not that complicated.

## 12.5.2 Distracting the masses (2015-05-09 18:00)

How government spends your tax dollars:

The EU has contributed €16m to Paramount's new park in Spain. Russia's government is helping to finance a nationalist-themed park near Moscow.

But official handouts are no guarantee of success: 70 % of the 2,500 theme parks built in China, many with generous state help, have closed down or are losing money. [1]*Theme parks in Europe: bumpy rides ahead*, 'The Economist', 9 May

If governments everywhere didn't waste your money on propping up inefficient industries everywhere or bailing out failed banks you might almost think their goal in subsidising theme parks is the single one of keeping us distracted. As it is, it's uncertain whether that is their main goal, or whether they just enjoy speculating on photogenic projects with your money. Why immensely wealthy multinational corporations are thought to be more deserving of help than the poor, or disabled, or the homeless is not obvious.

### 12.5.3 Progress in development (2015-05-23 18:30)

Social Policy Bond principles are slowly gaining acceptance. Here is *the Economist* writing about trends in development aid:

Now donors are trying a new approach: handing over aid only if outcomes improve. "Cash on delivery" sees donors and recipients set targets, for example to cut child mortality rates or increase the number of girls who finish school, and agree on how much will be paid if they are met. ... In cash-on-delivery schemes, recipients choose their own paths towards their targets, subject only to basic rules, such as respecting human rights. ... By setting and measuring targets, cash-on-delivery donors hope to spur healthy competition. [1]*It's not what you spend*, 'the Economist', 23 May

For my thoughts on applying the Social Policy Bond idea to development click [2]here.

## 12.6 June

### 12.6.1 Chopping down trees to fight climate change (2015-06-02 19:57)

It's inefficient, at best, for central government to try to prescribe how to achieve most social or environmental goals. Society's just too complex for any large, fixed organization fully to understand. But politicians aren't known for their humility. This is what happens when government thinks it knows how best to achieve its environmental goal of reducing greenhouse gases (not to be confused with trying to prevent climate change, but that's [1]another story):

[2]

For the sake of a greener Europe, thousands of American trees are falling each month in the forests outside this cotton-country town [Oak City, North Carolina, US]. .... Each day, dozens of trucks haul freshly cut oaks and poplars to a nearby factory where the wood is converted into small pellets, to be used as fuel in European power plants. Soaring demand for this woody fuel has led to the construction of more than two dozen pellet factories in the Southeast [of the US] in the past decade, along with special port facilities in Virginia and Georgia where mountains of pellets are loaded onto Europe-bound freighters. European officials promote the trade as part of the fight against climate change. Burning "biomass" from trees instead of coal, they say, means fewer greenhouse gases in the atmosphere. .... But ...scientists say, Europe's appetite for wood pellets could lead to more carbon pollution for decades to come, while also putting some of the East Coast's most productive wildlife habitats at risk. [3]*How Europe's climate policies led to more U.S. trees being cut down*, Joby Warrick, 2 June

It's a typical government intervention; confusing the causes of a problem (climate change) with the supposed causes of a problem (coal burning) and imposing a restricted (geographically limited to the EU) pseudo-solution to a problem that goes beyond politicians' sphere of influence. The result: government intervention makes things worse even on its own terms.

The same confusion arises in other areas, especially those where experts think they have all the answers. So we see the targeting of a surrogate indicator like blood cholesterol in medicine, through the mass prescription of statins, which might, but [4]probably [5]won't, do anything to reduce the overall health of a population - with large upfront and certain costs in terms of finance and side effects. Of one thing we *can* be certain: government [6]will not (pdf) look back at its policies and learn from its mistakes.

The solution, I think, is for governments to stick to what they are good at: articulating society's goals and raising the funds to achieve them. But, for complex social and environmental goals, government should contract out the actual achievement to a motivated [7]coalition of interests, which will have incentives to explore diverse, adaptive ways of achieving our goals. A Social Policy Bond regime would effect such a contracting out. The bonds, being [8]tradeable, would imply that this coalition could change, always to be composed of those who will be most efficient at achieving our goals. This, in turn, would mean that we could target long-term goals, including those, like climate change, that transcend national boundaries.

## 12.6.2 Why I don't like Social Impact Bonds (2015-06-05 17:57)

When I [1]first came up with the idea of Social Policy Bonds, their tradeability was an intrinsic part of their identity. Without tradeability, the bonds would be little more than prizes awarded to existing service providers for doing their jobs a bit more efficiently than previously. There's obvious scope for gaming here: perform badly, wait till the government issues SIBs, perform better, then cash in. But perhaps more important is the necessity for allowing new service providers - or, as I term them, outcome achievers - to buy the bonds at any stage and receive extra rewards, in the form of a rise in the market value of their bonds, for performing well. Without tradeability, that won't happen.

The way of the world is that big business and government go hand-in-hand. The way of Social Impact Bonds is equally familiar and equally dubious: government thinks it knows best who will deliver certain services and rewards them if they improve their performance. These will be existing service providers or, just possibly, new bodies upon which the government is equally keen to bestow favour for some reason or other. The whole point of my Social Policy Bond idea is to bring about creative destruction into the achievement of social and environmental outcomes. Under a Social Policy Bond regime new approaches *and new organizations will* be rewarded if, and only if, they are more efficient than anyone else. Social Impact Bonds won't do that: existing organizations will be favoured; they will have some incentive to perform their existing functions more efficiently, but little incentive to look at new approaches. For one thing, innovation risks rocking the boat. For another, SIBs, because they are not tradeable, are going to be restricted in their time horizon to that of existing

organizations: they will take a short-term view, relative to the complexity of our social and environmental problems. This is a major deficiency: it restricts the scope of the bonds to narrow, short-term goals. As well, the costs of monitoring progress toward such goals is going to be large relative to sums at stake.

Contrast this with Social Policy Bonds, which are not limited by the prejudices of government (or anyone else) as to *how* our goals shall be achieved nor *who* shall achieve them. So we can target long-term social goals that will inevitably require diverse, adaptive approaches: reduced [2]crime rates, for example, or improved [3]health. We can even target global goals, like [4]human development or the sustained avoidance of violent political [5]conflict. Governments that issue Social Policy Bonds don't have to take a view as to which organizations are best placed to achieve such goals, nor as to how they shall go about achieving them. That work is done by bidders for the bonds who will be motivated by the rewards they get for helping achieve the targeted outcome. Note the word 'helping': a single organization need not achieve the entire goal to be rewarded under a Social Policy Bond regime: helping raise the likelihood of early achievement of the goal will generate reward in the form of the increased value of the bonds they (or a contracting agent) owns. Social Policy Bonds encourage a coalition of interests, whose composition and structure will change in response to changing circumstances, to co-operate in exploring and implementing a diverse, adaptive array of initiatives with the aim of achieving our broad social goals, even ones as seemingly remote and unattainable as [6]universal female literacy or [7]world peace.

*For more on this see my short article: [8]why the bonds must be tradeable. Also [9]previous [10]blog [11]posts. For another critical view of SIBs (in New Zealand) see [12]here. Contact me if you would like to know more.*

### **12.6.3 Bonds in New Zealand (2015-06-07 17:24)**

This post is a follow-up to my previous post, where I discuss why I don't like Social Impact Bonds. Today, Sunday, there was a short tv [1]debate shown in New Zealand about using Social Impact Bonds to address mental health problems. My name is invoked at the five-minute mark. I would say that both protagonists are not quite correct. I'm against these SIBs only because they are not tradeable, because then there won't be much of the (necessary) innovation that the pro-SIB man, Stephen Franks, was talking about.

### **12.6.4 SIBs can be better than existing policy (2015-06-22 22:00)**

Though still [1]skeptical about [2]Social Impact Bonds - the non-tradeable version of [3]Social Policy Bonds - I do now think that under some circumstances they will be an improvement over existing policy. My main concern with SIBs is the danger that, being necessarily more narrow and short term than Social Policy Bonds, they will stimulate achievement of their targeted goals at the expense of people whose well-being isn't targeted for improvement. This possibility is lessened when the beneficiaries of a SIB regime are markedly disadvantaged. I am thinking now of the use of SIBs to target goals such as improving the well-being of the mentally unwell. (Here are arguments [4]for and [5]against the issuing of SIBs to brighten the employment prospects of mentally unwell people in New Zealand.) There will need to be provisos and careful monitoring, of course, as not all attempts to game a SIB regime can be foreseen and written into the redemption conditions of the bonds. But at this point SIBs are controversial, which is a positive in that it means that bondholders will want to ensure compliance with the bond issuers' intent and not only the bonds' legal stipulations.

The advantages of a SIB regime over existing policy arise from their rewarding of outcomes rather than activities. Not as effectively as a pure Social Policy Bond regime, to be sure, but they should nevertheless stimulate greater efficiency in current activities and some innovation of new activities - a big plus where existing policy is thought to be failing.

You'll notice that I still have my reservations about Social Impact Bonds. Being better than existing policy is not always a great recommendation, though it could mean a lot to those individuals who (as in the New Zealand example) are in urgent need of new approaches. A pure Social Policy Bond regime would represent a drastic change from current policy with, I believe, commensurate benefits for all. SIBs can be a useful intermediate step towards such a regime.

### **12.6.5 Scary (2015-06-30 19:18)**

Max Fisher concludes his long piece, *How World War III Became Possible*:

We may have escaped the Cold War, but we have not escaped the nuclear threat, which not only remains but is growing. The sense that this danger is resigned to history books, common in Washington and other Western capitals, is precisely part of its danger. It is another echo of the months and years before World War I, when the world drifted unknowingly toward disaster.

In April of last year, just after Russia had annexed Crimea, the London-based think tank Chatham House [1] published a report on the dangers of unintended nuclear conflict. It was not pegged to the events in Ukraine, and at that point few people, including the report's authors, saw Crimea as the potential beginning of a larger conflict. Even still, it was dire in its warnings. "The probability of inadvertent nuclear use is not zero and is higher than had been widely considered," it stated. "The risk associated with nuclear weapons is high" and "under-appreciated." Their warnings were widely ignored. As the report itself noted, the world has concluded, wrongly, that nuclear weapons no longer pose an imminent threat. Attention has moved on. But the seeds of a possible war are being sown in Europe. [2] *How World War III Became Possible*, Max Fisher, 29 June

You don't have to agree with all Mr Fisher's contentions to be scared by his discussion about how Russia and NATO might be sleepwalking toward devastating conflict. Still less should we be concerned to allocate blame. Probably there are faults on both sides, but trying to weigh them so as to have an opinion about which side is worse than the other is something a self-indulgence; understandable perhaps, given how powerless we ordinary people feel.

But I'd say we can do better than watch and debate on the sidelines. I cannot suggest a way out of any impending nuclear conflict, but what I do suggest is that we offer incentives for people to find ways of avoiding such a conflagration. Rather than leave everything to the politicians, ideologues, military men and the war-gamers, we could encourage people to back [3]Conflict Reduction Bonds that will be redeemed only when there has been a sustained period of nuclear peace. Backers could include any combination of governments, international organizations, non-governmental organizations and philanthropists, and their funds could be swelled by contributions from the rest of us.

The maintenance of nuclear peace is a goal that is ideal for solution via Social Policy Bonds:

- it has an unambiguous, verifiable metric
- existing policy doesn't seem to be working
- nobody now knows the best ways of achieving the goal
- the goal is long term
- the goal is likely to require a multiplicity of diverse, adaptive approaches.

Of course, the bond approach can run in parallel with existing policy, such as it is. It's likely to strengthen the hand of those whose activities seem to be working, as well as encourage new approaches, including those beyond current conception.

## 12.7 July

### 12.7.1 Health: it's complicated (2015-07-11 17:44)

At lower levels of general health we have a good idea about what's needed: basic sanitation, inoculations, and education about hygiene, for starters. A benign government with funds can

get things done. It gets a lot more complicated at the health levels prevailing in western countries. Here cause and effect are far more difficult to identify; there are huge numbers of, and possible interactions between, lifestyles and interventions that affect health. And these are changing constantly as our scientific knowledge grows. As well, lobbies are adept at influencing policy in their favour, often at the expense of the general health of the population. This is where an outcome-based approach can succeed where existing policy seems to have lost its way and is likely to be generating diminishing - even negative - returns.

Jerome Burn, [1]here, points out some of the flaws of evidence based medicine as practised in the rich countries. He quotes Dr David Unwin, a general practitioner in Liverpool, UK:

We had to balance evidence based medicine - you come with a problem; I give you a solution - with evidence based practise. That means drawing on my years of clinical experience, rather than just relying on guidelines, and applying it to patient's own experience. They are the expert on their lives, what they need and what works for them. Without taking that into account you are not going to change anything.

Mr Burn continues:

Even if charities or the government dug deep into their pockets and began to run many more RCT's [Randomised Control Trials] on lifestyle changes, they are the wrong tool to use. The lifestyle approach we need to integrate much more effectively into medicine doesn't involve just changing one thing - drug or no drug - it involves doing lots of things at once - for example: different diets and more exercise combined with psychological techniques such as stress reduction. RCTs have difficulties with such multiple interventions. Yet when they are tested they often turn out more effective than drugs.

The existing rich countries' healthcare systems don't encourage the approach that Dr Unwin and Mr Burn are advocating. What's more, they cannot do so. Drug companies' priority is to deliver returns to shareholders. One way of doing this is to influence government, which could not anyway gather, collate and exploit the data necessary to optimise the general health of the population.

Outcome-based policy, and Social Policy Bonds in particular, could be the answer. Improving rich countries' health is complicated and long term in nature. Existing policy isn't working very well. Broad metrics for physical health are fairly well established and robust. A gradual transition in the rich countries to a Social Policy Bond regime would reward efficient existing approaches and channel our limited funding into the most promising new ones. For more, see my essay on [2]Health Bonds.

### **12.7.2 Greenhouse gas emissions accelerating (2015-07-19 18:25)**

Michael Le Page, writes in [1]*New Scientist* (18 July) about the 'coal renaissance' and in particular about the heavy investments in coal power of poor, fast-growing countries in Asia and Africa. The result is that 'global CO<sub>2</sub> emissions are rising faster than ever. And they are likely to continue to grow.' Indeed 'not only are carbon emissions rising, the pace has accelerated since 2000'. A graph (in the print issue) illustrates this: emissions rose at an average rate of 1.3 percent a year from 1970 to 2000, and have been rising at 2.2 percent since then.

I have for years been pointing out the futility of the Kyoto agreement and other apparent attempts to cut greenhouse gas emissions. I favour a clearer identification of what we actually want to achieve. Is it reduced greenhouse gas emissions? Even with that exceptionally narrow and arguable goal (can we really identify all the greenhouse gases and weight their contribution to climate change accurately?), Kyoto, as Mr Le Page tells us, is a failure. Will reducing greenhouse gas emissions, even were we to be successful in doing that, actually affect the climate? To what end? Nobody knows. But perhaps Kyoto and its interminable followups is intended to be a respectable-sounding forum within which bureaucrats from all countries can talk to each other and syphon off enough taxpayers' money to bring up their families. Ok, yes, it's had more success there. But that's probably not an achievement that taxpayers support with enthusiasm.

We do need to focus on what we want to achieve. Climate Stability Bonds, which I advocate, don't need to be exclusively, or even partly, about aiming to reduce the variability of the earth's climate. We could target some physical and biological indicators of climate change, but we could instead, or as well, target social and financial measures, such as the numbers of people killed or made homeless by adverse climatic events and the cost of compensating them, or the costs of preventing the negative impacts from arising at all.

A bond regime would be sufficiently versatile to include all these indicators, and more. It wouldn't even require people to agree on the - [2]still [3]questioned - thesis that the climate is actually changing or that, if it is changing, it's something for which we are responsible. It would, though, require clarity and honesty about what we want to achieve. Hmm, perhaps that's why it's gone nowhere in the 25 years or so it's been in the public arena. But all is not lost, yet. For more, see [4]this page, and the links therefrom.

### 12.7.3 Targeting surrogate indicators (2015-07-26 19:06)

In the absence of broad, agreed, explicit goals, governments find it convenient to target surrogate outcomes. Climate change is one example: instead of targeting the adverse effects of climate change, governments target greenhouse gas emissions, which may or may not have something to do with climate change, and they target them in ways that even in their own terms achieve [1]nothing. More generally, instead of targeting anything as meaningful as human well-being, the de facto target of most governments is gross domestic product (or GDP per capita).

It's not just governments. It's big companies too. Instead of targeting anything that's inextricably linked to physical health ([2]Quality Adjust Life Years, for instance), they try to get us to focus on surrogate outcomes. Cholesterol levels are one such surrogate outcome. Statins have been the preferred - by the pharmaceutical companies - vehicle for reducing cholesterol levels but, now that their patents are running out, a new class of drug, PCSK9 inhibitors, [3]is on its way.

Reducing cholesterol levels might bring about a reduction in heart attacks, but it appears to do nothing for overall mortality. Indeed, overall mortality is not really a concern of many medical specialists, nor of big pharma. It's government that should be articulating our broad health goals. But in this, as in climate change and other policy areas, it's instead taking instruction from the wealthy and powerful, at the expense of the people it's supposed to represent.

## 12.8 August

### 12.8.1 Irrational health funding (2015-08-02 19:06)

This is irrational, but not surprising:

The [US] National Institutes of Health last month published a [1]startling analysis of how it allocates its funding: in 2010, HIV research received nearly \$3.1 billion in funding, while a deadly lung disease that has more than six times the health toll in the United States got only \$118 million. Two diseases with a similar health burden, breast cancer and chronic liver disease, received wildly different levels of support: \$763 million for the cancer best known for iconic pink ribbon awareness efforts, versus \$284 million for a disease commonly caused by alcohol abuse. Autism receives more than five times the funding of eating disorders, but their impacts on health, measured in years of disability and premature death, are quite close. [2]*Why the diseases that cause the most harm don't always get the most research money*, Carolyn Johnson, washingtonpost.com, 17 July

I've inveighed against this sort of bias in government policy for years. In health, as in other policy areas, I am sure that government is well meaning and hard working. But it suffers from its inherently uniform, top-down approach. Government can also be short term in its thinking, reactive rather than proactive, and disdainful of innovation while favouring tried, tested but failed approaches. It has to make its resource allocation decisions on the basis of data that are necessarily incomplete. How can it know in detail the effect that spending on, say, cancer diagnostic machinery will have on the overall health of the nation, as compared with subsidising the cost of nicotine chewing gum?

So, by default, health expenditure is influenced by groups of medical specialists with little incentive or capacity to see improvements in the overall health of a large population as an objective. Funding decisions are also heavily influenced by the public profile of a disease or its victims, rather than on what would best meet the needs of society. It's also a question of diet, exercise, transport, and culture. Recent research shows, for instance, the beneficial effects on health of green spaces in our cities (see [3]here (pdf) for instance). The way government is

structured, with its discrete funding bodies, makes it unlikely that such benefits will influence funding decisions.

We cannot expect a government nor any single organization to identify the huge numbers of variables, with all their time lags and interactions, that influence the nation's health. We can, though, devise a system that rewards people who explore and implement the most cost-effective health solutions, even when circumstances and knowledge are changing continuously. I have tried to do this with my [4]essay on Health Bonds, which would aim to distribute scarce government funds to where they would do most good, as measured by such indicators as [5]Disability Adjusted Life Years. One small caveat though: I'm assuming that most of us - at least in our most rational moments - favour such a distribution of health resources. But there is a possibility that the current (mis)allocation of resources originates in unvoiced but widely held preferences. Ms Johnson quotes one expert: "...we tend to underfund things where we blame the victim". It's unlikely that the large disparities in health funding outlined above do reflect such deliberate choices. But even if they do, it would be better to be explicit about it.

## 12.8.2 Hidden metrics (2015-08-06 21:00)

Hidden metrics, not to be confused with the [1]hidden variables of quantum mechanics, are one possible way of preventing the gaming that could otherwise result from targeting specific quantitative outcomes.

Let me explain. Say we are targeting [2]female literacy in Pakistan. We issue bonds that will be redeemed when the literacy level of 15-year old girls in Pakistan exceeds 95 percent each year over a ten-year period. Campbell's Law tells us, rightly I think, that:

The more any quantitative [3]social indicator (or even some qualitative indicator) is used for social decision-making, the more subject it will be to corruption pressures and

the more apt it will be to distort and corrupt the social processes it is intended to monitor. [4]Source

What metrics could we deploy that measure, accurately and inevitably, that which we want to achieve: namely, near-universal literacy for 15-year old Pakistani girls? We could subject every girl of that age to a standard reading test, but we know that academic tests and their results, even in developed countries, [5]are manipulated. Girls could be taught to the test (by, for instance, being given the test in advance and taught to memorise it by rote). Or anyone up the ladder from the administrators of the test to the collators of the results could be bribed to alter the data at any stage.

So instead we could take a random sample of, say, 100 schoolgirls from 100 districts around Pakistan at ten yearly intervals, and test them in non-standard ways for their literacy. We don't reveal which districts, let alone which girls, will be chosen; nor do we release exact details of the test. That makes it much harder to game the outcome.

More complex is the goal of [6]peace. Now, nuclear peace is relatively easy to target: we can issue bonds that will not be redeemed, say, until a thirty-year period has elapsed during which there has been no detonation (accidental or not) of a nuclear weapon that kills more than 100 people. But what about peace more generally? Hot wars are fairly easy to recognise and define and so would be correspondingly easy to deter using a bond regime. But there are more nebulous ways of fomenting conflict between states (Ukraine), or of ratcheting up tension to levels that severely curtail quality of life. In these instances we could use an array of metrics such as: trans-border movement of weapons, numbers of people killed or fleeing their homes. Even the lack of information could also be an indicator of conflict that could find its way into our calculations. We could also use survey data, such as attitudes about potential enemies, or expressions of fear. Other potential indicators are disruptions to food, water or electricity supplies and other results of damage to infrastructure.

The important point is that in this as in other goals, we need not and indeed should *not specify in advance exactly which combination of metrics and indicators* will be used to determine whether or not the bonds' redemption terms shall be deemed satisfied. In general, we try, as far as possible, to target metrics that are, or that are inextricably linked to, exactly what we want to achieve. Where that is difficult, we try to prevent gaming by not specifying too far in advance the exact redemption terms of the bonds. The aim, at all times, is for bondholders to comply with the spirit as well as the letter of the goals set by the backers of the bonds.

### **12.8.3 Where we're at (2015-08-16 18:34)**

How are Social Policy Bonds doing?

It's about 27 years since they first entered the public arena (see [1]here). In that time the Social Policy Bond idea has won praise from distinguished economists (point 8 [2]here), but no Social Policy Bonds have actually been issued.

It's not all doom and gloom though. There is widespread, though belated, recognition now that rewarding better performance in the public sector is a good thing, and non-tradeable variants of Social Policy Bonds are being issued on a trial basis in the UK, US, Australia and Israel. They are also being considered in New Zealand (see [3]here for a short video discussion). These bonds have various names including Social Impact Bonds, Social Benefit Bonds and Pay for Success Bonds.

I have my reservations about them, which I've expressed [4]here and [5]here. Essentially, their being non-tradeable drastically reduces the scope - in breadth and time horizon - of the goals that can be considered. They favour existing service providers, and their administrative costs are likely to be relatively higher than Social Policy Bonds. As well, because they aren't openly traded, they generate no price information that could be extremely useful to policymakers. Nevertheless, these bonds do reward greater efficiency in achieving their limited objectives, and they might well improve on current policy where that is particularly inefficient. They could therefore be a handy (and though I am hesitant to say so, necessary) first step toward a fully-functioning Social Policy Bond.

That said, I'd be disappointed that, as far as I am aware, the backers of all the Social Impact Bonds being issued have been, or will be, governments. I'd have much preferred the private sector, in the form of non-governmental organizations or philanthropists, take the lead. The bonds being issued are intended to help vulnerable or disadvantaged people and it seems regrettable in today's climate that the other beneficiaries of taxpayer funds will be financial intermediaries who will take their cut of the transaction costs. Indeed, it seems these bond issuers will benefit whether or not the bonds work as intended. If the bonds *do* work as intended, that's fine, but we should remember that they are an experiment and, it would be a shame if they come to be seen as a means by which the financial services sector syphons off yet more cash from taxpayers while contributing nothing (at best) to wider society. The

other danger is that if Social Impact Bonds fail - and especially if they do so while the brokers benefit - they could discredit the Social Policy Bond concept. For many reasons, therefore, I hope they succeed....

#### 12.8.4 Smoking and obesity; anxiety and sirens (2015-08-18 14:28)

The UK has seen an onslaught against tobacco smoking. At the same time cases of diabetes are [1]soaring, such that 'diabetes medication now accounts for 10 % of the NHS [National Health Service] drugs bill'. Research appears to [2]show that people who give up smoking put on weight.

By doing everything possible to suppress smoking has the UK Government unwittingly encouraged obesity and diabetes? Do the social costs of more obesity and diabetes outweigh the benefits of less smoking? I have no idea, but the important point is *how little it is in anybody's interests to answer these questions* and use their answers to influence government policy. With smoking the government has had an easy ride: 'everybody knows' that smoking is bad for you, just like 'everybody knows' that taking illegal drugs is bad for you, as is drinking alcohol. You see where I am going here: road traffic [3]kills 1.24 million people annually worldwide, but there are benefits to it as well as costs, as there are for drinking, taking illegal drugs and, yes, smoking, especially, but not only, insofar as people who are denied the opportunity of smoking then may be more likely to become obese and diabetic. These costs aren't easy to calculate of course, but government has created an environment in which nobody has an interest in doing those calculations. Instead, seeing that smoking directly and obviously causes some diseases, it reacts in the Pavlovian, short-term, one-size-fits-all manner that it, in common with [4]other governments, adopts when they encounter the symptom of a problem. [5]So now, in England: 'work smoking rooms and areas are no longer permitted. All smokers must take their smoke breaks outside.' I've no doubt that rates of lung cancer and other diseases directly related to smoking have fallen as a result. But, as well as the costs to freedoms of the campaign against smoking, there are also the indirect costs to physical health, possibly taking the shape of increased rates of obesity and diabetes. The cancer specialists, and the well-meaning (though perhaps hysterical and self-righteous) anti-smoking lobby have no incentive or capacity to see whether smoking bans help or damage the *overall* health of people. Nor, under the current policymaking regime, are there any incentives for others to do so. And smokers are an easy target. Car drivers not so much.

We see the same in the area of mental health. The small city in which I currently live is blighted, maybe 20 or 30 times in every 24-hour period, by emergency vehicle sirens. Designed to create alarm and panic, that is what they do, to thousands of people, day and night. I have no doubt that these sirens shave a few seconds off the average journey time of the police, fire and ambulance vehicles. And those few seconds, might, on occasion, make the difference between life and death. But has anybody looked at the costs in terms of mental health of these sirens? It's no surprise that [6]urban living is 'found to raise the risk of anxiety disorders and mood disorders by 21 % and 39 % respectively'. Physical health too: we may well be at the point where, as well as their reducing the quality of life of thousands of citizens every day, these sirens create more accidents than they help ameliorate by disturbing sleep patterns and inducing panicky responses in other road users and members of the public. Again, under the current policymaking regime, *it's in nobody's interests to find out*.

If government is to intervene in matters of health, it must look at the *overall* physical and mental health of its citizens. There have been, and no doubt still are, areas in which relationships between cause and effect are easy to identify. Provision of sanitation for instance, is clearly beneficial. I'd also support bans on smoking in all areas where there will be children and adults who don't choose to be exposed to the fumes. (That would be on aesthetic as well as health grounds.) But society is complex, as are the human body and mind. Most scientific relationships aren't easy to identify; and they vary over space and they change with time. We need policies that allow for diverse, adaptive approaches and that target broad mental and physical health, rather than particular maladies.

I offer my suggestion in [7]this essay, which applies the Social Policy Bond principle to health care. Briefly: governments would target for improvement the health of the population, as measured in Quality (or Disability) Adjusted Life Years. Bonds would be redeemed only after sustained periods of improved health. A bond regime would reward the most efficient ways of improving health by channelling society's scarce resources into the areas where they could do the most good. Unlike today's healthcare systems, it wouldn't assume that a one-size-fits-all approach, based on fossilised science, is good enough for everybody, for all time.

### 12.8.5 BMI: the GDP of health (2015-08-30 17:50)

I've railed [1]many [2]times about the inadequacies, and worse, of using Gross Domestic Product as the *de facto* indicator of social well-being. Which it has become, in the absence of any serious thinking about the social goals we want to achieve and the priorities we give them.

A similar phenomenon seems to have occurred in the world of health, where the body-mass index ([3]BMI) is a long-used measure of obesity. BMI is body mass in kilograms divided by the square of the body height in metres. Apparently, as measured by BMI, obesity in the US plateaued around the year 2004 at 35 percent of the population. But, just as GDP ignores such things as leisure time, state of the environment, income distribution; and counts useless or anti-social economic activities as positives, so too does BMI have its flaws:

It does not consider distribution of fat, type of fat, muscle tone, age, sex, or even big bones. In spite of these flaws, healthcare professionals continue to use BMI as a guideline. A BMI of 20-25 is considered 'normal', and anyone larger or smaller is automatically counselled to achieve a healthier weight. .... Obesity is generally understood as a risk factor for heart disease, stroke, cancer, and diabetes, as well as an increase in overall mortality. Excess body weight also increases stress on joints and internal organs. Given these concerns, it's easy to understand why so many people have celebrated the plateau in BMI. Unfortunately...BMI may not be the best measure of obesity. Your percentage of body fat and waist or abdominal circumference are far more reliable personal indicators of health outcomes than BMI. For example, central obesity, measured by waist circumference, is a more accurate determinant of personal risk and shows an even stronger correlation with poor health outcomes.

Caroline Weinberg,

[4]*Fat but fit?*, 'Aeon', 27 August

There is no clarity about goals. If our intention is to improve the health of people, why not [5]target indicators of people's health, instead of easy-to-calculate but flawed measures such as BMI? If our intention is to prevent disasters arising from adverse climatic events, why not [6]target for reduction the negative impacts of such climatic events, instead of atmospheric carbon dioxide levels or temperatures recorded in weather stations? If our intention is to improve social well-being, why not [7]target indicators of social well-being instead of those economic activities captured by GDP?

BMI, greenhouse gas emissions, GDP per capita: they might answer certain specific questions, but their use as policy instruments is inadequate at best, dangerous at worst. Policymakers need some humility here: neither they nor their advisors know the best ways of improving health, preventing climatic disasters or improving social well-being. Even if they did, at one

particular point in space and time, circumstances vary with region and our knowledge grows with time. No government, no single organization can hope to use fossilised knowledge on a one-size-fits-all basis and achieve meaningful results. Instead, policymakers should set broad goals, and let a motivated coalition of interests explore diverse, adaptive approaches aimed at achieving society's broad social and environmental goals. Government can set these goals and, indeed, it is probably the organization best suited to doing so. And, if it concentrated on that, it would come up with a better array of target outcomes than the flawed indicators it now uses, whether explicitly or not.

Government can also raise the revenue to reward the people who achieve these outcomes. But it has no business dictating how they shall be achieved, nor who shall achieve them. We need diverse, adaptive approaches, and those are exactly the sort of approaches that government discourages.

## 12.9 September

### 12.9.1 Climate change: current policy is doomed to fail (2015-09-10 17:23)

[T]he representation of clouds in climate models (and of the water vapour which is intimately involved with cloud formation) is such as to amplify the forecast warming from increasing atmospheric

CO<sub>2</sub>

—on average over most of the models—by a factor of about three. In other words, two-thirds of the forecast rise in temperature derives from this particular model characteristic. Despite what the models are telling us—and perhaps

*because*

it is models that are telling us—no scientist close to the problem and in his right mind, when asked the specific question, would say that he is 95 per cent sure that the effect of clouds is to amplify rather than to reduce the warming effect of increasing

CO<sub>2</sub>

. If he is not sure that clouds amplify global warming, he cannot be sure that most of the global warming is a result of increasing

CO<sub>2</sub>

. *Uncertainty, scepticism and the climate issue*, Garth W Paltridge, in '[1]Climate Change: the Facts,' edited by Alan Moran, 2015

The 'forecast rise in temperature' referred to by Professor Paltridge is that made by the Intergovernmental Panel on Climate Change (IPCC). The book in which Prof Paltridge's essay appears is a collection of skeptical essays, and one which, like the website [2]Watts up with that? is at first persuasive to non-scientists like myself. But then so too are most of the arguments on the other side of the debate; the ones agreeing with what has become the mainstream view, that anthropogenic climate change is happening. (There's also an equally convincing website: [3]RealClimate.org.)

We know that science is not a consensual process. So what are policy people to make of these irreconcilable differences? We can all agree that there are uncertainties, not only about the fact of climate change but also about the details: the magnitudes, the causes, the impacts. We can also agree that these uncertainties are not going to disappear any time soon. Conventional policy has a hard time trying to deal with such uncertainty. It seeks to identify, with a high degree of certainty, those causes, magnitudes and impacts of climate change, then come up with something to tackle the root causes. Conventional policy has identified greenhouse gases as those causes and keeps coming up with measures aimed at cutting emissions of those gases into the atmosphere. Or, more cynically, aimed at pretending that such cuts in emissions will happen: these measures are unpopular, divisive and expensive. As well, the costs are all upfront and the *climate* benefits - there's almost universal agreement about this too - will be slow in coming and probably not very significant. (It's likely any cuts will have beneficial effects on things other than climate, but they are not driving policy.)

Conventional policy, then, is failing. I think there's a broad consensus about that too. Some think it's too little; others think it's too drastic. But either way, it's not good enough. Even in their own terms, Kyoto and subsequent agreements are [4]failing.

So here's my suggestion. Instead of targeting what might or might not be the cause of what might or might not be anthropogenic climate change, why not target exactly what we want to achieve? It could be an array of ranges within which physical, biological, social and financial indicators must fall, for a sustained period. We could aim for relative and sustained stability in those indicators that are important to plant, animal and human life. A [5]Climate Stability Bond regime would do this, *regardless of what we currently think is driving the climate*. It is not only clouds (see excerpt above) whose contribution is uncertain: it's the relative contribution of the various greenhouse gases or any of a large number of other variables, anthropogenic or not. The conventional approach, which looks for root causes before doing anything significant, isn't working, *and cannot work* when our knowledge of such causes is expanding rapidly. Climate Stability Bonds, as well as being versatile in the range of variables that they target, would reward people who achieve our goals, whoever they are and however they do so. Bondholders would do the work of identifying the causes and effects of climate change on a continuous basis. They would research, explore and implement those measures that will achieve the best return on our scarce resources. They will, very probably, implement a very broad range of measures on a diverse, adaptive basis: something that no government or supra-national body can do.

There are things that governments can do well. Indeed, there are things that only governments can do at all. These usually are areas in which causal relationships are clear and stable, and the benefits of an established approach are large and unchallenged. None of these conditions apply to climate change. It's time for a different approach.

### 12.9.2 The root causes of war: don't bother (2015-09-21 19:55)

A Social Policy Bond regime makes inescapable the need to think about what we want to achieve. This should be an essential discipline, but in some instances it's never followed. There's much obfuscation - deliberate or not - and far too much attention given to identifying supposed 'root causes' at the expense of effective policy.

Take violent political conflict. It's still going on, killing, maiming and making homeless millions of people every year. The numbers so affected [1]might be falling, but that says [2]nothing (short pdf) about possible major violent future events. We could spend years analysing past outbreaks of war, but still never get close to identifying root causes in ways that forestall future outbreaks. Society is just too complex, diverse and fast-changing. Policymakers should begin by specifying society's desired outcomes, rather than distracting or indulging ourselves by trying to identify root causes - except perhaps for simple, relatively static, policy environments.

A bond regime wouldn't try to identify the root causes of war, which are a [3]moving target anyway. Instead it would start by specifying exactly the outcomes we want to achieve, and then injecting market incentives into achieving those outcomes. [4]Conflict Reduction Bonds are the means by which I propose we begin to end all war for all time. It's not idealism. It's giving incentives to motivated people to find solutions, rather than simply to turn up to work for a bureaucracy, corrupt or not.

### 12.9.3 Volkswagen: no surprise (2015-09-22 19:28)

[D]rivers of almost half a million cars in the US have now suddenly found that they are driving round vehicles which are a lot worse for the environment than they thought. The rigged tests masked the fact that these cars emit up to 40 times the legal limit of pollutants. And now VW has said that as many as 11 million cars worldwide could be affected. [1]VW scandal threatens 'Made in Germany' brand, BBC, 22 September

Social Policy Bonds have big advantages over conventional policy when addressing a problem like air pollution caused by millions of point sources. Conventional policy cannot effectively measure the pollutants emitted by any more than a few major sources, and then reward or punish the emitters accordingly. What might work for power stations or cement factories won't work for cars or households. Corporations (like Volkswagen) have every incentive to cheat the system, and individuals have every incentive to go along such cheating. The bureaucratic burden of measuring the pollution generated by millions of machines or people is not just a misallocation of resources: it's likely to be intrusive and divisive. Plus, it's not a very exciting job.

Social Policy Bonds can help. They're at once both more direct and more versatile. So instead of targeting the air pollution generated by millions of point sources, they can target an array of pollutants, weighted according to lethality, and let the market for the bonds work out, dynamically, the best ways of achieving our pollution reduction goal. I first [2]wrote about this approach back in 1991. My views haven't changed since then, so I won't repeat them here.

#### **12.9.4 Five-year survival rates: another Mickey Mouse indicator (2015-09-26 20:31)**

Health statistics are tricky and, when they're used to make a case for increasing or diverting funding, we need to be especially vigilant:

Research published in the European Journal of Cancer shows the UK has the worst survival rates for cancer in western Europe, with rates one third lower than those of Sweden. [1]UK cancer survival worst in western Europe, 'Daily Telegraph', 26 September

The article gives examples:

Five-year breast cancer survival was 79.1 per cent in England, 78.5 per cent in Scotland, and 78.2 per cent in Wales. In Sweden the figure is 86 per cent, with an European average of 81.8 per cent. In England, 80.3 per cent of men with prostate cancer were alive five years later, compared with 90.2 per cent in Austria, 90 per cent in Finland and a European average of 83.4 per cent.

At first glance, this seems an indictment of the UK's approach to diagnosing and treating cancer. But the five-year survival rate needs interpretation: it is the proportion of patients still living five years after diagnosis. We can improve the five-year survival rate by better treatment, which is unambiguously good, or by *earlier diagnosis*, which is far more questionable. Earlier diagnosis can simply mean more intervention and more treatment (and more side effects), but does not necessarily lead to a reduction in the cancer mortality rate - which is a far better indicator of healthcare efficiency than the five-year survival rate.

A Social Policy Bond regime aiming at improving the overall health of a population would refine and target more-robust indicators, such as mortality and longevity, and would do so impartially. For more about Health Bonds, click [2]here. For more about how misleading are five-year survival rates click [3]here or [4]here.

## 12.10 October

### 12.10.1 Biology, engineering, and Social Policy Bonds (2015-10-01 22:05)

An academic paper about the use of the Precautionary Principle says:

Significantly, the failure of traditional engineering to address complex challenges has led to the adoption of innovation strategies that mirror evolutionary processes, creating platforms and rules that can serve as a basis for safely introducing small incremental changes that are extensively tested in their real world context. This strategy underlies the approach used by highly-

successful, modern, engineered-evolved, complex systems ranging from the Internet, to Wikipedia, to iPhone App communities. [1]Source (pdf)

The paper justifies the application of the Precautionary Principle where 'ruin', defined as low-probability, infinite cost policy outcomes, is a nonzero possibility.

Importantly, it also recognises the positive role that evolutionary processes play in engineering. As the authors say, this mirrors biological evolution. It results in more robust outcomes. I suggest we adopt the same mechanism for society's broad, long-term goals: create a policy environment within which diverse, adaptive approaches are tried, and only the most successful (in their place and time) are given the funds necessary to continue and proliferate. There's very little of this in today's policy world. The necessary first step, self-evaluation, [2]is rare. Even less frequent are learning from failed policies and applying those lessons to current policymaking.

Explicit acknowledgement of the need for failed approaches is probably rare in engineering; it's equally unusual in the world of policy. But, society is approaching the complexity of that of biology. For those broad, long-term goals that we have failed to achieve ([3]ending violent political conflict, for instance), it's clear that no single, top-down approach is going to work - especially one based on relationships that apply in only one part of society or at only one point in time.

That's where Social Policy Bonds can play a role. A bond regime would target society's long-term problems: problems that no single approach can ever solve. Investors in the bonds would have incentives to try many different approaches, and to continue to fund only those that are working efficiently at achieving society's goals. Unlike in today's world, failing projects would be terminated: bondholders would be motivated to end them swiftly, rather than, as today, lobby for government funds to keep them going. A Social Policy Bond regime would create [4]new types of organization, whose activities would be entirely subordinated to achieving social goals efficiently. The bodies that currently are charged with achieving social goals are rarely paid in ways that encourage better performance. (Indeed, very successful organizations might even be punished by seeing their funding reduced.)

In policy, as in biology and engineering, we should let evolution do what it does efficiently: encourage a wide array of approaches and reward only those that are most successful for their time and place. Social Policy Bonds would do exactly that.

### 12.10.2 Environmental policies that hurt the environment (2015-10-05 18:38)

As cities move beyond recycling paper and metals, and into glass, food scraps and assorted plastics, the costs rise sharply while the environmental benefits decline and sometimes vanish. “If you believe recycling is good for the planet and that we need to do more of it, then there’s a crisis to confront,” says David P. Steiner, the chief executive officer of Waste Management, the largest recycler of household trash in the United States. “Trying to turn garbage into gold costs a lot more than expected. We need to ask ourselves: What is the goal here?” [1]*The reign of recycling*, John Tierney, 3 October

Say no more. Or rather, say it again and again: what is the goal? Recycling is not a goal: it is an alleged means to ends that remain unspecified. We’d do better to think about those ends, specify them, and then encourage people to achieve them. Recycling can and does play a role, but not always, as the article excerpted above shows.

We see something of the same lack of clarity about environmental goals in the recent Volkswagen debacle. A recent article title sums it up: [2]*The Volkswagen diesel scandal was driven by carbon obsession*:

From 2001, punitive rates of up to £500 were applied to cars [in the UK] which emit carbon emissions of more than 225g/km, while cars below 120 g/km were treated to token road-tax rates. As manufacturers quickly discovered, the only way to get many vehicles below these thresholds was to make them diesel. It was well known that diesel engines produced large amounts

of tiny

carcinogenic soot particles, but this was brushed over. Particulate emissions were meant to be dealt with by filters, yet these are known to become blocked if engines spend too much time idling, as they do on urban roads. Diesels also produce far higher levels of nitrogen oxides, the subject of the VW scandal. Ross Clark, 3 October

A Social Policy Bond regime would improve on this sort of random policymaking. Certainly, the first steps would be difficult, but they are essential: defining the environmental goals we want to achieve. Most likely, we'd target for reduction pollutants that adversely affect human, animal and plant life. The bonds are sufficiently versatile that other objectives could be simultaneously targeted. The important thing is that, under a bond regime, we'd be targeting meaningful goals according to their lethality, rather than their media profile.

*For more about application of the Social Policy Bond concept to the environment start [3]here. There are also numerous posts about the environment on this blog.*

#### 12.10.4 How to avoid societal collapse (2015-10-16 22:34)

We haven't evolved to think long term and globally, according to [1]Joseph Tainter, author of [2]*The Collapse of Complex Societies*. In a recent and fascinating podcast interview Dr Tainter sees the collapse of the Roman empire as a template for societal collapse:

Everything the Roman government did in the short term was rational. Everything they did made sense at the time they did it. It's the long-term consequences that they couldn't foresee. ... It's the long-term cumulative effects that do the damage, and these are unforeseeable. [3]*Societal Complexity and Collapse, 'Omega Tau'*, 13 October

It is this lack of an over-arching objective that is (and, I suspect, always has been) missing from policy. At almost every level of policymaking we do not explicitly target the crucial goal of societal survival. We cannot anticipate and so we cannot, with our conventional policymaking process, forearm ourselves against all possible threats to society. That's because conventional policymaking relies on some body (usually, at the national level, government) trying to anticipate threats and then work out the best ways of dealing with them. But the most potent threats are those likely to be long term in nature and to arise from outside the purview of the policymakers - precisely the qualities that evolution has not equipped us to tackle.

What we can do though is this: target societal survival, *whichever threats to it might arise*, and reward people for achieving it, *however they do so*. We don't know what these threats will be and we don't know who will be best at nullifying them nor how they will go about doing so. But, under a [4]Social Policy Bond regime, we don't need to know any of those things. We issue bonds, at the national or global level, that target the avoidance of such calamities as [5]violent political conflict (war or civil war) or other [6]disasters, natural or man-made. These bonds, floated on the open market, become redeemable for large sums, after a long period of societal survival. Policymakers don't need to identify specific threats, nor debate about their significance or relative priority. Investors or would-be investors in

the bonds would do all that, and would be motivated to do so continuously, throughout the targeted time period: which could be two or three decades in length (after which, similar bonds could be issued for a further period).

Social survival is perhaps our most important goal: it's worth targeting it explicitly and motivating people to find the most efficient ways of ensuring it. We cannot and should not look to government to take care of threats to our survival. But we can - and should - set in place a regime that explicitly targets our long-term survival and rewards its achievement. With Social Policy Bonds we can do that.

### **12.10.5 Climate change: the fundamental question (2015-10-26 18:55)**

Social Policy Bonds impose a useful discipline on policymakers. They oblige us to be very clear about what we want to achieve. Nowhere is this more necessary than with climate change. The fundamental question, which I don't see posed in policymaking circles or indeed anywhere else is:

*Are we more concerned about climate change, or about the impacts of climate change on human, animal and plant life?*

There seems to be a pervasive assumption that the most efficient way of mitigating the negative impacts of climate change is to reduce that which current science suggests (but does not know for certain) are one of its major causes: greenhouse gas emissions.

A Social Policy Bond regime would not make that assumption. Instead we would specify very clearly what we want to achieve. We would express our policy goal as a combination of physical, social, biological and financial measures that must fall within specified ranges for a sustained period. Only then would holders of [1]Climate Stability Bonds be paid out.

In fact, there's a strong case for ensuring that policy be independent of our views about what's happening to the climate. For instance: a family made homeless by an earthquake or a missile is just as homeless as one made homeless by rising sea levels. Perhaps we should target for reduction the human cost of [2]all disasters, whether caused by adverse climatic events, other acts of God, or by man. Impacts on animal and plant life could be targeted by [3]other bond issues.

Unfortunately an entire bureaucracy has grown around climate change as a discrete problem. It seems to me that the existence and activities of this bureaucracy embody the assumption that our trying to influence the climate is the most efficient way of dealing with problems caused by unfavourable changes in the climate. I think that assumption needs to be challenged.

### **12.10.6 Loyalty ... to what? (2015-10-28 20:13)**

My [1]previous post mentioned the climate change bureaucracy. Underpinning that bureaucracy are two assumptions: that it's better to deal with climate change than with its effects; and that cutting back greenhouse gas emissions is the best way of dealing with climate change. But what if those assumptions wrong? Would the climate change bureaucracy reform itself?

Freeman Dyson reviews a biography of Max Planck:

My  
Princeton colleague Albert Hirschman  
published in 1970 a little book with the  
title *Exit, Voice, and Loyalty* ....., exploring  
these issues in a different perspective.  
Hirschman was writing as an economist about large-scale enterprises that  
he had seen in many countries, beginning with the railroads in Nigeria  
and ending with the American war in  
Vietnam. In each of these enterprises,  
gross failures were manifest, and the

individuals occupying positions of responsibility had to choose between three alternative responses. Exit meant to quit the enterprise. Voice meant to stay on the job but speak out publicly for change of direction. Loyalty meant to stay on the job and give support to the continuation of failing policies. Hirschman observed that in the majority of enterprises, voice is sadly lacking. Most people choose loyalty and very few choose voice. Those who choose exit have only a small effect on the enterprise. If gross errors and injustices are to be corrected, voice must be fearless and fierce, loud enough to be heard. [2]*Max Planck: the tragic choices* (subscription), Freeman Dyson, 'New York Review of Books', 22 October

"Most people choose loyalty": with existing organizations this means loyalty to the people in control and their way of doing things. It's perfectly understandable: most organizations have worthy-sounding goals and are staffed by ethical, hard-working people. I have met such people who work to ensure compliance with the Kyoto agreement's climate commitments. Their loyalty - naturally, understandably, but regrettably - is to the climate change bureaucracy. Though they may express private doubts about the value of their work, they feel they are in no position to question the bureaucracy that employs them *or its underlying assumptions*. The bureaucracy has an inertia of its own; it continues living and breathing and trying to grow, even when its goals conflict with those of society.

That is what conventional organizations do. Under a Social Policy Bond regime though, things would be different. A bond regime would lead to [3]new kinds of organizations: ones whose composition, structure and range of activities would be subject to continuous change. Their entire purpose would be to achieve society's goals, as expressed in the redemption terms for Social Policy Bonds. Their composition and activities would depend entirely on how efficient its members and projects are in helping to achieve that goal. Assumptions as to *who* is best placed to achieve society's goals or *how* they will go about achieving those goals would be subject to continuous questioning by would-be investors in the market for the bonds. These investors would have interests exactly congruent with those of society as a whole: to achieve our social and environmental goals as efficiently as possible. They would, in short, be loyal to society's goals rather than, as at present, to a hierarchy, ideology or dubious assumptions.

## 12.11 November

### 12.11.1 "There's no money in health..." (2015-11-06 22:57)

[1]Suzanne Beachy talks to [2]Dr Peter Breggin about the loss of her son 'due to psychiatry's failure to offer beneficial, caring human services, and indeed due to psychiatry's opposition to them.':

There's no money in health; there's only money in managing illness. Suzanne Beachy, [3]Dr Peter Breggin Hour, 4 November

Ms Beachy is relating her experiences in the US, but the same applies to most western countries. The concept of 'health' is not one that can be readily addressed by our existing institutions. It suffers because it results from a huge number of influences, and because our institutions have grown up during times when that number of influences was much smaller. So these institutions and the systems they embrace aren't as good a fit in today's complex society's as they used to be. Curing short-term illnesses is a relatively visible and quantifiable activity. Treating or managing poor health can also be reduced to a series of procedures that can be performed by our current health care providers. Sure, clinical trials are performed, pills and equipment sold, and a whole array of indicators is measured and targeted. But much about the clinical trials - who performs them, how they're performed and which ones are quietly ignored - is [4]questionable, and many of the targeted indicators are [5]Mickey [6]Mouse at best. They have evolved to measure highly specific rates of activity, rather than outcomes that are meaningful to ordinary people, healthy or sick. The result is exactly what Suzanne Beachy experienced: a system that motivates people and institutions to manage illness rather than optimise health.

Here's another approach: measure the broad health of society, and target that for improvement. Society is so complex, and our knowledge about society and science is growing so rapidly that no government, however altruistic, generous, or far-sighted, can know how best to maximise our physical and mental well-being. But what a government *can* do is put in place a system that gives people incentives to find the most efficient ways to maximise society's health *continuously*. In short, government can apply the Social Policy Bond principle to society's physical and mental well-being and issue [7]Health Bonds.

### **12.11.2 Terror: too much too late (2015-11-15 18:44)**

There is one simple solution to the problem of terrorism: kill lots of people, of which some are certain to be terrorists. Choose a terrorist-rich area, and if you kill everybody within it, then you can be sure no terrorists will originate from there ever again. It's a cruel policy and also a stupid one, in that it's likely to create resentment outside the killing zone, which will generate more terror later. Of course you can enlarge the killing zone, create a desert, and call it peace, but you cannot do that indefinitely, and the costs to everybody rise hugely as your killing zone expands. Unfortunately, politicians, the military and the public want a simple solution, and the Tacitean desert approach seems to be the policy of choice in today's world. It's the 'too much, too late' option, which, arguably, has led to numerous devastating wars.

I have another idea. Let's recognise that there is no simple solution. That it's likely that only a combination of different approaches, varying with time and over geographical area, will work, and that our goal is a sustained period during which terror will not occur. There are initiatives now that can help achieve that goal, But they're not co-ordinated and are heavily outweighed by the reactive policies of governments under pressure to 'do something' when an outrage occurs. Almost all the incentives on offer are to those with a strong interest, conscious or not, in keeping conflict going. This means the military, the men of religion, the ideologues on all sides, and the millions of intimidated and frightened ordinary citizens.

We need to put in place a system of countervailing incentives; one that encourages diverse, adaptive approaches, and one that will reward people who oppose or undermine the interests that generate conflict. We should focus on the long term, so that our goal would not be undermined by policy changes or unconsidered reactions to outrages. One way of doing this

would be by issuing Conflict Reduction Bonds. These could be backed by any combination of governments, non-governmental organizations, philanthropists and ordinary citizens, whose funds would reward the achievement of *a sustained period* of global (or regional) peace. Incentives under a bond regime would cascade down into all sorts of initiatives, glamorous or not, high level or low level, bottom up or top down, old-fashioned or innovative: efficiency in reducing the prospects of conflict would be the sole criterion for the allocation of funds. For more see this previous [1]post, or my [2]papers on applying the Social Policy Bond concept to conflict reduction.

### **12.11.3 The bias against unglamorous diseases (2015-11-21 18:57)**

From a letter to the editor of *the Economist*:

[R]oughly speaking, mental health receives only about half the research funding it should in America, based on its health burden. The problem is that many interest groups lobby Congress vigorously for research funding for their disease. Patients with mental illness do not yet exert that kind of political pressure. [1]letter from Michael Hanna of Mercury Medical Research & Writing, 'the Economist' dated 21 November

It's striking how unrelated is healthcare funding to need. Medical experts have little capacity or incentive to see beyond their own institution or speciality. Government - and not only in the US - responds to pressure from interest groups and allocates funds accordingly. Slipping through the cracks are unglamorous diseases including mental illness. Even within a class of diseases, such as cancer, funding discrepancies are stark: [2]this paper looks at the UK. I think government here is failing in its purpose. It should target for improvement the broad health of all its citizens rather than merely respond to lobbyists, however dedicated, sincere and hard working. It should, as far as possible, be impartial as to the causes of ill health, and direct resources to where they can return the biggest health benefit per dollar spent. Applying the Social Policy Bond principle to health could do this. For more, see my short paper on [3]Health Bonds.

#### **12.11.4 Climate change, again (2015-11-27 21:29)**

I posed this question [1]before but it bears repeating: are we more concerned about climate change, or about the impacts of climate change on human, animal and plant life? The popular assumption is that the most efficient way of mitigating the negative impacts of climate change is to reduce that which current science suggests are one of its major causes: greenhouse gas emissions. But we don't know that for certain, and we don't know the degree to which we can do anything about it. And we'll never know whether any of the costly policies suggested in this article will have had any impact whatsoever. It would seem preferable to spend our scarce resources on dealing with the impacts of adverse climatic events - whether they're caused by greenhouse gases or not. Floods are just as devastating whether caused by greenhouse gas (ghg) emissions or not. [2]Climate Stability Bonds would, in fact, encourage ghg emission cuts if they are found to be the most efficient way of dealing with the adverse impacts of climate change on human, animal and plant life.

When I wrote along the above lines to an internet comment forum, one respondent said: 'What you don't do is cause a problem, then ignore it while you "fix" the symptoms.' My response is that we should not be dogmatic about whether we tackle causes or symptoms. The 'cause' of a large proportion of the crime problem is 'young men': we don't force all boys to undergo a sex change just so we can save money on a justice system.

There are undoubtedly symptoms whose root causes we can identify readily and address. There are others whose root causes are currently unknown or too expensive to tackle. We could still, with Social Policy Bonds, target the symptoms for solution and motivate bondholders to work out whether or not the best way of dealing with them is to go after possible root causes. There are [3]problems whose root causes might never be unambiguously identified. But if we issue [4]Conflict Reduction Bonds, for instance, there's no need to resign ourselves to living on a planet wracked by war.

## 12.12 December

### 12.12.1 But who allocates the funds? (2015-12-03 23:37)

From 'the Economist', in a feature about climate change:

Energy firms do not spend a lot on research because there is no product differentiation in energy (electrons are electrons) and thus nothing exciting to sell until the price falls below that of the existing technology. So taxpayers will have to stump up most of the cash. If more money were forthcoming, a good deal of it would be wasted on dead-end projects. But that is the nature of research and development. [1]*Second-best solutions*, 'the Economist', 28 November

I'm not sure whether funding research into alternative ways of generating electricity is a goal that ordinary people would find meaningful. But putting that aside, and assuming that 'taxpayers will have to stump up most of the cash', there are better ways of allocating that funding than via the usual activity-based, outcomes-don't-matter, formula that typifies government research programmes.

My proposal would be for the government to do what it's good at: (1) raising the necessary funding and (2) specifying a goal to be achieved, but then to bow out and allow a motivated private sector to allocate the funding to its chosen projects - something that economic theory, and all the evidence, suggest it can do more efficiently than the central planners in government. Social Policy Bonds *could* directly target cleaner electricity production, though I'd prefer they target broader and more obviously meaningful goals. Either way, a bond regime would lead to diverse, adaptive projects and bondholders would have powerful incentives to back only the most efficient ways of achieving whatever goal is specified. When government allocates funding, all sorts of criteria other than maximising returns per taxpayer dollar creep in. And we don't need to go beyond the energy sector to [2]see [3]that.

### **12.12.2 Metrics for climate change (2015-12-08 19:44)**

*The Economist* discusses metrics for climate change:

[T]aking the world's temperature is not as easy as it sounds. Different parts of the planet warm at different rates, as do different layers of the atmosphere, so all sorts of corrections have to be applied to arrive at a single number. A truly simple, and arguably better, approach would be to use concentrations of greenhouse gases—the cause of the warming—as putative maxima. These gases mix rapidly into the atmosphere, so are easily sampled in ways that brook little dissent. [1]*Goal difference*, 'the Economist, 5 December

I disagree, partly because greenhouse gases are not the sole cause of warming: we do not know, for instance, how big are the relative contributions of deforestation (through changes in albedo as well as carbon emissions) or different cloud types. Some proportion of climate change also comes from natural (non-anthropogenic) events. At least as importantly, our views about the greenhouse gases' relative contributions change dramatically with our growing scientific knowledge. There would, then seem to be a pragmatic basis, as well as the case for broader public engagement, for instead targeting for reduction the impacts on human, animal and plant life of adverse climatic events.

[2]Climate Stability Bonds could set such impact reduction goals. If, in time, and with the market's incentives on offer, bondholders decide that the best way of achieving such goals is to reduce certain greenhouse gas emissions, then that is what they will do. But it

would seem hubristic and inefficient for governments or UN bodies to assume that that this is the best way of achieving meaningful reductions in those impacts. There are too many uncertainties, and the science upon which such a policy is based is inescapably ossified. See also my other [3]recent [4]posts on this question.

### **12.12.3 Paris will fail (2015-12-17 23:27)**

Why I think the Paris deal on climate change, which concluded on 12 December, will fail.

- It may not be enough. It targets, using ossified science, cuts in greenhouse gas emissions. But what if that achieves nothing? What if the climate continues to change much more than expected, because the deal's underlying calculations and assumptions are wrong? What then? The emission cuts are a supposed means to unspecified, but crucial, ends. It would be preferable to do the hard work of identifying exactly and explicitly what those ends are, expressed in terms of impacts on human, animal and plant life, perhaps combined with social and financial targets. Then we could target those ends directly and, importantly, measure progress toward them more accurately.
- It may be too much, in the sense that resources could be diverted into reducing gas emissions and away from projects that could have a much more positive impact on human, animal and plant life.
- No buy-in. Ordinary people don't know or care about greenhouse gas emission volumes. What we do understand is adverse climatic events, and their effects on humanity and the environment. If we were to target those directly not only would we be solving real problems more efficiently, we'd also have more public understanding and commitment to the process. In short, you would get buy-in from the public, which is as essential as it is absent from the Paris agreement.

That said, the \$100 billion to be transferred from the rich countries (that is, their taxpayers) to the developing countries (that is, their governments) to adapt to climate change could be useful - if that's

where the money actually ends up. But, on past form, what isn't spent on luxury goods or otherwise squandered will end up in [1]Swiss bank accounts.

*To read more about how Social Policy Bonds could be applied to climate change see my paper [2]here, or recent blog posts [3]here, [4]here and [5]here.*

#### **12.12.4 Social Policy Bonds: the past and the future (2015-12-31 19:05)**

In the past year there has been a rise in the number of issues of Social *Impact* Bonds - the non-tradable variant of Social Policy Bonds, about which I have had mixed feelings. They essentially function as performance-related bonuses to service providers. Because they aren't tradable, they favour existing bodies and so, in my view, can be gamed or manipulated more readily than could Social Policy Bonds. However, there are social services that are currently so poorly provisioned that SIBs could well represent an improvement over existing policy. And they might be a first step - perhaps even a necessary first step - to the issuing of Social Policy Bonds. Tradability would greatly expand the range of goals that could be targeted, and I discuss this and other advantages of Social Policy Bonds over SIBs [1]here and [2]here. (You could also search for "SIBs" on this blog.) This [3]wikipedia page summarises where SIBs are being issued and other details.

As far as I know, Social Policy Bonds are not being issued anywhere. I believe, though, that the need for outcome-based policy is becoming increasingly urgent. Society grows ever more complex, and its problems ever less amenable to solution with our existing government machinery. As ever, there is a much broader consensus about the outcomes we wish to see than the possible means of achieving them. The gap between governments and the people they are supposed to represent keeps widening. The recent Paris meeting, which was supposed to address climate change, is the example *par excellence* of policymaking entirely disconnected from citizens. [4]It will fail for several reasons, foremost of which is the total absence of buy-in from ordinary people - that is, people who aren't involved in policymaking or lobbying. With efforts to address global problems, there would be huge benefits arising from

a market-based solution, which in economic theory and on all the evidence would optimise resource allocation.

For reasons of both buy-in and efficiency, then, and because of our increasingly inter-linked world, I remain optimistic that Social Policy Bonds will play a role in achieving social and environmental outcomes in the future. Perhaps not in 2016 but, I think, within the next ten years.

# 2016

## 13.1 January

### 13.1.1 No one is in charge (2016-01-10 19:46)

'The Economist' writes:

Global problems are not tackled[,] because governments fail to co-operate; voters get angrier and push their leaders into more nationalistic positions. And it is hard to see things changing this year, with no country likely to take the lead. America will be consumed by its presidential election, Europe by refugees and fear of terrorism, China by its adjustment to slower growth. No one is in charge. [1]*Loathe thy neighbour*, 'The Economist', 9 January

The column excerpted above is concerned mainly with the refugee crisis and economic problems. But other global concerns come to mind: the impacts of climate change, nuclear proliferation, or military tensions in south-east Asia and elsewhere. These are potentially serious problems that could lead to the death, injury or homelessness of millions of people and have devastating effects on the environment. Our current political system ensures that those whose lives would be shattered by, say, nuclear war have little sway over how policy is made. There is a huge and widening gap between the concerns of ordinary people and those who make policy. It's not the policymakers who are at fault: it's the system.

Nobody is in charge, as the column says. That's bad enough. But worse is that nobody has an incentive to stop what they're doing at the moment and look for solutions to these global problems. Under the current regime the costs of giving up an income are upfront and certain. The benefits of helping solve global problems are remote and nebulous. International bodies like the United Nations agencies or non-governmental bodies do tackle some large-scale problems, but their efforts are haphazard and the people who work for them are not paid

in ways that reward success. Some are corrupt.

Many of us, sensing the inadequacy of humanity's attempts to think globally, fall prey to some ideology that imposes meaning on our predicament. Such ideology can take the form of wishful thinking, at best, or a sort of revenge psychology, at worst. All ideologies, though, are insufficient to solve our global problems, in that they see one or other top-down, uniform and unresponsive mechanism as *the* solution. These ideologies are mutually incompatible and their leaders mostly corrupt, incompetent or insane. But helpless people facing huge uncertainties will seek reassurance from anybody who promises salvation in this world or the next.

A better policymaking system would help. [2]Social Policy Bonds, issued with the backing of all governments, supplemented by contributions from philanthropists and ordinary people, would articulate people's wishes for a world of peace, reduced poverty, and environmental health, to take three of our most urgent and serious challenges. It would separate the articulation of our wishes from their achievement. People - all people - would be in charge of specifying our broad, global goals. But the achievement of our goals would be in the hands of [3]new types of organization: coalitions of people, government or not, who at any one time would have incentives to find the most efficient solutions to our global problems. These new organizations would take a long-term view, targeting goals that might seem remote and unachievable, but that are necessary for humanity. Goals such as a thirty-year period of nuclear [4]peace, or the reduction of adverse [5]climatic events. The organizations would probably have changing compositions and structures, and would have incentives to co-operate with each other. Their goals would be exactly the same as humanity's. The bond regime would reward them in ways that correlate directly with their efficiency.

The Social Policy Bond mechanism would see to it that market forces would serve humanity as a whole, by allocating our resources - all our resources - where they can do most good. The world needs diverse, adaptive approaches to our global problems. The current system does not and cannot supply them. Social Policy Bonds can.

### 13.1.2 Insiders, outsiders, and world peace (2016-01-17 19:28)

*The Economist* describes the French labour market as...:

...divided into “insiders”, those with permanent, protected, full-time jobs, and “outsiders”, whose work is insecure and temporary. .... And France’s biggest unions, for all their revolutionary rhetoric, have become talented and conservative defenders of insider privileges, at the price of shutting too many young people out of decent jobs altogether. [1]*Fighting French unemployment: mode d’emploi*, ‘The Economist’, 16 January

It seems to be the way of all big organizations, be they trade unions, religious institutions, government bodies, large corporations or political parties. They start out well intentioned but at some point their interests diverge from those of the people they purport to represent, and their over-arching goal becomes self-perpetuation. Sometimes, especially during their early years, these bodies have interests that coincide with those of their members. Later, institutional growth or survival becomes an end in itself. Even when they do represent their members, large organizations do so only in their members’ capacity as members - as distinct from human beings with interests that are longer term and broader than those encompassed by their membership. People outside these bodies suffer, either directly, because the organizations’ rules benefit insiders at the expense of outsiders, or less directly, in that people expend a great deal of time and energy trying to become insiders because, largely thanks to big organizations’ ways of working, that’s the only way to improve one’s quality of life. So, for instance, we see large corporations manipulating the regulatory environment to keep out smaller companies.

My own thinking is that of course there must be large organizations - including countries with borders - but they must be made to keep to their principles and so have broader goals than self-perpetuation. Many of our social and environmental goals are the responsibility of the large bureaucracies that, in common with other other large bodies, have self-perpetuation as their ultimate goal. That is why I think Social Policy Bonds could help. Under a bond regime the structure and composition of organizations responsible for achieving our social goals would be constantly changing. The market for the bonds would see to it that the people working for these organizations would be paid according to their efficiency in achieving our goals - which coincide exactly with society’s goals. The market for would ensure that only the most efficient approaches to solving our social problems would flourish, and that unsuccessful approaches would be terminated.

The organizations’ structure, composition and all their activities, would be subordinated to the outcomes that we, as a society, want to see achieved. These [2]new types of organization, because of the way the market for Social Policy Bonds work, would always have powerful incentives to achieve our social goals. For all these reasons, Social Policy Bonds mean that

we could meaningfully target long-term, urgent, but hitherto idealistic-*sounding* goals such as the achievement of [3]world peace.

### 13.1.3 Health screwups (2016-01-25 19:12)

The evidence is necessarily scanty, but the (US) Institute of Medicine in 1999 [1]estimated (pdf) that at least 44 000 and perhaps as many as 98 000 citizens died each year in US hospitals and 1 million patients were injured from a range of mistakes. Since then, according to Joe and Teresa Graedon, there has been little, if any, improvement.

If medical mistakes and misadventures were a disease, there would be a great deal of hand wringing. We would have an organization comparable to the American Heart Association or the American Cancer Society to publicize the problem, and huge sums of tax dollars would be spent researching the causes and seeking solutions to all these screwups. Instead, the medical establishment mostly acts as if this problem were invisible. [2]*Top Screwups Doctors Make and How to Avoid Them*, Joe Graedon and Teresa Graedon, 2011

My own view is that resources for health care are rarely allocated in ways that optimize returns. It *might* be that, as I suspect, efficiency counts for little against the charisma or leverage of top specialists, interest groups and celebrities when it comes to deciding which diseases, for instance, shall receive most funding. Or whether preventive medicine should receive more funding. Or, indeed, whether the most efficient ways of improving a population's health have less to do with medicine, and more to do with, as the Graedons persuasively suggest, introducing check lists and rigorous procedures in healthcare facilities. It's only a suspicion, but the point is that *there are no incentives in place for people to find out whether it's true.*

Applying the Social Policy Bond principle to health might be the solution. To 'health', note, not 'health care'. Why? Because health is not something that arises mainly, or even primarily, from the decisions made by institutions devoted to health care. It may well be the case that relatively costless changes in diet, exercise, tobacco consumption or (one of my pet hates) the frequency and volume at which emergency vehicle [3]sirens are played would do more for health than, say, investments in [4]statins or new technology. As with exposing and tackling the 'screwups' identified by the Graedons, there are no incentives for anyone to find all this out. Instead we have organizations, such as hospitals, health services, charities, interest groups, and corporations which all have their own agendas which *might* at times coincide with improving the health of the population, but [5]might not, and even if they did, would not necessarily be doing so efficiently. The human and financial costs of such resource misallocation are huge. The Social Policy Bond concept applied to [6]health, by targeting and rewarding improvements in the population's health, *however achieved*, might be the solution.

## 13.2 February

### 13.2.1 The importance of buy-in (2016-02-02 20:23)

*The American Interest* writes about the European immigration crisis:

However much the idea appeals to cosmopolitan utopians, it is not possible for such human communities to accommodate levels of migration beyond some ceiling. That ceiling is variable, and when there are large cultural and religious differences between the native population and newcomers, the ceiling drops. [1]*Europe's waning welcome*, 'The American Interest', 1 February

'Such human communities' refers to 'polities that were relatively ethnically homogenous'. I agree that the 'ceiling is variable', but think the authors should have mentioned the importance of buy-in. It's unfortunate that hugely important issues, like immigration, are influenced less by ordinary people than by the usual benefactors and manipulators of an inaccessible policymaking environment. Especially when it is ordinary people who will experience most of the disadvantages of mass immigration, and it is ordinary people whose attitude to immigrants will do much to determine immigrants' loyalty to their new home. The usual benefactors and manipulators? Politicians, lobbyists, billionaires and ideologues.

It wouldn't be hard to involve the public in policymaking if we were to focus on outcomes rather than institutional funding and structures, legal processes, slogans and the celebrity status of policy proponents. Immigration is a relatively accessible issue, and the public should be consulted about it. I am certain the reception accorded to immigrants described in the article excerpted above would be less hostile if our leaders had thought to consult us on the issue.

So too with other policies: consultation generates buy-in, and our democracies face many urgent, big challenges for which buy-in from ordinary citizens will be crucial but is almost entirely absent. Climate change, for instance, health care, nuclear weaponry, or disaster prevention or, not least, the nature of the policymaking process itself. Expressing our policy goals in terms of outcomes, rather than impossible-to-follow procedures, would allow public consultation and with that, buy-in. Without buy-in, we're going to see continuing public disengagement from the policy process, which could express itself in ways that are dangerous to us all.

Social Policy Bonds are a means by which policymaking would be focused on outcomes rather than process. Under a bond regime, government would articulate society's goals and could back bonds that would reward their efficient achievement. By emphasising outcomes, rather than the supposed means of achieving them, policymaking would become comprehensible to ordinary people. Buy-in would be one happy result: efficiency, brought about by market forces, would be another.

Policy as if outcomes mattered  
SocialGoals.com

1. <http://www.the-american-interest.com/2016/02/01/europes-waning-welcome/>

### 13.2.2 The 'root causes' fallacy (2016-02-10 20:04)

The 'root causes' fallacy is my explanation for why we don't really do much to solve such seemingly intractable problems as violent political conflict (war and civil war) or other complex social and environmental problems, such as crime or drug abuse. For historical reasons, policymaking is almost entirely a top-down activity. Politicians and public servants see a problem, then decide what needs to be done about it. If they aren't certain what needs to be done, either they guess at the root causes, or they ignore the problem. What they are not comfortable doing (yet) is to contract out the finding of solutions to the private sector. And finding solutions to a problem does not necessarily mean that we have to find its root causes - which can take decades or, indeed, be impossible. This, from *the Economist*, writing about data-based models:

Too many things tend to happen at once to isolate cause and effect: liberalised trade might boost growth, or liberalisation might be the sort of thing that governments do when growth is rising, or both liberalisation and growth might follow from some third factor. And there are too many potential influences on growth for economists to know whether a seemingly strong relationship between variables is real or would disappear if they factored in some other relevant titbit, such as the wages of Canadian lumberjacks. [1]A *mean feat*, 'The Economist', 9 January

When it doesn't supply an easy excuse for inaction, this supposed need to identify root causes before doing anything can be catastrophically costly when mistakes are made: policies are put in place that cannot easily be reversed. Take climate change: our governments have decided that they know the cause of climate change is anthropogenic greenhouse gas emissions. They know, or act as if they know, exactly the relative contributions of each of these gases to climate change. But there are at least as many variables affecting the climate as there are 'potential influences on growth', and that makes a nonsense of trying to implement policies whose success depends entirely on their correct identification. But the juggernaut has begun its downhill movement: climate change policy has led to the creation of organizations powerful enough to oppose removal of their funding and even to [2]distort facts that might threaten their existence.

My solution: target outcomes, rather than the alleged means of achieving them. Instead of targeting climate change, target for reduction the negative impacts of adverse climate events on human, animal and plant life. Instead of trying (or pretending to try) to stop the civil war in Syria, target for reduction the numbers of people killed and made homeless in that country. Complex social and environmental problems require diverse, adaptive approaches for their solution. They don't require that we identify their real or mythical 'root causes' before doing anything. By contracting out the achievement of solutions to a motivated coalition of holders of Social Policy Bonds, we could bypass the supposed need to identify root causes and instead concentrate on finding solutions to the problems they create.

For more about my approach to climate change see [3]other [4]posts [5]on [6]this [7]blog, or this [8]essay. For more about my approach to achieving peace, follow this [9]link.

### 13.2.3 Society as a dynamic system (2016-02-19 18:43)

James Lovelock writes:

Cause-and-effect thinking, so often the basis of teaching, fails to provide understandable explanations of real dynamic systems. It fails in physiology, quantum physics and engineering. [1]*A rough ride to the future*, James Lovelock, 2014

And, I'd say, in policymaking. This links in to my previous [2]post about root causes. Our society and environment are too complex for linear, cause-and-effect thinking to work. That doesn't mean we should give up when faced with supposedly intractable national or global problems as crime, terrorism, war, or poor health. Within each of these problems there will be occasions when cause-and-effect thinking will work well: for instance, improving basic sanitation will probably greatly improve the health of people living in urban slums. But the over-arching policy environment within which decisions such as whether to improve basic sanitation or allocate health funding elsewhere must be one that takes account of the dynamic nature of human society. In other words, it must be adaptive.

A Social Policy Bond regime targeting an array of broad health goals for a population would be adaptive. Under a bond regime government (most probably) would still do what it does best; indeed, what only government can do: articulate society's health goals and raise the revenue for their achievement. But rather than dictate how those goals shall be achieved it would, by issuing (say) [3]Health Bonds, contract out the achievement of those goals to a motivated coalition of bondholders (or people paid by bondholders). The structure

and composition of this [4]coalition would probably change over the time period during which the goal are to be achieved - which could be several decades. But at every point in time, bondholders or their agents will have incentives to look for the most efficient ways of raising the population's health. To maximise their returns they will have to respond to changing circumstances, including our rapidly expanding scientific and technical knowledge, and *the effects their own activities have* on the social and physical environment. By maximising their returns, of course, they would also be maximising society's return on our limited resources.

In short, Social Policy Bonds would take account of the complexities inherent in the dynamic systems that characterise our large societies. They would encourage diverse, adaptive solutions to our social and environmental problems, as articulated by society itself through government. They would inject the market's incentives into the allocation of society's scarce resources *at every stage necessary* to achieve our goals. By so doing they would maximise the returns on society's investment in our future.

### 13.2.4 Overcoming institutional sclerosis (2016-02-27 21:54)

The disenchantment we see with western governments, the European Union, and some United Nations bodies is almost inevitable. But it's not particular to government bodies; it is a feature of almost any large institution, be it a trade union, church, university, or political party. It's also a feature of the largest private-sector corporations: those whose survival doesn't depend on customers buying the products in something more competitive than a monopolistic or oligopolistic market. These are the large corporations that can manipulate or subvert the policy environment to their ends at the expense of consumers. Institutional sclerosis can also afflict the military, where it remains untested. So I'd expand a bit on this quote from Thomas Sowell;

The most fundamental fact about the ideas of the political left is that they do not work. Therefore we should not be surprised to find the left concentrated in institutions where ideas do not have to work in order to survive. Thomas Sowell, 'The Survival of the Left', in [1] *The Thomas Sowell Reader*, 2011

Big businesses that are close to government, lobbyists for farmers (for example), right-wing

political parties, and other bodies *not* linked to the political left are subject to exactly the same sclerosis that Mr Sowell describes. It's not about 'left' or 'right'; it's about being responsive to changing circumstances. Many big organizations, not just those on the left, are institutions 'where ideas do not have to work to survive'. The long-term result of this is alienation from ordinary people and a culture of insiders against outsiders. And the result of that is something we are seeing now: a disenchantment with conventional politics and a willingness to embrace anything that promises radical change. This could turn out to be positive; it could also be calamitous.

Which is why I have suggested we think about policy *not* in terms of institutions, with their limited capacity to think in the very long term or to prioritize, when it comes to the crunch, anything other than their own survival. I suggest that we encourage instead the creation of [2]new types of organization whose funding, composition, structure and activities are entirely a function of how well they achieve society's goals. This would happen under a Social Policy Bonds. As well as channelling society's scarce resources with optimal efficiency, a bond regime would, by rewarding people for achieving society's goals, close the gap between policymakers and the people they are supposed to represent.

## 13.3 March

### 13.3.1 Economic growth and inequality (2016-03-04 20:55)

One of the less obvious advantages of a Social Policy Bond regime is that it insists on defining our goals; transparently and explicitly. And perhaps the least laudable feature of the current regime is that there are few explicit goals, and those that are stated have little to do with society's well-being. The goal that is usually invoked to justify some policy or other is economic growth, expressed most often as Gross Domestic Product per person. I've blogged about the flaws in the targeting of GDP before ([1]here and [2]here, for instance). It needs restating, though, that economic growth, however measured, does not inevitably benefit everybody. Most people in the US, for instance, feel this, but work by Professor John Komlos tries to quantify it. His main conclusion?

The major consistent findings are what in the colloquial is referred to as the "hollowing out" of the middle class as well as the tremendous increase in the income of the

top 1 %. The income of the latter relative to the 1st [poorest] quintile increased from a factor of 21 in 1979 to 51 in 2011. [3]*Growth of income and welfare in the U.S.*, (pdf) 1979-2011, John Komlos, Professor Emeritus, University of Munich

In a column, Professor Komlos shows that US census data shows that:

[T]he bottom 20 percent of U.S. households is underwater with an average net worth of - \$32,000, that is, the debts of about 60 million people are greater than all their assets combined. If you combine the first and second quintiles of the wealth distribution, it's apparent that 120 million people's average net wealth is still below zero at minus \$11,000. [4]*These facts about inequality can't be whitewashed*, 21 December 2015

The essential lesson from all this is one that bears repetition: economic growth is not an end in itself. In our increasingly complex world we cannot rely on trickle-down economics to achieve our social goals. More explicit targeting of broad social and environmental outcomes is necessary. Social Policy Bonds are one way of setting such targets and ensuring that they are achieved efficiently.

### **13.3.2 Blockchains and Social Policy Bonds (2016-03-08 19:58)**

I've started learning about [1]blockchains, a fairly new technology, and specifically the possibility that they can function as a platform for markets for Social Policy Bonds. This suggestion has been made by two of my correspondents in the past few days; it's a new idea, and my first thought is that it's an exciting one. The blockchain principle allows us to bypass government (or whoever issues the bonds) when it comes to monitoring progress toward goal achievement. It facilitates payments made to those who help achieve the objective; a role that I have thought might have to be played by a coalition of holders of large numbers of the bonds making decisions as to which projects are likely to be most efficient. This [2]link is to a short article showing how the blockchain principle is being applied to searching for a cure for HIV. Though it talks about a Social Impact Bond, if I surmise correctly the [3]tradeability of the bonds means that they are in fact Social Policy Bonds - perhaps the first ever to be issued.

*Update 12 March: there is a discussion about implementing Social Policy Bonds in Ethereum [4]here.*

### **13.3.3 Money isn't everything (2016-03-16 20:32)**

In chats with friends about deploying Social Policy Bonds to counter religious or ideological extremism, I'm often told that the fanatics just won't respond to financial incentives so, the reasoning goes, a bond issue aimed at [1]reducing conflict would be unlikely to succeed. I think the premise is correct: fanatics *are* motivated entirely by their beliefs. Money doesn't come into it. But I think the conclusion is false: financial incentives can work to eliminate conflict; fanatics are found in any bar, campus or on any street corner. Without backing, either direct or indirect, from others, they do not ascend into positions of influence. The further one goes from the fanatical centre, the more one will find supporters of the extremists who *are* amenable to financial incentives. Social Policy Bonds can motivate these people to withdraw their support from the fanatics and, possibly, to channel their support into goals that are more congruent with those of society. A bond regime wouldn't change the beliefs of the extremists, but it would decouple them from positions of influence. At its most simple level, a bond regime could act as a counterbalance to all the financial incentives that exist to create and continue conflict: those that motivate, at some level, arms manufacturers and brokers, and the interests of those who think they will gain if the conflict resolves in their favour. Money isn't everything, but Social Policy Bonds targeting conflict for reduction could channel the urge to acquire it into socially beneficial activities.

### **13.3.4 Bypassing democracy (2016-03-20 18:59)**

Jeff Madrick, reviews a [1]book by Lee Drutman about lobbying in the US. Drutman finds that business spends \$34 on lobbying for every dollar spent by likely opponents such as labour

unions and other interest groups. Drutman also briefly cites academic research showing that:

- The stocks of the firms that spent the most on lobbying as a percentage of their assets beat market averages substantially.
- The more firms lobby, the lower their tax rates.
- Lobbying has a positive effect on a firm's return on equity compared to the market as a whole.
- Companies that lobby intensively are less likely to be detected for fraud than other companies.
- Companies with politically connected board members have higher stock market returns than others. *How the lobbyists win in Washington*, Jeff Madrick, 'New York Review of Books', dated 7 April

Big business is the major beneficiary then, of a system that rewards lobbying. On one side we have corporations and their friends in government; on the other, small businesses and ordinary citizens. When policymaking is overly influenced by lobbyists, government is failing in its duty to articulate the wishes of society as a whole. Democracy is undermined and the response from ordinary people, who aren't consulted about issues that drastically affect their lives, could be dangerous indeed. We see portents of such danger in the western world today.

Social Policy Bonds could do much to close the ever-widening gap between lobbyist-influenced government and ordinary citizens. Under the current system policymakers can get away with favouring their lobbyist-paymasters because making policy has become an arcane, legalistic, protracted process to which ordinary people have no access. Discussion is centred around points of law, detailed regulation, and the structures and funding of various bodies. Only people paid to follow the process have the resources to do so. This means lobbyists. A Social Policy Bond regime, however, would focus on outcomes: policy would be expressed in terms that ordinary people can understand. Broad social and environmental goals would be targeted, and the people who help achieve these goals will be rewarded.

Under a bond regime, government would do what it is good at - indeed what only government can do: articulating *society's* goals and raising the revenue for their achievement. It would have more time and energy for these activities because, by contracting out the achievement of these goals to the private sector, it would spend less time trying to achieve them itself or working out ways to word legislation in ways that favour lobbyists and the

corporates that employ them. Big business might lose out. But ordinary citizens would gain. So too would democracy.

### **13.3.5 Society needs more creative destruction (2016-03-24 19:08)**

'[1]Creative destruction' is the term coined by [2]Joseph Schumpeter to denote a "process of industrial mutation that incessantly revolutionizes the economic structure from within, incessantly destroying the old one, incessantly creating a new one."

Creative destruction in the private sector essentially means that failing companies go out of business and successful ones survive and prosper. One of the reasons that social problems persist is that creative destruction rarely determines which policies shall be aimed at solving them. Largely for historic reasons, the solution of national and global social problems, including crime, pollution, terrorism and war, has been left to the public sector. That is, to bodies that face no competition and are seldom rewarded in ways that correlate with their success. Indeed, many failing institutions supposedly devoted to solving social problems are likely be penalised for success, by seeing their budgets cut or even their very survival threatened. At some level, for some employees, this perverse incentive is bound to operate, to the detriment of the people they are supposed to serve but to the continued survival of the inefficient institution.

Social Policy Bonds are intended to re-jig these incentives by injecting market incentives into the solution of social problems. A bond regime would direct funding to those approaches that bring about the most benefit, defined in terms of beneficial social impact per taxpayer dollar. Note the word 'approaches': it's the best policy initiatives that are rewarded, not the body that introduces them, which otherwise might well become more interested in self-perpetuation than in achieving targeted social goals.

The unfortunate trend is that, rather than social problems becoming more subject to creative destruction, the private sector is becoming less and less subject to it. The current *Economist* focuses on the US manifestation of this:

The excess cash generated domestically by American firms beyond their investment budgets is running at \$800 billion a year, or 4 % of GDP. The tax system encourages them to park foreign profits abroad. Abnormally high profits can worsen inequality if they are the result of persistently high prices or depressed wages. ... If steep earnings are not luring in new entrants, that may mean that firms are abusing monopoly positions, or using lobbying to stifle competition. The game may indeed be rigged. [3]*The problem with profits*, 'the Economist, dated 26 March

Exactly, and it's not only the biggest firms that can abuse government for their own purposes. [4]Farmers do it too, and have been for decades, though it is likely that most benefits that are in the public mind accrue to farmers do in fact go to the [5]biggest landowners and agribusiness corporates.

I believe this trend is unsustainable. The capture of government by big business and its lobbyists, which has led so much inequality, is already provoking a reaction. Let's hope that this leads to a policy environment that will allow creative destruction to play a bigger role in both the public and private sectors. I write about the need for a new protean type of organization, whose composition and activities will be exclusively focused on achieving social goals, [6]here. New technology, including the [7]blockchain, might help bring these organizations into being.

## 13.4 April

### 13.4.1 Inequality (2016-04-04 21:50)

The *Economist* writes:

VOTERS' anger over inequality is one explanation for the rise of politicians as varied as Donald Trump, Bernie Sanders and Marine Le Pen. [1] *Tough choices*, the 'Economist', 26 March

Very true, and our governments don't seem very highly motivated to do anything about it. Many might not consider reducing inequality to be a goal worth targeting in itself. But, if we did move in the direction of targeting meaningful outcomes, that would be for society as a whole to decide.

But Social Policy Bonds could reduce inequality in a less obvious, less direct way. A bond regime would be

a means whereby private gain would be strongly, visibly and inextricably correlated with public benefit. Some bondholders, whether institutions or individuals, would start out rich and, if their bonds rose in value, would become richer. But working successfully to achieve desired social goals would most probably be seen as a laudable way of acquiring wealth. There are intangible benefits from having people or institutions grow rich in this way. There are many disaffected people who view with suspicion or alarm the very high incomes or profits of corporations engaged in activities of little obvious net social or environmental benefit. They are also unconvinced that 'trickle-down' occurs to any meaningful degree. Wealth, in these people's eyes, must inevitably result from exploitation, either of other people or the commons

. Social Policy Bonds could shift this worldview and, by helping people take a more positive view of the act of earning an income and accumulating wealth, could make for a more cohesive society. A socially acceptable way of becoming wealthy would also make it more

politically feasible to tax less socially desirable ways more heavily - not necessarily an end in itself, but a means of raising more tax revenue for redistribution or increasing the number and quality of public goods

and  
services.

Meantime the OECD is [2]reporting that:

Income inequality in OECD countries is at its highest level for the past half century. The average income of the richest 10 % of the population is about nine times that of the poorest 10 % across the OECD, up from seven times 25 years ago.

### **13.4.2 Subsidising obesity (2016-04-09 18:41)**

Jason Fung writes:

The government is subsidizing, with our own tax dollars, the very foods that are making us obese. Obesity is effectively the result of government policy. Federal subsidies encourage the cultivation of large amounts of corn and wheat, which are

processed into many foods. These foods, in turn, become far more affordable, which encourages their consumption. Large-scale consumption of highly processed carbohydrates leads to obesity. [1]*The Obesity Code: Unlocking the Secrets of Weight Loss* (page 130), Jason Fung, 2016

What have this and [2]other perverse subsidies got to do with Social Policy Bonds? Simply that the relationship between a policy and its effect is obscured by a policymaking process that focuses on supposed ways of achieving desirable outcomes, rather than the outcomes themselves. So, the US (and most other rich countries) justifies agricultural subsidies because they are supposed to protect the 'family farm'. But very little of these subsidies actually go to smaller farms: most of them are capitalized into farmland values, benefiting [3]wealthy landowners, or end up as subsidies to large agribusiness corporates. And, as Dr Fung relates, they conflict with health objectives. They persist because our policymaking process allows the - deliberate or not - obscuring of the real goals of the powerful.

Expressing policy goals as broad outcomes that are meaningful to ordinary people would change this. If people truly wanted their tax payments and higher food prices to fund wealthy aristocrats and agribusiness then a government could achieve the same result without deceiving its citizens. But it's unlikely that the public actually wants to subsidise the very wealthy: it happens only because policymaking is effectively manipulated and disguised by the powerful. Social Policy Bonds would make the real goals of policy clearer to everybody, generating more public participation in the policymaking process and so, importantly, more [4]buy-in.

### 13.4.3 Health is not an accountancy issue (2016-04-17 18:41)

Reading about psychiatry and obesity, and health generally, you can easily get the impression that the incentives in play conflict with the stated goals of the professionals.

Psychiatry first: Dr Peter Breggin [1]writes copiously and [2]broadcasts about the over-prescription of psychiatric drugs to adults and children, in the US. Often these drugs have little in the way of robust scientific research to justify their use. Research can be shoddy

or misrepresented. The organizations that encourage misdiagnosis and overtreatment are captured by powerful interests in, for example, the pharmaceutical industry.

Or obesity: there is an entire weight loss industry dedicated to selling diet books, supplements or food substitutes. There are television shows and exercise programmes, all supposedly aimed at reducing obesity. Yet the *long-term* results of almost all these interventions are [3]almost invariably small and often negative.

Even in the less cash-driven, more socialized health services of, for instance, the UK, doctors come under pressure to [4]over-prescribe, and defensive medicine - [5]medical care performed primarily to reduce the risk of litigation - is significant.

Let's say that there are arguments on both sides: that some overdiagnosis and overtreatment is going on, but we're not sure how much, or how [6]deleterious are their effects on health. I have no idea how close we are to optimal levels of treatment. Perhaps Dr Breggin and the other sites to which I link above are mistaken, but the important point is that *nobody has incentives to find out*. Instead, largely by default or historical accident, the major determinants of what interventions get prescribed to whom and how often, are the short-term interests of companies that have goods or other interventions to sell. Their incentives are to overprescribe. It is the narrow, short-term goals of corporations or professional organizations, or government bodies, that largely dictate how we shall tackle our health goals.

So if, say, the best interventions, from the point of view of the unwell person, won't benefit, in cash terms, powerful interest group, it seems likely that they will be under prescribed. (A similar argument applies too to 'negative defensive medicine', where the *fear of a cash loss* motivates practitioners *not* to treat patients.) Dr Jason Fung, for instance, recommends [7]fasting as a cure for Type 2 diabetes and obesity.

Again, the point is that there are too few incentives in place that encourage people to look for low- or no-cost ways of treating people that are better, *from the patient's point of view*, than high-cost ways.

This is where the Social Policy Bond principle can play a part. [8]Health Bonds would target the broad, long-term, general health of an entire population. Bondholders would be rewarded if health outcomes improve, *however that occurs*. Bondholders would have incentives to research, investigate and exploit only the most efficient ways of improving people's health outcomes. If non-treatment or low-cost treatment is the best way of improving a person's health, then that is what bondholders will be motivated to supply. The important

point is that, under a Health Bond regime, *it is the ordinary citizen's long-term general health that is the priority for bondholders and not, as in the current system, the accountancy goals of existing organizations*, be they public- or private-sector.

#### **13.4.4 The business of America is lobbying (2016-04-24 19:09)**

*Broken at the top* is a recent Oxfam report which, amongst other findings, reports that:

- From 2008-2014 the 50 largest US companies collectively received \$27 in federal loans, loan guarantees and bailouts for every \$1 they paid in federal taxes.
- From 2008-2014 these 50 companies spent approximately \$2.6 billion on lobbying while receiving nearly \$11.2 trillion in federal loans, loan guarantees and bailouts.
- For every \$1 spent on lobbying, these 50 companies collectively received \$130 in tax breaks and more than \$4,000 in federal loans, loan guarantees and bailouts. [1]*Broken at the top*, Oxfam, 14 April

When I talk about Social Policy Bonds I usually emphasise their efficiency. But they have another great advantage: transparency. Expressing policy in terms of targeted outcomes does mean that ordinary people can follow what's going on - in contrast to the current system. So if society as a whole wanted to subsidise the largest, wealthiest corporations in the land, then we could do so, and we'd be doing so with our eyes open. But if, as seems likely, people would rather see society's scarce resources channelled into helping the most disadvantaged amongst us, then we could issue Social Policy Bonds targeting for improvement broad indicators of our citizens' basic well-being. [2]Health, for instance, or literacy and other basic [3]educational goals.

These are outcomes that are meaningful to ordinary people. Which means we could all participate in the policymaking process. This would be a huge improvement over the current

system, which is - deliberately or not - made so obscure that the only people who can follow it closely are those whose ultimate sources of funding are the already wealthy.

### 13.4.5 GDP and distribution (2016-04-28 17:42)

The current [1]*Economist* (dated 30 April) features Gross Domestic Product and its inadequacies, [2]here and [3]here. It doesn't seem to mention distribution of income, which is important as many governments use GDP as a *de facto* target. I argue though that rises in GDP don't do much for welfare if they are increasingly concentrated in the hands of the top one percent or so. If we are trying to do something to improve welfare, we need to target an array of measures.

Raising GDP (or

GDP per capita) has become the default goal for governments because they are unwilling or unable to target for improvement an array of broad outcomes that are meaningful to ordinary people: such as better [4]health, universal [5]literacy, full [6]employment etc. The vague, slippery, and ever-revisable GDP metric is a handy smokescreen that allows government not to commit itself to improving the welfare of ordinary citizens. A Social Policy Bond regime would be a stark contrast: it would target for improvement explicit, meaningful and verifiable metrics that are inextricably linked to the welfare of ordinary people.

## 13.5 May

### 13.5.1 Terrorism and strokes (2016-05-07 18:13)

The website [1]Think by Numbers looks at US government spending on health:

[W]e spend \$500 million for every death from terrorism and only \$2,000 for every death resulting from strokes. That means we spend 250,000 times more per death on terrorism. [2]*Anti-Terrorism Spending 50,000 Times More Than on Any Other Cause of Death*, Mike P Sinn, October 2011

We can quibble a bit about the numbers, but these figures do seem to indicate an inefficient way of improving the health outcomes of American citizens. There would be nothing necessarily wrong with such spending patterns if this disparity were the result of an informed populace deciding for itself where its taxpayer dollars should be channelled. But, this isn't the case, and the *Economist* this week [3]reminds us that 'defence' - that is to say, the military - is one of those industries notorious for cronyism. (Others identified by that journal include telecoms, natural resources, construction, which all 'involve a lot of interaction with the state, or are licensed by it'.)

Of course, it's unrealistic to ask people exactly how every health dollar should be spent. But we can engage the public in such decisions by focusing not on the pathways to improved health - which are complex and ever-changing - but on the outcomes we should like to see. For instance, we could express health goals in terms of [4]Quality Adjusted Life Years, and then answer questions as to whether some x percent improvement in QALYs should be weighted more heavily than others. If the consensus is 'yes', and we judge terrorist deaths, for example, to be more negative than deaths caused by strokes, then we can allocate spending accordingly. Even then, we're unlikely to see the sort of disparities outlined above, which are more a consequence of emotional reactions to television footage, lobbying and cronyism than

rational thinking.

My short piece on applying the Social Policy Bond principle to [5]health goes into more detail.

### 13.5.2 More regulation, more gaming (2016-05-15 17:53)

The Economist, writing about new vehicle emission testing, is realistic rather than cynical:

Changes to testing regimes are afoot. Japan is likely to review the way its tests are carried out. Europe's system is also being readied for an overhaul. Plans are in place to replace its test cycle with a new one that more closely mimics real-world driving and imposes stricter rules over how cars may be prepared. A system for rechecking NOx emissions from production vehicles on the road is under discussion. That should ensure exhausts are cleaner. But the new test will only be harder, not impossible, to game. [1] *Exhaustive analysis*, the 'Economist' 30, April

Incentives matter. The incentives faced by car manufacturers under any likely testing regime will, as the *Economist* says, encourage gaming. It's one chapter in an old and gloomy story: government sees a problem (air pollution in this instance), thinks it knows how best to solve it (by limiting certain vehicle emissions), and legislates its preferred solution. This can still work: where cause and effect are easily identifiable and when society's complexities are not overwhelming. But when it comes to air pollution it fails. It fails because vehicle manufacturers will game the system. And it's likely to fail for other reasons. The government doesn't and cannot know the type and impact on human health of the emissions vehicles produce when, necessarily, only some of the many emitted compounds can be identified and

quantified. Regulating carbon dioxide, for instance has led to increases use of diesel engines, which generate different pollutants of [2]unknown impact. Depending on how electricity is generated, even electric cars could have a more severe effect on health than petrol or diesel vehicles. Technology is changing fast, so is our knowledge of the relationships between emissions and health. Regulations cannot keep up with the pace of change.

Here's another suggestion: use the Social Policy Bond principle to target air pollution. Issue bonds that become redeemable only when air pollution targets have been met and sustained. The bonds would then encourage exploration, experimentation and implementation of those ways of reducing air pollution that are most cost-effective. Being tradeable, they could target a long-term goal: investors could profit by making achievement of the goal more likely, then sell their bonds to new holders who would take the necessary next steps toward the goal's achievement. For links to papers on applying the Social Policy Bond principle to the environment see [3]here.

### 13.5.3 What is government for? (2016-05-22 18:55)

Simon Calder writes about the effects of European Union regulation, EC261, which says that airlines must pay at least €250 to every passenger who arrives three hours or more behind schedule. Mr Calder quotes one senior airline executive:

Of course, if we are approaching a three-hour delay, we may decide to accelerate the turn-round by leaving bags behind. *When airlines deliberately leave behind your baggage* , Simon Calder, 'the Independent', 21 May

He imagines how passenger would react to this announcement from an airline captain:

Only half the bags have been loaded. We can either set off now, and be two hours 55 minutes behind schedule, or wait for another 10 minutes to load the remainder.

Passengers would vote unanimously to wait another ten minutes. But EC261 makes such an onboard referendum unlikely, stipulating, as it does, "a blunt three-hour boundary between paying out nothing and being exposed to compensation claims amounting to tens of thousands of pounds."

[1] ✖

You might think, as I do, that government would do better to leave this sort of micro-management to the market. But every organization, including every government agency, however well-meaning and hard-working, has as its over-arching goal self-perpetuation. Formulating, propagating and enforcing Mickey Mouse [2]micro-objectives like the three-hour deadline doesn't help passengers, still less airlines, but it does promote the unstated (and perhaps even unconscious) goal of government: to expand its role.

A Social Policy Bond regime would be different. it would target broad goals in essential areas, such as [3]health, [4]crime or - at a supra-national level - [5]war. These goals would be meaningful to ordinary people, and the agencies who take on the role of goal-achievement would have a composition and structure that would adapt to changing circumstances and expanding knowledge of the causes and effects of social problems. These [6]organizations would subordinate all their activities to the achievement of society's goals - in stark contrast with our current policymaking system.

### **13.5.4 Blockchain could guarantee integrity of redemption terms (2016-05-23 18:45)**

I've written before about [1]hidden metrics as applied to Social Policy Bonds. Briefly, the aim is to overcome the sort of gaming that we see nowadays with certain micro-objectives:

[2]here, for example. [3]Campbell's Law, if we're not careful, could apply. One answer, as I wrote, would be to target broad outcomes without specifying exactly how we shall determine whether our target has been achieved. So, say, we are aiming for 99 percent literacy of 15-year-olds in a country. We could issue Literacy Bonds, redeemable only when surveys show that that goal has been satisfied. We could say at the outset what the broad outlines of these surveys would look like: say a minimum of 250 boys and 250 girls randomly sampled from another random sample of 10 regions out of 100 regions. The identity of these regions need not be revealed or even determined until the bond market reckons that the literacy target has been achieved. At that point, the regions to be surveyed could be randomly chosen. That would work, provided the randomizing could be seen to be done transparently and fairly.

But the current *Economist* points to what might be a more elegant solution. It discusses using blockchain technology to distribute public keys to the protocols of the many thousands of medical trials carried out annually to ensure that the pharmaceutical companies sponsoring these trials cannot alter trial protocols. This, the sponsors have been known to do because the drugs being trialed have some positive effects, but not those specified at the outset of the trial. Such 'hidden outcome switching' can exaggerate the value of the drugs being trialed.

The blockchain is a database that acts as a public ledger of all transactions with the currency, and is thought to be almost completely tamper-proof because it is validated and stored independently on thousands of different computers worldwide. This provides a way ... to check that results have not been fudged. [4]Better with bitcoin, the 'Economist', 21 May

Anyone with a copy of the trial protocol could generate the original private key, and check that it generates the same public key when it's decrypted using the same algorithm that encrypted it. 'Public keys for protocols should be uploaded to trial registries ... and included in research papers. Researchers and medical journals could speedily check whether the right results were being reported.'

More important, from the Social Policy Bond point of view, is this possibility, which concludes the *Economist* article:

Another benefit, paradoxically, is that the protocol for studies could be hidden until completed. This might be useful for commercially sensitive trials of new therapies. As long as the public key was

uploaded to a registry when the trial began, the protocol could be verified later without the worry that it had been changed during the study.

If, instead of 'protocol for studies', we substitute 'detailed redemption terms', then we could use the same technology to could guarantee to investors in Social Policy Bonds that the backers of the bonds they own would not attempt to evade their obligations by manipulating the terms under which the targeted goal shall be deemed to have been reached.

### **13.5.5 Answering the phone quickly is not a health goal (2016-05-24 19:09)**

Another story - this from the UK - shows what happens when we have Mickey Mouse micro-objectives rather than broad meaningful goals:

In January 2016, Lincolnshire Police began an investigation after an allegation that staff within the Force Control Room were calling 999 at quiet times, to ensure calls were picked up quickly to improve performance statistics. ... Today [23 May], five Force Control Room staff have been suspended from duty and have been informed they are under investigation. *[1]Source*

('999' is the emergency phone number in the UK.) I've been inveighing against these micro-goals for years ([2]here's my first blog post on the subject). Their basic problem is that they arise from the narrow, short-term needs of organizations, rather than the people these organizations are supposed to serve. They're too easy to game, and their achievement is - to put it kindly - not inextricably linked to improvements in the well-being of ordinary people.

A Social Policy Bond regime would be different. We'd target for improvement broad, meaningful goals, such as the [3]health of the entire population. Bondholders would benefit by financing projects that accelerate the achievement of society's targeted outcomes, rather than, as so often today, turning up for work and fulfilling some meaningless quota.

### 13.5.6 Nuclear war? Yawn, yawn (2016-05-27 18:20)

The current [1]*Economist* writes about North Korea's nuclear capability. Amidst many worrying facts cited are these:

North Korea is thought to have a stockpile of around 20 devices. Every six weeks or so it adds another. [2]*Source*

Two engines from Soviet-era R-27 submarine-launched ballistic missiles were coupled together to provide the propulsive power and range for a warhead carried by a KN-08 to hit the east coast of the United States. It is not known how many R-27s North Korea has, but up to 150 went missing from Russia in the post-Soviet 1990s. [3]*Source*

The R-27, a submarine-launched ballistic missile, [4]has the explosive power of 1 Megaton, or about [5]50 times that of the bomb that was dropped on Hiroshima.

I have no solution to the problem of nuclear proliferation and its attendant risks of catastrophe. I don't think anyone has, despite valiant efforts by well-meaning people working for governments or international organizations. But what I can offer is a means by which we channel more of our human ingenuity into solving that problem, rather than expending time and energy on activities of very little social value (see [6]here for instance, or [7]here). In other words, a way of motivating more people to put more high-quality effort into reducing the risks of a nuclear catastrophe.

That way entails issuing Social Policy Bonds that target for reduction either man-made [8]conflict, or [9]disasters of any kind. Bonds could be specially issued to target the risk of a nuclear explosion. How would this work? First, funds would be raised from any source - public- or private-sector or both - to back bonds that would be redeemable for a fixed sum only when there has been nuclear peace for a sustained period of, say 30 years. These bonds would be issued on the open market for whatever price they fetch. The goal, being long-term, could mean that the bonds would sell for very little. So any movement to increase the likelihood of sustained nuclear peace would see an improvement in the bonds' value. The bonds would be tradeable, so holders (or their agents) could benefit in the short term by doing things that, in the eyes of the market, bring us closer to our long-term goal. The effect would be to reward people for helping achieving the goal efficiently. Nuclear Peace Bonds would create a [10]protean coalition of people who have a powerful incentive to explore, investigate and implement the most effective (at any given time) array of measures that bring us closer to our goal. With such a big, remote objective, no single approach will work. A bond regime would stimulate diverse, adaptive solutions to the problem of nuclear proliferation.

The current policymaking system can work well when the relationships between cause and effect are readily identifiable. But for problems like the risk of nuclear catastrophe, which are large-scale and have multiple causes, the Social Policy Bond idea offers a better solution. Our nuclear peace goal fulfils other key criteria that point to the advantages of a bond regime :

- Current approaches are either ineffectual or inefficient;
- A robust and verifiable metric. I suggest 'a nuclear detonation that kills 500 or more people within 24 hours'; and
- Financial rewards to those involved in achieving objectives are currently uncorrelated to their effectiveness or efficiency in doing so.

Currently, there's a jarring mismatch between the fears of, and risks to, almost everyone on the planet and the resources devoted to mitigated them. A shift in resources away from ingenious ways of manipulating financial markets, or ingenious commercials for dog-food, would undoubtedly (in my view) be a worthwhile public good. But our current policymaking system doesn't encourage such a re-orientation of priorities. Instead, we have people, many of whom are dedicated and hard working, working through outdated bureaucratic channels to achieve bureaucratic goals in ways that do not reward directly and immediately reward

success or deter failure. Nuclear Peace Bonds would be change all that, to the long-term benefit of all of us, including generations yet unborn.

## 13.6 June

### 13.6.1 PBR and SIBS: bring in tradability! (2016-06-08 19:05)

The *Economist* writes about Payment By Results (PBR) for public services in the UK, and cites these problems:

- PBR can create strange behavioural incentives, including a phenomenon known as “cream-ing”. Given the emphasis on meeting targets, providers are often tempted to focus on the easiest-to-help people.
- In addition, the economics of PBR can work against innovation. Providers of public services must pay their employees and suppliers. It is difficult, especially for small firms, to wait around for a payment based on how they have done. [1] *Pay up*, the 'Economist', 4 June

It goes on:

The question, then, is not whether to get rid of PBR, but how to make it work better."

My suggestion? Make the contracts tradable. Then government can specify broad, much longer-term objectives which would encourage participation of a much wider range of potential service suppliers at every stage of the pathway towards goal achievement. Unlike under PBR there would be creative destruction of useless interventions and inefficient agencies.

The article also mentions Social Impact Bonds, of which there are now 32 in the UK and the most famous of which 'seems promising'. I have posted before about Social Impact Bonds, which, while I think they may be a much-needed improvement in neglected policy areas, would benefit greatly by being made tradable (and so becoming Social Policy Bonds, as I conceived them). You can now search this blog for keywords such as Social Impact Bonds, or see [2]here and [3]here for my short papers on them.

### **13.6.2 Metrics for World Peace Bonds (2016-06-09 18:39)**

Metrics for World Peace Bonds, or: Why Long-term Goals are Best

Pondering the best metrics for peace, I came to think that with a goal for peace sustained over fifty or more years, metrics that target for elimination the use of deadly violence become more closely aligned with what we actually want to achieve. By this I mean that, with a decades-long goal, bondholders would have incentives not merely to prevent the outbreak of violence, but also to prevent the precursors to violence. From the point of view of the backers and issuers of World Peace Bonds this makes the metric of deadly violence more robust.

For example: the Cold War ended peacefully, but if [1]World Peace Bonds issued in the year 1950 had targeted a period of sustained peace of just ten years then bondholders would have profited, despite the accumulation of ever more horrific atomic and nuclear weapons, during the period that preceded the [2]Cuban Missile Crisis of October 1962. If the same bonds had been issued with a target of fifty years of sustained peace, then bondholders would have been motivated to reduce tensions, including by such means as reducing the weapons pile-up, or fostering better relations between the US and USSR. A ten-year goal would see the original bondholders making profits while the prospects for peace looked ever darker. A fifty-year goal would have seen the value of their holdings collapse before and during the Crisis.

The point is not only that peace sustained for a decades-long period encourages longer-term thinking. It is also that by choosing the longer-term goal, our targeting of a relatively easy-to-measure metric like deadly violence and its consequences, we shall inevitably do much to eliminate the much less quantifiable - but hugely important - precursors of violence.

### **13.6.3 Britain and the European Union (2016-06-20 17:49)**

I am sympathetic to the idealism that led to the formation and development of what is now the 28-member European Union. I also see great value in having hundreds and thousands of bureaucrats, from all the member states, in Brussels, talking to each other; their children going to the same schools.

But, more and more, the people who work for the European Union; the administrators and politicians, are seen as - and indeed are - a separate caste. They have seldom worked outside government and they enjoy safety-nets and benefits that are decreasingly available to private-sector would-be employees, especially the young. The processes and institutions of the EU are opaque. The decision-makers are unknown and unelected. They dictate policies that are hugely important to ordinary citizens, such as those concerning immigration, without consulting the public and so without getting buy-in. Ordinary people cannot vote these people out and cannot engage in the policymaking process. There are few consequences for failure at any level of the EU bureaucracy. All this would be less intolerable if the European Union showed any sign of adapting to the wishes of the broader population. But I don't see that.

So I fear that this project is going too far, too fast, and without the consent of the vast majority of the public. If I could be persuaded that the EU and the people running it were keeping the peace, then I'd forgive all their *hauteur* and all their extravagances. Nothing would be worse than another European war. But the signs as I interpret them - in Austria, France and elsewhere - are that we are seeing exactly the opposite: the European project, in widening the gap between politicians and ordinary people, is planting the seeds of exactly the sort of vicious nationalism that made its founding so necessary.

A vote in favour of Britain's leaving the EU might lead to worthwhile reforms. So might  
1028

a close decision, either way. But I wouldn't bet on it. For British voters, I'd suggest that a Leave victory would help to close the gap between themselves and the people who make their laws, and reduce the risk of contagion from what looks increasingly likely to be a mean-spiritedly (at best) or murderously (at worst) nationalistic continent.

### **13.6.4 The CAP is destroying Europe (2016-06-22 19:20)**

George Monbiot's article today about our [1]old [2]friend, the European Union's corrupt, insane Common Agricultural Policy, does a great job in describing its wastefulness, its transfers from the poor to the very wealthy, and its disastrous environmental deprecations.

I am perplexed therefore by his decision to vote for the UK to stay in the EU:

I will vote In on Thursday, as I don't want to surrender this country to the unmolested control of people prepared to rip up every variety of public spending and public protection except those that serve their own class. But if we are to live in Remainia, we should insist on sweeping change. Daylight robbery and mass destruction: the EU is supposed to prevent them, not to deliver them. [3]Leave well alone, George Monbiot, 'the Guardian', 22 June

Why Mr Monbiot thinks the EU is suddenly going to reverse itself and dismantle the CAP - which still swallows up 40 percent of the EU budget - is a mystery to me. It has been four decades since, as undergraduate agricultural economists, we learned about the CAP's calamitous [4]impacts. In those 40 years the unelected EU decision-makers have shown themselves to be incapable of responding to economic, social or environmental rationality. Which is why I think Britons would do better to vote to leave the EU in tomorrow's referendum. Yes, as Mr Monbiot points out, the Leave campaigners have promised to keep subsidizing UK farmers. But if Britons don't like that policy, they can vote to change it. They still have a say in who become Members of the British Parliament, and they can vote against stupid, cynical, wasteful and destructive policies. But the people who make EU policy? We don't even know who they are or how they got there. And we certainly can't get rid of them.

### **13.6.5 Good policy is not about choosing a team (2016-06-27 18:51)**

Michael Tomasky quotes Christopher Achen and Larry Bartels:

We conclude that group and partisan loyalties, not policy preferences or ideologies, are fundamental in democratic politics. Thus, a realistic theory of democracy must be built, not on the French Enlightenment, on British liberalism, or on American Progressivism, with their devotion to human rationality and monadic individualism, but instead on the insights of the critics of these traditions, who recognized that human life is group life.... For most people, partisanship is not a carrier of ideology but a reflection of judgments about where "people like me" belong. [1]*Can the monster be elected* ?, Michael Tomasky, 'New York Review of Books', dated 14 July

There are likely or possible explanations for this. One, perhaps, is that a country - still less a group of countries - is just too large a body of people with which we can identify. But more important is how this insight links with policymaking, and how it can be, and is, manipulated by those seeking power. So, for instance, it's regarded as 'compassionate' to approve of Angela Merkel's impulsive decision to welcome unlimited numbers of migrants from the third world. And the impulse truly was a compassionate one. Who would want to identify with the (relatively) hard-hearted approach of Australia towards boatloads of refugees and migrants? Or the (absolutely) hard-hearted approach of Saudi Arabia? People understand compassion and we all want to think ourselves compassionate.

It makes for disastrous policy. Migrants drowning in

[2][3]record numbers

in the Mediterranean. People in Europe feeling let down by their elected representatives, generating widespread alienation and anger, more support for [4]extremist parties, the erosion of [5]free speech, British exit from the European Union and [6]record gun sales throughout Europe.

It points to the irrelevance of outcomes as a determinant of policy in today's democracies. Bonding with 'people like me', signalling virtue and 'compassion', mutual back-patting: these are how we choose which policies and parties to back. I don't think there's anything particularly wrong or reprehensible with this - except that it leads to calamitous results, as we are seeing. Policymakers should hold themselves to a higher standard: instead of being

compassionate, or acting compassionately, or allying themselves with the 'compassionate' side of an argument, they should be making decisions with a view to their likely outcomes.

Unfortunately, our system doesn't target outcomes and, especially, it does not target long-term outcomes. Politicians win points by seeming compassionate and human and empathic, regardless of the long-term results of their policies. Or by identifying themselves as being in opposition to 'compassion', unity, tolerance and all the other labels the other team likes to apply to itself.

The losers from all this are ordinary people including, especially and most tragically now, those thousands of Africans risking their lives trying to cross the Mediterranean.

Social Policy Bonds are a way of closing the gap between ordinary people and the politicians and bureaucrats who make the policy that determines how we live. Under a bond regime we could target long-term goals; goals that would not be swayed by striking televisual imagery, rhetoric, impulse or reaction. Ordinary people would help choose these goals and their relative priority far more readily than they can engage in policymaking in today's world. Crucially, policy goals - as distinct from the ways we achieve them - would be stable over time, and not subject to the whims and caprices of the 'people like us'.

Social Policy Bonds will never be seen as 'compassionate'. They channel people's self-interest into solving social problems. (I titled an early version of my book Give greed a chance.) People make money by achieving social goals, and if they're efficient, they make more money. That is anathema to the 'compassion' lobby, who are more interested in picking a team, banging a tambourine and advertising their virtue than actually finding the best ways of helping the most people. I would think, though, that the people we are trying to help - the poor, the disadvantaged, those who are illiterate after years of schooling, those whose lives are devastated by war - are more interested in outcomes than motives. I certainly am.

## 13.7 July

### 13.7.1 Compassionate woman, compassionate policy, cruel outcome (2016-07-02 19:11)

Compassionate woman, compassionate policy, cruel outcome:

IOM [International Organization for Migration] reports an estimated 222,291 migrants and refugees entered Europe by sea in 2016 through 26 June, arriving in Italy, Greece, Cyprus and Spain. Deaths in the Mediterranean so far this year are 2,888, compared with 1,838 through the first six months of 2015. [1]Source

Nobody, least of all, Chancellor Merkel, wanted this. Compassion works in everyday life, with people whom we know, or with people whose need is desperate and urgent. As a policy, though, it fails. I think we should do better to target outcomes, rather than the supposed means of achieving them. If our goal is to reduce drownings in the Mediterranean, then reward people for achieving that outcome. If our goal is to improve the [2]quality of life for ordinary Africans, then we should reward people for achieving that outcome. And if our goal is to reduce or eliminate [3]conflict in the Middle East, then why not put in place a system of incentives that motivates people to achieve that?

Social Policy Bonds allow us to set these long-term objectives and to reward the people who achieve them. They don't *sound* compassionate relying, as they do, on monetary incentives, and many on the left disdain or despise the idea (and their originator!) for that reason. But monetary incentives - often known as salaries or wages as well as prizes or bonuses or profits - are the very basis of whatever prosperity there is on this planet. The wish to acquire more cash can be directed into social and environmental causes, as well as frivolous or destructive ones. The world would be better served if we all got over our hang-ups about money and with our wish to *appear* compassionate, and actually worked towards more compassionate outcomes. Or, as a [4]line from the 1981 movie, *Southern Comfort* has it: "Comes a time when you have to abandon principles and do what's right."

### 13.7.2 From operative to speculative politicians (2016-07-12 19:38)

The more I chat with politically interested people, the more I become disillusioned. Outcomes for the people they purport to represent mean far less to them than the other things that go along with identification with a political party or opinion: belonging to a group of like-minded (good or 'compassionate') people; the joy of differentiating themselves from the other (evil) lot; participation in group events and rituals; the convenience of having an ideology that both explains the world and generates apparent solutions to its problems.

I am respectful of all this. I recognize the need of all humans to engage with each other, to sing or dance [1]together, to share our hopes, to be with people who have a similar world view for whatever reason, to identify with a clan or tribe; above all: to belong. What I do find problematic, though, is that the 'rightness' of such belonging, the elation and joy that come with satisfying a genuine human need, can lead participants to prescribe policies that they try to apply to people outside their in-group, without seeking the outsiders' buy-in - without, indeed, thinking it necessary or desirable. I've [2]written (frequently!) about how the over-arching goal of any institution, however well intentioned, initially, however hardworking its members, becomes more and more that of self-perpetuation.

Most of us, if we're allowed to express ourselves coolly and freely, want to live in some sort of welfare state, with a safety net for the disadvantaged. We also want a healthy, productive, wealth-generating business sector. Yes, there will be differences of emphasis and priority, disagreements about procedure. But our overall goals are not that different. Not so different, surely, as to justify the mutual hatreds that we are seeing in the politics of many western countries today. These hatreds could bring about calamity, in the form of weakened societies, prey to those with far less edifying ambitions. The old Arab proverb comes to mind: 'a falling camel attracts many knives'.

My response is twofold. The first (predictably!) is to advocate [3]Social Policy Bonds. The ostensible reasons for our polarized, dysfunctional politics, are not so much about our goals, but about the ways we think they shall be best achieved. We could instead debate social and environmental outcomes, about which there is more consensus and more objectivity. On a global scale, for instance, we could target the sustained [4]survival of our species, or [5]world peace, or the non-deployment of [6]nuclear weapons. At a regional level, we could target [7]Middle East peace. At a national level we could target [8]universal literacy, or improvements in [9]crime rates or [10]environmental health. People understand these outcomes far more than we do the intricacies and legalisms of policymaking under the current system, and the structures and activities of those charged with achieving our social goals. And because we understand outcomes, we can participate in the policymaking process. Nobody would be perfectly satisfied by the array of specified targets, but there would be [11]buy-in - something we need and something missing in today's organization- and activity- based policies.

Less frequently have I mentioned my second response: the deliberate refocusing of ideological politics away from policymaking and towards other, more inward-looking, activities. You might have thought that the economic and social shambles that was Marxism would have expired with the old Soviet Union. But it survives in China and elsewhere, not as an economic system, but as an extraordinarily potent ideology *about* an economic system. Freudian psychoanalysis, though [12]discredited as a [13]therapy, [14]survives as a cult revolving around the life and work of Sigmund Freud. There is not a single proven example of a visit to Earth by an alien spacecraft - yet opinion [15]polls consistently show that more than half of adult Americans believe in such an event.

Could our political parties and their associated ideologues take the same steps? They probably wouldn't take the initiative, but if it became the only means by which they survive, then they would surely do so. A Social Policy Bond regime could accelerate the process. Parties and ideologues are concerned with personalities, ideologies, activities, funding and institutional structures, all of which are the supposedly rational basis for their existence from which derives the positive features of belonging. Social Policy Bonds would lead to [16]new types of organization which would erode that basis - but not the more edifying need for bonding. There is a precedent, and it is the world of Freemasons. Some groups of working or 'operative' stonemasons began to allow non-masons into the guilds. Operative masonic lodges raised money by charging the gentry for admission to their "mysteries". (See [17]here.) The guilds and mysteries persisted after the great British and European cathedrals had been built. Operative masons declined in number; 'speculative' masons took over, and today there are around six million freemasons [18]worldwide.

Could our politicians and those with a vested interest in the power-structures to which they belong and from which they derive inspiration be persuaded to give up their dysfunctional organizations and divisive politics, and become 'speculative' policymakers? Then we'd be free to focus on social and environmental outcomes that are meaningful to ordinary people. I think everyone - politicians and public - would be happier if our potentially catastrophic 'operative' way of making policy became 'speculative' and focused more on inward enlightenment than on making an impact on the world.

### **13.7.3 Political parties are divisive and unnecessary (2016-07-23 17:43)**

John Lanchester writes about UK politics:

Political parties are the mechanism through which divisions in society are argued over and competing interests asserted. The trouble with where we are now is that the configuration of the parties doesn't match the issues which need to be resolved. [1]*Brexit Blues*, John Lanchester, 'London Review of Books', dated 28 July

Quite so. Society has become too complex for the old political parties which, I [2]believe, will have to evolve much as the stonemasons did, into organizations that are less concerned with improving material circumstances than with ritual, bonding and inner development. In their place we could see new types of organization: ones with protean structure and composition that are dedicated to single issues.

In a Social Policy Bond regime, these [3]organizations would target social or environmental outcomes. All their activities would be devoted to achieving broad, meaningful outcomes as cost-effectively as possible. Most of us agree that we need a society that both looks after its disadvantaged members and has a healthy, efficient business sector that will generate surpluses to pay for a welfare state. Broad, meaningful goals would encompass (for examples) health, education, the state of the environment, crime, and poverty; at an international level we could target the elimination of all war and civil war.

Of course there will be disagreements about priorities, but there will be more consensus about these goals than there is about the supposed means of achieving them. Political parties are failing. They cannot cope with society's complexities and are unnecessarily divisive. They're unlikely ever voluntarily to relinquish their over-sized role in making policy, but a transition toward a Social Policy Bond regime could see them decline or encourage them to reinvent themselves as something different, much as did the old stonemasons. For my thinking as to how this transition could be managed, see chapter 4 of [4]my book.

### 13.7.4 How we select our policymakers (2016-07-24 19:23)

How do we select our policymakers? By what criterion do we judge our potential leaders? No, it's not good looks, or ability to generate soundbites, or 'the common touch', or gender, race, or sexual orientation. Still less does competence have anything to do with it. Politico.com supplies the answer:

Inside the VP hunt: How Clinton picked Kaine

How tough was the vetting? Finalists had to turn over every password for every social media account for every member of their families. They had to turn over every password for every social media account for every member of their families. They had to list every piece of property they'd ever owned, and copies of every résumé that they'd put out for the past 10 years. Every business partner. Every gift they'd ever received, according to those familiar with the details of the vetting process. [1] *Inside the VP hunt*, Edward-Isaac Dove and Gabriel DeBenedetti, 'Politico.com', 23 July

### 13.7.5 Policy for the Middle East (2016-07-30 19:12)

Philippe Sands discusses the recently released Chilcot report into the UK's role in the Iraq conflict:

There's nothing really new, since the material emerged when the hearings took place, but these 169 pages of tightly woven narrative and assessment nonetheless offer a unique insight into the place of legal advice within government: **how law is made to fit around policy, rather than the other way round.** .... [T]he decision to remove Saddam Hussein and wage war in Iraq was taken early, and ... intelligence and law were then fixed to facilitate the desired outcome. [1] *A grand and disastrous deceit*, Philippe Sands, 'London Review of Books', 28 July. (My emphasis.)

The Iraq debacle is a tragic story of how policy is made without regard not only for the law, or the truth, but also for the well-being of people in Iraq. It's a typical conceit of those in power. Here's a problem: Saddam's regime is nasty. And here's our solution: remove Saddam and wage war in Iraq.

I can't offer a better solution. But what I can offer is a way of generating better solutions. The first step is to be clear about our goals. I'd say our over-arching goal should have been to improve the well-being of all the Iraqi people. A second goal would be to remove any threats to non-Iraqis arising from weapons of mass destruction. For each of these two goals we need reliable indicators that we could then target by issuing Social Policy Bonds. A quantifiable indicator of well-being could target for improvement a combination of such measures as the [2]human development index, the numbers of political prisoners, the numbers killed in sectarian violence, numbers of emigrants and refugees, and some measures of media incitement to hatred and violence. Importantly, such Iraq Peace Bonds would not assume that, for instance, Saddam must be removed and his regime dismantled. It would be up to bondholders, motivated by financial incentives, to calculate how best to achieve peace in Iraq. Financial incentives - not emotion - would dictate their decisions.

What about the second goal: the elimination of the threat arising from real or imagined weapons of mass destruction? This goal could have been targeted by a second bond issue, which would reward bondholders for achieving the non-use of such weapons over a sustained period of, say, several decades.

In both bond issues, bondholders would have incentives to generate *diverse, adaptive* approaches to meeting their goals. This means that they would not impose top-down solutions on the basis of how they feel at one point in time, and that they would have a *continued* strong interest in the long-term success of their approaches. I've written about bonds targeting

peace in the Middle East [3]here, and about bonds targeting sustained nuclear peace [4]here.

## 13.8 August

### 13.8.1 Government of the people, by the rich, for the rich (2016-08-03 20:43)

Elizabeth Drew quotes John Tanner, a former US congressman, explaining extremist attitudes in US primary elections:

If a Republican strays from the far ideological right ... they put themselves in political peril. They know better—some of them—but it's not worth the political fallout to wander into the sensible center and try to sit down and work something out. No one will do what they *all know has to be done to keep the country from going adrift*. (My emphasis.) [1]*American democracy betrayed*, Elizabeth Drew, 'New York Review of Books', dated 18 August

I've always maintained that there is more consensus about our social goals than there is on how to achieve them. Even so, as Mr Tanner indicates, there is also wide agreement over what needs to be done: that is, over activities. And yet the way we conduct our politics makes us incapable even of undertaking those activities. Divisiveness, which in its less virulent form may on balance have served us well over history, has become toxic. In the US particularly, it has become self-entrenching, through cynical manipulation of constituency boundaries, as in

this example given by Ms Drew in the same article:

[A] a tiny peninsula was added at the last minute to a new district in northeast Ohio not because it contained certain residents but because it was the site of a large manufacturing company that could produce campaign contributions.

To put it bluntly, our system has been hijacked by experts who have little interest in the well-being of broader society. The result is becoming clear to us all: a wide and widening gap between government and big business on the one hand, and ordinary people and small business on the other. The political systems, not only of the US, but in all countries, have become too complex for ordinary people to follow. The dangers are becoming apparent: growing cynicism, extremism and nihilism.

To close the gap between people and their supposed representatives, I offer [2]Social Policy Bonds. They aim to inject the market's efficiencies into the achievement of our social and environmental goals. But perhaps even more important, they demand clarity of these goals. Meaningful, explicit goals, which all of us can understand. Goals such as universal literacy, improved health, reduced crime and pollution and, at an international level, peace. With greater comprehension of our politics, we'll see more public engagement, and hence more [3]buy-in: an end in itself, as well as a means towards more efficient ways of solving our social problems. What we have now is a travesty: government of the people, by the rich, for the rich. I don't think it's sustainable. By switching deliberately and slowly towards something like a Social Policy Bond regime we could ensure that, instead of a likely collapse followed by anarchy or tyranny, we'd see politics geared towards the well-being of all society and not, as now, those who are powerful enough to manipulate the system.

### 13.8.2 Health funding needs to be more impartial (2016-08-07 18:59)

Priorities for healthcare funding are heavily influenced by factors other than the ratio of benefit to cost.

[A] [1]review by Cancer Australia (pdf) showed that between 2006 and 2011, breast, colon and prostate cancer all received funding greater than their proportional toll on society — measured in years of healthy life lost. By the same measure, research into lung cancer, along with lymphoma, pancreatic cancer and cancer of the brain were underfunded. [2]*Lung cancer research underfunded compared to societal impact*, ABC news, 12 August 2015

In this graph, taken from the above link, 'DALYs' on the vertical axis means disability adjusted life years lost to the type of cancer on the horizontal axis. Funding is given in millions of Australian dollars.

x

Some disparities are striking: "Lung cancer, which takes the heaviest toll on years of healthy life, received less than a quarter of the funding given to breast and colon cancer research."

Governments have to make their resource allocation decisions on the basis of data that are necessarily incomplete and constantly changing. So, by default, health expenditure is influenced by groups of medical specialists with little incentive or capacity to see improvements in the general health of the nation as an objective. As a result, funding of these specialities depends to a great and varying extent, on the strength of their lobby groups or on their public profile rather than on what would best meet the needs of society.

The problem is the same sort of top-down, one-size-fits-all, fossilised systems of funding that bedevil other (well-meaning) attempts by government, or any large organisation, to keep track of multiple variables across any but the smallest geographic area. In health, as in education, housing, crime prevention, or environmental pollution we need diverse, adaptive approaches to solving our problems. Society is just too complex now for simple approaches to work effectively, except in those increasingly rare cases where cause and effect can be readily identified and relatively stable over time and space.

The Social Policy Bond principle can be applied to health. Essentially, under a bond regime, government would target for improvement the health of the entire population as measured by (probably) DALYs in combination with other measures. Resources would then be allocated impartially according to where they will yield the most benefit per dollar spent. Any target could be long term: if it were several decades bondholders would have an incentive to investigate numerous approaches, including preventive measures, research and education, on a dynamic basis and always with an eye to cost-effectiveness. For more on this, see my brief piece on [3]Health Bonds.

### 13.8.3 Social Policy Bonds: state of play (2016-08-14 20:22)

I don't think any Social Policy Bonds have yet been issued, despite their having been in the public arena for 28 years. That said, more national and local entities are issuing or considering Social Impact Bonds, the non-tradable variant of Social Policy Bonds. This wikipedia [1]page summarises the history and current deployment of SIBs. I'm pleased to say that they are becoming more widespread. Countries in which they have been issued include the UK, Australia, the US, and they are also being considered in Brazil, Israel and New Zealand. Dan Corry of [2]New Philanthropy Capital in London summarises the current (9 August) state of play with SIBs in the UK [3]here, while Patrick Young, in Australia puts out the [4]Daily SIB Newsletter.

I do have reservations about SIBs, which I have expressed [5]here, [6]here, and in several blog posts (search this page for *Social Impact Bonds*). Perhaps necessarily, they are narrow in scope and, in my view, will be prone to manipulation and gaming, especially if they become so commonplace that they escape public scrutiny. Because of their limitations they are also, as I expected, relatively costly to administer, as Alliance 54 [7]reported in July: 'SIBs are gaining traction with 57 models operating, but they have proven complicated and costly to design and implement.' I haven't been consulted about, and have no involvement in, any of these SIB issues. My hope is that SIBs, will advance, rather than discredit, the Social Policy

Bond concept.

ngozi (2016-08-17 09:14:43)

Success is indeed good

hello, my name is Ngozi, a student of University of Nigeria . i find your work quite interesting. please contact us at [www.unn.edu.ng](http://www.unn.edu.ng) to stay informed

#### **13.8.4 Poverty: the need for diverse, adaptive approaches (2016-08-20 19:29)**

The *Economist* writes about US President Clinton's 1996 welfare reform package. Under the sub-head *Blockheads*:

Challenged to reduce the number of people receiving welfare, many states merely shifted people onto disability insurance instead, declared victory and sent the bill to Congress.... How might the reform be reformed? Most vitally, by concentrating attention and resources on those 1.5m families at the very bottom. Since this is the hardest group to reach, the federal government should use its money to encourage states to find new ways to help them. [1] *A patchy record at 20*, the 'Economist', 20 August

Quite so. Clarity about aims is an essential and inescapable first step in implementing a Social Policy Bond regime. Unfortunately, policymakers under the current system can get away - or get rewarded for - with shifting people from 'receiving welfare' to receiving 'disability insurance'.

The article continues:

A useful model is “Race to the Top”, an education initiative from the Obama administration which rewards states that achieve improvements with extra money, in the hope that others will copy their success. There are plenty of policies worth experimenting with: expanding tax credits for those without children, extra government help with finding a job and even public make-work schemes. But this must be experimentation with the right purpose—helping the poorest into work rather than simply cutting welfare rolls.

True: the aim is not to cut the number of people on welfare. But I question whether raising the number of poor people in work is exactly what we want to achieve. I would think our over-arching goal is to eradicate poverty over a sustained period. Increasing employment among those currently poor may be one way of doing that, but we should not assume that it is the most efficient way. Nor the most compassionate: it’s not difficult to think of people for whom employment would be less helpful than other interventions. For instance, a struggling single parent of several small children could benefit more from, for instance, help with childcare. Society as a whole would benefit more, in the long term, by improving the children’s education and healthcare or their physical and social environment, or improving the parent’s access to information about how best to nurture children. If parents were compelled to work, the benefits of a higher household income could be outweighed by the negative effects on the children.

As Barbara Ehrenreich put it:

The “working poor” ... neglect their own children so that the children of others will be cared for; they live in substandard housing so that other homes will be shiny and perfect; they endure privation so that inflation will be low and stock prices high. To be a member of the working poor is to be an anonymous donor, a nameless benefactor, to everyone. [2]Source

Social Policy Bonds targeting poverty could encourage the exploration and implementation of

whichever approaches would best suit the varied and ever-changing circumstances of a population. Every one of those 1.5 million worst-off families referred to in the first excerpt above will face different challenges. Employment will be a solution for some, but not all. Social Policy Bonds would motivate people to find the diverse, adaptive solutions that extreme poverty and many other social and environmental problems require if they are to be solved, rather than merely disguised.

### 13.8.5 Alternative data and metrics for a bond regime (2016-08-22 20:20)

The *Economist* writes about 'alternative data':

The growth of small, low-cost satellites and machine learning means companies can quickly and cheaply parse millions of satellite images a day. A common trick is to analyse photos of car parks outside big-box retailers such as Walmart to get a sense of daily revenues. A Chicago-based data firm, RS Metrics, sells estimates on the productivity of factories by tracking the number of lorries parked outside. [1] *The watchers*, the 'Economist', 20 August

Mindful of [2]Campbell's Law, I've always thought that each Social Policy Bond issue should target a set of metrics, each of which has to fall within a specified range before the bonds can be redeemed. Also, that, if we target a broad national goal (universal [3]literacy, say) the bond's issuers could stipulate that the bonds would be redeemed on the basis of data from a random sample of people of the country, so as to minimize the risks of manipulation. Alternative data could contribute to robust combinations of metrics for the purposes of a bond regime, especially those covering countries where official data is scarce or unreliable. As the article says: "Investors are particularly keen for firms to study pictures that yield rare data on, say, steel production in China or Russia, where official data can be patchy." It's not difficult to imagine scenarios in which alternative data could play a possibly indispensable role in the monitoring of progress toward [4]environmental goals, or goals such as [5]disaster prevention or [6]conflict reduction.

### **13.8.6 Make them tradeable (2016-08-27 19:30)**

Quite a bit going on with Social Impact Bonds, as is apparent from their [1]Wikipedia page and the almost daily [2]*Social Impact Bond newsletter*; one recent [3]issue highlighting Japan's interest in the concept. I do have reservations about SIBs, which I have written about [4]here and [5]here, though they do seem to have been inspired by my early work on Social Policy Bonds. One weakness, in my view, is that because they are not tradeable, SIBs are more subject to gaming and manipulation than Social Policy Bonds. This could become a bigger problem if the SIB concept becomes so widely adopted that they avoid public scrutiny. There is a long and sorry history of (presumably) well-intentioned measures, ostensibly taken to boost efficiency in the public sector, ending up as subsidies to the already wealthy and powerful. See, for instance, this [6]piece about the UK's Private Finance Initiative. This is [7]corporate welfare wearing a thin disguise.

So, given my doubts about SIBs, do I have anything positive to say about them? Yes:

First, is that they aim to reward better performance in the provision of social services. True, their lack of tradeability drastically narrows the range of such services and severely restricts their applicability over space and, especially, time. Still, they do give incentives to service providers to do a better job, given such limitations: something that is more revolutionary than it should be, but nevertheless a definite step forward.

Second, whatever their weaknesses, SIBs might be an improvement in policy areas that are particularly poorly served by existing interventions. Such unglamorous policy areas as, for instance, provision of services to the mentally unwell or to newly-released prisoners to help prevent them from recidivism.

And third, of course, SIBs might serve as a helpful or necessary transitional step toward Social Policy Bonds. SIBs allow the bonds' issuers, whether public- or private-sector a greater degree of control than Social Policy Bonds over *who* shall go about achieving the bonds' objectives and (less directly) *how* they shall do so. Government and other backers of bonds are, understandably, reluctant to relinquish their control over these levers of power. But

Social Policy Bonds could be introduced gradually, and government agencies - if they are truly efficient - need not fear their introduction. Exposure to competition from others motivated to achieve society's goals, as targeted by a Social Policy Bond regime, would stimulate the exploration and implementation of diverse, adaptive solutions to national and even global problems. If it takes a decade or two's experimentation with SIBs to get there, it's a worthwhile journey. My hope is that SIBs' weaknesses and the greater scope they give for manipulation do not falsely discredit the Social Policy Bond idea in the eyes of the public.

*For more about a transition to a Social Policy Bond regime, see chapter 3 of [8]my book.*

### **13.8.7 Social Policy Bonds as a meta-system (2016-08-30 18:39)**

I haven't read [1]*The Moral Economy: Why good incentives are no substitute for good citizens*, by Samuel Bowles, but I have read reviews. Mr Bowles points out that, in some circumstances, monetary incentives alone cannot make people behave as we should wish and can even encourage perverse behaviour. This echoes the work of [2]Professor Bruno Frey who found that monetary incentives can undermine our willingness to do the right things for ethical and moral reasons. People perform valuable social or environmental services not only for monetary gain, but also because they enjoy doing them for their own sake, because they believe them to be the morally right things to do, or because they believe that their actions will advance some cause to which they are committed. These 'intrinsic' motives are qualitatively different from external, monetary incentives, and offering monetary rewards might 'crowd out' or undermine these less mercenary and more civic-minded motivations. Crowding out internal motivation can occur, writes Prof Frey, because, monetary incentives can undermine people's feelings of self-determination and self-esteem. Also, when external incentives are

supplied, the 'person acting on the basis of his or her intrinsic motivation is deprived of the chance to exhibit this intrinsic motivation to other persons.'

Not mentioned by Frey, but also plausible is that financial incentives can undermine the cognitive outlook that sees socially and environmentally beneficial services as worthwhile in their own right, rather than as a cost for which compensation and payments must be paid by taxpayers.

What do these findings mean for Social Policy Bonds, which at first sight seem to be entirely dependent on monetary incentives that will encourage achievement of socially desirable goals? First, it's important to note that, as Frey points out, the crowding-out effects are not always significant. In markets, which are based on relationships amongst essentially self-interested strangers, financial incentives as exhibited through the price effect do work as classical economics predicts. That is, they work to increase supply. And when (as they would be under a Social Policy Bond regime) external rewards are seen as correlated with civic duty rather than an attempt to 'buy' one's civic performance, they may well support, rather than undermine, moral and other intrinsic motivations. This would be especially true if, partly because of the role that a bond regime [3] could play in raising taxes on less socially valuable forms of wealth accumulation.

Second: Social Policy Bonds are not merely a system by which monetary incentives are funneled into the most efficient providers of public goods and services, but a 'meta-system' that motivates bondholders to find the best ways of encouraging socially beneficial behaviour - whether these be monetary or not. A bond regime could give bondholders incentives to explore further the insights of Mr Bowles and Prof Frey, looking in detail at the relationships between financial incentives and civic performance. They could use this knowledge to minimise the costs of achieving targeted objectives by, for example, finding out when monetary incentives are least likely to supplant the intrinsic motivations of people who help achieve objectives, and concentrating their use in those circumstances.

Social Policy Bonds, then, are not a relatively crude financial instrument that rewards payment for performance in a narrow sense (that would be Social Impact Bonds), but rather a way of rewarding people for encouraging socially beneficial behaviour, however they do so.

## 13.9 September

### 13.9.1 Impediments to a radical transformation (2016-09-03 18:25)

My 27 August [1]post pointed out the advantages of making [2]Social Impact Bonds tradeable. In other words, of issuing Social Policy Bonds rather than SIBs. Why then have Social Policy Bonds, to my knowledge, not yet been issued?

One reason is that Social Policy Bonds work best on a large scale and over long time periods during which resources can most readily find their optimal deployment. I've pointed out the necessarily narrow scope of Social Impact Bonds [3]here and [4]here. Because SIBs cannot be traded, their ownership is restricted to a specified (small) number of service providers with an inescapably short time horizon as compared with the long time usually needed to solve important social and environmental problems. But SIBs' restricted scope acts as reassurance to policymakers in general, and the bonds' issuers in particular: it gives them control over who shall undertake the activities that help achieve the targeted goal. Yes, the bonds do reward more efficient performance, but only for specified service providers.

Social Policy Bonds, in contrast, work best when service providers are subject to [5]creative destruction: the impetus that rewards successful firms and winnows out failures. It's a discipline rarely seen in the provision of social services which, being very often government agencies, are immune from penalty for poor performance (and often, if too successful, will face a reduction in funding, or even dissolution). The time period required for the solution of most major social problems will necessarily be long; longer in most cases than the planning horizon of existing service providers and probably, in the case of very remote goals ([6]world peace, for instance) longer than most people's life expectancy. The creative destruction that will be a necessary byproduct of efforts to solve these large-scale problems discourages existing service providers, be they government or non-governmental organisations of any type, from advocating for, or themselves issuing Social Policy Bonds. Existing bodies, in this view, are impeding the achievement of some of humanity's most urgent goals, not so much through any active lobbying on their part, but because of an understandable wish not to jeopardise their survival.

It is the interests of existing organisations, public- and private-sector, and their wish either to control who shall achieve social goals or to survive that, I think, are impediments to the radical transformation of humanity's prospects to which Social Policy Bonds could give rise.

### **13.9.2 Health: better late than never (2016-09-08 22:18)**

The *Economist* looks at the UK's National Health Service

A better model [than the NHS] would be to give health providers a budget based on the population they serve, and pay them according to their ability to meet targets of better public health. This would increase the incentives to use new technology that would give patients more responsibility for their own health. If private outfits can do this with a profit margin to spare, good for them. [1] *Bitter Pills*, the 'Economist', dated 10 September

Quite right. The current system is staffed by dedicated, well-intentioned, hard-working people, but its goals, explicit or implicit, have little to do with raising the general health of the population. In this the NHS is like many other social services: it began at a time when (1) relationships between cause and effect were easier to identify and (2) resources and expectations were constrained, so that only the most urgent and obvious challenges could be met. Times have changed. Society is more complex, time lags more important, and expectations are higher.

Targeting broad, general, health outcomes, and injecting market incentives into doing so, would greatly improve society's well being, as the *Economist* (belatedly), suggests. My 2013 [2] essay on applying the Social Policy Bond principle to health goes into more detail.

### **13.9.3 New world disorder (2016-09-15 19:58)**

Walter Russel Mead writes about the world we actually live in:

The problem isn't that the goals of the liberal internationalists are bad goals. They are excellent goals: no war, the spread of democracy and human rights, limits on weapons of mass destruction, strong institutions. The world they dream of is a much better world than the one we have now. And the liberal internationalists are also right that the world can't afford to go on in the old way. Given 21st century technology and the vulnerability of our large urban populations to anything that disrupts the intricate networks on which we all depend, old-fashioned great-power politics with its precarious balance of power shored up by recurring wars is a recipe for utter disaster and, maybe, the annihilation of the human race. But the difficulty that over and over sinks hopeful efforts by liberal internationalists is this: *Liberal internationalist methods won't achieve liberal internationalist goals.* [1] *It's Kim Jong-un's World; We're Just Living In It*, Walter Russell Mead, 'The American interest', 9 September (my emphasis)

It's not an optimistic view, but it's one that I mostly share. A world in which North Korea and other small, poor countries acquire nuclear weapons is not going to be safe for the liberal values under which most of us, mainly in the west, are lucky enough to live. We can see the pessimistic scenarios as a clash of civilizations, or a clash of values, or shifts in geopolitical power, but I choose to see it as a problem of perverse incentives.

To be simplistic, but not wholly inaccurate: for most of the people in politics, more power is an end in itself. Solution of social problems can be a means to that end but, for example, whipping up nationalistic fervour *at the expense* of improving your citizens' well being can work just as well, with Kim Jong-un being today's exemplar par excellence. Our political systems reward the acquisition of power and on the international stage as currently set up is strongly correlated with the acquisition of nuclear weapons.

Social Policy Bonds can drastically re-orientate the operating incentives and reward the proliferation not of nuclear weapons but of what Mr Russell Mead calls liberal internationalist values. I would assign a high priority to ensuring sustained nuclear peace, but we could also strive for 'the spread of democracy and human rights'. Social Policy Bonds with sufficient backing and a long-term focus could give incentives for people to focus on achieving these goals. The current system will always be vulnerable to people like Kim Jong-un (or worse) because it does not encourage people to find ways of stopping those who are psychopathically hungry for power from ascending into influential positions. There's very little upside to seeking to depose Mr Kim. We need to change that. [2] Nuclear Peace Bonds could help to do this. Mr Russell Mead continues his article saying that ' [p]ower, not communiqés, is what makes the world go round.' But money correlates strongly with power. And while it's nice that our cats and dogs have a [3] huge range of foods to choose from, I'd like to think that, given the choice, they'd rather see some of that human ingenuity channelled into making the world safe from nuclear apocalypse.

-

The [4]first cross-border Social Impact Bond has been issued. I have no involvement in this project, and I have written about my reservations about SIBs [5]here and [6]here. However, I have always hoped that the bonds would be used on a level higher than the national level, as in my post above. It might be that these first cross-border SIBs are a necessary first step toward internationally-backed [7]tradeable Social Policy Bonds.

### 13.9.4 Industry concentration discredits market forces (2016-09-21 18:21)

The 'Economist' writes about the direction in which our economies appear to be heading: briefly, the concentration of business into fewer big companies:

The share of GDP generated by America's 100 biggest companies rose from about 33 % in 1994 to 46 % in 2013. The five largest banks account for 45 % of banking assets, up from 25 % in 2000. In the home of the entrepreneur, the number of startups is lower than it has been at any time since the 1970s. More firms are dying than being born. [1]A giant problem, the 'Economist', 17 September

The dangers of such concentration extend beyond the 'too big to fail' paradigm that in the past few years has brought about a [2]massive transfer of wealth from the poor and middle class to banks and wealthy investors. It's the [3]usual [4]scenario: government and big business on the one side, ordinary people and small enterprises on the other. I have two objections to increasing industry concentration: first, that it widens the gap between governments and the

people they are supposed to represent. This results in a public disengaged from policymaking, which can lead to flawed policymaking or, just as bad, the creation of otherwise good policies that have no [5]buy-in.

My other objection is simply that industry concentration discredits our economic systems in general and markets in particular. The 'Economist' identifies technology and globalisation as two of its causes. But, as the journal points out, some of the consolidation of business represents the triumph of the anti-market approach. Big business is adept at taking advantage of and manipulating trade rules and other important parts of the regulatory environment to stifle competition:

Regulation inevitably imposes a disproportionate burden on smaller companies because compliance has a high fixed cost. ... The complexity of the American system also serves to penalise small firms. The country's tax code runs to more than 3.4m words. The Dodd-Frank bill was 2,319 pages long. Big organisations can afford to employ experts who can work their way through these mountains of legislation; indeed, Dodd-Frank was quickly dubbed the "Lawyers' and Consultants' Full-Employment act". General Electric has 900 people working in its tax division. [6]*Why giants thrive*, the 'Economist', 17 September

Society needs *some* guidance. Not, heaven forbid, central planning, but some sense of direction over where both market and anti-market forces are taking us. We're now on a path that is taking western countries into a world of entrenched wealth and class differences and widespread, growing alienation. It's not a healthy outlook.

Which is where Social Policy Bonds could enter the picture. A bond regime wouldn't randomly allow influential players to throw their weight around with the government (if we're lucky) coming in to deal with the adverse consequences or (if we're unlucky) being co-opted to join with big business in stifling competition and extracting funds from taxpayers. In contrast, Social Policy Bonds would reward people who achieve universally wished for social and environmental outcomes. They would do so in ways that inject the market's incentives and efficiencies into the achievement of social goals. The skills and energies of, for instance, those 900 tax experts working for General Electric, would be channelled into socially useful projects. Incentives matter and we need to give big business and its pals in government incentives to work for all citizens, and not just for their own narrow short-term interests.

### **13.9.5 Polluter Pays Principle: Social Policy Bonds as a meta-system (2016-09-24 19:33)**

The Polluter Pays Principle (PPP) says simply that those who pollute the environment must pay for the damage they have caused. The idea originated in the 1970s when members of OECD countries sought a means by which pollution control costs would be financed by the polluters rather than the public in general. Its principal defect is that it does not guarantee efficiency of pollution control and environmental protection.

The PPP assigns environmental rights to those who benefit from environmental improvement, so polluters pay. The Beneficiary Pays Principle (BPP), on the other hand, says that whoever benefits from a cleaner environment should bear the costs of pollution control.

Especially for diffuse sources of pollution, it's not always obvious who should pay: the polluter or the beneficiary. One of the virtues of a Social Policy Bond regime is that it would leave it to holders of [1]Environmental Policy Bonds to decide how to allocate the costs of a cleanup. They would do so not according to the the subjective and possibly divisive criterion of 'fairness', but on the basis of which principle will be more efficient at ensuring the maximum reduction in pollution per dollar spent.

Social Policy Bonds are versatile in that respect; they also scale up. So: assume that we want to target global levels of air pollutants, according to their lethality. A global fund, backed by contributions from governments and possibly non-governmental organization, could be set up to reward bondholders once a targeted reduction in global air pollution levels has been achieved and sustained. No single approach - PPP or BPP or any other - will work best over the entire planet for a period of (say) decades. Instead, a mosaic of approaches, varying with time and space, will maximise the pollution reduction per dollar spent by our global fund. There will be some circumstances, especially when polluters can be clearly identified, where the PPP will work best. But even under very similar circumstances, politics might make that approach unacceptable.

The crucial points are that the Social Policy Bond principle:

1. is versatile enough to encompass both the PPP and the BPP, or any combination; and
2. maximises efficiency, expressed as maximum reduction in pollution per dollar spent.

Social Policy Bonds are, then, a meta-system. They do not dictate how goals shall be achieved, nor who shall achieve them. They do require some source of funding, but raising funds for widely agreed environmental *outcomes* is likely to be less contentious than the current system, whereby contributors and beneficiaries have to be identified in advance of projects that for the most part reward activity rather than success.

### **13.9.6 Policymaking is incomprehensible to outsiders (2016-09-27 21:39)**

Lee Drutman writes:

The organizations that are most likely to be the winners in the modern policymaking process are those that:

- are able to lobby on multiple issues over multiple years;
- can pay the increasingly high price of entry necessary for effective participation; and
- gain from policy complexity, both because it gives them more opportunities to insert narrow provisions with limited public scrutiny and because they are more capable of supplying expertise to overworked staffers.

More and more, the only organizations that are capable of marshaling the resources to do all these effectively are business organizations,—both individual companies and the associations that represent them. [1]*The business of America is lobbying*, Lee Drutman, 2016

I've [2]long [3]railed [4]against [5]the [6]increased [7]complexity of policymaking in western countries. It is now too complicated for ordinary people to follow. So, on the one hand we have government and big business in a mutually enabling relationship, and on the other we have ordinary people and small enterprises. The gap is widening and so we see rising and potentially dangerous levels of alienation and cynicism.

Social Policy Bonds could narrow that gap. Ordinary people understand broad national or global goals, such as better [8]health, a cleaner [9]environment, or [10]world peace. Governments could target these goals by issuing Social Policy Bonds. The current system is arcane, long-winded and incomprehensible to outsiders - presumably by accident rather than design. It's focussed on process and decisions about funding and organizational composition and structure. It rewards activity, rather than outcomes.

Achieving goals such as better health or world peace would in most cases mean that governments relinquish control over those organizations that are currently charged with achieving these goals. Governments, naturally, are not keen to do so willingly, so perhaps the first issuers of Social Policy Bonds will be philanthropists, non-governmental organizations or members of the public: or some coalition of all three, who would put up the funds necessary to

redeem the bonds. I discuss the transition to a Social Policy Bond regime here and in chapter 4 of [11]my book.

## 13.10 October

### 13.10.1 Limitations of the Payment by Results model (2016-10-04 18:50)

An interesting comment from Mr Toby Lowe on an [1]article extolling the benefits of Payment by Results (PbR):

[1]n order for PbR to work, 'results' must be directly attributable to particular interventions .... In complex systems, results are never attributable to particular interventions, and so PbR cannot work. This is not a technical issue about measures, it is an inescapable consequence of the way that complex systems operate. Toby Lowe, [2]commenting on [3]*The next step in payment by results* by Rodney Schwartz, 28 September

You might think that this - valid - point undermines the Social Policy Bond concept. But I would  
1056

disagree. PbR as practised today differs from Social Policy Bonds in that the bodies that are paid to perform better are (1) conventionally structured, and (2) generally known in advance.

Both these features multiply the opportunities for gaming and manipulation. Bodies that are paid by results under current regimes are service providers that have a persistent composition and identity, and mainly for that reason are committed to a fairly limited range of activities. The 'results' for which these bodies are paid, though termed 'outcomes' are therefore quite narrow. So a body can, for instance, game the PbR scheme by simply exporting a targeted problem to areas not covered by that scheme. More importantly, the very scope of the 'outcomes' targeted is greatly restricted in time and space by the constraints imposed by the structures and activities of existing organizations. I believe that to tackle broad social problems we need a [4]new type of organization; one of protean structure and composition, so that at each point along the outcome-achieving path it forms a coalition of the bodies that will be most efficient at solving the targeted problem. Social Policy Bonds would bring about such organizations.

What about the difficulty of attributing results to interventions in complex societies? Again, I agree with Mr Lowe. But under a Social Policy Bond regime, there would rarely be a need for direct, deliberate (and manipulable) attribution. Take for example the goal of targeting a nation's health for sustained improvement over, say, thirty years, as measured by a combination of such indicators as longevity, infant mortality and quality adjusted life years. Under a Social Policy Bond regime, such [5]Health Bonds would be valued not by some cash-doling bureaucracy, but by the market for the bonds. Any activities undertaken by holders of the bonds would raise the value of their bonds only if they, *in the market's view*, make the early achievement of society's health goal more likely. Bondholders can undertake, or finance, a vast range of health-improving activities, some of which might benefit from a PbR approach, others of which will not (and might even [6]conflict with one). It will be for motivated bondholders to decide. Such broad outcomes, undertaken by bodies that come and go during the lifetime of the bonds and overseen by a motivated market, cannot be manipulated. The complexity of the interventions and their effects is matched by the complexity of the bondholders', their coalition and the vast range of approaches that they will try in their efforts to achieve the targeted goal. *Direct* attribution of payment to successful interventions is no more necessary in such a long-term, broad project than it is to employees of a hospital.

Most of the PbR schemes that are being talked about involve [7]Social Impact Bonds (also known as Payment for Success bonds), which are non-tradeable versions of [8]Social Policy Bonds. I have discussed the limitations of such bonds, and my ambivalence toward them, [9]here and [10]here and in many posts in this blog: [11]here and [12]here, for examples, or search this blog for *Social Impact Bonds*. Long ago I did a post on [13]New Public Management, which is also relevant.

### 13.10.2 Why I voted for Brexit (2016-10-09 20:35)

Some colleagues and friends were surprised by my voting for Britain to leave the European Union. I have tried to explain my reasons to them but, invariably, disappointingly, revealingly, they choose to ignore my arguments. It's not lack of interest in the topic: it's that they just *know* they're right. I agree with them that the European project began as a noble, well-intentioned and extremely successful way of anchoring democracy and helping keep the peace in Europe. I also value its helping to free trade within Europe and its promoting democracy in eastern Europe. Where we differ is that they think the EU retains its noble character and continues to be a force for good. I disagree and these are my reasons why.

First, as I wrote [1]here and [2]here: the persistence of the Common Agricultural Policy, in the face of four decades of its environmental [3]depredations, its raising of food prices for European families (by [4]around 17 %), and its subsidies to the extremely wealthy:

Greenpeace analysed the top recipients of CAP subsidies in the UK for the first time. Some 16 of the top 100 are owned or controlled by individuals or families who feature on the 2016 [UK's] *Sunday Times* rich list, receiving a total of £10.6m last year in "single payment scheme" subsidies alone, and £13.4m in total farm subsidies.... [5]*The Queen, aristocrats and Saudi prince among recipients of EU farm subsidies*, the 'Guardian', 29 September

Worse than all this is the CAP's crippling of trade opportunities for Africa, with the tragic results that we are seeing in the Mediterranean. Some would say that the EU's refugee crisis is largely self-inflicted. Bad karma.

Now the EU, again led by France, wants to do to Latin America what it did to Africa:

But

13 European countries, led by France, want to scupper the talks [about a trade pact] because

their farmers are scared of Mercosur [a trading bloc whose core countries are Brazil, Argentina, Paraguay and Uruguay], the world's most competitive producer of grains and meat. They forced the EU to withdraw, at the last minute, proposed tariffs cuts on beef. A trade pact between the blocks would make shopping cheaper for 750m consumers. [6]*Mercosur's missed boat*, the 'Economist', 14 May

This is no small matter: the Common

Agricultural Policy, still swallows up 40 percent of the EU budget. The EU has had 40 years to solve the CAP problem, but it has failed. The persistence of the CAP, in the face of all the evidence of its destructive insanity shows very clearly that the EU is systemically incapable of reforming itself.

The EU's Common Fisheries Policy is another [7]disaster, also with grave environmental implications.

The EU, meaning Brussels bureaucrats, knows the CFP is crazy. Top European Commission officials say the current quota system is indefensible. The problem is that certain key national governments, eg, France, Italy, Greece, Malta, Poland (it is a long list), are adamantly opposed to any reforms that would lead to wholesale restructuring and consolidation of fishing fleets. [8]*Britain and the EU*, Bagehot's notebook, 13 January 2011

Again, the real problem is not simply that the CFP is deranged, corrupt and environmentally disastrous. It is that, even knowing this and having known it for decades, the decision-makers at the EU won't reform it. Worst of all we, the common people, cannot even identify who's making these decisions; still less boot them out of office.

Nor are the Eurocrats addressing the problems caused by a common currency - including high unemployment in southern Europe - or immigration.

I regard these two statements as axiomatic:

- Big government is remote government, and
- People in power always overplay their hand. No exceptions.

The EU has morphed into an unaccountable, anti-democratic, opaque, self-interested, coercive body. Its structure and activities are creating precisely those most poisonous forms of nationalism that it was supposed to eradicate. The consequences of this threaten to negate all the undoubted good that European integration has brought about.

Divorce is always painful but sometimes it's necessary. Relationships, however glorious their beginning, frequently turn sour or abusive. Brexit might just be the shock that stimulates the EU to reform itself. I hope that happens, but I wouldn't bet on it.

### **13.10.3 Make democracy work: target outcomes directly (2016-10-14 18:26)**

George Monbiot [1] writes about the weaknesses of democracy. He ends on a vague note but does ask: 'What if democracy doesn't work? What if it never has and never will?' To which I would reply with another question: 'how do we know if it's working?'

I think there are two elements to an answer. One: democracy is working when people

1060

have [2]buy-in to the way society runs. Two: it's working when things are generally getting better for ordinary people. The two go hand-in-hand. Buy-in is important, because unanimity over virtually anything in any large society is impossible and if we have been consulted we are more likely to go along with what wider society decides, even if it's not what we would choose.

We do occasionally consult ordinary people over certain decisions. But - and this is where the other essential element comes in - these decisions are rarely expressed in terms of outcomes. Instead we are asked questions such as: which political party do you want to form the government? Whom do you want to be President?

Prospective politicians say what they hope to achieve; we vote for them on the basis of what they say and on factors such as their looks, delivery, public image, or their experience in or out of office. These attributes might tell us something about candidates' intentions but they tell us very little about the impact they will actually have on the things that matter to us.

Which is why I think policy should focus on broad, meaningful outcomes. Things like better health, a cleaner environment or, at a global level, world peace. We know something about how to achieve the first two of those examples: essentially, throw more money at them. But neither we nor any politician has a clue about how to achieve them *with maximum efficiency*. And world peace? We are completely clueless on that one.

[3]Social Policy Bonds could be the answer. Instead of wasting time with political parties, public images, or simplistic and inescapably inadequate (at best) ideologies, we could instead move toward a policymaking system that targets outcomes directly. A bond regime would do that, and would inject the market's incentives and efficiencies into the every process needed to achieve our social and environmental goals. Because the bonds would be [4]tradable, we could target goals that will require many approaches and that are inevitably going to take many years to achieve - such as, yes, [5]world peace. Bondholders (or the people they contract) would have incentives to explore numerous approaches, to boost the successful ones and - something that seldom happens in the public sector nowadays - terminate the failures.

Our current policymaking systems fail because they don't engage the wider public. Buy-in is a lost cause. Political processes are arcane, legalistic, complex and time-consuming. The only people who follow it closely are those who have a strong financial interest in doing so; mainly big corporations, lobbyists and think-tanks. Social Policy Bonds could both widen public participation and achieve society's goals more efficiently. Then we'd know that democracy is working.

#### **13.10.5 The EU: killing its citizens and destroying rainforests (2016-10-19 17:58)**

Craig Sams writes, in a letter to the *New Scientist*:

... In 1993 my company Whole Earth Foods launched a trans-fat-free spread, branded Superspread. Other manufacturers objected to our advertising: the Advertising Standards Authority banned it, effectively killing our product. We presented the ASA with

the medical evidence, which was abundant 23 years ago. They accepted its validity but said we violated their code because we were “appealing to fear” by suggesting trans fats could damage your heart health. When Denmark banned trans fats the food industry replaced them with coconut and palm fats, and the EU was faced with a rapeseed oil glut, as that was the oil that was mostly hydrogenated. So the Renewable Transport Fuels Obligation required rapeseed oil to be blended with diesel. That requirement overshot. So we are now deforesting Indonesia to grow palm oil to make up the quota for vegetable oil in diesel. If there is anything to be learned from this tragic fiasco that continues to cost tens of thousands of lives annually and blights many more with ill health, it is that agricultural policy should never trump health policy. [1]*The tragic fiasco of trans fats*, letter to the ‘New Scientist’, 16 October

In short, the European Union couldn’t care less about the health of its subjects, and helps destroy Indonesian rainforests. It keeps on doing it. And there are *no mechanisms in place* either to stop the insanity, nor to make the decision makers accountable, nor even to identify the decision makers, still less to get rid of them. That’s why I [2]voted for Brexit, and hope that this whole tragic experiment, which began so nobly, gets [3]dragged behind the barn and killed with an ax.

### **13.10.6 World Peace: the quick and efficient way (2016-10-25 22:33)**

Keith Ward writes:

There is any number of ways in which the Darwinian process of slow, gradual, cumulative adaptation could fail. This is not an argument for God. But it shows that reliance on the predictability of nature, and on its tendency to produce increasingly complex and adapted organic life-forms, is dependent on a very specific adjustment of physical laws that is itself hugely improbable. [1]*Why there almost certainly is a God: doubting Dawkins*, Keith Ward, April 2009

Mr Ward is well aware that evolution - even if the human species represents its crowning achievement - depends on very specific circumstances. We don't know (though we might believe) that there was a plan. Nor do we know whether the evolutionary path will continue to produce more complex life-forms.

There's a similarity here with the downward trend in violence that Stephen Pinker has [2]identified: Professor Pinker tells us that over human history most forms of violence have steadily and steeply declined, and that we live in one of the most peaceful ages in history. This seems right to me looking, as Pinker does, at relative, rather than absolute levels of violence in human society.

Just as with the evolution of life-forms, we cannot know whether this decline was inevitable, nor whether it will continue. What we *can* be sure of is that both trends have been extremely inefficient. Millions of species have no doubt been created and become extinct as complex life-forms developed. It's been a slow and wasteful process, if we are to take today's ecosystem as an end point. Similarly, and even more tragically, countless millions of human beings have been killed or maimed in deadly conflicts in our history - and it's still happening.

And we have no reason to assume that either our history as a species or as social animals will continue to play out favourably. Professor Pinker is writing descriptively rather than prescriptively and he does not say the trend will continue. Some would argue (see [3]here, scroll down to "...Taleb's major complaints...") that the *risk* of catastrophic violence has risen, even as the actual level of physical violence has fallen.

What's all this got to do with Social Policy Bonds? Simple: whether or not initial circumstances are God-given, I think we could use the bonds consciously and deliberately to guide our progress toward a world of peace, and to speed it up.

Instead of relying on centuries of history, during which numberless millions of innocent people's lives have been destroyed, to bring about the tentative and incomplete peace that most of us enjoy today, my suggestion is that we issue [4]World Peace Bonds. These bonds would be redeemable for a fixed sum only when a targeted array of indicators of peace had been achieved and sustained for a long period. They would reward people who do what they can to end violence. Backed by a combination of governments, non-governmental organizations, philanthropists and ordinary people, they would encourage a vast number of peace-generating approaches. Some would inevitably fail; the way the market for the bonds would work means that these efforts would be terminated and resources diverted into more promising initiatives.

The effect of World Peace Bonds would be to give incentives to accelerate and guide our progress toward a less violent world more efficiently than has happened so far: a protracted, haphazard and bloody path that has, true, given us a less violent world, but also one that has left us fearful of self-induced catastrophe. We can do better than that. By acknowledging that not all approaches are going to work, and supplying incentives for those that do, we can guide and accelerate evolutionary processes to bring about, quickly and efficiently, what is surely our most urgent goal: world peace

## 13.11 November

### 13.11.1 Consensus and politics (2016-11-05 22:55)

Maria Bustillos introduces the concept of dismediation:

Dismediation is looking to make you never really trust or believe a news story, ever again. Not on Fox, and not on NPR. It's not that we can't agree on what the facts are. It's that we cannot agree on what *counts as fact*. The machinery of discourse is bricked. That's why we can't think together, talk together, or vote together. ...

The peculiar mendacity of [George W Bush's] catastrophic presidency left us with worse problems than a bunch of lies to put straight and reflect on. There's a broken trust to restore—to the extent that it's possible to replace toxic cynicism with healthy skepticism—in media and in government. [1]When truth falls apart, Maria Bustillos, 3 November

And, as this prolonged US Presidential election campaign reaches its end, she asks "How do

we restore consensus in an age so divorced from fact?"

Here's my suggestion: we vote on social and environmental goals, rather than the supposed means of achieving them: namely, politicians or political parties. Personality is not a sound basis for choosing who shall make policy. Neither, we know now, are campaign sound-bites or media commentary. Currently though, we have little else to go on. We choose policymakers rather than policies; and we choose them on the basis of their image at worst, or their stated policy priorities or ideological leanings at best. Rarely are we given the chance to target desirable outcomes.

In theory, our current approach is practical: social, economic and environmental policy-making is complex and time-consuming. Ms Bustillos quotes Edward Bernays writing in 1928:

[E]very citizen makes up his mind on public questions and matters of private conduct. In practice, if all men had to study for themselves the abstruse economic, political and ethical data involved in every question, they would find it impossible to come to a conclusion about anything... *Propaganda*

But if we don't have the skills or energy to evaluate policy ourselves, and if we can't rely on the media any more, what can we do to bring about some consensus and repair what looks increasingly like a dysfunctional policymaking system?

I suggest outcome-based policy. Instead of voting for people or parties, we'd all participate in choosing and prioritising social goals. Social Policy Bonds lend themselves to a gradual transition to this sort of policymaking: by focusing on outcomes to be targeted they would be more transparent than the current policymaking process. A bond regime would generate more consensus - and, just as important - [2]buy-in, about our chosen goals. A transition to a Social Policy Bond regime would be quite easy to arrange, with funding to existing activity-based bodies (mostly government agencies) being reduced gradually, at the same time as funds for Social Policy Bond redemption rise.

Choosing policymakers is fraught with problems, not the least of which is the raucous and destructive *dialogue des sourds* flooding out of our news media. It's time to target outcomes, issue Social Policy Bonds, and let motivated public- and private-sector bondholders work towards achieving society's goals.

### **13.11.2 Bootlickers, yes men, liars (2016-11-09 19:52)**

There are many ways we can interpret the US Presidential election result. I prefer to see it as the victory of ordinary people over the people who are supposed to look after their well-being. In domestic politics, just as in the international [1]aid [2]industry, a whole class of intermediaries, supposedly devoted to improving the condition of the ordinary man and woman, has grown and expanded so much that its interests have now diverged from the

very people they are supposed to represent. Mr Trump speaks for these people. Whether he will improve their lot remains to be seen, but it would difficult to do a worse job than the current motley coalition of politicians, bureaucrats, academics and media persons.

Two statements I take as axiomatic:

- Every institution, whether church, government body, trade union, university, charity or whatever, however well meaning it began, however well meaning and hard working the people it employs will, sooner rather than later, have as its over-arching goal that of self-perpetuation.
- Everybody - *everybody* - in a position of power, will always overplay their hand.

The US establishment - the political parties, the bureaucrats, the media, the countless lobbyists, academics and government bodies - are no better and no worse than innumerable other spinners of dreams, bootlickers, yes men, liars, whose corruption and degeneracy have let ordinary people down. Hence [3]Brexit - and hence President Trump.

### **13.11.3 Ideologues and vested interests impede good policymaking (2016-11-17 23:17)**

A letter-writer reacts to the suggestion by the *Economist* that poor American consumers gain more from cheap imports than they would if imports were restricted and America produced the same goods:

Being able to buy a Chinese-made 50-inch TV when you work by flipping hamburgers for the minimum wage may be more efficient than working in a factory on wages where you can only afford the 30-inch American-made model. But Donald Trump's voters weighed up factors that many economists and your newspaper often downplay: the marginal utility of consumer goods in a rich society, the distribution of wealth and a sense of self-worth. The medium through which they channelled their anxiety may be flawed, but their message is clear. [1]*Trump's triumph*, Prof Diomidis Spinellis, the 'Economist' dated 19 November

Exactly so; countries as a whole [2]benefit from free trade in that the benefits to the economy more than offset the losses, even if the losers - those whose jobs become obsolete - are fully compensated. The problem is that most of the gains are going to the wealthy, and *the losers aren't being compensated*.

One of the great advantages of the Social Policy Bond approach is clarity about ends and means. Free trade isn't an end in itself: it's a means to an end: the improved well-being of society. A bond regime targeting poverty or income levels would ensure adequate compensation to the losers from free trade (which could take the form of subsidies to struggling companies or laid-off individuals, or enhanced re-training opportunities). Or it could restrict trade, perhaps temporarily, if that were to better meet society's long-term income goal. Such measures would be heresy to the free trade ideologues, but in a bond regime it is outcomes that matter, not ideology.

We see similarly non-outcome driven approaches in other policy areas, where ideology or vested interests get in the way of rational, welfare-enhancing policies. Healthcare in

the US is one example, where the interests of insurance companies and blind resistance to anything that could be called 'socialist' do so much to blight the security of even middle-class Americans.

### **13.11.4 Policy for the post-truth era (2016-11-27 18:57)**

US President Barack Obama talks about the new media system which:

...means everything is true and nothing is true. ...An explanation of climate change from a Nobel Prize-winning physicist looks exactly the same on your Facebook page as the denial of climate change by somebody on the Koch brothers' payroll. .... Ideally, in a democracy, everybody would agree that climate change is the consequence of man-made behavior, because that's what 99 per cent of scientists tell us. And then we would have a debate about how to fix it. That's how, in the seventies, eighties, and nineties, you had Republicans supporting the Clean Air Act and you had a market-based fix for acid rain rather than a command-and-control approach. So you'd argue about means, but there was a baseline of facts that we could all work off of. And now we just don't have that. [1]*It happened here*, David Remnick, 'New Yorker' dated 28 November

Science isn't a consensual process though, so even if the majority of scientists agree

on one thing, whether it's anthropogenic climate change, or acid rain, or whatever, that should carry no more weight than the collective wisdom of experts in other fields, such as [2]economists or [3]opinion pollsters. There is a genuine problem here: how should we make policy when the relationship between cause and effect in our ever more complex societies is impossible to identify? It's not simply a question of following the opinions of existing bodies often backed by vested interests - nor of reflexively ignoring them: they might after all be right as well as self interested. Nor should we simply identify a problem then mindlessly dole out funds to the organizations whose stated objective is to solve it, but whose over-arching objective - in common, [4]I think, with all organizations - is self-perpetuation.

We should instead recognize that resolving complex social and environmental problems, cannot wait for our receiving [5]perfect information about causal relationships, and nor should we delay making decisions until such information becomes available - it might never happen.

Take climate change: it's likely that, by the time we know the effects of man's greenhouse gas emissions on the climate, it will be too late to do anything to avoid or reverse their catastrophic effects on the environment. The current way of addressing the problem seems inadequate: extravagant gestures that *might* lead to some reductions in emissions that we *think* contribute to climate change, which *might* lead to some tiny, almost imperceptible (but unverifiable) effect on the climate some decades hence.

I think we can do better than this. We could use the Social Policy Bond idea, first to identify exactly what we want to achieve; and second to channel the market's incentives and efficiencies into achieving it. With climate change, we need to [6]clarify whether we are more concerned about climate change, or about the impacts of climate change on human, animal and plant life. In other words, we define the outcome that we wish to achieve, then let the market decide how best to go about achieving it. Most social and environmental goals will embody an array of conditions that have to be satisfied for the goal to have been deemed met and the Social Policy Bonds redeemed. Our climate change goal should embody measures of physical, biological, social and financial variables that shall have to fall within a targeted range for a sustained period before the redemption of [7]Climate Stability Bonds.

And as with climate change so with other major challenges. The important point is that the Social Policy Bond principle works *even when the facts about what causes climate change, say, or [8]crime, or [9]war, are disputed*. As such, Social Policy Bonds are the perfect policy instrument for today's [10]post-truth politics.

*Update 5 December: a version of this post for newcomers to the Social Policy Bond idea is available [11]here*

## 13.12 December

### 13.12.1 Fossilised science is no basis for policy (2016-12-07 19:19)

How do we weight different environmental impacts? Take diesel, lauded at one stage as a way of cutting back greenhouse gas emissions, but known to have lethal effects through emissions of particulates and other pollutants:

Volkswagen's rigging of emissions tests for diesel cars comes after nearly 20 years of the technology being incentivised in Europe in the knowledge that its adoption would reduce global warming emissions but lead to thousands of extra deaths from increased levels of toxic gases. [1]*The rise of diesel in Europe*, John Vidal, 'The Guardian', 22 September 2015

Or, take organic food. An organic field will certainly host more wildlife and biodiversity, and decrease or eliminate air and water pollutants. But the same field will most probably yield less than conventional farming. More land would then have to be devoted to supply the same volume of food. And it's likely [2]too that organic food production results in higher greenhouse gas emissions than conventional farming. There are also questions about whether GM crops (foods genetically modified by modern techniques) are better for the environment because they could, for example, require less fertiliser, less land, less water and be more tolerant of salt.

What should policymakers do here? The difficulties of weighing environmental impacts are compounded by our imperfect, but ever-growing knowledge of, say, the effects of pollutants, and more and more research into how to reduce emissions from transport or agriculture. Fossilised science is no basis for sound policy, and getting it wrong, as did those who incentivised European diesel engines, can have disastrous effects.

This is where the Social Policy Bond idea could help. Instead of trying to work out whether, say, less petrol and more diesel is a good idea, or whether organic agriculture is better than conventional, we could instead target social and environmental *outcomes*, and let a motivated coalition of interested decide how best to achieve them.

How would this work? We first need clarity over what we are trying to achieve. Mostly, we'll be concerned about impacts on plant, animal and human health. Focusing just on human health, we would have broad, national, targets for an array of indicators, such as longevity, infant mortality, quality adjusted life years and others. These would be determined

by government, articulating as it does society's goals. But the ways of achieving these goals, and who would achieve them, would be the function of a market in Health Bonds. It would be up to holders of these bonds to decide, on a continuing basis and in response to all new scientific knowledge, what will be the most efficient ways of achieving these goals. The most efficient ways will be those that maximise returns to the bondholders but also to *society as a whole*. Bondholders' interests will be exactly congruent with those of society, and they will remain so until the bonds are redeemed - which could be decades hence.

Health Bonds would make it unnecessary for decision makers to try to anticipate new scientific knowledge, or to make decisions on trade-offs that can be, and have been, disastrous. They would stimulate the exploration and implementation of diverse, adaptive ways of improving the nation's health. It's unfortunate that we have very few people or institutions devoted to the health of an entire country. We have instead organizations like Ministries of Agriculture, Transport, the Environment, and plenty of organizations advocating for solutions to specific health problems: cancer, heart disease, respiratory diseases, and so on. These organizations undoubtedly do good work and are staffed by well meaning, hard working individuals. But they cannot, in good conscience, make the trade-offs between, say carbon dioxide emissions and lung problems in ways that maximise the total health of an entire population. Sadly, that necessary policy perspective falls outside their remit and could even threaten their income and status.

*For more about Health Bonds see [3]here. For more about Social Policy Bonds, see [4]here.*

### **13.12.2 Target environmental ends, not means (2016-12-13 23:03)**

The current *Economist* [1]looks at the the environmental cost of solar electricity generation and in particular at work done on quantifying the very big efficiency improvements in the production of solar cells since 1975. It appears that, over the lifetime of solar panels made today, there will be very significant cuts in emissions over those that would result from the consumption of fossil fuels in generating the same quantity of electricity. This is interesting but it doesn't actually tell us a great deal about the net environmental impact of substituting solar panels for fossil fuels. As one commenter puts it:

If you're going to measure the "clean" of solar power, why would you neglect the production of all of the minerals that are used in the process? These minerals include arsenic, bauxite, boron, cadmium, coal, copper, gallium, indium, iron ore, molybdenum, lead, phosphate, selenium, silica, tellurium, and titanium dioxide. Some of these minerals are difficult to source and mine, and almost always create a large degree of environmental damage in their wake. [2]Source

There are also the environmental costs of providing backup (for when the sun isn't shining) in the form of batteries, or other storage, and the costs of disposing of the panels after their lifetime. As the *Economist* article says, "The consequence of all this number-crunching is not as clear-cut as environmentalists might hope."

This underlines what I have said in my [3]previous post when it comes to making policy: rather than try government try to identify all the environmental implications of any policy with inescapably limited knowledge at fixed point in time, we should rather be identifying the outcomes we want to see and rewarding their achievement, *however that is done*. This would be more practical than attempting to conduct entire [4]life-cycle analyses over all possible policy choices - which, even if it were possible, would be instantly made obsolete by new technology and our expanding scientific knowledge. It would also cohere more closely with goals that can be clearly articulated and that are meaningful to ordinary people: those that specify desirable levels of plant, animal and human health.

*For more on applying the Social Policy Bond concept to the environment see [5]here.*

### **13.12.3 Working for a living (2016-12-30 22:47)**

*It doesn't matter whether the cat is black or white, as long as it catches mice.* [1]Deng Xioping

I'm not sure I fully understand the recent article entitled [2]*Shared stakes, distributed investment: Socially engaged art and the financialization of social impact* by Emily Rosamund, but it

did make me think about the apparent disdain that some have for worthwhile activities when they are undertaken mainly for financial gain. Social Policy Bonds have been in the public arena for something like 28 years now and their non-tradeable variant, [3]Social Impact Bonds, are now being issued in about 15 countries. In my experience, it's been the ideologues on the left that are most opposed to the concept.

Often implicit, sometimes explicit, is their feeling, or argument, that Social Policy Bonds are a means by which investors make money out by doing what they should be doing anyway. It is true that some wealthy bondholders could become even more wealthy by first buying Social Policy Bonds, then doing something to achieve the outcome that they target, then selling their bonds for a higher price. This some call "profiting from others' misery" and it offends their sensibilities.

But it can also be called "working for a living while doing something socially useful". In the long run it's quite probably that only a few people or organizations will amass huge fortunes under a bond regime, even if they do successfully achieve society's goals and profit from their bondholding. The way the market for Social Policy Bonds works would mean that excess profits could be bid away by competitive would-be investors. The market for the bonds would openly transmit a huge amount of information, that will indicate the constantly varying estimated costs of moving towards a targeted goal (see chapter 5 of [4]my book for a full explanation). Barriers to entry into helping with target achievement could be low, especially if most bonds are held by investment companies who would contract out the many diverse approaches necessary to achieve most social and environmental goals.

The absolute sums of money at stake might be huge, particularly for Social Policy Bonds that target apparently remote, national or global goals, but there's no particular reason to assume that, *in the long run*, it would be shared out any less equitably than, say, teachers' salaries. Teachers? Yes, and nurses, doctors and social workers, all of whom perform socially valuable services for which nobody, even on the left, begrudges payment.

# 2017

## 14.1 January

### 14.1.1 How to become a nuclear optimist (2017-01-05 18:24)

Bruce Schneier [1] discusses Steven Pinker's optimism that trends that have brought about a less violent world will continue. Schneier doesn't share this optimism, thinking that 'the damage attackers can cause becomes greater as technology becomes more powerful', and that this trend will overtake Pinker's. It's an interesting discussion.

What do I think? I can't see any reason to doubt Schneier's belief, which is predicated on what 'the most extreme person with the most extreme technology' will be able to do, if trends continue. *But* I think that, understanding this, we can do something to influence the speed and direction in which 'technology' takes us. It's not only the compactness and falling cost of massive destructive power that threaten us; it's their proliferation. These need not be taken as a given: all can be influenced by the incentives on offer.

Unfortunately, the incentives currently on offer reward people for finding ever cheaper, more concentrated destructive power, *and for selling it*. The results, which we see now, fully justify Schneier's pessimism. So I think the time has come to offer countervailing incentives: in other words, to reward the sustained non-use of weapons of mass destruction.

Issuing a sufficiently large number of very high-value Nuclear Peace Bonds would, in my opinion, go a long way toward avoiding nuclear catastrophe. Assume that we issue bonds that become redeemable for, say, \$10m each only when a period of thirty years of non-use of a nuclear weapon has been achieved. While that long-term goal seems remote, the bond issue would have an immediate effect on current investment programmes. Incentives would cascade down from the expected redemption value of a large bond holding, to finance an array of approaches aimed at reaching our goal. People or organizations would benefit by doing what they can to reduce the possibility of a fatal nuclear detonation: it would be up to them to decide the most effective ways of doing that. Such ways could entail bribing politicians or 'religious' leaders to tone down their rhetoric, the investigation into technical ways of detecting

nuclear materials, giving nuclear scientists now working for belligerent regimes one-way, first class air tickets to the tropical resort of their choice, or any of a vast array of other possible initiatives. The important point is that we don't have to know in advance which will be the most efficient ways of achieving our nuclear peace goal. That will be up to bondholders to decide, continuously, as our political, scientific and psychological environments evolve.

I fully accept that even the most dangerous demagogues in human affairs are unlikely themselves to be amenable to financial incentives. But their capacity to unleash destruction can be realized only by dealing with others - who will be. Social Policy Bonds can re-jig the incentives, giving a more credible voice to the vast majority of humanity who don't want to see nuclear catastrophe.

*For a short piece on Nuclear Peace Bonds see [2]here . For a longer article about Conflict Reduction see [3]here . For a 5800-word essay about how we can use the Social Policy Bond principle to bring about World Peace see [4]here .*

### **14.1.2 Target health, not surrogate indicators (2017-01-08 17:20)**

Surrogate indicators in medicine are measures that might be correlated with physical health. An example would be cholesterol levels, which can be correlated with heart disease. There are general problems with such indicators: correlation does not imply causation; the correlation anyway may be weak; or the measure might indicate a specific medical concern but not the overall health of an individual. In recent years ([1]here and [2]here, for instance) I've inveighed against the medical establishment's use of surrogate indicators for policy purposes, claiming that most medical professionals have neither the incentive nor capacity to look at the broad health of a nation and to target that for improvement.

It's been a lonely road, so I was much cheered to hear [3]this *British Medical Journal* podcast, with Professor Emeritus of Surgery, Michael Baum, arguing on exactly the same lines as I do in my work on applying the Social Policy Bond concept to health. There is a link to the BMJ article on which the podcast is based [4]here. My paper on Health Bonds, and links to some of my other blog posts on the subject can be found [5]here.

### 14.1.3 Outcomes versus Justice (2017-01-16 19:03)

Sometimes we have to put aside notions of justice and fairness in order to achieve our goals:

Richmond to me is a story of pragmatism ... This idea that we're going to step away from a purely ideological, moralistic approach to try new things and see what works. Barry Krisberg, criminologist at the University of California in Berkeley, quoted in [1]*A radical approach to gun crime: paying people not to kill each other*, by Jason Motlagh, 'The Guardian', 9 June 2016

This (long) article discusses a programme in Richmond, California that entails paying people not to kill each other. Such payments amount to "a pittance compared with what Richmond police department must pay for overtime, or what the city pays for the cost of a criminal trial, or medevac helicopter rides to take shooting victims to hospitals." There *are* moral or ethical principles that might be being violated here, but that shouldn't be a bar to pragmatic solutions. It's not difficult to think of problems whose solution might mean that, for instance, killers aren't brought before a court of law, but instead are, essentially, bribed to give up (or decommission) their weapons. Real-world examples include the recent peace deal in [2]Colombia, and deals made with men of violence in [3]Northern Ireland and [4]South Africa. In such cases, despite their crystallising injustice, the benefits to society as a whole far outweigh the costs.

They are not pure expressions of the Social Policy Bond ideal, but they do embody payment-for-outcomes, which is an essential element of that ideal. How would Social Policy Bonds differ? They would allow us to take a longer-term, broader, approach. A bond issue targeting gun deaths in Richmond, California, for instance, could target the reduction of gun deaths by 50 percent over a sustained period; say twenty years. Payments to potential killers *might* be one way of achieving that goal, but holders of those bonds would make such payments *only*

when they are convinced that they are the most efficient way of achieving their goal - a goal which is exactly congruent with that of society. Still: it's a start.

#### **14.1.4 Land use and mental well-being (2017-01-18 19:22)**

Society's long-term goals often conflict with the short-term, narrow, outlook of our political systems. As well, many of the most valuable things in life are often ignored by our economic and political systems, because they cannot readily be converted into monetary terms. Some contributors to air pollution, for instance, are still disregarded in most countries. The consequences to plant and animal life of loss of habitat are usually ignored too.

But I'll look today at mental health, and specifically the negative impact on it of certain forms of planning and land use. Society's mental health goals are difficult to quantify, but I think we can be reasonably sure that our recent patterns of development of the built environment and land use increase alienation, loneliness, anxiety and depression. A brief extract from a recent article on land use in the US:

[W]alkable communities and co-housing — sound exotic to American ears. Thanks to shifting baselines, most Americans only know single-family dwellings and auto-dependent [ie car-dependent] land use. They cannot even articulate what they are missing and often misidentify the solution as more or different private consumption. But I do not think we should just accept that when we marry and start families, we atomize, and our friendships, like our taste in music, freeze where they were when we were young and single. We shouldn't just accept a way of living that makes interactions with neighbors and friends a burden that requires special planning.

[1]How our housing choices make adult friendships more difficult, David Roberts, 'Vox', 16 January

My own belief is that the evidence that US-style suburban patterns of settlement are injurious  
1078

to mental health is compelling, though perhaps not proven nor provable. But my opinion isn't important. What is important are these points:

- Few of us have any incentive to find out whether in fact our land use patterns do create or exacerbate psychological problems for large numbers of people, and
- Even were we to find that suburban living does destroy communities, lead to alienation and atomisation, and so aggravate psychological problems, policymakers have no incentive or capacity to do anything about it.

Acute mental health problems - the sort whose consequences are tragically newsworthy - do get some passing attention. But long-term mental well-being counts for very little in our economic and political systems. Just as policymakers failed to consider most aspects of our physical environment for decades until the consequences of doing so became too difficult to ignore, so too are mental problems and their causes neglected today. And, as the excerpt above implies, if we don't even know what we're missing, there's very little chance of either the market or benign central planners doing anything to help.

Perhaps Social Policy Bonds targeting for improvement the mental well-being of all citizens could be a solution. They could function as a way of representing the interests of people as human beings, as distinct from economic units. Such bonds, in targeting mental health indicators, could act as a countervailing force to the weight given to financial indicators in the property sector. Quantifying mental health might appear difficult, but there is important work being done in this area: examples are [2]here and [3]here.

Mental health is a hugely important issue, but there are others equally important that are similarly ignored by policymakers. There *are* measures being taken to help avoid nuclear war, for instance, but they are laughably small in relation to the enormity of the problem. The few people charged with conflict reduction - hard working and well meaning though they undoubtedly are - are not paid for their success in doing so, nor do the aggregate funds on offer reflect the urgency and magnitude of the challenge. Which is why I believe we should back Social Policy Bonds that reward the achievement of sustained [4]nuclear peace - an indispensable requirement for humanity and one that is routinely ignored by policymakers. Just like long-term mental health.

### 14.1.5 What are economists for? (2017-01-21 23:58)

Markets are means, not ends

Though much of my working life was intended to promote free trade, I question most economists' adherence to it. On the grounds of freedom, I fully agree that governments have no business interfering with willing buyers' importing goods and services from willing sellers. With some caveats, concerning risks to plant, animal and human health, and labour and environmental standards, I do think people should be free to trade with one another. The other argument in favour of free trade is slightly more subtle, but no less persuasive: it's underpinned by the principle of [1]comparative advantage. Essentially, it shows that international specialisation of labour can benefit all trading countries. There are, again, caveats, but generally the theory holds. My concerns are that, yes, a country, say, the US, will benefit from trade with China, but who *within the US* captures most of the benefits? Consumers, including many poorer consumers, do benefit from cheaper imported goods. But do those gains from cheaper goods outweigh the income lost from jobs now done overseas? Are most of the gains from free trade going to the owners of capital, rather than low-income labour? Comparative advantage says that even after compensating the losers countries benefit from free trade. The problem is that most of the losers are not being fully compensated.

There's what appears to be a similarly misplaced ideological commitment to something called 'markets' in such policy areas as health and education where these are mostly run by government. Much intellectual effort has gone into trying to implant in the public sector those disciplines that characterise the creative destruction of the private sector. This is the sort of work in which my profession seems to revel. (Along, incidentally, with making false predictions: here's how successful they were in predicting the Great Recession: "As you can see, even in the third quarter of 2008, the best models we have missed the big recession entirely.")

Source: [2]*Economists' biggest failure*, Noah Smith, 'Bloomberg', 5 March 2015

I don't know whether such efforts have been successful; I'm not sure anybody does. They have certainly been divisive and morale sapping, and have expanded bureaucracy, and led to such wasteful distractions as [3]Mickey [4]Mouse [5]micro-[6]objectives and 'teaching to the test'.

This is where Social Policy Bonds could enter the picture. Instead of seeing 'free trade' and 'markets' as ends in themselves, why not see them as means to an end, and so *why not target those ends directly?* All the empirical evidence backs up economic theory that markets are the best means we have of allocating society's scarce resources. The definition of economics I was taught is the allocation of scarce resources *in order to meet prescribed ends*.

Most countries don't bother with broad social or environmental goals. By default, therefore, the implicit goal becomes something like Gross Domestic Product per head, or its growth rate. Occasionally a social or environmental problem becomes so acute - and visual - that it becomes impossible to ignore, so resources are devoted to solving it. But we can do better than that. Instead of seeing free trade or markets as ends in themselves, we can yoke them to a higher purpose, as defined by society and its government. That would probably mean helping those severely disadvantaged, including those who suffer from the freeing up of international trade.

So I think society should define certain ends and use markets to achieve them. This has to be at a broad level, because resources can readily move between sectors. Under a Social Policy Bond regime, government would do what it is best at: articulating society's goals, whether they concern health, education, or extreme poverty; and raising the funds necessary to achieve them. And markets would do what they are best at: allocating our scarce resources in order to achieve our social goals with optimum efficiency.

## 14.2 February

### 14.2.1 Sacrifice on the altar of 'renewable energy' (2017-02-07 18:26)

From the current issue of [1]*New Scientist*:

Last week, air pollution in London soared to heights not seen since 2011. The usual suspects were named and shamed, including traffic fumes and a lack of wind. But joining them was a surprising culprit. "We think about half of the peak was from wood smoke," says Timothy Baker, part of a team at King's College London that monitors air pollution. The trendy log-burning stoves producing much of this pollution are marketed as a source of renewable energy that can cut fuel bills while helping reduce global warming. But recent findings suggest they pose a serious threat to the health of their owners, and are also accelerating climate change in the short term. If nothing is done to discourage log burning in homes, it could become the biggest source of air pollution in cities like London. .... Children are especially vulnerable .... [2]*Where theres's smoke*, Michael LePage, 'New Scientist', 4 February

This is just one example showing how our governing institutions cannot deal with broad, long-term social and environmental problems. We have in mind something that sounds like an unarguable benefit: 'renewable energy', say, and target it, explicitly or implicitly. But we fail to take into account the broader, longer-term ramifications. There's no clarity about the distinction between means and ends. Something like 'renewability' - which is anyway a function of our ever-expanding scientific knowledge - is not an end in itself. At best, it's a means to certain ends, which are rarely specified, or specified in such vague terms ('sustainability') as to be subject to bureaucratic or corporate manipulation. The bigger picture is lost: in this instance, the health of vulnerable people and children is sacrificed on the altar of 'renewability'.

It's not good enough. We need to be reward the achievement of goals that are meaningful to ordinary people. 'Physical health' would be a good starting point. Defined in terms of

objective criteria, such as longevity or [3]Quality-Adjusted Life Years, a benign and far-sighted government could target the health of its citizens for improvement, and contract out the achievement of such a goal to bodies motivated to, and capable of, keeping up with relevant scientific advances. Our existing institutions and systems of government cannot do this, but Social Policy Bonds targeting health could. I have written about such bonds [4]here. As society grows more complex and the linkages and time lags more intricate, so the scope for problems such as the increased air pollution described above or self-interested deception expands. We need a system that keeps the big picture in mind, and that starts with articulating what, as a society, we want to achieve. Our existing institutions, hard working and well intentioned as they doubtless are, have little incentive to advocate for goals broader than their remit. That worked in times and circumstances when the relationship between cause and effect was easy to identify and address. In today's society, that no longer applies. [5]New organizations with an interest in seeing the big picture are necessary, and a Social Policy Bond regime would see their creation.

### 14.2.2 Consensus and buy-in (2017-02-08 20:01)

From the current issue of the *Economist*:

Millennials are accustomed to tailoring their world to their preferences, customising the music they listen to and the news they consume. A system that demands they vote for an all-or-nothing bundle of election promises looks uninviting by comparison. [1] *Not turning out*, 'Economist', 4 February

And not only millennials. There's palpable disillusion, cynicism and despair about where our political systems are taking us. There's consensus that they are not working, but little consensus about how to change them. In such circumstances, we appear to be drifting toward

authoritarianism.

My suggestion? Instead of taking as our starting point the political party and its membership, let's focus on the social and environmental outcomes that we'd like to see. There's certainly more consensus over the in which direction we'd like to see broad outcomes move than there is about the supposed means of effecting that movement. I would say there's near total agreement amongst the global electorate that, for example, nuclear war is something we don't want. And while we do have organizations at every level trying to defuse conflict, they do not have the command of resources nor the expertise to look at the global interest over a period of decades. And unlike the 'defence' contractors or the ideological fanatics, neither do their rewards correlate with their success or otherwise in achieving their organizations' objectives. More fundamentally, because we take our current policymaking system as a given, the wishes of the vast majority of human beings have to be channelled through our over-worked, or entirely self-interested, or corrupt politicians and bureaucracies. Few people can afford to spend their time and expertise in working full-time to ensure nuclear peace. When the issue does exercise the public imagination, it invariably becomes a forum for energy-sapping, ideologically-based squabbling about partisanship and motives.

A Social Policy Bond regime targeting sustained nuclear peace would transcend party political differences. It would generate a motivated [2]coalition of interests devoted to achieving that goal - which would be exactly society's goal, as laid down in the redemption terms of the bond. That coalition would be of diverse, changing composition and structure, but its goal of nuclear peace would not be subject to the whims and caprices of faddish ideology or party politics.

The same would apply to less lofty goals: there would be little debate about, for instance, the direction in which we'd want to see a nation's health go. We could debate definitions, targets and priorities but, unlike our current arcane policymaking system, these debates would be relatively easy to follow, so we should have greater public participation and hence greater public [3]buy-in - an asset of crucial importance and one that's almost absent from today's politics.

For more about applying the Social Policy Bond concept to nuclear peace, see [4]here. For health, see [5]here. If you would like to consider supporting my work through patreon, please click [6]here.

### **14.2.3 New overview paper (2017-02-17 23:25)**

I've written a new long overview paper on [1]Social Policy Bonds. It's about 6000 words.

-

Policy as if outcomes mattered  
SocialGoals.com

1. <http://www.socialgoals.com/long-paper,-6000-words.html>
- 

### **14.2.4 Dealing with the unknown (2017-02-20 19:22)**

Speaking ahead of an address to the Munich Security Conference, [Bill Gates,] the [1]richest man in the world said that while governments are concerned with the proliferation of nuclear and chemical weapons, they are overlooking the threat of biological warfare. [2]*Bioterrorism could kill more people than nuclear war, Bill Gates to warn world leaders, 'The Telegraph', 17 February*

One of the strengths of the Social Policy Bond principle is that we do not need to specify in advance the exact nature of the problem we want to solve. Many potential problems could arise from our denser, more linked, populations and higher technology. These are difficult even for a well-resourced government, or indeed any single big organisation, to anticipate, let alone do much to forestall. Hurricanes, tsunamis or pandemics are only a subset of a range of and disasters that threaten mankind. Others include the risks arising from new biological advances or scientific experiments that concentrate energy, or natural disasters such as asteroid impacts or volcanic super-eruptions. These threats are in addition to the 'known unknowns' of more widely understood catastrophes. Social Policy Bonds are versatile: depending on society's wishes, and the views of the bonds' backers, bonds could target any type of disaster that, say results in the deaths of 10 000 people within one week or its occurrence, however caused and in whatever part of the world.

Holders of such [3]Disaster Prevention Bonds, would be able to redeem them only after a sustained period of, say, ten years, during which no such disaster has occurred. They would have incentives to anticipate potential disasters and to work to prevent them and mitigate their effects on human life. Today's disaster prevention policies are mostly carried out by

bodies anticipating 'known' types of disaster, and mitigation strategies are often merely reactive. As well, few have the types of incentives that Disaster Prevention Bonds would put in place, that would reward the sustained *absence* of a disaster.

## 14.3 March

### 14.3.1 How we decide (2017-03-02 19:33)

How we decide whom we shall vote for: Andrew Tyndall, a media analyst based in the US, monitors American broadcast news media at his website the [1]Tyndall Report. He found that the overwhelming majority of the time spent by the US media in coverage of the run-up to last November's presidential election was spent on coverage of (1) the candidates and (2) polling. What about policy issues?

With just two weeks to go, issues coverage this year has been virtually non-existent. Of the 32 minutes total, terrorism (17 mins) and foreign policy (7 mins) towards the Middle East (Israel-ISIS-Syria-Iraq) have attracted some attention. Gay rights, immigration and policing have been mentioned in passing.

No trade, no healthcare, no climate change, no drugs, no poverty, no guns, no infrastructure, no deficits. To the extent that these issues have been mentioned, it has been on the candidates' terms, not on the networks' initiative. [2]Andrew Tyndall, 25 October 2016

From my viewpoint, it doesn't really matter whether we, the public, are more interested in personalities and opinion polls than issues, or whether the almost total absence of policy discussion reflects the preferences of the mainstream media. The important point is that we do not, as a society, debate the outcomes we want to see. Policymaking in all the democracies, not just the US, has become so obscurantist as to become inaccessible to all except those who are paid to follow it. All that's left for the rest of us is to discuss the personality flaws of the candidates, and how people react to them. It's not an edifying spectacle, nor is it one that makes for social cohesion. Powerful interests, with much at stake and resources to match, follow policymaking and influence it in their favour. We have, then, on the one hand government and big business (which these days includes much of academia) and on the other, ordinary people and small businesses. The gap between the two is already wide, and appears

to be growing wider.

Social Policy Bonds could change that. They are focused entirely on the social and environmental outcomes we wish to see. 'We' meaning *all* society; not just policy wonks, ideologues and public- and private-sector interest groups. Social outcomes, under a bond regime, would be agreed and targeted for improvement. There's more consensus over such outcomes and the direction in which we want to move, than there is about the supposed ways of achieving them, or who we think will be better at achieving them - even when outcomes are actually under discussion which, as we see, is very seldom. And there's certainly more comprehension about what outcomes are than about the arcana that are such a feature of our current policymaking process. Of course, even under a bond regime, there would be disagreements about the priorities people would give to different goals but, importantly, even those whose strong opinions would be over-ridden, would have been consulted. More generally, with greater public participation in the policymaking process, there would be more [3]buy-in - an essential feature that is largely absent from today's politics.

"How we decide" today is a risible process; one that is divisive and distracting. As a result "what we decide" is far removed from the concerns of ordinary people. Social Policy Bonds targeting broad, meaningful goals, would be a big improvement.

### **14.3.2 Fossil fuel subsidies (2017-03-12 18:31)**

Two brief excerpts from the International Energy Agency's publication, *World Energy Outlook 2016*, highlight what happens when there's no guiding strategic vision for our planet's future:

The value of fossil-fuel consumption subsidies dropped in 2015 to \$325 billion, from almost \$500 billion the previous year. ... Subsidies to renewables are around \$150 billion today. [1]*World Energy Outlook 2016*, Executive Summary; link to pdf [2]here

The drop owes something to what the publication calls a 'subsidy reform process' but also to lower fossil-fuel prices. As well as these billions, there are, of course, subsidies for the exploration, development and production of fossil fuels. These are difficult to assess because

of the "lack of transparency in government and company accounts, and limited information on off-budget subsidies to producers" [3]source. It's easy to see how these subsidies arose, and why they persist. What is more difficult to discern is how our policymaking systems can do anything to address them. Large corporations have immense political power, partly funded by the very subsidies whose withdrawal they can effectively resist. The multitude of smaller interests, those of ordinary people and the environment, have little weight in our policymaking system.

There's nothing new in such an analysis, but what I can offer is a means by which we can aggregate and represent the interests of the vast majority of human beings - now and in the future - who don't benefit from energy subsidies and who suffer from the environmental depredations they cause. We could issue Social Policy Bonds that target for improvement the health of humans, plants and animals. Backed by national governments, the bonds would channel the market's incentives and efficiencies into improving the environmental well-being of the entire planet. Large corporations could still make money doing what they do now, but they'd find it less profitable. They might instead re-focus their resources into more environmentally beneficial areas. The way the bonds work means that bondholders would pick the lowest-hanging fruit first. In other words, they would maximise the environmental improvement per dollar spent.

But perhaps most important of all, Social Policy Bonds would clarify what we, as a species, wish to see. The current arrangement, the one that subordinates mankind and the planet to the narrow, short-term interests of large corporations, came about without consulting the rest of us. It thrives because the policymaking process is opaque to ordinary people, concentrating as it does on legalisms, institutional structures and, as we see with energy subsidies, obscure funding arrangements. A Social Policy Bond regime would change that. Because the bonds' starting point would be social and environmental outcomes, the public could participate in the policymaking process. So, if we wanted to donate billions of our taxes to large energy corporations we could still do so under a bond regime. I doubt that we'd choose to do that, but if we did we'd be doing so with our eyes open.

*For more about environmental applications of the Social Policy Bond principle see [4]here .*

### **14.3.3 Social Policy Bonds: the acceptable face of capitalism (2017-03-18 22:43)**

Social Policy Bonds have many advantages over conventional policymaking. Mostly, they would be more efficient, as investors would have incentives to achieve society's social and environmental goals quickly and cost-effectively. Clarity and transparency of policy goals are further advantages, arising from the bonds' focus on, and explicit targeting of outcomes rather than the supposed means of achieving them. The question of which goals should be targeted is one that most governments evade or obscure, leaving a vague goal, most commonly 'economic growth', expressed as GDP per capita, to fill the vacuum. For much of history, that goal would have been strongly correlated with the improved well-being of a country's population. Nowadays, though, that correlation appears to be broken, with most of the gains in national wealth and income accruing to a minuscule number of people dubbed 'the elite'. In the US, for instance, the most recent data show that top 1 % families captured 52 % of total real income growth per family from 2009-2015 ([1]source, pdf).

Under a Social Policy Bond regime, we could ask whether society sees such inequality as a problem to be targeted directly or, rather, whether our main income goal is the alleviation of poverty. Even if inequality were seen as a problem in itself, it might not be necessary to target it for reduction. This is because Social Policy Bonds would be a means of acquiring wealth with which private gain is strongly correlated with public benefit. Many bondholders would be rich and, if their bonds were redeemed early, they would become richer. But this would be a socially acceptable way of acquiring wealth. Bondholders would become richer only by efficiently and quickly achieving society's targeted social goals. This means of accumulating wealth would allow other, less socially beneficial ways - inheritance, say - to be taxed more heavily. It might even transpire that investors would find achieving society's social goals will be easier than the sort of ethically questionable ways of acquiring wealth that constitute the ever more [2]unacceptable face of capitalism. Social Policy Bonds: a new means of acquiring wealth that actually leads to a more cohesive society? Call them 'the acceptable face of capitalism'.

### **14.3.4 The corruption of science (2017-03-28 16:45)**

John Michael Greer writes:

Especially but not only in those branches of science concerned with medicine, pharmacology, and nutrition, the prostitution of the scientific process by business interests has become an open scandal. When a scientist gets behind a podium and makes a statement about the safety or efficacy of a drug, a medical treatment, or what have you, the first question asked by an ever-increasing number of people outside the scientific community these days is “Who’s paying him?” .... These days, in any field where science comes into contact with serious money, scientific studies are increasingly just another dimension of marketing. [1] *Dark Age America*, John Michael Greer, 2016

It *is* a scandal, and it’s no wonder that we are increasingly cynical about scientists’ pronouncements on climate change, diet, or virtually anything else. Science, like politics, has become removed from the concerns of the people it’s supposed to serve. The gap between on the one hand government and big business, and on the other ordinary people, grows ever wider. Without deliberate action that’s unlikely to change, as many of the reasons for the gap are self-reinforcing: more funding means more can be spent on advertising, and lobbying for still more funding and a more favourable - to corporate interests - regulatory environment. Ordinary people don’t come into it. The result? Skepticism, cynicism, alienation, and [2] despair. Not all the reasons for the gap can be ascribed to self-interest or malevolence, but it remains an urgent concern.

My suggestion is that we start to express policy goals in terms of outcomes that are meaningful to ordinary people. Broad, long-term goals such as the improved health of a country’s citizens, should guide the activities of all the agents, public- and private-sector that have anything to do with health: not only big pharma, but also the medical profession, agribusiness, retailers, schools, town planners, architects and so on. We cannot solve our health problems simply by spending more on organisations whose sole (stated) interests have to do with health. And just as health is not just a matter for drug companies alone, so crime is not just a matter for the police and the corrections industry. And so on.

Which is why I suggest we issue Social Policy Bonds that would not only target broad, long-term social goals, but also inject the market’s incentives and efficiencies into their achievement. Social and environmental goals are more easily understood and more meaningful than the narrow, short-term goals of the bodies that are supposed to be achieving them but end up, as we see in science, spending much of their energy trying to justify their survival and expansion. With more comprehensible, explicit, policy goals, more people would engage with the policymaking process. Our views might be debated and over-ruled, but we’d have a greater understanding of the inevitable trade-offs that resource allocation entails. Importantly too, we’d have [3] buy-in to policies that are not only currently remote from us, but also sometimes conflict with our interests. Most important of all, the goals of a Social Policy Bond regime would be understood by, and linked to, the concerns of all of us. It’s a sad indictment that we cannot say that of our current system.

## 14.4 April

### 14.4.1 The European Union: just like every other organisation (2017-04-06 18:45)

From Nigel Farage's recent speech to the European Union Parliament:

Eighty-five percent of the global economy is outside the EU. if you wish to have no deal [with the UK] it is not us that will be hurt. ... A return to tariffs will risk the jobs of hundreds of thousands of people living in the EU. What you are saying is that you want to put the interests of the European Union above that of your citizens and your companies. [1]Nigel Farage, 5 April

Earlier in the same speech Mr Farage also pointed out that in 1973 the UK voted to stay in the European *Economic* Community; not a political union. The speech neatly illustrates two principles which I deem axiomatic:

- Every organisation, be it a church, trade union, university, government or whatever, will always seek to overplay its hand.
- Every organisation will, sooner or later, forget its founding ideals and its stated objectives, and devote its energies to [2]self-perpetuation.

In the private sector there is, or should be, the discipline of the market and competition, though we increasingly see larger companies winning out over small businesses not through fair competition but via manipulation or subversion of the market.

Social Policy Bonds would lead to a[3] new type of organisation: one whose goals would exactly coincide with those of society. That's one feature that would differentiate them from all other organisations in history. The other is that the goals of the organisation would either themselves be, or be inextricably linked to, society's well-being. Every activity of a coalition of holders of Social Policy Bonds would be undertaken with exactly one objective in mind: to

maximise the efficiency with which society's targeted social or environmental goal is achieved. The activities, structure and composition of the organisation would be entirely subordinated to that one objective.

The difference between a Social Policy Bond regime, and any other current policymaking system, is stark. Under a bond regime governments would do what they do best (democratic governments anyway): that is, articulate society's goals and raise the revenue for their achievement. Then they'd, in effect, contract out the achievement of these goals to new organisations whose interests are exactly those of society. Their focus, and their striving for efficiency, are built into the Social Policy Bond mechanism. All society would benefit.

My reasons for voting for Brexit are given [4]here. For more on Social Policy Bonds see the overview papers linked to [5]here.

#### 14.4.2 What are governments for? (2017-04-15 18:18)

George Monbiot quotes from Kate Raworth's [1]*Doughnut Economics*, saying that:

[E]conomics in the 20th Century “lost the desire to articulate its goals.” It aspired to be a science of human behaviour: a science based on a deeply flawed portrait of humanity. The dominant model – “rational economic man”, self-interested, isolated, calculating – says more about the nature of economists than it does about other humans. The loss of an explicit objective allowed the discipline to be captured by a proxy goal: endless growth. [2]*Circle of life*, George Monbiot, 13 April

I've inveighed for [3]years against the *de facto* goal of governments everywhere which, in the absence of clear, explicit goals, has become economic growth, expressed as the rate of

increase of Gross Domestic Product, or GDP per capita. The grievous effects of this mistargeting on income and wealth [4]distribution, the environment, and much else, are now becoming apparent. More recently, I've asked [5]What are economists for? Governments as well as economists have lost their way. As Raworth says, they do not think in terms of explicit goals that are meaningful to ordinary people. They are pre-occupied with process and complexity:

The Dodd-Frank bill, like Obamacare, is tyranny by complexity.  
Consider the Glass-Steagall Act, at 37 pages in length, and the 2,319-page monstrosity of the Dodd-Frank Wall Street Reform and Consumer Protection Act.  
[6]Charles Hugh Smith, 6 April

The only people who follow and understand our policymaking system are those politicians, bureaucrats, academics, lawyers and [7]lobbyists who receive monetary rewards, sometimes [8]vast, for doing so. The 'rational economic man' just happens to be the person who, in our sad attempts to purchase things that used to be supplied by the [9]commons, maximises economic activity: that is, GDP. I think most people now see the flaws in targeting GDP as if it were an end in itself, but we are less united over what to do about it. My suggestion is that we start to express our policy goals in terms of broad, verifiable, explicit outcomes that are meaningful to ordinary people. Social Policy Bonds could do this, and inject the market's incentives and efficiencies into the achievement of those outcomes.

Under a Social Policy Bond regime, governments could still do what they are good at: raising revenue to achieve our social and environmental goals. And, though it would be a departure for most of them, they could learn to articulate these goals, as expressed and debated by the people they are supposed to represent. They could even, through government-financed bodies, help achieve these goals, but only if, through the Social Policy Bond mechanism, bondholders have confidence in their ability to do so more efficiently than other investors in the bonds. The current model which as Raworth points out, is dominant - that of 'rational economic man' - assumes and entrenches a paradigm that undervalues and often conflicts with community, the environment, small enterprises, and ordinary people's mental well-being. The short-term interests, as measured by accountants, of large organisations, both public- and private-sector, are privileged at the expense of the the rest of us. Social Policy Bonds would change that, right from the start, by posing the question that we cannot continue to evade: what are governments for?

### **14.4.3 Reinforcement learning and the public sector (2017-04-22 18:44)**

Will Knight writes about reinforcement learning:

Reinforcement learning is a way of making a computer learn through experience to make a series of decisions that yield positive outcomes—even without any prior knowledge of how its actions will affect its immediate environment. A software-based tutor, for example, would alter its activities in response to how students perform on tests after using it. [1]*Reinforcement Learning*, Will Knight, 'MIT Technology Review', March/April

It's the same approach practised by the computer called *DeepMind*, which 'mastered the impossibly complex board game Go and beat one of the best human players in the world in a high-profile match last year.' It's also, at least in theory, the basis of our economic system: the learning process that is supposed to go on through the creative destruction of business enterprises that fail to adapt to changing circumstances. As applied to driverless cars, 'the software governing the cars' behavior wasn't programmed in the conventional sense at all.' The software learns through trial and error.

Large corporations and their friends in government have seen to it that competitive markets play a lesser role than they should in determining our economic prospects. Corporations succeed today not so much through competing in markets, but more by manipulating the legislative and regulatory environment, and participating in effective cartels with other powerful players, both private- and public-sector. But the principle - that of survival of the most adapted, and the most quick to adapt - has generated enormous material wealth, and continues to operate, though more to the benefit of the already-wealthy than to ordinary people.

With its record of success, why isn't reinforcement learning, or competition to find the best approaches, allowed to operate in the public sector. That is, why don't we allow competition to solve our social problems? It's partly for historical reasons. When governments began to take an interest in the welfare of ordinary people, solutions to their basic problems were fairly easy to identify. Requirements for things like sanitation, elementary education, a police force, fire engines and hospitals were - and are - difficult to argue against. But as society has grown more complex so too have our social and environmental problems. How, for example,

do we go about reducing crime, improving our (already relatively high) levels of physical health, improving our mental well-being, or ending war? No obvious solutions leap to mind.

Which is where Social Policy Bonds could enter the picture. Rather than let public-sector organisations have a monopoly on trying to deal with these problems, a bond regime would, in effect, contract out finding the best solutions to the private sector. A goal such as eliminating war is going to need the exploration, deployment and refinement of a multitude of potential approaches. More than that, though, it's going to need to reward the most effective of these approaches and *to terminate the useless ones*. There are well-meaning organisations working to end war, but the people working for them are not rewarded for their success. There are no built-in incentives for the organisations to find optimal solutions, nor for inefficient organisations to be dissolved if their efforts prove futile or counterproductive. The result is that the challenges humanity faces, including environmental calamities or nuclear proliferation, are nowhere near being effectively met. But, unlike computers learning how to drive cars, or businesses operating in competitive markets, our failed approaches and ineffectual organisations aren't terminated. Sometimes, in fact, our politicians pump even more money into them.

Social Policy Bonds would change that. They would channel the market's incentives and efficiencies into the discovery and implementation of diverse, adaptive and, above all, efficient approaches to our social and environmental problems, including those, like war, that many of us have concluded have no solution. Our current system places responsibility for the solution of our problems in the hands of large, usually monopolistic, organisations that face little competition and have no incentive to try diverse approaches. There's certainly no reinforcement learning. It is because of its ability to stimulate diverse, adaptive approaches that a Social Policy Bond regime could succeed where existing policies have failed.

#### **14.4.4 We need countervailing incentives in science (2017-04-28 22:20)**

Dr Malcolm Kendrick writes about what he learned at medical school:

[N]ot only were certain key facts wrong, there seemed to be a co-ordinated effort to attack anyone who dared to challenge them. [1] *Tim Noakes found not guilty - of something or other*, blog post by Dr Malcolm Kendrick, 26 April

Dr Kendrick picks two cases spanning forty years. The first was John Yudkin, the founder of the nutrition department at the University of London's Queen Elizabeth College, who 'did not believe that saturated fat was to blame for heart disease, the idea at the centre of the diet-hypothesis. .... In 1972 Yudkin wrote the book *'Pure white and deadly'* in which he outlined why sugar was the probable cause of heart disease, not fat(s). He was then ruthlessly attacked.' Dr Kendrick quotes from the (UK) *Daily Telegraph*:

Yudkin was "uninvited" to international conferences. Others he organised were cancelled at the last minute, after pressure from sponsors, including, on one occasion, Coca-Cola. When he did contribute, papers he gave attacking sugar were omitted from publications. The British Nutrition Foundation, one of whose sponsors was Tate & Lyle, never invited anyone from Yudkin's internationally acclaimed department to sit on its committees. Even Queen Elizabeth College reneged on a promise to allow the professor to use its research facilities when he retired in 1970 (to write *Pure, White and Deadly*). Only after a letter from Yudkin's solicitor was he offered a small room in a separate building. John Yudkin: the man who tried to warn us about sugar

Similar treatment has been dished out to Professor Tim Noakes, 'a very well-known proponent of the high fat, low carb (HFLC) diet, as a way to treat obesity and type II diabetes - and improve athletes' performance.'

As Dr Kendrick says:

[A]ny scientist looking on gets a very clear message. If you say things we don't like, we will attack you and drag you through court and make your life a living hell for three years. Now, that is how you silence people, just as they silenced Yudkin nearly forty years ago.

It's not really news that nutritionists and, indeed all scientists, are heavily influenced by whoever funds their research. But it is news of which we need constantly to be reminded. The stakes - the funding involved and the absolute number of people's lives involved - are high:

perhaps higher than they have ever been. And what does need emphasis is that *nobody under the current system has incentives to change things*. Certainly not in ways that reward their success in doing so.

This is where Social Policy Bonds targeting the broad health of all a country's citizens could enter the picture. The bonds would introduce a source of funding that rewards people who improve society's health: not those who head institutions that purportedly improve health, or whose research budget depends on vested interests. [2]Health Bonds would allocate funding purely on the basis of which approaches to improving society's health will bring about the most improvement per dollar spent. They would reward efficiency in achieving society's health goals. You would think that any multi-billion dollar government health budget would be doing that anyway. But, as in so much of the way policymaking is conducted even amongst western democracies, government and big business have interests that differ from, and are often in conflict with, those of ordinary people and smaller enterprises. They can get away with doing so by keeping our focus on nebulous and irrelevant arcana, such as [3]Mickey Mouse micro-targets. Under a bond regime dissenting experts would be given a fair hearing. That would not only be in the interests of bondholders: it would be in the interests of society.

## 14.5 May

### 14.5.1 I don't know (2017-05-05 17:59)

'I don't know.' How often do we hear this from policymakers? Ask them how they plan to reduce crime, improve the environment or grow the economy and they will talk about things to do with funding allocations, institutional structures, laws, regulations and processes. They will never say 'I don't know.' We could even ask them how they intend to bring peace to the Middle East, to reduce the chances of a nuclear exchange, or to deal with climate change...and they'd still come up with superficially adequate responses. Responses, though, not answers.

Simple goals - sanitation, basic education, satisfying the nutritional needs of children etc - are those for which cause and effect are easy to identify, don't vary much over

space, and don't change much over time. A benign and reasonably efficient government knows how to achieve these things. The more complex problems, though - including how to bring about benign and efficient government where it is absent - require a range of approaches to be tried, with only the most efficient being implemented. This is something policymakers don't do very well. Probably no single conventional organisation can do it well, beholden as they are to fixed world views, and the interests (monetary, ideological) of their supporters and employees.

I don't know how to bring about world peace, nor improve a nation's health, nor prevent or mitigate disasters, man-made or natural. I offer no solutions, but I do think that the [1]Social Policy Bond concept is a way of encouraging people to find solutions: a way that channels the market's efficiencies and incentives into all the processes necessary to discover and implement the optimal mix of approaches to solving our complex problems. So, when asked how to solve the world's problems, I answer 'I don't know. *However...*'

-  
Policy as if outcomes mattered  
SocialGoals.com

1. <http://socialgoals.com/>

---

Anonymous (2017-05-13 22:49:57)  
That is so true.

### **14.5.2 Bribes for peace (2017-05-13 19:46)**

A headline from [1]Mailonline:

Could \$175bn pay for the removal of Kim Jong-un?  
Huge bribes of \$30m may be enough to convince North Korea's top officials to abandon their dictator, says expert  
by Julian Robinson, 12 May

I'm happy to see that the judicious use of financial incentives to achieve a desirable social outcome is at least being considered by one academic. The piece continues:

In his [2]book, *Stop North Korea!: A Radical New Approach to Solving the North Korea*

*Standoff*, [Professor Shepherd] Iverson imagines a scenario where the top tiers of North Korea's power elite could be bribed to ensure a peaceful transition.

I've made similar suggestions [3]myself: under a Social Policy Bond regime targeting, say, [4]Middle East peace, bribes could be paid to troublemakers, but *only if bondholders think that to be one of the most efficient ways* of ensuring peace. As I'm sure Professor Iverson would agree, while the fanatics themselves are unlikely to be moved by lavish cash handouts, their enablers and supporters are another story.

This particular type of activity is one that neatly illuminates one of the less obvious advantages of a Social Policy Bond regime: whereas governments would find it politically impossible to pay such bribes, and whereas if they were anyway to offer such payments, there would very likely be a counterproductive reaction, holders of Social Policy Bonds need suffer no such qualms. Even if the bonds were issued and backed by some government or combination of governments, bondholders are not agents of government. It's entirely up to bondholders to decide how best to achieve the targeted goal, and if bribery is the most effective way of doing so, then that's how they'll do it. Notions of justice and fairness may have to be suspended but, in the case of North Korea (and others), avoiding catastrophe should be our highest priority.

### **14.5.3 New concepts in Mickey Mouse micro-targets (2017-05-19 22:06)**

What determines the targets that our governments aim at? Something that sounds good? Something that they're already measuring? Something that they know they can easily achieve without doing anything? One thing's clear: whether the goal is big ([1]GDP, *net* immigration, inflation) or small (waiting times at [2]hospitals), the goals chosen have nothing to do with the well-being of the citizens our governments are supposed to represent. Two examples recently cited:

Fifteen years ago police in Hokkaido, in Japan's sparsely populated north, conspired with yakuza gangsters to smuggle guns into the country so they could meet quotas for finding them. [3] *As crime dries up, Japan's police hunt for things to do*, 'the Economist, dated 20 May

Some road space rationing schemes have had perverse knock-on effects. According to some reports, people in Mexico and Beijing have started buying second vehicles with different licence plates to get around restrictions. Often the second car will be cheap and more polluting. [4] *Cutting through the smog: What to do to fight air pollution*, Nic Fleming, 'New Scientist', 3 May

In our complex societies quantitative targets are probably necessary. But these targets need to be both meaningful to ordinary people and *inextricably linked* to improvements in well-being. The alternative to such indicators are the sort of Mickey Mouse micro-targets, like those above, that actually conflict with societal well-being. Social Policy Bonds would clarify what exactly as a society we want to believe. Targets would be the subject of debate in which the public can participate. They'd be broad and relevant, comprehensible and explicit. Targets are too important to be left to the interests of those with an interest in keeping them narrow, short term and irrelevant (at best) to the nation's well-being.

#### 14.5.4 Economics and politics: closing the gaps (2017-05-23 18:33)

Elisabeth Jacobs, in an essay, about Thomas Piketty's book [1] *Capital in the Twenty-First Century*, says that politics is 'everywhere and nowhere' in his book. The reviewer points out that:

A focus on efficiency is unobjectionable in a world in which political and institutional stability can be taken for granted, much less so in a world in which it cannot. ... [E]conomists set themselves too easy, too useless a task if they can describe how capitalism works only when politics is unchanging. [2] *A new anthology of essays reconsiders Thomas Piketty's "Capital"*, the 'Economist', 20 May

Quite so. I've questioned the limited purview of the economics profession [3]before. Economists find it safer to describe the world as it is, and to try (and usually fail) to predict what's going to happen to certain macro-economic variables. (There are [4]exceptions [5]of [6]course.) The gap between economics and useful endeavours mirrors that between politicians and the concerns of the citizens they are supposed to represent.

In both cases, I think Social Policy Bonds could help close the gap. A bond regime would take as its starting point broad goals that are meaningful to a population: goals that are inextricably linked to our well-being and that we can understand. And because we can understand outcomes such as improved [7]health, or [8]nuclear peace, we can participate in assigning their priorities. (Economists could, perhaps, make a useful contribution here.) Such participation will give us more understanding of the trade-offs that inevitably need to be made. We might not see our own priorities replicated exactly in those that society chooses to target, but we shall have been consulted, and so have far more [9]buy-in, than under any of the current policymaking systems.

I think that lack of buy-in goes a long way in explaining why our political systems are failing, perhaps catastrophically. The gaps between policymakers and citizens; between the rich, the bureaucrats, media, academics, and ordinary people, are growing ever larger. Consultation about the outcomes we wish to see would start to close these gaps. Injecting the market's efficiencies and incentives to bring about those outcomes with optimal efficiency, would take that process a step further. The ultimate goal would be a politics that improves all our well-being, making for a more healthy, more prosperous and peaceful, more contented and cohesive society. A Social Policy Bond regime, I believe, could achieve all that.

### 14.5.5 Focus on outcomes, not party (2017-05-30 19:02)

Matt Taibbi discusses the US Democratic Party's reaction to the Bernie Sanders campaign, in a piece originally penned on 9 June 2016:

Politicians are so used to viewing the electorate as a giant thing to be manipulated that no matter what happens at the ballot, they usually can only focus on the Washington-based characters they perceive to be pulling the strings. Through this lens, the uprising among Democratic voters this year wasn't an organic expression of mass disgust, but wholly the fault of Bernie Sanders, who within the Beltway is viewed as an oddball amateur and radical who jumped the line. Nobody saw his campaign as an honest effort to restore power to voters, because nobody in the capital even knows what that is. In the rules of palace intrigue, Sanders only made sense as a kind of self-centered huckster who made a failed play for power. Matt Taibbi, [1]*Insane Clown President*, January 2017

Exactly. We need to reconnect politicians and their parties with voters. Policymaking systems have been subject to two principles which I deem axiomatic:

- Every organisation, be it a church, trade union, university, political party, large corporation or whatever, will always seek to overplay its hand.
- Every organisation will, sooner or later, forget its founding ideals and its stated objectives, and devote its energies to [2]self-perpetuation.

So political parties are no better, and not much worse, than any other large organisation, except in their oligopolistic power over the rest of us. I think our policymaking models are outdated. In the western democracies we choose a person or a party who promises to do something to help achieve some vague, usually unverifiable outcome at some indefinite time in the future, usually long after they can be called to account. It's a very indirect form of influence, and one that, as we see, has been corrupted, so that the link between the voter and the politician is distorted and broken by wealthy interest groups, whether they be corporations or government agencies who don't want their boat to be rocked.

I propose that instead of choosing people or parties, we choose outcomes: explicit, verifiable outcomes that are meaningful to ordinary people. Which means outcomes that are not phrased in terms of expenditure, institutional size, structure or remit, or regulatory or legislative powers. Outcomes such as improved [3]health, or [4]world peace, that people can understand, and that we can help choose and prioritise. I am not necessarily advocating Social Policy Bonds here: a shift toward discussing outcomes and their costs would be an

improvement over our current systems. But Social Policy Bonds could focus debate more, and have the crucial advantage that they inject the market's incentives and efficiencies into all processes necessary to achieve society's goals.

## 14.6.2 Self-entrenching atomisation (2017-06-06 19:11)

In a discussion about air travel, Steve Randy Waldman makes an interesting point:

Aggregate outcomes are not in general or even usually interpretable as an aggregation of individual preferences. When we learn about the Prisoners' Dilemma, we don't interpret the fact that both players rat as evidence that, really, they both just wanted to go to jail for a long time. After all, that is their revealed preference, right? No. We understand that the arrangement that would obtain if they could cooperatively regulate one another's behavior is in fact the outcome that they would prefer. As isolated individuals, they simply have no capacity to express this preference. [1]Source See also [2]Prisoner's Dilemma

This explanation of the mismatch between the sum of individual preferences, and aggregate decisions makes a lot of sense, and we can see its implications beyond the air travel industry in the deficiencies of our policymaking system. (I'm not, incidentally, convinced by the rest of Mr Waldman's discussion of the air travel industry.) To my mind, it points to the need for more public engagement with policy; more discussion amongst ordinary people about the costs and benefits of policy alternatives. But policy itself is not really the issue: policy is a means to various ends, and those ends under our current system are rarely articulated, often deliberately obscured, and often in conflict with each other and with the interests of anybody except those bodies wealthy enough to follow and influence them. We don't "cooperatively regulate one another's behaviour" in the policymaking process, because that process is just too esoteric and time-consuming for ordinary people to follow.

The result is that our politics is ceded to powerful bodies, public- and private-sector, which benefit by ordinary people's unwillingness or inability to follow the policymaking process. A self-entrenching mechanism seems to be at work: certain policies weaken social and family bonds. I'd include amongst these policies that deal with welfare payments, subsidies to (for instance) road transport and capital-intensive agriculture, zoning laws, regulations that favour big business, and trade agreements. Importantly, the positive effects of these policies might well outweigh the negative, but the negative effects do tend to divide us. And, as atomised individuals or nuclear families, we exhibit exactly the behaviour that Mr Walden talks about: we cannot translate our wishes through a broken policymaking system, into 'an aggregation of individual preferences'. This cycle perpetuates itself.

Social Policy Bonds could help. They would refocus policy discussion onto outcomes that are meaningful to ordinary people. Goals, in short, that we could understand and debate. Under a bond regime anyone could engage with the policymaking process and, crucially, with each other, over policy goals and priorities. Even if our individual wishes were over-ruled, we'd have the satisfaction of knowing we'd been consulted. One result of this would be more [3]buy-in: a crucial feature missing from politics these days. Another would be the solution to the problem to which Mr Waldman alludes: our individual preferences could be aggregated in a meaningful way. For example: few of us would want to see, say, a conflict anywhere in the world that led to the detonation of a nuclear device. Or, at the national level, most of us would like to see universal literacy and reductions in the level of violent crime. Currently, we have no way of articulating and debating these preferences in a systematic way: we can vote for political parties that may or may not offer different perspectives; we can join single-issue groups (which tend to [4]deviate from their initial remit), and there are various other *ad hoc* activities we can undertake in support of some, but not all, of our individual goals. But they're unsystematic, often incoherent, and rarely exposed to moderating or contrary argument. And a large number of interest groups anyway replicates almost exactly the mismatch discussed above.

In contrast, a Social Policy Bond regime would enable us meaningfully to express goals that our current system finds difficult to target: goals like the avoidance of a nuclear conflict.

The bonds could do this effectively because they would not presuppose how our goals shall be achieved, nor who shall achieve them. By focusing entirely on outcomes and costs, Social Policy Bonds would translate and modify our individual preferences into coherent, consensual policy goals. An invaluable by-product of a bond regime would be its reversal of the atomisation process afflicting western democracies.

### **14.6.3 Listening to the 99.9 percent (2017-06-13 17:27)**

Jeffrey Lewis writes about *Our Nuclear Future*:

President Trump, for example, would have between two and four minutes to decide that computerized reports of [a nuclear] attack are not a false alarm and to give the order to retaliate. [1]*Our Nuclear Future*, Jeffrey Lewis, 'The American Scholar', Summer 2017

The possibility of nuclear catastrophe is not confined to the Russia - US theatre:

If the 30 minutes that it would take for an intercontinental ballistic missile to fly from Russia to the United States imposes crushing time pressures, consider that flight times in South Asia will be five to 10 minutes, depending on the missile and the target. India and Pakistan are re-creating a Cold War deterrence framework under much more demanding conditions.

That's scary enough, and then there's North Korea.... What can be done to reduce the chance of catastrophic nuclear conflict? Mr Lewis writes about the Global Zero initiative, but that appears to be a failing attempt to eliminate all nuclear weapons. So, despite its fading somewhat from public consciousness, the nuclear nightmare hasn't gone away. In many ways it's getting worse. As Mr Lewis writes, the very narrow window available for decision-making 'requires an enormously complex computerized system to detect missile launches, convey that information to the president, and then transmit and execute his order. Every minute that is lost to these processes reduces the time in which the president must decide. As a result,

the pressure to automate much of the system is strong.’ And with automation comes the possibility of malware or defective hardware or software.

The problem is magnified, in my view, by the mismatch between the enormous costs of nuclear catastrophe and the relatively minuscule rewards on offer to those working to prevent it. I am certain those involved in initiatives such as Global Zero, and in disarmament, whether they be UN or non-governmental agencies or other public- and private-sector bodies are hard working and well meaning. They probably couldn’t work harder even if their salaries were tripled. But the point about lack of incentives is that they are needed to attract more, and more-talented people into striving for nuclear peace. Our current political systems have no way of funnelling sufficient funds into a goal, such as nuclear peace, that is inherently long term, and that has no powerful interest group to lobby in its favour, despite the enormous potential benefit to the 99.9 percent of humanity that would like to see it happen.

The Social Policy Bond principle could help, in the form of [2]Nuclear Peace Bonds. We don’t know how to achieve nuclear peace; we don’t know who’ll be best at achieving it, but we do know that, if we’re going to achieve it, we need to offer higher rewards, so as to encourage a diverse, adaptive range of peace building initiatives. Some of these initiatives will be failures or inefficient; others will need research and refining before they can be implemented effectively. This points to the need for a long-term, guaranteed reward for success, as well as the need to make the bonds [3]tradeable, so as not to discourage people from taking only partial steps toward our goal. It seems ridiculous to me, that the rewards to people who gamble with other people’s money, keep their winnings and get taxpayers to pay for their losses, are in the [4]billions of pounds, while the collective rewards for those working in an unglamorous but far more socially beneficial field - like nuclear peace - are much more modest and entirely unrelated to effectiveness. Nuclear Peace Bonds would fix that.

#### **14.6.4 Creeping corruption afflicts charities too (2017-06-17 19:13)**

I’ve blogged [1]before about my two opinions about organisations, which I deem axiomatic:

- Every organisation, be it a church, trade union, university, government or whatever, will always seek to overplay its hand.

- Every organisation will, sooner or later, forget its founding ideals and its stated objectives, and devote its energies to [2]self-perpetuation.

Sadly, but not unexpectedly, the list in the first axiom can be taken to include charities, which appear to be just as [3]subject to [4]creeping [5]corruption as all the others. There's little point in trying to find why this happens, but there is a great deal to be gained, in my opinion, by remedying the problem.

Social Policy Bonds would lead to the creation of a [6]new sort of organisation: ones whose composition and structure will adapt to changing circumstances. The bonds would encourage the achievement of social goals that will take longer to achieve than the current, relatively short, time horizons of people or bodies in the current system. Under a Social Policy Bond regime, the members of the coalition of bondholders targeting, say, better [7]health, would gain by buying bonds, doing what they can to improve the nation's health, then selling their bonds at an increased value. *They need not stay invested in the bonds for the lifetime of that bond.* At every point in time between the flotation of the bond and its redemption, the bondholders would form the body that can advance goal-achievement most efficiently. Bondholders need not be directly involved in achieving the goal; they might be investment companies, whose role will be to allocate funds according to what they think will be the most efficient people or projects that will help bring about the next step toward achievement of the targeted goal, simultaneously raising the value of their bonds. The identity of any and all bondholders would change over time, if that turns out to be the best way of achieving our objective quickly. Blockchain technology could facilitate any shifts in the membership of the coalition of bondholders.

The important point is that every activity of every bondholder would be devoted to achieving our goal. Their self-interest would be exactly congruent with those of society - in stark contrast to what happens now under even the best of our current systems of government.

### 14.6.5 Social Policy Bonds and price signalling (2017-06-27 17:42)

One of the less obvious benefits of a Social Policy Bond regime arises from the price signalling of the market for the bonds. At flotation, the bonds would be auctioned, and difference between the sums raised at flotation and the total redemption value of the bonds would supply the market's best estimate of the cost of achieving the targeted goal at that time. This estimate would vary over time, depending on many factors including bondholders' performance in undertaking or financing goal-achieving projects. The market for Social Policy Bonds, then, as with all markets, plays a vital role not only in allocating resources but also in signalling; in this instance to policymakers, the approximate costs of achieving social goals.

A competitive market for Social Policy Bonds would minimise the

*total*

cost of achieving a specified objective, as well as signalling it. More subtly, and more technically, it would

also indicate the

*marginal*

cost of achieving further

improvements. Say one million [1]crime reduction bonds issued by a local authority were to sell for \$5

each. This would tell the issuing body that the present value of the expected maximum cost, including bondholders' profits, of reducing the crime level from, say 50 to 40 units, would be \$5 million. The local authority might then suppose that it could afford to be more ambitious, and aim for a further fall to 30 units. It could issue a million additional bonds redeemable when this new lower rate were reached. These would (probably) have an initial market value of less than \$5, reflecting the (probably) diminishing returns involved in preventing crime. The point is that, by letting the market do the pricing of the bonds, the local authority would be getting an informed view of the

*marginal*

cost of its objectives. So if the bonds targeting the

new level of 30 units were to sell for \$4 each, then the maximum cost of

achieving that objective would be \$11 million, being equal to: \$5 million (paid out when the level fell from 50 to 40 units) plus \$6 million (paid out when the level fell from 40 to 30 units). The marginal cost of a 10-unit drop in crime would thus have been revealed to have risen from \$5 million to \$6 million. Should the local authority aim for a further fall to 20 units? Following such crime rate-targeting bond issues

*it would have robust information about the cost of doing so.*

This is, of course, a simplified example and in fact the bond market would continuously update its pricing information. Say that new research, of the sort that might be stimulated by an initial bond issue targeting crime, suggested new ways of reforming or deterring criminals. Bondholders may, for example, have financed successful research into more effective reform programmes, or set up more appealing alternative lifestyles for especially hardened criminals. How would the market react to such developments? Once their effectiveness had been revealed, the value of all the bonds would rise. Instead of being priced at \$5 and \$4, the two crime reduction issues of the example might sell for \$8 and \$7. The total cost to the government of redeeming these bonds would not change: it would remain at \$11 million (though redemption would most probably occur earlier). But the market would be generating new information as to the likely cost of future reductions in the crime rate. The market would now be expecting reductions of 10 units of crime to cost \$2 million (from 50 to 40 units), and \$3 million (from 40 to 30 units). The new research would have reduced the costs from \$5 million and \$6 million (respectively). So the cost of any further crime reductions would also fall, and by following market price movements policymakers could gauge approximately by how much.

These figures are hypothetical, but they do indicate the role that markets for Social Policy Bonds could play in helping the government, and taxpayers, decide on their spending priorities.

The market for the bonds is elegantly efficient in conveying information about the cost of achieving objectives and, crucially for policymakers, how this cost varies with time and circumstances. I discuss this in chapter 5 of [2]my book.

## 14.7 July

### 14.7.1 Blockchain-based investing and the Social Policy Bond principle (2017-07-01 17:39)

Zipper Global Ltd, on 28 June, released a draft paper that marries the Social Policy Bond and blockchain concepts. The aim is to address some of the flaws in current startup protocols. The abstract of their draft:

Blockchain based investing and contributing to early stage token projects

Today's startup funding protocols have several serious flaws. Startup founders struggle to get early stage funding and spend significant amount of their time fundraising instead of building their company and community. Investors are stuck with their illiquid investments for years, and have to make risky investments without knowing if startups are able to execute their plans. Zipper investment platform fixes these pain points and disrupts startup funding with milestone and token based investments. The platform, based on Ethereum blockchain, provides professional investors an early access and safe way to invest into even the most ambitious startups' tokens, as funds are released to startups in tranches based on reached, smart contract controlled milestones. Investors can exit anytime by selling the startup's tokens, and startups can scale more easily by giving tokens

to their network such as users and contractors as incentives. Startups spend also significantly less time in fundraising as less funding rounds are needed. ZIP token,

the platform's native usage token, grants investors the right to invest through the platform. Moreover, a smart contract controlled Startup Trust scales the platform by investing into selected startups in the platform with the ZIP tokens the Trust holds. ZIP token holders co-decide which startups the Trust invests into and how to spend the Trust's investment profits, such as purchasing ZIP tokens from the open market which would create demand and liquidity for the tokens.

The paper - full text [1]here (pdf) - is a first draft, and Zipper Global invite comments via either zipperglobal.com or <https://slackin-qhgawovsyq.now.sh/>.

### **14.7.2 The environment: what do we want? (2017-07-05 17:54)**

John Michael Greer writes:

A huge fraction of the energy consumed by a modern industrial society is used indirectly to produce, supply, and transport goods and services; an allegedly "green" technological device that's made from petroleum-based plastics and exotic metals taken from an open-pit mine in a Third World country, then shipped halfway around the planet to the air-conditioned shopping mall where you bought it, can easily have a carbon footprint substantially bigger than some simpler item that does the same thing in a less immediately efficient way.

[1]*Dark Age America*, John Michael Greer, 2016

The sort of life-cycle analysis required to establish the environmental benefits or otherwise of shifts in our behaviour are bedevilled by boundary issues, measurement difficulties and the difficulty of weighting one type of environmental impact against another. They are better than blandly assuming that rail is 'better' than air travel, or that solar power is better than coal-fired power stations but, for the making of robust policy, they would need to be continually reassessed in the light of improving technology, our ever-expanding knowledge of the environment, and our ever-changing environmental priorities. Government policy cannot be so responsive: if government did use life-cycle analysis with the aim of altering our behaviour, it would probably do so on the basis of a one-time, one-size-fits-all, and possibly quite subjective assessment of environmental costs and benefits. It's not good enough, but even worse would be what we largely

have now: government environmental policy based on corporate interests, regulatory wrinkles, and 'feels-good' media stories and the launching of visually appealing initiatives that attract air time but otherwise achieve nothing.

## Social

Policy Bonds would take a different approach. They would subordinate environmental policy to targeted environmental outcomes. It might be, for instance, that society wishes to reduce its use of fossil fuels. A Social Policy Bond issue that rewarded achievement of such a reduction would generate incentives for bondholders to bring it about *at least cost*. They might well carry out life-cycle analyses in their attempt to do so. But there is an important difference between the way do they would conduct their research and the way government would do so: bondholders have incentives to achieve their goal efficiently. This is likely to mean responding to and stimulating: increased knowledge of scientific relationships, and technical advances.

More important, though, is that a Social Policy Bond regime would compel clarity over society's real goals. In this case, we'd have to answer the question: is reducing fossil fuel use an end in itself, or a means to other ends? And if the latter, what are those ends? Let's say those ends include, *inter alia*, improving air quality. Now, is improving air quality an end in itself, or is it the effects that air pollution has on human, plant and animal life that we really want to be targeting? And, if the latter, why not target these ends directly? There might be good reasons, involving the costs of monitoring, for targeting indirect means of achieving our goals, but we do need to keep these goals clearly in mind.

A Social Policy Bond regime would necessarily entail asking ourselves what are the real goals of, say, environmental policy. It would then contract out the achievement of these goals to those people or bodies - public- or private-sector - who, at any one time, will form that coalition that can most efficiently take us along the route towards achieving our goals. Even a perfect life-cycle analysis cannot do this: technology and our knowledge are changing constantly. Policy should therefore limit itself to articulating our environmental goals, and raising the revenue for their achievement.

Most of our important environmental goals will require diverse, adaptive responses. These are precisely the sort of responses that government does very badly. Government can and should articulate society's environmental goals, and can help pay for their achievement: in the democratic countries it performs these functions quite well and, indeed, it is the only body that can do so. But actually achieving these goals requires continuous, well-informed and impartial decisions to be made about the allocation of scarce resources.

For that purpose, Social Policy Bonds, with their incentives to achieve targeted outcomes efficiently would, I believe, be far better than the current ways in which environmental policy is formulated. For more about how Social Policy Bonds could target improve the environmental goals, see [2]here.

### 14.7.3 Immigration: the need for buy-in (2017-07-11 19:09)

Tim Black writes about the immigration crisis facing Italy, where last year 181 000 migrants arrived via Libya, and 'already this year, a further 84 000 have arrived, which is 20 per cent more than arrived in the first half of 2016.'

Now, if those Italians whose towns have been turned into migrant holding stations had been allowed to debate the migration issue; if those living in Lampedusa and the other migrant destinations in Italy had been part of a process of democratic deliberation; and if they had been allowed to voice their concerns, and influence the decisions which have led to the influx of migrants, then perhaps the seething resentment, the sense of being imposed upon, of having their lives turned upside down with the stroke of pen in Brussels, might have been absent. Perhaps a more workable solution could even have been found. And perhaps the migrants themselves wouldn't be treated as a problem, but as people just like us, sometimes fleeing wretched lives, always seeking better ones. [1]*The EU: pitting migrants against citizens*, Tim Black, 'Spiked', 12 July

Sadly for everybody involved, our so-called representatives at the national and EU levels have got into the habit of not consulting us about almost everything. The results are as dismal as they are predictable: the gap between citizens and politicians grows ever wider. Ordinary people feel - and are - powerless. Politics are hyper-polarised. Anger and violence are now a normal feature of political discourse.

Our politicians just *know* they're right. So do those NGOs and philanthropists who support 'open borders', for example, though, unlike the rest of us, they don't have to live with the consequences of their momentous decisions.

It's time to change the way policymaking works. Social Policy Bonds have two main elements: identifying society's social goals, and injecting market incentives into their achievement. If we could strive for the first of these elements alone, that would be preferable to our current system. As it is, few ordinary people are consulted on issues, such as immigration, and our political class is now so removed from everyday life that they no longer have any feeling for what's important to us.

Social Policy Bonds could narrow the gap between politicians and the people they are supposed to represent. Political debate under a bond regime would focus on outcomes that are meaningful to ordinary people; things like physical and mental health, crime and housing. Because such concerns are meaningful to all of us, we could all contribute to discussion about which goals we should target, and their relative priority. Of course, none of us will be fully satisfied by our collective decision. But, crucially, we shall know that we have been consulted and that, if we wanted to, we could have contributed to the debate.

One happy result of that is that there would be widespread *buy-in*. We might not fully agree with every decision, but we were able to participate in the process, and we now have a fuller understanding of the trade-offs inherent in any political decision.

I've written more about Social Policy Bonds and buy-in on my main website [2]here, and in various blog posts including, recently, [3]here, [4]here and [5]here.

#### **14.7.4 Climate change: means and ends (2017-07-14 18:12)**

A leader in the current 'Economist,' referring to public- and private-sector commitments to run their operations on 100 percent renewable energy is titled: [1]*Better to target zero emissions than 100 % renewable energy*:

Most important, a 100 % renewables target confuses means with ends. The priority for the planet is to stop net emissions of greenhouse gases, especially carbon dioxide. Putting too much emphasis on wind, solar and other renewables may block off better carbon-reduction paths. 'The Economist', dated 15 July

No. The real ends of policy have to do with the problems caused by climate change. Whether, and by how much, greenhouse gas (ghg) emissions contribute to those problems is still an open question. And, whatever the answer to that question, still more important to policymakers is whether reducing ghg emissions is the best way of dealing with climate change. For that, we need to go beyond the cant about renewables and beyond the *Economist's* - and almost everyone else's - focus on greenhouse gases to ask whether we are more concerned about climate change, or about the impacts of climate change on human, animal and plant life?

A Social Policy Bond regime would not assume that reducing ghgs is the best way of achieving our goals. Instead it would specify very clearly what our goal actually is. Most likely, we would express our policy goal as a combination of physical, social, biological and financial measures that must fall within specified ranges for a sustained period. We'd then issue [2]Climate Stability Bonds that would be redeemed only when that had occurred.

Unfortunately an entire bureaucracy has grown around ghg emissions. It seems to me that the existence and activities of this bureaucracy embody the assumption that our trying (and most probably failing, though we'd never know either way) to influence the climate is the most efficient way of dealing with problems caused by unfavourable changes in the climate. I think that assumption needs to be challenged. Clarity about what actually we want to achieve, of the sort that a Social Policy Bond approach would necessitate, is the only feasible starting point.

### **14.7.5 Targeting long-term goals (2017-07-20 17:20)**

James Hansen talks about climate change:

You're talking about a system that responds on the timescale of decades to centuries — that's a different time constant than the political constant." James Hansen talking to David Wallace-Wells in [1]*The Uninhabitable Earth: Annotated Edition* (reference 12)

It's not only climate change for which our current politics is inadequate. Any crisis building now, but whose effects will be felt only by future generations or, even more scarily, future administrations, is going to be neglected within our current system. Our politicians face few incentives to consider future generations, and plenty of incentives to ignore them completely. We see this in the amassing of grotesquely inflated [2]debt levels, badly thought-out [3]immigration policies, under-investment in [4]critical infrastructure, and environmental behaviours including, but by no means limited to, those that affect the climate. The narrow, short-term interests of powerful interests, public- and private-sector, win out every time. As for future generations: our politicians are expert at kicking the can down the road.

Social Policy Bonds could remedy this neglect of long-term consequences. They would create a coalition of interests in favour of achieving social and environmental goals that are currently too remote to receive much attention - though plenty by [5]dystopian [6]fiction [7]writers. The way the bonds work would be to reward the achievement of our long-term goals at every stage of the process.

Social Policy Bonds (unlike [8]Social Impact Bonds) are radeable, which means that bondholders don't have to hold them until redemption to see their value rise and realise a profit.. This allows the bonds to target effectively such remote goals as [9]climate stability, [10]universal literacy and [11]world peace. The bonds would begin their work as soon as they were issued: those who buy the bonds would be motivated to begin the explore measures that would immediately raise the chances that the targeted goal will be achieved quickly. For most long-term goals, a large array of diverse measures will need to be proposed, implemented

on a small scale, then either terminated or implemented more widely. No government can effectively oversee such a range of projects, nor can any single, conventional organisation. In particular, terminating failed approaches in favour of more efficient ideas does not come easily to government. But under a Social Policy Bond regime there would be every incentive to focus only on those approaches that will achieve our targeted goal most efficiently. And, crucially, the optimum mix of approaches will change over time - especially over the long time period that remote goals will require for their achievement. The bonds would give rise to a [12]new type of organisation; ones whose composition and structure would change, perhaps radically, over the lifetime of the bonds, in response to changing circumstances and improving knowledge. Again, such adaptiveness is not a characteristic of government action, but it is an essential element of any attempts to solve our long-term problems.

Social Policy Bonds would represent a radical change from today's politics. But, as long-term problems threaten to overwhelm humanity (click on the source excerpted at the top of this post, for one example) it's clear that business as usual is not working. Targeting long-term goals and injecting market incentives into their achievement would seem to be our best hope. Social Policy Bonds, uniquely amongst policy instruments, would do both.

*I've written about why I believe tradeability is important [13]here, and why I am ambivalent about Social Impact Bonds [14]here.*

#### **14.7.6 Social Policy Bonds and free riders (2017-07-21 19:57)**

Let's say that the bonds have been floated, and that a high proportion of them have been sold to people or bodies have no intention of

doing anything to achieve our targeted goal. These are would-be *free riders*, hoping to benefit from other bondholders' efforts to achieve the goal, or a drift toward the goal that happens regardless of anybody's efforts. (An example of this would be a holder of Climate Stability Bonds benefiting from new scientific evidence showing that the climate isn't changing as quickly as the market thought it was when the bonds were issued.)

If too many Social Policy Bonds were held by would-be free riders who had no intention of doing anything to help achieve the targeted social objective, then the value of all the bonds would fall. At that point it becomes worthwhile for active bondholders to buy those bonds that are traded, do something to achieve the goal, and see the value of their bonds rise. This would benefit any remaining free riders of course, but not as much as the new bondholders, because these new bondholders would have paid less for their bonds. Most likely, we'd see aggregation of bond holdings as it becomes worthwhile for passive bondholders to sell their bonds. The resulting small group of large bondholders would then have incentives to cooperate with each other. This would mean, amongst other things, that they would all benefit by agreeing on how the specified social problem could best be targeted. One element of the optimal strategy will be to decide who will be responsible for what activities, and how they shall be compensated. Major bondholders will certainly have incentives to share information with each other. Many of the bonds would be traded between bondholders.

If the proportion of bonds held by free riders is small, then their passivity would have little effect on the market value of the bonds, and they might benefit by hanging on to their holdings if active bondholders are successful in their efforts to move towards the goal's achievement. Such behaviour would, to a limited degree, undermine the Social Policy Bond concept, but keep in mind that:

- The true standard of comparison is not perfection: just something significantly better than any alternative, and
- Our goal is to achieve social goals as efficiently and quickly as possible; not to ensure that everyone is rewarded strictly in accordance with their efforts.

There is more about Social Policy Bonds and free riding in my [1]book, [2]chapter 4.

### 14.7.7 Nappies, LCAs, and the environment (2017-07-30 17:24)

From an article in a recent *New Scientist*:

Greenhouse gas emissions from the production of various materials reveal that recycling is always greener than using virgin resources [1]*Throwaway culture: the truth about recycling*, Bob Holmes, 'New Scientist', 22 July

This is problematic for two reasons. First: I think it's a mistake to define 'greener' as 'generating a lower level of greenhouse gas emissions'. Why? Because production inevitably entails numerous other environmental impacts. Second: because 'always' is anyway too definitive.

Life Cycle Analyses (LCAs) are not a simple exercise, but one conducted by the UK's Environment Agency compared the environmental impacts of disposable nappies (diapers) against home- and commercially-laundered cloth nappies. The conclusion:

For the three nappy systems studied, there was no significant difference between any of the environmental impacts – that is, overall no system clearly had a better or worse environmental performance, although the life cycle stages that are the main source for these impacts are different for each system. [2]*Life Cycle Assessment of Disposable and Reusable Nappies in the UK* (pdf), Environment Agency, 2005

This LCA considered a wide array of environmental impacts: 'resource depletion; climate change; ozone depletion; human toxicity; acidification; fresh-water aquatic toxicity; terrestrial toxicity; photochemical oxidant formation (low level smog) and nutrification of fresh water (eutrophication).' Climate change, note, is just one of these impacts. This study was published 12 years ago, and its conclusion might have changed since then - which is my second point: that even if we can say now that recycling aluminium, say, is currently 'greener' than producing from the virgin resource, it might not always be so. Weighting environmental impacts, apart from being largely subjective, can never be definitive: our scientific knowledge about these impacts changes, as do the technologies of extraction and recycling and numerous other relevant variables. Our current policymaking system, as applied most spectacularly to climate change, relies on our trying to identify the source of a problem and then basing policy instruments *for decades ahead* on that - ossified - knowledge of scientific relationships. As well as failing to account for our rapidly expanding scientific knowledge, it necessarily ignores potentially massive changes in social, financial or biological variables.

My suggestion is that policymakers or environmental campaigners stop focusing on *how* things are done and instead target environmental outcomes, measured in terms of human, animal and plant health. [3]Environmental Policy Bonds could target quite ambitious goals at the national or even global level. Just choosing their target could force policymakers and the rest of us into clarifying what we really want to achieve. For example: do we primarily want to influence the climate, or are we more concerned about the adverse effects of the climate on human, animal and plant life? The difference is subtle, but it might be that doing the former is not the most efficient, nor even a feasible, way of mitigating the latter.

Clarification of goals is one crucial advantage of the Environmental Policy Bond concept. Another is that the bonds, being [4]tradeable, could target ambitious, long-term goals that will probably require the lifetime of multiple democratic government administrations to achieve. A bond regime would not dictate how our goals shall be achieved, nor who shall achieve them. At any one time the bonds will be held by that coalition of interests who are - or who think they are - the people who will be most efficient at achieving the next step on way to the bonds' redemption.

In all, then, the [5]Social Policy Bond concept, as applied to the environment, would motivate bondholders to explore and implement diverse, adaptive initiatives that will efficiently achieve our environmental goals. This is something that our current policymaking system, based as it is on the use of fossilised science and heavily influenced by vested interests, simply cannot do.

### **14.7.8 A successful Social Impact Bond (2017-07-31 18:47)**

A flurry of reporting on the success of the world's first [1]Social Impact Bond. The goal was to reduce reoffending rates of short-sentence ex-prisoners in the English city of Peterborough by at least 7.5 percent. The result was a 9.0 percent reduction:

The conclusion of the world's first social impact bond (SIB) will return all of the investment as well as a one off payment described by Social

Finance as "just over 3 % interest per annum" over five years go to 17 social investors after outcomes were achieved. All of the investors were charities or charitable foundations.

[2]Peterborough social impact bond investors see 3 % interest, Lee Mannion, 'Pioneers Post, 27 July

Social Impact Bonds are the non-tradeable variant of Social Policy Bonds. I've had no direct involvement in any of the 89 SIBs in 19 countries which have now been issued. I'm ambivalent about SIBs and their non-tradeability - see [3]here and [4]here. But I think they can be helpful where the alternatives are neglect or poor policy. They might also serve as a handy stepping-stone to the full [5]Social Policy Bond model. For current news about SIBs there is a database and relevant links, [6]here.

## 14.8 August

### 14.8.1 Health: too important to be left to the healthcare industry (2017-08-04 17:42)

Brian Nelson writes:

That our payment incentives have had the unintended consequence of often harming patients has been recognized by payers (government included) and efforts are underway to change. Can we devise a system that pays for outcomes rather than paying for services regardless of effectiveness? Unless we do, I fear things will not change. A

[1]review by

Brian W Nelson (orthopaedic surgeon), of [2]*Crooked: Outwitting the Back Pain Industry and Getting on the Road to Recovery*,

21 May

There's an idea: pay for favourable health outcomes, rather than activities or institutions purporting to deliver those outcomes, but at least as concerned for their own well-being as those of the people they are supposed to be helping. We see this not only in orthopaedics, but in other areas of [3]physical and [4]mental health. There's nothing particularly startling about this: practitioners have their own families to support, and are reacting perfectly rationally to the incentives on offer. And those incentives encourage [5]over-[6]screening and [7]over-treatment, and the neglect of commercially [8]nonviable [9]preventive [10]interventions. As the British Medical Association puts it, in a recent paper:

Despite the clear acknowledgement across the UK of the need to prioritise ill-health prevention and public health activities, the data analysed in this briefing show this is not matched by funding commitments. [11]*Funding for ill-health prevention and public health in the UK* (pdf), British Medical Association, 2017

It's the same, or worse, in the US:

Almost 1.3 million people went to U.S. emergency rooms due to adverse drug effects in 2014, and about 124,000 people died from those events. [R]research suggests that up to half of those events were preventable. ... An estimated \$200 billion per year is spent in the U.S. on the unnecessary and improper use of medication, for the drugs themselves and related medical costs.... [12]*Too many meds?*, Teresa Carr, 'Consumers Reports', dated September 2017

It's time for a new approach. My suggestion is that rather than policymakers' focusing on the means by which they think good health can be achieved, they instead focus on targets for good physical and mental health, and provide incentives for people to achieve those targets. The Social Policy Bond concept, applied to health, would do this, and more: it would inject the market's incentives and efficiencies into all the processes necessary to improve a nation's health. [13]Health Bonds would channel our scarce resources into the most efficient means of improving our health, including those currently neglected or not even considered by our current healthcare bodies, most of which have little incentive or capacity to consider broad health outcomes that fall outside their increasingly specialised remit.

Health Bonds wouldn't stipulate how our health goals shall be achieved, nor who shall

achieve them. This allows a broader approach. For example: our current compartmentalised accountancy-driven policy approach would not take into consideration the adverse health impacts of subsidising advanced courses for young drivers of motorbikes or cars. But holders of Health Bonds would look at such measures, investigate their possible health impacts, and make an informed decision as to whether any improvement they might bring to the nation's health is worthwhile, compared to other possible interventions.

## 14.8.2 Incentives and health (2017-08-13 18:36)

Dr James DiNicolantonio writes about the influence of the sugar industry on nutritional guidelines:

Throughout the years, the effects of conflicts of interest with the sugar industry were never quantified, until a recent systematic [1]review of systematic reviews was published in 2013 in the journal [2]PLOS Medicine. The review found that in studies with a conflict of interest with the food industry, 83.3 percent found no evidence linking sugar-sweetened beverages with weight gain/obesity. In contrast, when only studies without conflicts of interest with the food industry were analyzed, the same percentage (83.3 percent) found a positive association—that sugar-sweetened beverages have a definitive connection with weight gain and obesity. This one study provides just a small glimpse of how much science has likely been affected by these types of

influences. [3]*The Salt Fix: Why the Experts Got it All Wrong and How Eating More Might Save Your Life*, Dr. James DiNicolantonio, June 2017

Nothing particularly new, but we do need reminding of the importance of incentives even on hard-working, well-meaning, highly talented members of the medical profession. Of course, financial incentives can reinforce public health as well as degrade it. The Social Policy Bond concept, as applied to health, would align our national health goals with rewards to those who are efficient at achieving them. It's unfortunate that, under our current healthcare systems, there is little to encourage people to seek out those ways of improving our health at least cost. Medical specialists, expert in their field, advocate effectively for their share of limited resources, but the overall health of the nation isn't effectively targeted. Few people have any financial incentive to consider it, and especially not to question the current ways in which funding is allocated.

[4]Health Bonds would be different. They would target our broad health goals, probably in the form of a range of indicators such as longevity and Quality Adjusted Life Years. For the bonds to be redeemed, each indicator would have to fall into a specified range, representing an improvement over the current level. Significant improvements in a nation's health will probably take decades to achieve, but Health Bonds would be tradeable, meaning that any coalition of interests who improve our health, however marginally, can profit from their doing so by virtue of the increased value of their bondholding. By backing and issuing Health Bonds, a government could effectively maximise the health gains per tax dollar spent without having to specify how such gains shall be achieved, nor who shall achieve them. Opportunities for the sort of corruption (whether deliberate or not) hinted at by Dr DiNicolantonio and the authors of the paper he cites, would disappear, to be replaced by a healthcare system in which the interests of practitioners and population would be entirely congruent.

### 14.8.3 What exactly is the problem? (2017-08-21 10:24)

'When greenbacks are on offer, American schoolchildren seem to try harder': the *Economist* discusses how financial incentives can change test results:

[R]esearchers conducted an experiment in secondary schools in Shanghai and America. In each place pupils were split into two groups. The first answered 25 maths

questions that had appeared in PISA. The second took the same test, but before the pupils did so, they were presented with an envelope with 25 dollar bills or the equivalent in yuan. The teens were told that for every wrong answer they would be docked a dollar. [The researchers] found that the ploy boosted scores among American students relative to their compatriots without a cash incentive, but not among the Chinese ones. [1] *Effort, not ability, may explain the gap between American and Chinese pupils*, 'the Economist', 19 August. PISA is the Programme for International Student Assessment

The boost was significant: 'According to some rough calculations, if extrapolated to the main PISA test, the improvement in performance would have moved America from 36th to 19th in the ranking [of 69 countries], in which Shanghai came top.' It's an interesting result, and one that should make us question what the tests are trying to measure, and whether there are wider policy implications.

Test scores will most likely continue to play a big role in determining policy and the allocation of resources in education. That would be true whether or not we issue Social Policy Bonds that aim to achieve, say, [2] universal literacy. So, in the light of the research results summarised above, should we offer cash incentives to pupils about to take literacy tests?

I'm inclined to think not, at least when it comes to measuring basic literacy. One reason is that motivation, or the lack of it, are significant in themselves. If children of school age find a basic reading test too burdensome to pass without a financial incentive, then that in itself can be seen as a problem that needs to be solved. The nature of that problem might be a general cultural one, or one that's specific to certain classes of pupil. We might even interpret the difference between performance with a financial incentive and without as a social problem; and aim to narrow it.

There's no definitive answer though. Much depends on how we're going to use test scores, and whether there are other indicators that can usefully be targeted at the same time. As a society, we do need to think carefully about what we are trying to achieve. '[3] Teaching to the test' is problematic in itself and, while I do think universal literacy and numeracy are valid goals in themselves, and not very susceptible to the effects described above, we might do better to target for reduction as well as, or instead of, illiteracy, the social problems of unemployment and poverty.

#### 14.8.4 Climate change: humility recommended (2017-08-25 22:37)

The *Economist*, in a long article about the US state of Louisiana's coastal erosion problem (much of which is caused by factors other than climate change) says:

The state's impressive coastal policy illustrates America's ability to adapt to a natural disaster that is already upon it. It does not seem to have nudged the state, or the Republican Party, any closer to policies that **might** slow the warming that is contributing to that disaster. (My emphasis)  
[1] *Louisiana fights the sea, and loses*, the 'Economist' 26 August

I approve of the tentativeness implied by 'might', and it's good to see others implicitly question whether stopping greenhouse gas emissions is the best way of achieving whatever are our goals concerning the climate. I would argue that the fundamental question we should be asking ourselves is:

*Are we more concerned about climate change, or about the impacts of climate change on human, animal and plant life?*

Accepting that there is a climate change problem, and that anthropogenic greenhouse gases are responsible (to an uncertain degree) for it, we need, I think, to challenge the pervasive assumption that the most efficient way of mitigating its negative impacts is to reduce those same greenhouse gas emissions. With the word 'might', the *Economist* would seem to agree.

A Social Policy Bond regime would specify very clearly what we want to achieve. We would express our policy goal as a combination of physical, social, biological and financial measures that must fall within specified ranges for a sustained period. Only then would holders of [2]Climate Stability Bonds be paid out. These bonds would, in effect, contract out the achievement of our multiple climate goals to the private sector, leaving it to respond to our ever-expanding scientific and technical knowledge. Current policy is rigid and arrogant, in that it is based entirely on current science and assumptions about future trends. It cannot adapt to new knowledge. We shall need a multitude of diverse, adaptive approaches to achieving our goals relating to climate change and its impacts - many of which will have nothing to do with greenhouse gas emissions. Climate Stability Bonds would encourage them. Current policy, as well as being politically divisive and imposing extremely high upfront costs, will not.

## 14.9 September

### 14.9.1 I don't know: Climate Stability Bonds edition (2017-09-09 14:46)

Social Policy Bonds aren't always the best way of solving a social or environmental problem. When such a problem has a clearly identified (and universally acknowledged) cause, or set of causes, then direct action, usually done, or organised, by government, is probably the most efficient way of solving it. Much of the *raison d'être* of government arises from its ability to raise revenue to solve our social problems. Dealing with military threats, providing basic sanitation and transport infrastructure, and elementary education are examples of solutions that are usually best funded via, and designed, by government.

Other problems are trickier: crime, for instance, or health and education beyond universally achieved basic levels. Or, at the global level, risks of nuclear conflict. Tried and tested approaches can help, and many dedicated, hard-working people follow these, with some, limited, success. But, in my view, these problems have so many causes, and the relationships between cause and effect can change so radically over time, and differ so widely between geographic areas, that the one-size-fits-all, top down, approaches that characterise government action just don't work. Especially when our goals are inescapably long term in nature, we need diverse, adaptive approaches that government does not do well. It is for these goals, I believe, that the Social Policy Bond concept can show the most marked advantage over any other approach.

I am not sure about climate change. A correspondent, who knows a lot more about the science than I do, tells me that it is now beyond doubt that the causes of climate change (or climate breakdown, as George Monbiot puts it) are anthropogenic greenhouse gas emissions. If this is the case, then perhaps my suggested solution of Climate Stability Bonds aimed at addressing the depredations caused by climate change to human, animal and plant life might not be optimal. The most efficient solution might be to target greenhouse gas emissions directly, either through a carbon tax, or cap and trade, or (possibly) by a Social Policy Bond issue targeting the composition of the atmosphere.

Theoretical efficiency, though, isn't the only criterion. I said 'universally acknowledged',  
1128

in my first para, above. And I've written many times here and on the SocialGoals.com website about the importance of buy-in. For dealing with climate change, which is going to require the expenditure of massive resources, upfront, for an uncertain and inherently long-term benefit, buy-in is as elusive as it is crucial. I don't know whether there will ever be enough buy-in globally to deal adequately with greenhouse gas emissions. The Climate Stability Bond approach might yet have presentational advantages and more palatable money flows than such elegant solutions as a carbon tax. Any presentational advantages would be due to people's more readily identifying with the direct targeting for reduction of the impacts of adverse climatic events, whether they be short term - and televisual - such as hurricanes, or long term and drawn out, such as desertification. The money flows would be more palatable because, essentially, payment is for results: Climate Stability Bonds would not be redeemed until all targeted goals had been achieved. Another possible advantage of the bond approach is that it could be more ambitious than simply trying to return our atmosphere to something like its pre-industrial state. With a much greater global population than (say) 150 years ago, climatic disasters on an appalling scale would still occur, even if that very remote goal were achieved and sustained. A bond approach could, amongst other goals, target those disasters for reduction.

Set against those possible advantages is the more practical one of the atmosphere's composition being much more readily measurable than the multiple goals of a Climate Stability Bond regime.

I'll conclude inconclusively, by suggesting that perhaps the best approach would be to target (1) atmospheric composition and (2) the impacts of adverse climatic events, independently. Social Policy Bonds could be used to achieve either goal, or both, or neither. Much depends on how willingly people will pay upfront for the abstract-*sounding* goal of aiming to reduce greenhouse gases in the atmosphere to their pre-industrial levels.

### **14.9.2 We're all human (2017-09-26 10:36)**

As Kaiser, King, and Supreme War Lord, Wilhelm II was simply bound to be central to the decision-making process in July 2014, and a heavy responsibility rests on his shoulders for the terrible catastrophe that befell the world that summer. ... "The Serbs need sorting out - *and soon*." It was "now or never", [the Kaiser] declared, for a thoroughgoing settling of accounts with the Serbs. [1] *Wilhelm II: Into the Abyss of War and Exile 1900-1941*, John C G Rohl (English translation ), 2014

What is particularly striking is how, at the highest level of national government, big decisions

appear to be made on the basis of reactive, primal emotion. Rationality and the long-term interests of the people politicians are supposed to represent hardly figure at all. Reading some of the Kaiser's comments made in the run-up to World War I, one is struck by how their puerile, reactionary nature. Yes, monarch and policymakers are human - but so too are the millions of citizens for whom they make policy.

Reactive thinking is particularly dangerous when military conflict looms, and not much has changed in the 103 years since 1914. Except, of course, the destructive power in the hands of our leaders. An [2]article about Henry Kissinger's role in US foreign policy quotes him saying to US President George W Bush's speechwriter, about radical Islamic opponents: 'We need to humiliate them'. Comments like this abound in high politics. George W Bush himself [3]cried 'bring 'em on' at an early point in the invasion of Iraq. These are not examples of high-level thinking. Current comments by political leaders are no more considered or sophisticated.

One of the benefits of a Social Policy Bond regime would be the clarification of social goals, and the transparency of the process that targets them. Goals would have to be articulated before targeting. They'd have to be thought through. There would have to be consultation and buy-in. It's unlikely that random, reactive emotional outbursts would crystallise into policy in such a inescapably level-headed policymaking environment, however eminent the people making them. Had the well-being of all their citizens been targeted for improvement, a Kaiser and his ministers would have had seriously and coolly to think of the interests of the people they were supposed to represent. They would never have been allowed to lead (or '[4]sleepwalk', as Christopher Clark puts it) Germany and much of the rest of the world over the brink into catastrophe.

## 14.10 October

### 14.10.1 Short termism: taking advantage of complexity (2017-10-07 14:59)

There's much of interest in John Kay's [1]presentation at the Public Hearing on Sustainable Finance at the European Commission. The key point is this:

Short termism is the product of the intervention of intermediaries. Evolution of the financial system over the last 40 years has been characterised by the steady growth of the process of intermediation, a process which has taken finance further and further away from meeting the real needs of the underlying users and suppliers of finance. Market-based capital allocation and long-term decision-making do not fit easily together. John Kay, 18 July

There's a mismatch between people's long term goals, and the short-term focus of the people who are supposed to help us achieve those goals. The same sort of mismatch occurs not only in finance but also, though perhaps less pervasively, in healthcare and education. Reasons vary, and are not easy to pin down. Information asymmetry may play a big role: in finance, as in healthcare, providers know a lot more than customers. Society is complex and large institutions are adept at misusing that complexity to take advantage of our relative ignorance. In fact, they are not above manipulating the regulatory environment to add to our confusion.

The more important question, though, is how to close the gap between what we want to see, and what our public- and private-sector institutions deliver. My suggestion is that we articulate long-term social and environmental goals, and reward people for achieving them. We don't need to prejudge intermediate steps, nor specify who shall achieve our goals. If we issue Social Policy Bonds with the aim of improving our citizens' health, say, or achieving universal literacy, then intermediaries will proliferate only if bondholders think them necessary to reach our targets with maximum efficiency. Information asymmetry means that intermediaries can take advantage of our relative ignorance about how best to achieve our personal long-term goals and substitute their own, usually much shorter-term objectives, which rarely coincide with our goals and often, indeed, conflict with them. But whereas we might not know how best to achieve our personal goals, nor society's goals, we are not at all ignorant about what those goals actually are. Social Policy Bonds would recast the way we, as a society, do things. They would put our broad, long-term, goals back where they belong: as top priorities, to which our institutions and all their activities are entirely subordinate.

### **14.10.2 Emotion-based policy (2017-10-12 17:00)**

What drives policy? And what should drive policy? Two entirely separate questions. What actually drives policy today is largely emotion, which seems to be supplanting other policy drivers, and is easily manipulated by large private- and public-sector bodies. Society is growing ever more complex as are the relationships between cause and effect in social and environmental

policy. Emotion is easier to communicate and exploit than a rigorous accounting of which policies work and which don't. But as a policy driver emotion has obvious faults. It's far too easy to subvert for mercenary and more sinister ends.

I'd much prefer to see meaningful outcomes drive policy. These could bypass the complexities of our economy and society, so they would be relatively easy for non-specialists to understand. It's far simpler, say, to aim to reduce violent crime, or climate change, than it is to make a case for (say) subsidising leisure centres for youths or urging poor countries to stop building coal-fired power stations. These actions, at some point in time, *might* be necessary and efficient, but that should be an open question: one to be answered by informed and motivated investors, rather than remote, cumbersome, corruptible and monolithic central government.

Which is where Social Policy Bonds would enter the picture. One of the benefits of a bond regime is to bring transparency and stability into the policymaking process. Framing policy decisions in terms of costed outcomes would be an inescapable first step. Currently policymakers can - indeed must - express their decisions as vague, noble-sounding declarations of intent, backed up by funding programmes for favoured bodies, be they government agencies or other interest groups. As Milton Friedman [1] said:

"one of the great mistakes is to judge policies and programs by their intentions rather than their results". (I would insert 'stated', before 'intentions' here.)

Issuers of Social Policy Bonds, would in contrast, have to be explicit about their objectives: transparency and accountability are built into a bond regime, as surely as they are excluded from the current policymaking apparatus. as well as more efficient goal-achievement, formulating policy in terms of meaningful outcomes would generate more [2] buy-in - something that we urgently need as the gap between citizens and the politicians they are supposed to represent is in danger of becoming unbridgeable.

### 14.10.3 Avoiding the disaster of disengagement (2017-10-18 17:34)

Peter Arnold writes:

Mimicking 'the Trump phenomenon', Emmanuel Macron did not win the French presidential election. The politicians who had, for decades, governed the country, *lost*. Mark Rutte's governing party *lost* seats in the Dutch parliament to Geert Wilders and other small parties. Matteo Renzi's governing party *lost* the 2016 plebiscite to change the Italian constitution. Theresa May's governing party *lost* ten seats to minor parties. Malcolm Turnbull's governing party *lost* seats to minor parties. As further proof my thesis, Angela Merkel will lose seats next month.

What is it about governing politicians in these democracies that has caused their electorates to vote against them? The French have a word for it, a word which emerged after Mr Macron, although lacking a political party, saw his opponents fall by the wayside – *dégagement*.

'Disengagement'. [1]*Winning by default*, Peter Arnold, 'Quadrant online', 13 October

We shouldn't be surprised at this all-pervasive disengagement. Policymaking is now so removed from the concerns of ordinary people and the process itself is so arcane, that only specialists, usually employed by large public- or private-sector bodies, can afford to follow it. Despite the odd referendum, the gap between the politico-bureaucratic complex and the people they are supposed to represent grows ever larger. In such a dysfunctional environment, disengagement would seem to be the least timewasting strategy for ordinary citizens to adopt.

[2]Social Policy Bonds might be a way of closing the gap. Their aim is to inject market incentives into the solution of our social and environmental problems. But, as well as, and perhaps even more important than, the channeling of the market's incentives and efficiencies into such problems, they take as their starting point outcomes. Social and environmental outcomes, that is, that we want to achieve. Under a bond regime, the focus of political debate would be on these outcomes: the priority we attach to them and how much we are willing to spend on them. Current policymaking focuses on institutional funding and structures and esoteric aspects of law and regulation, all of which can be, and are, manipulated by those lobbyists and their paymasters. The rest of us have to live with the consequences. The underlying assumption is that, if we have a social problem, it's government who should decide how we'll try to solve it, and who shall be charged with doing so. With anything at all complex it's unsurprising that such a way of doing policy is at best inefficient, and at worst an opportunity for vested interests to delay or oppose anything that threatens their business model.

Social Policy Bonds, in centering policy debate on outcomes, would encourage less rarified policymaking than the current system. People understand broad meaningful outcomes more than we do the obscurantist tactics of today's legislators. So we should be able - if we want - to participate for more fully than we can today. It's likely too that some of the heat would be taken out of politics: there's probably far more consensus over outcomes that we want to see - [3]healthier citizens, [4]less air pollution, [5]universal literacy, say - than over the supposed means of reaching them.

Under a bond regime, probably nobody would see exactly the policy priorities they want to see. But, compared with today's policymaking, (1) it's probably more likely that citizens' interests will be considered and taken seriously, and (2) public participation in the process can be seen both as a desirable goal in itself (see [6]here, for instance), and as a necessary condition for [7]buy-in, without which many of our most urgent challenges are unlikely to be met. Disengagement presages disaster. Social Policy Bonds could be the way to avoid it.

#### **14.10.4 How to bypass cultural imperatives (2017-10-20 17:52)**

Philip Salzman writes:

Peace is not possible in the Middle East because values and goals other than peace are more important to Middle Easterners. Most important to Middle Easterners are loyalty to kin, clan, and cult, and the honour which is won by such loyalty. These are the cultural imperatives, the primary values, held and celebrated. When conflict arises and conflict-parties form based on loyal allegiance, the conflict is regarded as appropriate and proper. [1] *Why There Is No Peace in the Middle East*, Philip Carl Salzman, 14 October

On first reading, this seems correct. If so, it would devalue my attempts to encourage the  
1134

issuing of [2]Middle East Peace Bonds. But what would ordinary people - men and women - in the Middle East or, indeed, anywhere else, say if they were given the chance to voice their opinions in private? I'd like to think that they would happily ditch tribal loyalties in exchange for peace and the consequent brighter prospects for themselves and their descendants. Middle East peace might seem overly idealistic, and it probably is, if we see tribal loyalties which, simply because they've persisted for a thousand years or more, as intractable. But slavery too, used to be [3]considered part of the natural order of things, along with other physical and societal pathologies. Over the course of a conventional politician's planning horizon, of course, Salzman is correct. Conventional politicians, unfortunately, generate conventional policies; a particularly ineffectual approach when trying to address problems that will most likely require an array of possibly untried and adaptive approaches for their solution.

Applying the Social Policy Bond concept to armed conflict might be the way forward. For some regions, a definition of our peace goal might need to be more nuanced than 'cessation of conflict' (as measured, say, by numbers of people killed or made homeless). But the bonds can target peace, however defined, over a decades-long term, which means that bondholders would be motivated to bring about popular, sustainable peace agreements. 'Cultural imperatives' and other so-called 'intractable' problems, I believe, are amenable to solution: we might not know the exact nature of such solutions, but we can and should be giving people incentives to finding them.

#### **14.10.5 Whose goals? (2017-10-25 18:28)**

There are two main elements to the Social Policy Bond idea. One is the injection of market incentives into all the processes necessary to bring about our social goals. The other is the focus on these goals themselves, and my contention that they be goals that are meaningful to ordinary people. Goals such as [1]reduced crime, better [2]health, and a cleaner [3]environment. Under a Social Policy Bond regime we could target such apparently remote goals as [4]world peace, or universal [5]literacy.

Our current policymaking systems don't really consider either element. There's plenty of rhetoric about market forces but the people spouting it are, most likely, using them to justify decisions made in the favour of large corporations, typically multinationals. The hypocrisy is breathtaking: market forces imply competition, but large corporations typically try to maintain their status by undermining competition, usually by pressuring governments to manipulate the legislative, regulatory and trade environment in their favour.

Nathan Robinson's article about how Amazon is going about choosing its second headquarters in the US makes sombre reading:

There's something sad about watching suffering post-industrial cities like Gary plead for an investment from Amazon. (Gary's mayor issued a [6]heartfelt appeal, on the mistaken assumption that Jeff Bezos possesses a conscience.) It feels like the peasants are coming before the king, bearing whatever meager offerings they can scrape together, and begging him for his favor. Having humbled themselves at Bezos' feet, [7]praised his products and promoted his brand, nearly all of them will walk away with... nothing. Even though Bezos could single-handedly transform the economic fortunes of a place like Gary, the spoils will almost certainly go to a place that is already prospering. *The sad spectacle of cities groveling to Amazon*, Nathan J Robinson, 'Current Affairs', 16 October

A long [8]article by James Meek looks at the human costs of such subservience to the interests of multinationals from a European perspective. I think it's time for us to ask the question: whose goals should have a higher priority: those of the multinationals or those of ordinary people? It's an important question, not only because these goals differ, but because they often conflict. Most of us as individuals have longer-term and more broad interests than large corporations, which are duty bound to put the interests of the company (though [9]not specifically shareholders) above all. Because our political systems give little voice to our interests as individuals or as a society, we now have policymaking that is largely influenced only by those who have the means to follow it closely. That is, large corporations, including government agencies.

Which do you want? Do you want to live in a town patronized by some great combination of capitalists who pick it out as a suitable place to plant their industry and draw you into their employment? Or do you want to see your sons and your brothers and your husbands build up business for themselves under the protection of laws which make it impossible for any giant, however big, to crush them and put them out of business? [10]Attributed to US President Woodrow Wilson, 1912

[11]Social Policy Bonds could be a way of raising the influence of ordinary people at the expense of large corporations. They would take as their starting point *our* interests: as individuals,

families, communities and societies. Being [12]tradeable, the bonds could target goals whose end-point might be years or decades into the future. Large corporations could still play a part, but their goals would be congruent with those of wider society. In much the same way, governments issuing Social Policy Bonds while still, articulating society's goals and raising the revenue for their achievement, would be doing so with the aim of raising the long-term well-being of all society and not, as now, the short-term interests of large corporations.

## 14.11 November

### 14.11.1 Who cares about efficiency? (2017-11-04 16:49)

The title of an [1]article in last week's *Economist* itself gives cause for concern:

Counties that voted for the president get more in disaster relief

The article is referring to the federal aid that United States dispenses following natural disasters. It's a bit more nuanced than the title suggests. Research found that:

[G]iven two natural disasters that inflict the same amount of damage, presidents have been twice as likely to declare a disaster when one occurs in a swing state like Ohio or Florida, with a roughly equal number of Republican and Democratic voters, as when one happens in a politically uncompetitive place. *Economist*, 20 October

Another study quoted in the article says that:

[I]t takes about \$27,000 of relief spending to “buy” just one extra vote for an incumbent party. It would be far more efficient to invest that money in disaster preparation, since each dollar governments spend on preventing harm from nature's wrath is thought to yield some \$15 in savings on future relief costs. Unfortunately, the electorate seems to reward only politicians who open up the public purse after damage is done.

The problem, then, is not solely one of cynical politicians: we citizens are culpable to the degree that we react emotionally in times of crisis, especially when that such crises have impacts that can be filmed. Which is why I advocate targeting outcomes, including the impacts of national or global disasters, ahead of time, so that we can channel our scarce resources into the areas where it will relieve most suffering. [2]Disaster Prevention Bonds could do this. Issuers of these bonds would target for reduction the numbers of people killed, injured or made homeless by natural or manmade disasters. The nature of the disaster need

not be specified in advance and the bonds could aim to target for reduction national or global catastrophes.

Disaster Prevention Bonds targeting global disasters could be backed by some or all of the world's governments and issued by an international body like the United Nations or World Bank. These bonds need not bear interest, and would be redeemable for a fixed sum once a sustained period of absence of a humanitarian disaster had passed. The bonds would be floated on the open market and be tradeable at any time thereafter. Because they *are* [3]tradeable, they would give people incentives to look for solutions to problems that might arise years beyond the planning horizon of today's policymakers. The bonds' redemption terms would stipulate that they would become worthless the moment an unspecified calamity killed, say, 100 000 of the world's citizens by a single catastrophic event in any 48- hour period. So bondholders would have powerful incentives to anticipate such an event, and minimise the chance of its occurring. Nationally backed Disaster Prevention Bonds would work in similar fashion, on the national scale.

Disaster Prevention Bonds would entail our making decisions about funding before catastrophes arise, when efficiency, in terms of the reduction of suffering per dollar spent, will be our key driver. They would not stop the misallocation of resources once a disaster has occurred, but the second piece of research quoted above would suggest that disaster prevention is currently underfunded. A bond regime would make such funding levels transparent, in ways that ordinary people can comprehend, and it's likely that, as a result, it would work to minimise the suffering inflicted by future disasters.

### **14.11.2 Society as an interest group (2017-11-12 22:01)**

Clive James writes:

[W]e tend to believe that there is some natural state of justice to which political life would revert if only the conflicts between interest groups could be resolved. but whatever justice we enjoy arose from the conflicts between interest

groups, and no such natural state of justice has ever existed. The only natural state is unjust.... [1] *The Meaning of Recognition*, 2005, page 4

I'm not so gloomy. When it comes to how things shall be done, and who shall do them then, yes, interest groups - those motivated to follow the policymaking process and so to benefit from it - are the only protagonists that really matter. But it doesn't have to be that way. Or rather, by targeting outcomes rather than the alleged means of achieving them, we can enlarge the interest group such that it includes *all* citizens.

Targeting broad outcomes, such as better health or reduced adverse environmental impacts, that are meaningful to all of us can bring about greater public engagement in the policymaking process. Yes, there will be disagreements over priorities, but we shall have been able to follow the process and contribute to it - unlike under today's regime, where policymaking is strictly for devotees or their paid employees.

The world is too small now for the solution of social and environmental problems to be left to exclusive interest groups to sort out. Social Policy Bonds could represent a middle way between the happenstance of a free market approach to solving our problems, and the coercive, and (often) ham-fisted, inefficient way of central planning. Government, influenced as it is by interest groups, usually does a terrible job in actually achieving our complex social goals. A Social Policy Bond regime, on the other hand, would play to government's strengths: articulating society's goals and raising the revenue to achieve them. But then it would, in effect, contract out the achievement of those goals, letting market forces do what they are best at: ensuring the optimum allocation of society's scarce resources in order to achieve society's goals - not those of interest groups, be they private- or public-sector.

Social Policy Bonds would, I believe, achieve our social and environmental goals more efficiently and less randomly than the current system. The planet as a whole cannot afford either the time for conflicts between interest groups to be resolved or the collateral damage that such conflicts are inflicting on our ever smaller planet.

### 14.11.3 The stability of the septic tank (2017-11-16 18:54)

I often agree with British journalist and military historian [1]Max Hastings. But not with his remarks in this interview with Tobin Harshaw:

MH: One of the things I've learned as a historian is that one should never listen to anybody who uses the word "solution." Most difficult problems in the world are not susceptible to solutions. What they are susceptible to is management. We'd all get along a lot better if we understood there is not the remotest possibility of a "solution" or even multiple solutions to the troubles in the Middle East because they are so fantastically complex. The only way to approach them is to think how we can best manage them. How best can we avoid making things worse?

TH: That goes back to what you said earlier... about peace not being the goal. What did you say - it should be stability?

MH: Yes, stability is the key.

[2]*Trump, Brexit and Echoes of World War I*, Tobin Harshaw, 'Bloomberg View', 11 November

I think Mr Hastings is too pessimistic. Yes, war and conflict have been a feature of humanity at least since history began, and yes, many conflicts appear [3]intractable. But Mr Hastings is in good company: here is Professor Colin Gray:

War is a part of the human condition, it is not a problem that can be solved. However, it is a condition some of the worst features of which can be alleviated by law, custom, norms and plain self-interest. [4]*Another Bloody Century* (page 379), Colin S Gray, 2007

I am much more optimistic, and I think we should be aiming for outcomes more edifying than the stability of the septic tank. I think that if war's negative impacts can be satisfactorily defined, then targeted for reduction, then, with sufficient incentives, the suffering imposed by human conflict can be drastically reduced. As Professor Gray explains elsewhere in his book "Warfare is social and cultural, as well as political and strategic, behaviour. As such it must reflect the characteristics of the communities that wage it." (page 385). These characteristics

are deep-seated and pervasive, which means that any solution to the problem of human conflict will need to be long term in nature. An array of diverse, adaptive and focused approaches will therefore be required.

[5]

Stability: our highest aspiration?

A Conflict Reduction Bond regime could work to stimulate such approaches of the sort that we cannot necessarily foresee. We should, I believe, contract out much of the work needed to find the best approaches to eliminating war. While robust definitions of 'peace' will need to be thought through, we could immediately issue bonds redeemable only when there had been large numbers of people killed, injured or forced to flee their homes for a sustained period.

Bondholders would then have incentives to prevent conflict with maximum efficiency. They would explore and invent new, more diverse options than are currently being undertaken, and they could divert funding into the most promising of these. They would have more latitude for action than government. For example, bondholders could subsidise intermarriage between members of different religious or territorial communities. They could sponsor school exchange visits, sports matches or the broadcasting of peaceful propaganda. They could arrange for the most virulent warlords and preachers of hate to take one-way, first-class journeys to luxurious holidays in remote resorts with limited access to communication facilities. Whatever holders of bonds targeting war and terrorism do, they will have successes and failures. But *they will also have incentives to terminate projects that are failing* and to refine and replicate their successes - to be efficient, in other words.

Government has no such direct incentive. It cannot offer direct financial rewards for success, and its talent pool is limited, partly for that reason. It would get into trouble if it advocated things like intermarriage, or sponsored sybaritic retirement for warmongers. As in other areas of social policy, its options are limited. They tend to be one-size-fits-all, slow to adapt and advocated mainly because they have been done before, rather than by their efficiency: government will always prefer *tried, tested and failed* to *promising, innovative - and potentially destabilising*.

The field of conflict is one area where the private sector can and should be given the chance to operate more freely. Sadly, it is largely private incentives - to arms manufacturers and brokers - that have contributed to human conflict. We need to redress the balance and reward those who strive for peace.

Under a [6]Conflict Reduction Bond regime, government would still have the responsibility of defining our peace goal, and it would be the ultimate source of finance for achievement of that goal. But the actual achievement of peace would be contracted out to the private sector, who would have powerful incentives to achieve it as cost-effectively as possible. Government and the private sector would each do what it does best: respectively, articulating its citizens' wishes, and finding the most efficient ways of achieving its goals. We can, and should, aim for peace, not managing the stability of the septic tank. Peace, after all, is what almost all of us want for ourselves and for future generations.

#### **14.11.4 Short selling (2017-11-22 18:06)**

A correspondent asks whether short selling will work against the Social Policy Bond concept. Specifically: *if [1]Conflict Reduction Bonds are issued, would short sellers profit from events that would make peace less likely?*

Short selling in this context would be the selling of Conflict Reduction Bonds that are not currently owned, in the hope that their market price will fall, and that the seller will buy the bonds at their lower price. Short sellers could then be motivated to foment conflict.

I have these responses:

(1) The short seller doesn't own the bonds, but has to borrow the bonds from the broker or dealer when placing the sell order. The seller is then obliged to buy back the bonds at some point in the future. Just as the seller will want to see the value of the bonds fall, so the broker or dealer will want to see their value rise. In the Conflict Reduction Bond example, any additional incentive to foment conflict on the part of the seller would be balanced by an incentive on the part of the broker to reduce conflict.

(2) The weight of money - that is, the funds for the bonds' redemption - will be in favour of progress toward the goal; just as in the share market, the short selling of a company's shares doesn't change the incentives for the company itself to succeed. It's likely that any profits from short selling will be short term in nature; the long arc of the market for the bonds will bend in our favour.

(3) Public opprobrium. While people or corporations do profit from the failure to achieve social goals, they do so in ways that are indirect. If short sellers were to work to make social goals less achievable, the source of their activity and the reasons for it would be direct and identifiable. Taking the Conflict Reduction Bond example, again, weapons manufacturers and military contractors do already profit from their activities. They could even now be deliberately fomenting conflict with the aim of boosting their revenue. Short selling would be only one more way of profiting from war, but it is one that is both more identifiable and more likely to attract public opprobrium than any other so, even if a corporation were that way inclined, it would be unlikely to follow through.

Social Policy Bonds are not a Utopian solution but (in my view) they are much better than the current system. They would bring about the re-jigging the incentives to reward the outcome we want, rather than the activities, institutions or policies ostensibly trying to achieve it.

#### **14.11.5 Perverse incentives and health (2017-11-28 22:33)**

Dr Jason Fung explains why 'there is so much money being raised for heart disease or cancer or diabetes, and why there is so little real medical progress.' As he says, 'there are many ways that Big Pharma pays doctors':

- The most common are speaker's fees and consulting fees. ...
- The second form of graft is consulting fees. The company will pay the doctor for his/her 'advice' as a consultant on how to market a drug. Of course, the company cares not at all about what he/she says. It is an opportunity to give these doctors a 2 hour advertisement disguised as a consultation. For this the doctor is paid \$2000- \$5000. ...
- The most insidious form of corruption is 'research' money. While it sounds great, it is usually another thinly disguised form of bribery. Some research project is usually set up with little or no academic merit. The universities setting this up are well paid. The doctors who participate are well paid. Best of all, research meetings are held regularly in lovely locations like Vienna and Hawaii. 'Researchers', of course, are invited to participate, all expenses paid. The public only sees that the company has donated 'research' money and that the doctor is doing 'research'. These shenanigans happen every day, in every university. If you've ever wondered why there is so much money being raised for heart disease or cancer or diabetes, and why there is so little real medical progress - this is the reason. [1]*Clinical Practice Guidelines or Legalized Bribery?*, Dr Jason Fung, November

He's mostly referring to the United States, but perverse incentives pervade even government-run healthcare systems. By default, health expenditure is influenced by groups of medical specialists with little incentive or capacity to see improvements in the overall health of a large population as an objective. As well as the substantial money flows described by Dr Fung, funding decisions are also heavily influenced by the public profile of a disease or its victims, rather than on what would best meet the needs of society. Health is about a lot more than what Big Pharma does, or how governments allocate healthcare funds. It's also a question of diet, exercise, transport, and culture. Recent research shows, for instance, the beneficial effects on health of green spaces in our cities (see [2]here (pdf) for instance). The

way government is structured, with its discrete funding bodies, makes it unlikely that such benefits will influence funding decisions.

We cannot expect a government nor any single organisation, even if they were ethical and altruistic, to identify the huge numbers of variables, with all their time lags and interactions, that influence the nation's health. We can, though, devise a system that rewards people who explore and implement the most cost-effective health solutions, even when circumstances and knowledge are changing continuously. I have tried to do this with my essay on [3]Health Bonds, which would aim to distribute scarce government funds to where they would do most good, as measured by such indicators as [4]Disability Adjusted Life Years.

Incentives matter, and current incentives have nothing to do with achieving society's broad, long-term goals. Instead, they accrue to those who maximise the narrow, short-term goals that have more to do with the financial success of big companies than the health of ordinary citizens.

## 14.12 December

### 14.12.1 Free market? Don't believe it (2017-12-07 22:26)

There's a lot of lip service paid to the notion of the free market, as if competition, at least over the long run, will lead to economic efficiency. There are many problems with this. The biggest, in my view, is that we now have political systems that not only entrench wealth and income inequalities, they extend them. This seems to be an almost worldwide phenomenon. Our governments and big business now act as a coalition, very often acting against the interests of ordinary people and small businesses. Inequality on a staggering scale is both the result of policies favouring the rich, and the stimulus to more of them.

Take this excerpt from a review of [1]*The Captured Economy: How the Powerful Enrich Themselves, Slow Down Growth, and Increase Inequality*, by Brink Lindsey and Steven Teles, discussing the US economy:

Of the firms that enjoyed returns on invested capital of 25 % or more in 2003, 85 % were still earning returns that high a decade later. The authors put forward four case studies to illustrate the choking spread of rent-seeking behaviour. Implicit and explicit government subsidies to the financial industry enrich bankers and sow the seeds of crisis, for example, but have done little to boost growth. Increasingly strong intellectual-property protections have not unleashed a torrent of new ideas, but have instead swelled the earnings of top firms, which wield their patents and copyrights menacingly at would-be innovators. The cost to negotiate reams of licence agreements, and the risk of lawsuits, can stymie the most determined of entrepreneurs. Analyses of occupational licensing and land-use rules turn up similarly skewed policies: they benefit those already on top at the expense of society as a whole. [2] *How America's economy is rigged by special interests*, the 'Economist', 2 December

Having been involved in agriculture, I have seen how [3]corrupt, [4]insane [5]policies can persist for decades. More important than their benefiting bureaucrats and fraudsters, is that they enrich people and corporations sufficiently to finance opposition to their being withdrawn. No trick is too low. I think much of the reason for the persistence of profligate policies like agricultural subsidy programmes, and those competition-stifling regulatory barriers described above, is that our policymaking process is too protracted and complex for ordinary people to follow unless, of course, they are paid to do so.

One of the benefits of Social Policy Bonds is that they would define explicit, transparent policy goals that are meaningful to ordinary people. This would make the policymaking process itself more accessible. And when people understand what a policy is all about, we can participate more in its development, refinement, and implementation. We should also better understand the limitations and trade-offs that are intrinsic to public policymaking when resources are limited - as they always are. A hugely important benefit arising from this will be [6]buy-in: having been consulted when our social goals are being formulated, we are more likely to participate in achieving them. The widening gap between politicians and the citizens they are supposed to represent would begin to close. Bondholders and their paid agents would experiment with different approaches to solving our social and environmental problems and, no doubt, they will try some that are useless or worse. But - unlike in today's policymaking world, with its entrenched interests - they will have every incentive to terminate their failures. We'd still need regulation and licensing, but they would be means to ends that are wanted by ordinary people, not corporations and other powerful interests.

### **14.12.2 The Collapse of Complex Societies (2017-12-16 18:54)**

Clay Shirky writes about Joseph Tainter's 1988 book [1]*The Collapse of Complex Societies*.

One of the interesting questions about Tainter's thesis is whether markets and democracy, the core mechanisms of the modern world, will let us avoid complexity-driven collapse, by keeping any one group of elites from seizing unbroken control. This is, as Tainter notes in his book, an open question. There is, however, one element of complex society into which neither markets nor democracy reach—bureaucracy. even when moderate adjustments could be made, they tend to be resisted, because any simplification discomfites elites. Clay Shirky, [2]*The Collapse of Complex Business Models*, April 2010 (?)

In my view, these elites include the bureaucrats themselves.

As Mr Shirky writes: "In a bureaucracy, it's easier to make a process more complex than to make it simpler, and easier to create a new burden than kill an old one." There are too many powerful people with an interest in maintaining the complex way we do things. This includes policymaking. It suits vested interests to keep it complex and arcane, so that only they or, more likely, their paid agents, can follow and influence it.

Social Policy Bonds would simplify policymaking because policy goals would be expressed in terms that ordinary people can understand. Goals would be explicit, transparent and meaningful to ordinary citizens, who could then engage in the policymaking process. If Tainter's thesis is correct, it might well be the complexity of our politics that precipitates societal collapse: too few of us understand it, so we have very little buy-in to the process and its institutions. In the west we are seeing the result of this lack of buy-in: extreme polarisation, whereby different views are barely tolerated. Yet [3]buy-in is going to be essential if we are to face up to urgent, huge challenges facing all of us: [4]climate change for instance, or [5]nuclear proliferation.

Social Policy Bonds could help remove unnecessary complexity further down the track, when it comes to solving our social problems. Under a bond regime, inefficient operators would be penalised - whoever they are - and only efficient approaches would receive funds. It would be the self-interest of bondholders that would ensure this: their goal would be exactly congruent with those of society: to achieve our social goals as efficiently as possible. There

might still be complexity in achieving these goals, but only if it boosted efficiency. The contrast with today's system, in which complexity is almost a deliberate ploy to deter scrutiny, would be total.

### 14.12.3 Planet to government: humility required (2017-12-18 20:41)

Helena Bottemiller Evich writes about research done by Irakli Loladze on the effects of a changing atmosphere on the nutritional content of plants:

“Every leaf and every grass blade on earth makes more and more sugars as CO<sub>2</sub> levels keep rising,” Loladze said. “We are witnessing the greatest injection of carbohydrates into the biosphere in human history—[an] injection that dilutes other nutrients in our food supply.” ... Within the category of plants known as “C3”—which includes approximately 95 percent of plant species on earth, including ones we eat like wheat, rice, barley and potatoes—elevated CO<sub>2</sub> has been shown to drive down important minerals like calcium, potassium, zinc and iron.

[1] *The great nutrient collapse*, Helena Bottemiller Evich, 'Politico' 13 September

The loss seems to be of the order of 8 percent or less, but the implications for humans and for the species that eat and pollinate these plants are uncertain. (See [2] here for a spirited debate.) Policymakers prefer to focus on variables that they can influence or control. In agriculture, the focus has been on yields: that is, the mass of crops per unit of land area. Many governments have funded agricultural extension and research institutes with the main aim of maximising yields. Reasons for this are understandable; memories of wartime shortages, for instance. For yields, cause and effect are relatively easy to identify, as are the effects of time lags. There are costs, though, which take the form of [3]depleted soil, [4]polluted water (pdf), loss of [5]wildlife habitat and, as we see, nutrient depletion.

What does this have to do with social policy, or with Social Policy Bonds? Simply this: Social Policy Bonds would change policymakers' focus from things that they can influence, to problems that society wants to solve. So, rather than simply aim to maximise food production, for instance, we'd focus on improving society's health, broadly defined. If nutrient depletion worsens society's health, its effects would be captured by components of our targeted health goal including, probably, [6]Quality Adjusted Life Years, infant mortality and longevity. It would be up to bondholders, motivated to find the most efficient ways of achieving our health goal, to work out whether, and how, to deal with nutrient depletion. No government, no single organisation, the way policy is made now, has the incentive or the capacity to address problems that we do not fully understand, using science that is inescapably out of date. Our social and physical environments are too complicated for any government to understand. Instead, they should be looking at desirable social and environmental outcomes, and setting up a system that motivates people to achieve them. If they use Social Policy Bonds, they'd be doing that, *and* injecting the market's incentives and efficiencies into all the stages necessary to achieve those outcomes. Focusing on any particular variable, whether it be greenhouse gas emissions, numbers of smokers, or [7]hospital waiting times - or crop yields - just isn't good enough any more.

For more about Social Policy Bonds see [8]here. For more about how the Social Policy Bond concept can be applied to health see [9]here. For my views on agricultural policy see [10]here and [11]here.

#### **14.12.4 What do we actually want? (2017-12-29 18:08)**

One reason I don't watch tv programmes about wildlife is given by George Monbiot:

To be aware of the wonder and enchantment of the world, its astonishing creatures and complex interactions, and to be aware simultaneously of the remarkably rapid destruction of almost every living system, is to take on a burden of grief that is almost unbearable. [1]*The unseen world*, George Monbiot, 28 December

Neither have I read all of *Tipping point for planet Earth*, which ends:

The world really is poised to roll in one of two different directions. One direction leads us right over an environmental tipping point....The other direction leads to the bright future that our children want, and that we all want. Ending up at that future requires building communication bridges, and enhancing our global awareness, to the point that a critical mass of the global society and world leaders recognises our current environmental problems as real, and begins fixing them before it's too late. If we can get to that kind of tipping point we're in good shape, because we've already got much of the technology we need, and people are incredibly clever when they're motivated. [2]*Tipping point for planet Earth*, Anthony Barnovsky, July 2016

We are all the beneficiaries of a degraded environment. I don't just mean those of us who fly or drive or buy supermarket food. I mean everyone on the planet. By destroying the environment we have allowed a massive increase in the quantity of life, and we ourselves, our lives, are the result. Without past environmental destruction the earth would be supporting far fewer people. Many of us are also beneficiaries in that we enjoy a life of abundant food, good health and material wealth. My point is that any campaign or reframing, must start with recognising that It's not us versus them. We are all 'us'. If we do actually want future generations to face brighter prospects we, the 'critical mass of global society' need to encourage our 'world leaders' to express that goal in some form that will motivate people to do something about it. Statements of intent aren't enough.

To be more pragmatic, I suggest reframing the discussion in terms of explicit, agreed, meaningful, environmental goals. Not, as at present, about rights, processes, activities, or funding of institutions. Broad goals that are meaningful to all of us, such as reductions in the levels of pollution of our air and water, or so that instead of trying to monitor and pin down polluters of our air and water, we'd agree on and target the quality of our air and water. Instead of trying to target the average planetary temperature, we'd target for reduction the harm done (to humans, animals and plants) by adverse climatic events. These are goals that mean something to everyone and there is more consensus over what we need than about how to get there.

Talking about outcomes makes trade-offs clearer, and brings more participation and [3]buy-in into environmental policy. My piece on [4]Environmental Policy Bonds goes into more detail and discusses how we can use the market's incentives and efficiencies to achieve environmental goals. (I've also written about [5]climate change.) Efficiency is part of it, but the first step, which we have not taken, is to articulate and reward

the achievement of agreed, explicit and *meaningful* goals.

# 2018

## 15.1 January

### 15.1.1 Experimenting with Social Policy Bonds (2018-01-07 19:13)

As far as I know, there's not been a single trial of the original Social Policy Bonds. [1]Social Impact Bonds, on the other hand, are being issued in about nineteen countries. The main difference is that SIBs aren't tradable and, as I argue [2]here and [3]here, this drastically diminishes the range and timescale of the social problems that they can set out to solve. It also, again in my view, opens them up to exactly the sort of gaming and manipulation that feature so prominently in our current policymaking environment, and from which we are trying to escape.

That said, there are genuine difficulties in getting people interested in the Social Policy Bond concept. Principal amongst these is that it's never been tried. The difficulty is that Social Policy Bonds are at their best, in that they show their most marked advantage over current policies, when the problems they target are likely to require trialling and adapting many diverse approaches to their solution.

If we already know the best approach, there's no need real need for Social Policy Bonds, and if we know the people best placed to solve the problem, then SIBs, essentially functioning as a performance-based incentive, are adequate. My contention is that, for many of our biggest and most urgent challenges, neither of these conditions apply. We don't know how, for instance, to end war, nor which combination of people and organisations are best placed to do so.

All this implies large-scale goals with a relatively long time frame. So I've found it easy to write about applying the Social Policy Bond principle to goals like [4]world peace, universal [5]literacy, and [6]climate change. It's more difficult to think of less grandiose goals, immune from the possibility of gaming, that could serve as experimental examples to prove the validity of the concept. Perhaps SIBs, despite my concerns, could serve as a stepping stone

toward the issuing of a Social Policy Bond, and the subsequent refinement, development and implementation of the concept, so that it can meet our large-scale challenges.

### 15.1.2 The costs of bad policy (2018-01-16 22:08)

The costs of bad policy are ... spread across the public at large, making it harder for them to organise. [1]Getting it back: how America's economy is rigged by special interests. 'The Economist', 30 November 2017, in a review of [2]*The Captured Economy: How the Powerful Enrich Themselves, Slow Down Growth, and Increase Inequality*, by Brink Lindsey and Steven Teles, December 2017

The book looks at areas of the US economy where barriers to competition, mandated by government, have led to excess income. In the words of the reviewer:

Implicit and explicit government subsidies to the financial industry enrich bankers and sow the seeds of crisis, for example, but have done little to boost growth. Increasingly strong intellectual-property protections have not unleashed a torrent of new ideas, but have instead swelled the earnings of top firms, which wield their patents and copyrights menacingly at would-be innovators. ... Analyses of occupational licensing and land-use rules turn up similarly skewed policies: they benefit those already on top at the expense of society as a whole.

The book suggests 'a more deliberative politics' to loosen the grip of the powerful. It also proposes philanthropy and more government researchers. The reviewer, though, thinks that 'America's institutional rot' might be 'too far advanced for mere deliberation to help'.

I agree; I think the same diagnosis applies to most countries, and I have another suggestion, which might have a better chance of succeeding: focus on policy goals, rather

than the means of supposed means of achieving them. Government, and perhaps only government, can do two things well: articulating our social goals, and raising the revenue for their achievement. Where it fails is in areas where policy is too complex for it to actually achieve these goals. It sets up agencies that pay their employees according to activity, rather than outcomes, and are inherently inefficient in complex, changing environments. And policymaking itself, with its focus on organisations, their structures and funding, and on regulation, has been captured by exactly the interests outlined in the the *Captured Economy*: the already rich and powerful. Our policymaking processes are too arcane and long-winded for ordinary people to follow. Yet the results of these processes, and their failures, affect us all.

A government that issued [3]Social Policy Bonds would concentrate on what it can do well: raising revenue and using it to reward the achievement of society's social and environmental goals. Incentives would cascade down from bondholders to all those working to solve these problems. The bonds, being tradable, would stimulate long-term initiatives to achieve goals currently thought to be too remote or idealistic: the [4]ending of war, for instance, or [5]universal literacy. A bond regime would encourage the exploration of diverse, adaptive, approaches and - crucially - the termination of failing approaches. Powerful interests could, as they do now, take an interest in achieving our social goals but the difference between a bond regime and the current system is critical and stark: they would be rewarded only to the extent they achieve society's goals, not their own.

### 15.1.3 Ends and means in energy policy (2018-01-22 17:43)

James Lovelock in 2006, in [1]*The Revenge of Gaia* :

I find it sad, but all too human, that there are vast bureaucracies concerned about nuclear waste, huge organizations devoted to decommissioning nuclear power stations, but nothing comparable to deal with that truly malign waste, carbon dioxide.

Energy policy is largely politicised; which means that people are less likely to engage in

rational argument. But Lovelock's case for going nuclear should be debated. Unfortunately, like so many other facets of life in a complex world, nuclear technology is highly technical, which probably explains why many of us react emotionally to it, or are content to leave it to the 'experts'.

Under a [2]Social Policy Bond regime society would have explicit goals for the environment. These would be long term goals so that, if carbon dioxide is indeed a malign by-product of energy production, then people would be motivated to reduce CO2 emissions. Environmental outcomes are much easier for all of us to understand than highly specialised and politicised technical data, based on fixed science. Holders of [3]bonds targeting environmental goals would have incentives to achieve the specified goals, but it would be up to them to decide how. They would have powerful incentives to meet the agreed environmental criteria. And these criteria would be agreed by society in general, rather than a handful of politicians taking advice from a few scientists and industry lobbyists, using ossified science.

Social Policy Bonds would bring about more public participation in the debate - essential if we are going to have the [4]buy-in that will become increasingly necessary in meeting our huge, urgent environmental challenges. The question should not be the divisive one of nuclear or non-nuclear. Agreeing upon and achieving environmental goals: that is what is important, and that is what an outcome-based policy approach, such as Social Policy Bonds, could deliver.

#### **15.1.4 Doomsday or dog-food? (2018-01-27 19:15)**

Even now America and North Korea are perilously close to a conflict that risks dragging in China or escalating into nuclear catastrophe. .... Conflict on a scale and intensity not seen since the second world war is once again plausible. The world is not prepared. [1]*The growing danger of great-power conflict*, 'The Economist', 27 January

There's a huge mismatch between the catastrophic consequences of a nuclear exchange and  
1156

our relatively feeble efforts to avoid it. There is probably more human ingenuity going into devising new ways of [2]selling [3]dog-food than avoiding nuclear war. There's nothing wrong with people choosing to make a career of advertising dog-food. They're not greedy. They are simply reacting rationally to the incentives on offer. Meantime, almost everyone on the planet wants to avoid nuclear conflict. But that want isn't channelled into meaningful ways of doing so. So we have bureaucrats in the United Nations, and in numerous well-meaning think-tanks and charitable institutions who are doing what they can. But where are their effort's taking us? [4]Doomsday clock' ticks closer to apocalyptic midnights?

There has to be a better way. A means by which we can reward people for avoiding nuclear conflict, rather than merely turning up to work for a large international organisation that says that's what it's doing. An approach that encourages smart people who are currently developing new marketing strategies for pet-food to think instead about effective ways of achieving nuclear peace.

We don't know what those ways might be. But we do know that our current ways aren't working. What we need is a system that encourages people to research, experiment, and implement effective approaches to nuclear peace. Which is where [5]Nuclear Peace Bonds would enter the picture.

Nuclear Peace Bonds: these would be backed by funds contributed by governments, non-governmental organisations, philanthropists, perhaps swelled by contributions from ordinary people, none of whom wish to see nuclear conflict. The issuers of the bonds would define a nuclear peace targets, with rewards to be paid after a specified, sustained period (say, thirty years) during which a nuclear exchange does not occur. Bondholders would be motivated to bring about nuclear peace by whatever means they see as being efficient. They would not be limited to the solutions or activities that only government can implement. With a decent monetary incentive they could bring in our undoubted, boundless ingenuity to remove what is probably one of the greatest threats to our survival.

For more about applying the [6]Social Policy Bond principle to ending conflict, see [7]here.

## 15.2 February

### 15.2.1 Social Impact Bonds today (2018-02-11 21:50)

[1]Social Impact Bonds are the non-tradable version of the [2]Social Policy Bond idea. Around 108 SIBs have been [3]launched in 24 countries, with nine countries launching their first SIBs in 2017. The [4]Social Finance Impact Bond Global Database provides information on all these projects, which have collectively mobilised \$392m in capital and touched more than 738 000 lives.

David Bank [5]writes that:

Social impact bonds have been bedeviled by complex structures and measurement difficulties, not to mention the thorny social problems themselves.

It's much as I have written [6]here and [7]here: because the bonds aren't tradable, bondholders will focus on approaches that will reach their end-point some time in the near future. In order to benefit from the success of their bond-achieving projects, they will have to own the bonds from flotation to redemption. This greatly diminishes the scope of the projects, and also means that inherently long-term goals cannot be targeted. When we have such small objectives, the costs of monitoring progress toward or away from their achievement is going to be a higher proportion of the total administrative costs than they would under a regime that could target broader goals. It's almost as easy (or not much more difficult) to monitor national crime indicators, say, as to look at the behaviour of group of a few hundred specific ex-prisoners in one part of the country over several years. These are the problems of SIBs to which Mr Bank alludes.

In the same piece, Mr Bank quotes

Tracy Palandjian, CEO of Social Finance US, a leading social impact bond developer:

What has surpassed my expectations, and why the work is so hard and the impact so enduring, is we are changing mindsets. We are changing how government officials think about problems.

Contracting out the solution of social problems and payment for results are two essential elements of the Social Policy Bond idea as I envisaged it, and SIBs incorporate these. Where SIBs fall short, though, is that without tradability, not only is the range of solvable problems limited, but the market's efficiencies in resource allocation cannot be realised. Another possibility is that they can be more readily gamed and manipulated - especially likely, I believe, once their novelty has worn off and they disappear from public scrutiny. I'm therefore ambivalent about SIBs. They might be an essential stepping stone on the way to a pure Social Policy Bond regime. But their limitations and flaws might discredit the Social Policy Bond concept. For the record, I haven't been involved in any SIB projects.

## 15.2.2 A step toward funding health outcomes (2018-02-18 23:57)

The *Economist* writes:

When doctors reach for their prescription pad, most patients expect to receive a jar of pills or a bottle of ointment. Few think they will be referred to a gym or a volunteering scheme. But more and more doctors

are dishing out these “social” prescriptions.... [1]*Tango classes, ukulele lessons: the rise of “social prescriptions”, ‘The Economist’, 15 February*

### Social-prescribing

schemes, in which doctors refer patients to non-medical treatments, are becoming more numerous in the UK. I think it’s an encouraging trend. Just as crime is not solely a matter for the police, nor education solely a matter for schools, so health is not solely a matter for the medical profession. I hope social prescribing presages a wider move from government funding of institutions to funding for outcomes. I’ve long argued that funding for outcomes is going to encourage more imaginative solutions to our complex social and environmental problems than the current focus on the structures and funding of government agencies. And more efficiency:

One review of studies on social prescribing showed that, on average, it was associated with a 28 % fall in GP visits and a 24 % drop in attendance at emergency wards.

For more on applying the Social Policy Bond principle to health, see [2]here. For more on applying the principle to crime see [3]here, and to education, see [4]here. The Social Policy Bonds home page is [5]here.

## 15.3 March

### 15.3.1 Feeling good about ourselves (2018-03-02 18:01)

Much of the opposition to Social Policy Bonds comes from people who regard any sort of explicitly money-making activity as distasteful. It's understandable. Market forces have been undermined, corrupted and abused. They've been manipulated in ways that have led to staggering inequality and, worse, the entrenchment of that inequality.

But the opposition to the parody of market forces that pervades society misses the point. Competitive markets are still the most efficient way yet devised of allocating scarce resources. They are not a complete solution, and they create problems that government, and sometimes only government, has to solve by, most importantly, looking after the poor and disadvantaged, and the environment. But in theory and in practice the alternatives, when applied at an aggregated level, have proven to be worse. If market forces could be directed into achieving society's goals, rather than those of the already wealthy who have no shame in using their influence to stifle competition, then those goals could be achieved more readily than ever. Social Policy Bonds are intended to do this.

Unfortunately, people who otherwise do have a social conscience treat money-making in general, and markets in particular, with disdain. They look down on the Social Policy Bond idea because it generates wealth in the form of capital gains, via the increased value of people's bondholdings. And it's a fact that people have made enormous capital gains through activities that have zero or even negative social value. I think Social Policy Bonds are different, in that they inextricably link the capital gains from bondholding to the achievement of society's social and environmental goals. If people become wealthy through owning Social Policy Bonds, they would do so only because society's goals are being achieved.

Two further points. Most of us, when we see terms like 'profit' and 'capital gain', forget the time element: holdings of assets take time to appreciate. We also focus on the final amount of profit, and forget the risk involved in holding an asset.

Second: at a school morning assembly years ago, we were told that it's better to raise £1 million from 5000 people for charitable purposes than £5 million from 1000 people. Sounds lovely doesn't it? Who could deny that the more people who raise funds for the social good, the better? But I had my doubts then and now. We raise funds for the benefit of people who

need them, not for ourselves. There are many desperate, impoverished people in all societies. Let's take the example given by my usually impressive schoolmaster: if £1000 would be a significant help to people in need, then £1 million will help one thousand people, while the £5 million would help five thousand. So how about we ask the four thousand people deprived of help under my old schoolmaster's preferred scenario which option they'd prefer?

What I conclude from all this is simple. There is a clear difference between projects like Social Policy Bonds and those who hold them in disdain, bordering on contempt. A Social Policy Bonds regime has as its over-arching objective the solution of society's social problems. Those opposed, who also view business and capitalism in general with distaste, have as their prime goal that of feeling good about themselves.

### **15.3.2 Subsidising the rich (2018-03-11 18:24)**

Writing some years ago about the United States Government's perceived need to 'reframe pretexts not only for [military] intervention but also for militarized state capitalism at home', Noam Chomsky writes:

It is sometimes argued that concealing the development of high tech industry under the cover of "defense" has been a valuable contribution to society. Those who do not share that contempt for democracy might ask what decisions the population would have made if they had been informed of the real options and allowed to choose among them. Perhaps they might have preferred more social spending for health, education, decent housing, a sustainable environment for future generations...as polls regularly show. [1] *Failed States* (page 127)

Quite. If people want to subsidise at vast expense high technology, non-stick saucepans, or the replacement of wildlife by oil-burning heavy machinery let us at least make those

decisions for ourselves. Given the sums involved and the destruction and conflict such subsidies can create, they are hardly trivial. Any half-sensible outcome-based policymaking system would give a high priority to the polls to which Professor Chomsky refers, rather than the short-term interests of corporate or 'defence' lobbyists. And of course, it's not only the weapons manufacturers who benefit from this sort of effective voter disenfranchisement.

One of the benefits of an outcome-based regime would be transparency. People should have a rough idea of what their tax payments are supposed to achieve. Expressing policy goals in terms of outcomes would be a good start. Instead, policy is almost always a convoluted, arcane, protracted and therefore opaque process, followed closely only by those who can best manipulate it, their paid agents or those who are paid to formulate or comment on it. It's a corrupt process - not necessarily legally, but certainly ethically. The losers are ordinary people.

A Social Policy Bond regime would aim to achieve specified, agreed goals, and would inextricably link taxpayer funds to the achievement of those goals. Under a bond regime UK citizens for instance could still vote to subsidise [2]wealthy landowners including the richest people in the country, but they would know exactly what they were doing and making a conscious choice to do so. The current policymaking system is so removed from the concerns of ordinary people that it is not fit for purpose. The gap between people's goals, and those of government and its big business pals is becoming ominously large.

### **15.3.3 Killing through complexity: the US healthcare system (2018-03-19 22:56)**

The *Economist* looks at healthcare in the US:

Every year America spends about \$5,000 more per person on health care than other rich countries do. Yet its people are not any healthier. [1]Which firms profit most from America's health-care system, 'The Economist', 17 March

... In crude terms, the health-care labyrinth comprises six layers, each involving the state, mutual organisations and private firms. People and employers pay insurance companies, which pay opaque aggregators known as pharmacy-benefit managers and preferred provider organisers. They in turn pay doctors, hospitals and pharmacies, which in turn pay wholesalers, who pay the manufacturers of equipment and drugs. Some conglomerates span several layers.

Understanding the US healthcare system is possible, but it might be conceptually simpler to solve the problem rather than explain it in detail. With the proliferation of [2]Social Impact Bonds (about which I [3]have [4]reservations) there has been a welcome shift in public policy toward focussing on outcomes.

I think that health policy, by targeting improved outcomes could go a long way toward making healthcare systems the world over more efficient. The outcomes I'd target would be ones that are meaningful to ordinary people. That is, they would *not* be about funding arrangements, institutional composition or structure, or irrelevant micro-targets. Instead we'd target measures of health such as: [5]Quality Adjusted Life Years, longevity, infant mortality.

We'd also reward people for achieving these outcomes, rather than for carrying out activities that may or may [6]not be helpful, or that might even conflict with our health goals.

The Social Policy Bond principle applied to health could be the answer. [7]Health Bonds would target meaningful outcomes, and they would reward their achievement. Being tradeable (unlike SIBs), investors would have incentives to carry out steps leading to long-term goals: goals that extend beyond any individual investor's time horizons. Bondholders could use the information generated by the market for the bonds to allocate funds to those initiatives that will bring about the biggest improvements in health per dollar spent. Such initiatives might well fall outside the traditional, antiquated purview of those currently responsible for health policy. One example: the most cost-effective way of saving young lives might be to lay on taxis for people leaving nightclubs in certain areas. Maybe. Maybe not. But under the current system there's no way of knowing, *and nobody with any incentive to see how such a project stacks up against others.*

The second para, above, excerpted from the *Economist* does help our understanding. The US healthcare system is riddled with so many vested interests, that any change in any direction will be seen as a threat and opposed. As in other sectors, it is precisely the profits these bodies gain from uncompetitive and manipulative practices that allow them to fund lobbyists to oppose any reform that might diminish them. I don't think the complexity of the system is an accident either. Indeed, policymaking itself is so complex that only powerful

vested interests, or their paid agents, can follow and hope to influence it.

In this, again, US healthcare is quite typical. As the *Economist* article concludes:

Wherever products are too complex for customers to understand, and where subsidies and complex regulation add to the muddle, huge profits can opaquely be made. Remember mortgage-backed securities?

### 15.3.4 Who speaks for the losers? (2018-03-28 23:22)

The *Economist*, accurately I think, says the explanation for today's political polarisation lies not so much between those who favour free trade, immigration and cultural openness and those against, but in:

the gap between exam-passers and exam-flunkers. Qualifications grant access to a world that is protected from the downside of globalisation. You can get a job with a superstar company that has constructed moats and drawbridges to protect itself, or with a middle-class guild that provides job security, or with the state bureaucracy. Failing exams casts you down into an unpredictable world of cut-throat competition. Exam-passers combine a common ability to manage the downside of globalisation

with a common outlook — call it narcissistic cosmopolitanism — that binds them together and legitimises their disdain for rival tribes. Exam-flunkers, meanwhile, are united by anger at the elitists who claim to be open as long as their jobs are protected. They are increasingly willing to bring the system crashing down. Talking about open v closed is a double error. It obscures the deeper forces dividing the world, and spares winners by playing down the legitimate concerns of losers. [1]*The trouble with open v closed*, the 'Economist', 22 March

I agree, though I would add that the exam-passers add to the problems of the exam-flunkers by formulating policies that favour economic openness. Simple economics, for instance, tells us that large-scale immigration (for instance) raises the cost of housing and reduces wages for those whom the exam-passers see as 'losers'. Similarly with free trade: such openness might be good for that abstraction called 'the economy', but the benefits go mainly to the exam-passers (the insiders) and often accentuate the losses of the flunkers. The cultural negatives of such policies are more subjective, but I'd argue that they are important too. It's especially unfortunate, to my mind, that not only is the formulation of economic policy conducted almost exclusively by the exam-passers, but so too are discussion and debate about such policy and its consequences.

## 15.4 April

### 15.4.1 Goals for health (2018-04-06 22:04)

Peter Jacobsen writes to the *New Scientist*:

One factor may be missed when comparing war severity between 1823 and 2003 using fatalities.... Recent wars have had fewer fatalities, but perhaps not because they were less severe. Weapons are increasingly potent but trauma care has improved a lot, and hence the lethality of war has decreased over time. A similar bias can be seen with the murder rate. [1]*Medical care means more survive modern war*, Peter Jacobsen, 'New Scientist', 27 March

This points to the importance of choosing our social and environmental goals carefully. They need to be goals that are, or are inextricably linked to, what we actually want to achieve. Do we want to aim to reduce (for instance) deaths by violence, regardless of how much funding is to be spent on trauma care? Or would any additional funding be better spent on general health care with, perhaps, more lives saved per dollar spent? These questions need to be addressed for the operation of a Social Policy Bond regime, and they are not simple. But it's crucial to remember that they need to be asked too in our current policy regimes. They rarely are. Instead funding for healthcare is typically decided by people with little incentive or capacity to maximise improvements in health per dollar spent. Funding is often a function of history, or the charisma of medical specialists, or how newsworthy is a particular health problem. (See for instance this [2]report from Australia: *Men die earlier but women's health gets four times more funding.*)

My suggestion is that we issue [3]Health Bonds, which would explicitly and *impartially* target improvements in longevity, [4]Quality Adjusted Life Years, infant mortality rates and other general population health indicators. Resources are always going to be limited but decisions our healthcare goals and - and the basis on which they are made - should be made clear to ordinary people, so that we can participate, if we want, in their formulation.

### 15.4.2 Killing for profit (2018-04-12 21:22)

Dr Jason Fung concludes his concise post about the corruption of Evidence Based Medicine thus:

So here's a damning list of all the problems of EBM

1. Selective Publication
2. Rigged outcomes
3. Advertorials
4. Reprint Revenues
5. Bribery of Journal Editors

6. Publication Bias
7. Financial Conflicts of Interests

[1]*Killing for profit*, Jason Fung, 12 April

My comment, after thanking Dr Fung for his post, was short: I think we need to re-orientate the incentives away from activities, publications, and other surrogate indicators, and focus entirely on outcomes that are meaningful to ordinary people: longevity, infant mortality, [2]Disability Adjusted Life Years etc. In the abstract, this sounds difficult, but my suggestion of a [3]new financial instrument could help.

### **15.4.3 The EU: punishing the poor (2018-04-16 16:44)**

I set out my main reason for voting for the UK to leave the European Union [1]here. It is not simply that the EU has corrupt, stupid, wasteful policies - most countries have those. It's that the EU has no mechanism by which these policies can be terminated. The EU's Common Agricultural Policy has done much to [2]destroy Europe's environment, raise food prices for all Europeans while transferring taxpayer funds to Europe's wealthiest people and agribusinesses ('[3]One in five [of the CAP's] biggest recipients are billionaires and millionaires'), and it has been doing all this for more than forty years. It [4]swallows up 40 percent of the EU's budget and imposes further costs on ordinary consumers by putting up tariff barriers.

High import tariffs (estimated at 18-28 %) have the effect of keeping prices high by restricting competition by non-EU producers. It is estimated that public support for farmers in OECD countries costs a family of four on average nearly 1,000 USD per year in higher prices and taxes. [5]Source

These barriers have helped impoverish Africans by limiting their exports to Europe, and now, equally tragically, the EU is subsidising milk, which gets exported to Africa, and helps destroy the livelihoods of African dairy farmers.

European milk is pouring into Africa, with disastrous effects for local herders and farmers. ...Multibillion-euro dairy multinationals are exploiting rock-bottom European milk prices to expand aggressively into West Africa. Over five years, they have nearly tripled their exports to the region, shipping milk powder produced by heavily subsidized European farmers to be transformed into liquid milk for the region's booming middle class. This milk rush is ratcheting up long-standing accusations that poor countries pay the price for EU farm policies crafted in Brussels. [6] *How EU milk is sinking Africa's farmers*, Louis Nelson, Politico, 8 April

The consequences can be seen in the Mediterranean: desperate Africans sacrificing their life-savings and often their lives, in an attempt to get to Europe.

How do our politicians get away with it? One answer is that nobody, except those with vested interests or their paid agents, can understand the Common Agricultural Policy or, indeed, any other policy throughout the protracted, arcane, corrupt and legalistic processes that lead to their enactment or modification. It's a good bet that if ordinary citizens knew that the CAP means they pay more for their food so as to enrich millionaires, devastate the environment and destroy the livelihoods of millions of Africans, then we'd vote against anyone advocating it. But policymaking is so obscure - deliberately so, perhaps - that apathy rules.

Social Policy Bonds could be the answer: under a bond regime, we'd target explicit goals that are meaningful to ordinary people. There would be many ramifications of such an approach; one happy one would be that corrupt and insane policies, such as the EU's Common Agricultural Policy, would fall at that first hurdle.

#### 15.4.4 A crass attempt at transparency (2018-04-22 17:27)

Targets and indicators are essential if we're looking at improving well-being in our large, complex societies. Currently, though, our targets are chosen unsystematically and incoherently. So we see results like this:

[1]One in three heart surgeons refuse difficult operations to avoid poor mortality ratings, survey shows.... [S]urgeons would look at a patient and think, 'I know what's best for you', it's this operation. Now a surgeon looks at a patient and says, 'I know what's best for you but is this going to be good for my figures?' ...Since 2014 the [UK's national Health Service] has published the individual mortality rates for consultant surgeons on the publicly available website 'MyNHS', which was supposed to represent a milestone in transparency. ' Daily Telegraph', accessed 22 April

It's pitiful. A national health service will always need numerical indicators, but we should be making sure that achieving them is *inextricably linked to improvements in people's health and well-being*. Mickey Mouse micro-targets, like an heart surgeons' 'success' rates are, as we see, worse than useless. They are as crassly thought out as certain other targets, such as:

A notorious example was that some hospitals kept patients waiting in ambulances outside the hospital until the hospital could be confident that the patient could be seen in its accident and emergency department within the 4-hour target. [2]Source

I suggest that instead of these idiotic micro-targets or idiotic attempts at 'transparency', we look at we target measures that are important to ordinary people: the users of health care services. My suggestion is that we issue [3]Health Bonds, which would explicitly and *impartially* target improvements in longevity, [4]Quality Adjusted Life Years, infant mortality rates and other general population health indicators. Resources are always going to be limited but decisions our healthcare goals and - and the basis on which they are made - should be made clear to ordinary people, so that we can participate, if we want, in their formulation.

## 15.5 May

### 15.5.1 Skin in the game (2018-05-02 17:12)

David Bahnsen reviews [1]Skin in the game, by Nassim Nicholas Taleb:

When operators are forced to adopt the negative implications of their decisions, poor decision-makers do not survive, asymmetries are eliminated, and the result is a system that is devoid of poor decision-makers. In other words, skin in the game does not just cause better decision-making because of disincentives; its evolutionary forces eliminate those fools or shysters who are the source of great systemic damage. [2]*Risk and business*, David L Bahnsen, 'National Review', 26 April

The pity is that operators in the public sector are rarely 'forced to adopt the negative implications of their decisions'. This is partly because effect is genuinely difficult to trace back to cause when looking at the consequences of, say, this or that health intervention or infrastructure investment decision: there are too many confounding variables and time lags. But it's also because nobody within our policymaking system has any incentive to evaluate. That's no basis for an efficient bureaucracy.

[G]overnment bureaucracies non-self-evaluate. At a minimum, agencies with evaluative responsibilities are not invited to evaluate - they are kept out of the loop, their opinions unsought. At a maximum, government agencies actively suppress their own internal evaluative units and are discouraged from evaluating the beliefs and policies of other agencies. [3]*Why States Believe Foolish Ideas: Non-Self-Evaluation By States And Societies* (pdf), Stephen Van Evera, Massachusetts Institute of Technology Political Science Department and Security Studies Program, 2002

We need to be reminded that around 40 per cent of the rich world's income is spent by organisations that resist, almost to the death, the idea of examining their policy blunders and learning from them. I mean, of course, governments who, in Taleb's words, have no skin in the game. Van Evera says that even in the world wars of the 20th century, when policy mistakes could have grievous consequences: 'the belligerents made large errors without carefully assessing their options. Even rudimentary analysis often would have exposed these errors but was omitted.'

In my experience, it is often the smallest decisions in government that receive most scrutiny: whom to offer a three-month contract; which brand of computer printer to buy; that sort of thing. The larger decisions often escape detailed analysis. Sometimes this is unavoidable but what is inexcusable is that lessons from policymaking disasters are never learned. One grievous example: it's now estimated that the US intervention in Iraq will

cost about ten times more than the White House projected. This calculation was done by a non-governmental body and it's a safe bet that it will never be referred to when similar enterprises are considered in the future.

Social Policy Bonds would change this. They would give investors in the bonds incentives to look at which projects help achieve society's goals, and which are a waste of resources. They would do this on a continuous basis; that is, throughout the lifetime of the bond. Currently, the way governments tackle long-term goals is to build on existing ideas with, perhaps, some funding for research. Incremental improvements are possible, but there are few financial incentives to come up with innovative ideas that might undermine existing institutions. Social Policy Bonds, in contrast, would subordinate institutional survival, and all their activities, to the efficient achievement of transparent, meaningful outcomes. At every stage of every approach that will be needed to solve our most complex social problems, bondholders (and would-be bondholders) would have powerful incentives to explore, investigate and implement only the most promising projects and, crucially, to terminate those that are failing or inefficient. They will have so much 'skin in the game' that they would optimise returns on their investment to the benefit not only of themselves but of all members of society.

### **15.5.2 Subsidising planetary destruction or: Another reason to leave the EU (2018-05-03 17:37)**

If you are serious about tackling climate change, the best approach, and the one I've [1]advocated for years - decades - is to reward people for tackling climate change. Not to reduce greenhouse gas emissions, and certainly not to subsidise the production or use of biofuels. So, of course, subsidising biofuels, which means cutting down rainforests, is what the European Union, with its corrupt, psychotic subsidy regime, is paying people to do:

Half of all the palm oil imported by Europe is turned into biodiesel and blended into conventional fuel to power cars and trucks. This misguided attempt to "green" fuels is actually tripling carbon emissions, not reducing them. What's more, the practice is subsidised by the European Union. In other words, taxpayers are paying to destroy rainforests and accelerate climate change. [2]*The real palm oil problem: it's not just in your food*, 'New Scientist', 2 May

The loopholes in the way international carbon accounts are calculated mean that emissions from biomass are never counted. The *New Scientist* article quotes Tim Searchinger of Princeton University: 'You could cut down the Amazon, ship the trees to Europe to replace coal and that would count as a 100 per cent greenhouse gas reduction.'

There are plenty of [3]suggestions in the UK media about how some of the people who voted for Brexit might have regrets. [4]I don't.

### 15.5.3 Safety, going backwards (2018-05-12 16:53)

Charles Hugh Smith, writes about US attitudes to health and safety:

If you've bought a new vehicle recently, you may have noticed some "safety features" that strike many as Nanny State over-reach. You can't change radio stations, for example, if the vehicle is in reverse. ... The narrowness of this obsession with safety comes into focus if we ask: how can a society so obsessed with safety have spawned an opioid addiction crisis that kills tens of thousands of people and ruins the lives of millions of Americans?

[1]*How Safe Are We? Our Blindness to Systemic Dangers*, Charles Hugh Smith, 10 May

An excellent question. The safety bureaucracy has goals that differ markedly from those of the health care sector, and both have goals that have little to do with maximising the well-being of citizens per dollar spent. And that should be the guiding criterion for both health and safety: from the policy point of view, they shouldn't be distinct.

Policy decisions about health policy, broadly interpreted to include safety, are heavily influenced by the public profile of a disease or its victims, rather than on what would best meet the needs of society. It's also a question of diet, exercise, transport, and culture. Recent research shows, for instance, the beneficial effects on health of green spaces in our cities (see [2]here (pdf) for instance). The way government is structured, with its discrete bureaucracies and funding bodies, makes it unlikely that such benefits will influence funding decisions.

We cannot expect a government nor any single organisation to identify the huge numbers of variables, with all their time lags and interactions, that influence the nation's health - and to do so *dynamically*, taking into account our rapidly expanding scientific knowledge. We can, though, devise a system that rewards people who explore and implement the most cost-effective health solutions, even when circumstances and knowledge are changing continuously. I have tried to show how this can be done with my essay on [3]Health Bonds, which would aim to distribute scarce government funds to where they would do most good, as measured by such indicators as [4]Disability Adjusted Life Years. Under a Health Bond regime, investors in the bonds would have continuous incentives to maximise their returns on the bonds at all times: their objective, assuming we have carefully defined our targeted health goal, will be exactly congruent with those of society. Bondholders might well decide that, for instance, we should implement measures to switch off the ability to flip radio stations while a car is going backwards - but only if they think that to be one of the most cost-effective ways of reaching society's health goal. Indeed, Health Bonds would ensure that every decision, every activity, that bondholders contemplate or implement will be entirely subordinated to that objective. A stark contrast with the current system, under which officials have goals entirely distinct from, and sometimes in conflict with, the broader interests of society.

#### 15.5.4 Government by intuition (2018-05-15 16:21)

In our complex, interlinked societies, it's increasingly difficult to identify cause and effect. This matters when making policy, because policy is supposed to have a beneficial effect. Linkages are sometimes easy to identify: that between, say, water quality and infectious disease rates, for instance. Others are much more difficult and, with our scientific knowledge rapidly growing, often impossible: So, facing problems such as crime or war or nuclear proliferation, where there are huge numbers of contributing variables, and our knowledge of relationships is both imperfect and expanding, should government do nothing, waiting for certainty?

What governments actually do is create bureaucracies, or shovel funds into bodies that might once have been successful (when society was simpler) but have become useless or, worse, obstacles in the way of achieving our goals.

A much better approach, in my view, is to target long-term outcomes, and let investors decide, continuously, what are the best approaches to solving our problems. Especially for longer-term goals, the optimal mix of approaches will vary with time in ways that nobody, including governments, can foresee. We need to reward people for coming up with new, efficient, solutions to our problems, many of which are so complex that only diverse, adaptive approaches will work. These are precisely the sorts of solutions that governments cannot identify. That, in essence is the Social Policy Bond approach.

Alternatively, we could opt for an easy life:

Peter Navarro, the head of the White House National Trade Council, told an interviewer, "My function, really, as an economist is to try to provide the underlying analytics that confirm [President Trump's] intuition. ..."  
[1] *Trump vs. the 'Deep State'*, Evan Osnos, 'New Yorker', dated 21 May

Unfortunately, Mr Navarro's way of doing things predominates.

### 15.5.5 Heart disease: too complicated for government (2018-05-25 16:43)

When the cause of a social problem cannot - yet - clearly be identified then targeting the outcome we wish to achieve, and rewarding people for achieving it, could be the way to go. This is the Social Policy Bond approach. Many social and environmental problems fall into that category, including climate change, crime, poor health and war. We need long-term, diverse, adaptive approaches to the solutions of these problems - unfortunately these are exactly the sort of approaches that government is ill-equipped to discover.

The same limitations apply in microcosm in some areas of medicine; those such as cardiovascular disease (CVD), for instance, where the relationship between high LDL and CVD appears to be too complex to form a basis for sound policy. Unfortunately, once a hypothesis is widely accepted, it becomes difficult to dislodge. Dr Malcolm Kendrick writes:

If your hypothesis is that a raised LDL causes CVD, then finding someone with extremely high LDL, and no CVD, refutes your hypothesis. Unfortunately, but predictably, the authors of the paper have not questioned the LDL approach. Instead, they fully accept that LDL does cause CVD. So, this man must represent 'a paradox'. They have phrased it thus:

*Further efforts are underway to interrogate why our patient has **escaped the damaging consequences of familial hypercholesterolemia** [FM] and could inform future efforts in drug discovery and therapy development.'*

To rephrase their statement. We know that high LDL causes CVD. This man has extremely high LDL, with no CVD, so something *must be protecting him*. I have an alternative, and much simpler explanation: **LDL does not cause CVD**. My explanation has the advantage that it fits the facts of this case perfectly, with no need to start looking for any alternative explanation. [1] *Very high LDL and no cardiovascular disease - at all!*, Dr Malcolm Kendrick, 12 May

Dr Kendrick goes on to cite the longest and one of the world's largest studies of people diagnosed with familial hypercholesterolaemia (FH). Contrary to current popular thinking it shows that 'people

with FH have a lower than expected overall mortality rate - in comparison to the 'normal' population. Or, to put this another way. If you have FH, you live longer than the average person.'

This to me means that government policymakers should be more humble: when it comes to complex problems outside their expertise, they should admit to themselves that they don't know the best solutions. That doesn't mean they should do nothing: government can, and should, identify our social problems and raise the revenue to help solve them. It can actually do those quite well. But when it comes to solving our complex problems, it should consider issuing Social Policy Bonds, which do not presuppose how our problems shall be solved, nor who is best placed to solve them.

For more about Social Policy Bonds see [2]here. For application of the Social Policy Bond principle to [3]health, see here.

## 15.6 June

### 15.6.1 Outcome-based policy and buy-in (2018-06-10 18:09)

In my efforts to promulgate Social Policy Bonds I've usually emphasised their efficiency, which arises from a number of sources, including their harnessing of market forces, their encouragement of diverse, long-term approaches, and their capacity to adapt to changing circumstances. I've also stressed their transparency: because the bonds target broad, meaningful outcomes, ordinary people will understand them more.

This, in turn, means another hugely important benefit: buy-in. When we understand what a policy is all about, we can participate more in its development, refinement and implementation. This would apply even if our views are over-ridden by others: at least, we'd have been consulted. A Social Policy Bond regime would express its goals as outcomes that are meaningful to real people. Such outcomes would be more comprehensible to more people than the current unstated or unconsidered, vague, or platitudinous goals that characterise current policymaking all over the western democracies. Discussion about outcomes, rather than the alleged means of achieving them, would be more accessible than current policymakers' emphasis on legal pathways, funding arrangements, institutional structures and composition,

and other arcana. You might even think the system has been specifically designed to keep ordinary citizens out of it.

If people have the chance of participating in such discussion, we shall come to understand the limitations and trade-offs that are intrinsic to public policymaking. This means quite a few things, but to my mind buy-in is the most important. It's likely this would reconnect citizens with our policymakers; it would entail the sharing of responsibility and concern for policy initiatives.

This matters hugely when government has to do things that hurt people's narrow, short- or medium-term interests. Dealing with environmental depredations for instance; or raising taxes for a multitude of purposes. The current system discourages buy-in because it's difficult to follow. As such, it's easily influenced by the wealthy or powerful, be they in the private- or public sector. This does much to widen the gap between politicians and the people they are supposed to represent. Social Policy Bonds, because of their focus on outcomes, would help close that gap.

-  
Policy as if outcomes mattered  
SocialGoals.com

---

### **15.6.2 Superbugs: disastrously misaligned incentives: (2018-06-13 15:50)**

William Hall and others write:

When asked what she would do with a useful new antibiotic, the chief medical officer for England, Sally Davis, said that the drug "would need a stewardship program"—that is, that systems would have to be in place to make sure that the antibiotic was only prescribed when absolutely necessary. Indeed, limiting unnecessary use is essential to keep bacteria from becoming resistant to new antibiotics, and thus essential for our continued health.

While this is a cogent strategy, it doesn't coincide with the marketing goals of the

drug

industry: “When a really useful new antibiotic is found, the company that invests in it cannot rely on high sales for return on investment.” William Hall et al, [1]*Superbugs: an arms race against bacteria*, quoted by Jerome Groopman, [2]*The bugs are winning*, 'New York Review of Books', dated 28 June

The interests of the drug companies - and of those who target, implicitly or explicitly GDP - don't merely fail to coincide: they are in conflict with each other. Discovering and manufacturing a new antibiotic is expensive so, when a pharmaceutical company succeeds, it has every incentive to maximise sales in the relatively short period before its patent runs out. With such misaligned objectives, you'd hope government would take the long view and give the health of its citizens (and, incidentally, the welfare of farm animals fed prodigious quantities of antibiotics so that they'll grow more rapidly) a higher priority than the short-term interests of pharmaceutical companies. But no: it's the farmers and the pharmas who override the interests of ordinary people. You know, those of us who can't afford to follow and manipulate an absurdly complex policymaking process, nor pay others to do so.

The authors of *Superbugs* estimate that the total number of people dying annually from resistant microbes is at least 1.5 million and, extrapolating from US estimates, they estimate the costs to health services at about \$57 billion and the loss in world productivity at \$174 billion. There are currently no financial incentives for anyone to take the long-term view, though it's in almost everybody's interests for somebody - most likely government - actually to do so. As individuals, we know what needs to be done: ensure that doses of antibiotics are carefully regulated and that research into new antibiotics continues. Developing effective antibiotics, Hall et al write, should be recognised as a public good, which would justify government intervention. They blame short-term thinking for the absence of such intervention.

Applying the Social Policy Bond principle to the health field could be one way of meeting the challenge, and might be easier and less contentious for government to do than more direct intervention. Government could issue [3]Health Bonds aiming for improvements in the general health of the population over a period of decades. One necessary approach would then be to optimise the use of, and research into antibiotics. Doing this would generate rises in the value of the bonds, and so reward investors. Government would have to do little more than raise the funds for the bonds' redemption and articulate, with the help of experts and input from the public, health goals for the population. After that, it would be up to bondholders to pursue these goals. The overarching objective of investors in the bonds would then coincide with those broad, long-term goals. The investors, and the people they contract, would have incentives to bring about society's health goals as efficiently as possible - a stark contrast with the current system.

### 15.6.3 The environment: it's complicated (2018-06-16 16:41)

From the current *New Scientist*:

It turns out that vegan-friendly alternatives to fur and leather, as seen on display at Australia's recent Fashion Week (above), can harm sea creatures, because they are made of that other pervasive ecovillain: plastic (see [1]*Vegan-friendly fashion is actually bad for the environment*). The evidence is not yet clear, but some animal fabrics may be the least harmful choice overall. Such unintuitive outcomes crop up again and again when we try to make ethical lifestyle choices. As *New Scientist* has reported, ditching disposable plastic bags for a fetching cotton tote only pays off after you have used it 131 times, due to the large environmental burden of cotton – which is also an issue for clothes. [2]*Beware the bandwagon*, 'New Scientist', 13 June

The sort of life-cycle analyses (LCAs) required to establish the environmental benefits or otherwise of shifts in our behaviour are bedevilled by boundary issues, measurement difficulties and the difficulty of weighting one type of environmental impact against another. They *might* be better than blandly assuming that vegan clothes are 'better' than animal fabrics, rail is better than air travel, solar power is better than coal-fired power stations, etc, but for the making of robust policy LCAs would need to be continually reassessed in the light of our ever-expanding knowledge of the environment and our ever-changing environmental priorities.

Government policy cannot be so responsive nor, probably, can any single organisation – at least not as currently structured. If government did use life-cycle analysis with the aim of altering our behaviour, it would necessarily do so on the basis of a one-time, limited, and possibly subjective assessment of environmental costs and benefits. It's not good enough, but even worse would be what we largely have now: environmental policy based on corporate interests, 'what feels right', media stories and the launching of visually appealing initiatives that attract air time but are otherwise useless.

Social Policy Bonds would take a different approach. They would subordinate environmental policy to targeted environmental outcomes, which could be national or global. Say,

for instance, that we wish to preserve the Earth's marine environment. A Social Policy Bond issue that rewarded the sustained achievement of such a goal would generate incentives for bondholders to bring it about at least cost. They might well carry out life-cycle analyses in their attempt to do so. But there is an important difference between the way do they would conduct their research and the way government, or any supra-government body would do so: bondholders have continuous long-term incentives to achieve our goal efficiently. This is likely to mean responding to and stimulating increased knowledge of scientific relationships, and technical advances. Investors might conduct LCAs, but they would do so in ways that optimise the benefit to the marine environment per dollar spent.

Effective environmental policy must take a long-term view and for national or global goals, will need to encourage diverse, adaptive approaches. The environment and our knowledge about it are just too complex for an 'it feels good', command-and-control approach that, for instance, brands animal-derived clothing, or plastic shopping bags as bad. Diverse, adaptive approaches to addressing complex problems are precisely the sort of responses that government does very badly. However, government does have crucial roles in articulating society's environmental goals and in raising the revenue to

pay for their achievement: in the democratic countries government performs these functions quite well. But actually *achieving* society's social and environmental goals is a different matter. Such achievement requires continuous, well-informed and impartial decisions to be made about the allocation of scarce resources. For that purpose, Social Policy Bonds, with their incentives to achieve targeted outcomes efficiently would, I believe, be far better than the current ways in which environmental policy is formulated.

For more about application of the Social Policy Bond principle to the environment see [3]here.

#### **15.6.4 Make Social Impact Bonds tradeable (2018-06-22 17:46)**

It's now thirty years since I first floated the idea Social Policy Bonds at a meeting of the Australian Agricultural Economics Society in Blenheim, New Zealand. My aim was to inject the market's incentives and efficiencies into the achievement of social and environmental outcomes. Under a Social Policy Bond regime, bonds are issued on the free market for whatever price they will fetch.

The bonds would be backed by either government or the private sector. They would not bear interest and would be redeemable for a fixed sum only when a targeted social or environmental objective has been achieved and sustained. The idea is that the holders of the bonds would form a coalition whose over-arching goal is exactly that of society: to achieve the targeted goal as quickly as possible.

If this sounds familiar, it's because my work led to the creation of Social Impact Bonds of which about 60, involving investments of more than \$200m, have been launched in 15 countries, aimed at meeting various social challenges. There are 32 in the UK alone, with such goals as reducing recidivism rates and housing rough sleepers in London.

There's one important feature, though, about my original idea that differentiates it from Social Impact Bonds: my intention has always been that the bonds be tradeable, whereas SIBs, also known as '

Pay for Success' bonds, are not. This is, in fact, a critical difference, and it is one that makes me ambivalent about SIBs (with which I've had no involvement). I believe their lack of tradeability limits the usefulness of SIBs in several ways.

Most

importantly, it means they can tackle only short-term problems. Investors will buy the bonds only if they expect to profit from them. Because SIBs are not tradeable, people will have to hold them to redemption to make a profit. That in turn means that would-be investors would want any targeted goal to have a realistic chance of being achieved within their time horizon, which might be quite short, and certainly within their lifetime. This narrows the scope of the goals we can target and, indeed, SIBs have invariably narrow goals. Because their goals are so limited, so too are the opportunities for shifting resources to and from different approaches to solving a particular problem, and varying them as circumstances change. With a short payback period, investors in SIBs have no incentive to research and experiment with innovative approaches that have anything other than the shortest lead time or are otherwise almost risk free.

Another

important reason why the bonds should be tradeable, is because the identity and composition of the groups best placed to achieve a targeted objective will change over time. Our most urgent and challenging social and environmental problems will require multiple steps before they are solved. The people who are best at step one will not necessarily be those who are best at step two and all subsequent steps. We cannot even specify in advance what step one, or indeed any step, will entail; still less can we identify those best placed to take these steps. Tradeability means there be a market for Social Policy Bonds, which will ensure that the bonds will find their way into the hands of the highest bidders for them - who will be the best-placed to advance progress towards society's

targeted goal most efficiently. When the bonds are not tradeable, then we have something similar to the way social policy is currently implemented: government identifies some organisation (most likely an existing body, often one of its myriad own agencies), and pumps money into it. If this agency is paid for performance (as in Social Impact Bonds), it has an incentive to perform well. This might be an improvement on the way things are usually done. But if, as so often, one or all of the steps necessary to resolve the targeted problem optimally lie beyond the imagination or competence of such a designated agency, then we are going to be stuck with current (woeful) levels of under-achievement in social and environmental policy.

#### Social

Policy Bonds have the advantage in that they not only do not stipulate *how* society's goals are to be achieved, nor *who* shall achieve them. They will leave those decisions to the market, which will favour the most cost-effective coalition of operators at every stage on the way to achieving social goals.

#### Another

advantage of the bonds being tradeable is that a market for the bonds would generate extremely useful information both for would-be investors and for policymakers. The value of the bonds will rise and fall depending on whether the market thinks the targeted goal will be achieved more or less quickly. These prices, and their changes, will be immensely valuable to those having to decide where to allocate society's scarce resources, be they in the public or private sector.

One

of the problems with SIBs is that, because their goals are relatively narrow, the costs of monitoring progress toward or away from their achievement will always be a higher proportion of the total administrative costs than they would under a regime that could target broader goals. It's almost as easy (or not much more difficult) to monitor national crime indicators, say, as to look at the behaviour of group of a few hundred specific ex-prisoners in one part of the country over several years.

And

it is to achieve these broader goals that my original idea was intended. Goals such as improving the health of a population, eliminating poverty or achieving universal literacy. Social Policy Bonds could target global goals too: the ending of war, civil war, terrorism; the mitigation of climate change (or its negative impacts) or any global environmental problem, such as loss of biodiversity and preservation of the marine environment. These broad problems require a long-term outlook well beyond the purview of investors in Social Impact Bonds. To solve such problems, we shall need Social Policy Bonds which, because of their tradeability, will encourage the exploration, refinement and implementation of diverse, adaptive approaches.

Most

people would agree that humankind faces huge and urgent challenges, including war, nuclear proliferation, climate change and poverty. Yet, while there is almost universal consensus that these challenges need to be met, our politics is crippled by venomous, divisive tribalism, obsessed by ideology and personality. The gaps between policy and goals, and between people and politicians grow ever wider. Social Policy Bonds, by injecting the market's incentives into achieving humanity's long-term ideals could help close these gaps.

## 15.7 July

### 15.7.1 Target world peace actively, explicitly (2018-07-02 20:17)

John Lanchester quotes Adam Smith:

'Commerce and manufactures gradually introduced order and good government, and with them, the liberty and security of individuals, among the inhabitants of the country, who had before lived almost in a continual state of war with their neighbours and of servile dependency on their superiors. This, though that has been the least observed, is by far the most important of all their effects.' [1]After the Fall, John Lanchester, 'London Review of Books', dated 5 July

Mr Lanchester doubts that this still applies: 'elites seem to have moved from defending

capitalism on moral grounds to defending it on the grounds of realism. They say: this is just the way the world works,' and then writes cogently and readably about the crash of 2008, subsequent policy changes, and inequality. My focus here though is on the Adam Smith's point: "So according to the godfather of economics, 'by far the most important of all the effects' of commerce is its benign impact on wider society."

Francis Fukuyama [2]pointed out that, once you have a common agreement to engage in voluntary, good-faith transactions, people engaging in market transactions can be highly individualistic and do not even need to like each other. It's hard to disagree, but trade, and especially international trade, can be disrupted by politics, with rancorous results. So here's my question: instead of relying on a highly politicised world trading system to achieve peace between countries, why not reward people directly for achieving peace? Perhaps it's because we believe at some level, like the ancient Greeks, that war is part of the natural order of things, so there's no point trying to do anything about it. Or perhaps it's because we think that bodies like the United Nations will succeed in bringing about world peace. Or it could be because our politicians and bureaucrats, and many of the rest of us, don't think there's much point looking too far ahead; and achieving a sustained period of world peace, by any definition, is going to be a long-term undertaking.

Which is where the Social Policy Bond principle applied to violent political conflict, can play a role. No single way of stopping war will work. We therefore need to encourage diverse, adaptive solutions, including feedback mechanisms that ensure that promising approaches are encouraged and, crucially, that failing approaches are terminated. It's unlikely that existing organisations, however well resourced, however well meaning, could do this, even if they had proper incentives. Organisations have their own objectives, of which the over-riding one is self-perpetuation; they have few incentives to be imaginative in their approaches to social problems. What is needed are highly motivated [3]new organisations, whose goals are exactly congruent with society's. Under a [4]Conflict Reduction Bond regime these organisations might not have a stable structure, nor a stable composition, but their societally defined goal would be stable: a sustained period of peace would be the *raison d'être* of such organisations. Their rewards would be inextricably tied to their achieving it. Conflict Reduction Bonds would be redeemable only when absence of conflict had been sustained for a defined period. These bonds would contract the achievement of peace to the market, instead of to the inevitably poorly-resourced, distracted or corrupted bureaucracies that are currently charged with the task. Peace, then, would not be an incidental side-effect of commerce and an ever more rickety world trading system, but the direct, targeted, explicitly rewarded a goal for highly motivated coalitions and their agents.

### **15.7.2 Solitudinem fecerunt consilium canis cibum\* (2018-07-10 21:54)**

Douglas Rushkoff, after chatting to 'five super-wealthy guys—yes, all men—from the upper echelon of the hedge fund world', fills us in on their priorities:

they were preparing for a digital future that had a whole lot less to do with making the world a better place than it did with transcending the human condition altogether and insulating themselves from a very real and present danger of climate change, rising sea levels, mass migrations, global pandemics, nativist panic, and resource depletion. For them, the future of technology is really about just one thing: escape. [1]*Survival of the Richest*, Douglas Rushkoff, 5 July

It's an unedifying picture. Would it look any different if a coalition of governments, non-governmental organisations, philanthropists, and the public backed [2]Social Policy Bonds, aimed at solving our global problems? It might just be that our current policymaking systems are so obviously inadequate that even those of us not wealthy enough to contemplate escape are so resigned or distracted that we remain passive when confronted by an array of potentially calamitous social and environmental problems. Perhaps a more coherent, well-financed, range of policy goals would encourage the super-rich to solve our problems rather than attempt to escape them, and enable more of the rest of us to be employed in such solutions, rather than in devising ingenious ways of [3]advertising dog food. Possibly not, but isn't it worth a try?

\*The Latin, according to [4]Google Translate, for *They make a desert and advertise dog food*

### **15.7.3 Wanted: humble billionaires (2018-07-19 20:58)**

Most of our chronic social and environmental problems don't have simple solutions. Governments, though, are reluctant to relinquish power and therefore keen to control the funds and

institutions whose ostensible purpose is to solve our problems - even when these bodies are manifestly overwhelmed, incompetent, or corrupt. It shouldn't be surprising that politicians, whose lifetime ambition has been to accumulate power, behave like this. It's a bit more surprising that billionaires are subject to the same conceit:

Tech billionaires from Mark Zuckerberg to Bill Gates have done impressive philanthropic work, but they have both applied their hubris and their cash to failed efforts to try to reform education in America. It turns out that being great at computer software doesn't necessarily make you great in other areas. ...

Memo to tech billionaires: Just because you solved one problem with a simple solution doesn't mean all problems have simple solutions. Let's continue to register our displeasure with tech titans when they show their arrogance, and let's be a little more skeptical when they want to reinvent everything from food to space travel. [1] *Stop worshipping guys like Elon Musk*, David R Wheeler, CNN, 17 July

So it seems that those who have power *or* money, having achieved their personal goals, think they are the people best placed to achieve society's goals. Social Policy Bonds are a means by which government or billionaires could both articulate society's wishes and channel funds into satisfying those wishes, without actually doing the work themselves. They could, instead, reward the *achievement* of our goals, without dictating who shall achieve them nor how they shall be achieved. They would still have the power to articulate these goals and to raise, or spend, the revenue required for their achievement - things that they are good at. But, under a bond regime, they would relinquish the control over *how* these goals are to be achieved. That would be difficult for politicians or billionaires to accept. But the stakes are high: our social and environmental challenges are too big and too urgent to be left to those whose expertise lies solely, it seems, in the accumulation of power or money.

We need diverse, adaptive solutions, with time horizons longer than those of individual lifetimes. As a species, we now have massive potential to solve those problems that have bedevilled mankind for millennia: war, for instance, poverty, illiteracy, disease. Social Policy Bonds are a means by which we could motivate people toward solving these problems. Governments aren't likely to be the first to issue them. They owe too much to existing career paths, methods, and institutions. But billionaires? They could be more amenable to persuasion. They want to see the right thing done. All it would take is a bit of humility on their part so that they don't feel they have to be the ones doing it.

Policy as if outcomes mattered  
SocialGoals.com

#### **15.7.4 Environmental goals need diverse, adaptive approaches (2018-07-27 17:52)**

David Lauterwasser writes:

Free energy is nowhere around the corner, neither is truly sustainable energy. Solar panels are made from sand, which is running out. The production of photovoltaic plates for solar panels requires tremendous amounts of energy, involves the excessive use of highly toxic chemicals and creates vast amounts of waste products such as silicon tetrachloride (three to four tons of which are produced for every ton of the desired polysilicon), which forms hydrochloric acid upon contact with water, is often casually dumped somewhere and already devastated landscapes in China. [1]*The Collapse of Global Civilization Has Begun*, David B Lauterwasser, 'Medium', 14 November 2017

The [2]life-cycle assessments required to establish the environmental benefits or otherwise of shifts in our behaviour are bedevilled by boundary issues, measurement difficulties, and the difficulty of weighing one type of environmental impact against another. They are better than blandly assuming that rail is 'better' than air travel, that solar power is better than coal-fired power stations but, for the making of robust policy, they would need to be continually reassessed in the light of our ever-expanding knowledge of the environment and our ever-changing environmental priorities. Government policy cannot be so responsive: if government did use life-cycle analyses with the aim of altering our behaviour, it would probably do so on the basis of one-time, necessarily limited, and possibly quite subjective assessments of environmental costs and benefits. It wouldn't be good enough, but even worse would be what we have now: environmental policy largely dictated by corporate interests, with attempts to mitigate disasters that are fast-moving and visual enough to make the television news.

Social Policy Bonds would take a different approach. They would subordinate environmental policy to targeted environmental outcomes. It might be, for instance, that society wishes to reduce its use of fossil fuels. A Social Policy Bond issue that rewarded achievement of such a reduction would generate incentives for bondholders to bring it about at least cost. They might well carry out life-cycle analyses in their attempt to do so. But there is an important difference between the way do they would conduct their research and the way government would do so: bondholders have incentives to achieve their goal efficiently. This is likely to mean responding to and stimulating: increased knowledge of scientific relationships, and technical advances.

A single environmental goal, such as reduction in fossil fuel use, entails diverse, adaptive responses. These are precisely the sort of responses that government does very badly. Government can and should articulate society's environmental goals, and can raise the revenue required to pay for their achievement: in the democratic countries it performs these functions quite well. But actually achieving these goals requires continuous, well-informed and impartial decisions to be made about the allocation of scarce resources. These, government does badly. For that purpose, the Social Policy Bond principle as [3]applied to the environment, with their incentives to achieve targeted outcomes efficiently would, I believe, be far better than the current haphazard, one-size-fits-all approach.

## 15.8 August

### 15.8.1 Climate change: we're not really doing anything (2018-08-03 17:19)

David Roberts asks:

Are any of the countries that signed the Paris agreement taking the actions necessary to achieve that target? No. The [1]US is not. Nor is the [2]world as a whole. Source: [3]*No country on Earth is taking the 2 degree climate target seriously*, David Roberts, 'Vox', 29 April 2017

Disappointing, but hardly surprising. The two degree climate target is too abstract, too remote  
1192

for most of us, who have far more (apparently) urgent, short-term priorities. As individuals, we might be lucky to receive subsidies for driving electric cars. But what good do they really do:

"...China's 1m-plus electric cars draw their oomph from an electricity grid that draws two-thirds of its power from coal, so they produce more carbon dioxide than some fuel-efficient petrol-driven models. [4]*The world is losing the war against climate change*, the 'Economist', dated 4 August. )

In essence, the incentives are all wrong. A broad definition of subsidy that includes tax write-offs can generate this headline, which tells us all we really need to know:

[5]America spends over \$20bn per year on fossil fuel subsidies,  
Dana Nuccitelli, the 'Guardian', 30 July

Even ignoring subsidies, if the incentives are there for us to extract and burn fossil fuels, then that is what we shall do. Similarly, if the incentives are there for landowners, car manufacturers, politicians and officials to engage in bickering, lobbying in defence of their own interests, and competing with other interest groups for subsidies - then that is what they will do. Much serious brainpower is being spent on resisting change or extracting privileges from government.

We need to target meaningful goals, and we need to motivate people to achieve them. The outcome we should be targeting must be a composite definition of climate stability, which should include indicators of plant, animal and human well-being as well as climatic variables and the rate of change of those variables. This targeted outcome would include reductions in the negative impacts of climate

change. Targeting climate like this means that we don't prejudge the best way of achieving it, which might well be reducing greenhouse gas emissions as the main approach, but would motivate people to look at all other potential approaches, including ones we cannot anticipate. We are learning more and more about the links between greenhouse gas emissions and the climate, and about ways in which we can prevent or mitigate climate change.

We also need to enlarge and *motivate* the pool of people prepared to do something to tackle climate change. The fact is that the rewards to a successful pet food campaign manager can be in the millions of dollars, while someone trying to generate new ideas for tackling climate change that don't fit in with Kyoto will have difficulty getting attention, let alone adequate funding. This points to the need to divert some private sector resources away from trivia and towards solving our most urgent environmental problem.

There's more. We also need people to buy in to solving the climate change problem. Paris type agreements (or 'agreements') don't do this. Just the opposite in fact: most people-instinctively resent imposed pseudo-solutions originating in remote bureaucracies. Climate change has become politicised.

It is for all these reasons that I believe [6]Climate Stability Bonds would be an improvement over current policy. Climate Stability Bonds would be backed by the world's governments. They would be redeemable once a specified climate stability goal had been achieved and sustained. They would be freely tradeable and their value would rise or fall as the targeted goal

become more or less likely to be achieved. The goal could be specified as a combination of climate and other indicators. The bonds would not prejudge the best ways of achieving their goal. They would reward the achievement of climate stability, *however it is achieved*.

Investors in the bonds would have incentives to respond quickly and appropriately to new knowledge about what is causing climate change and to new ways of dealing with it. Governments would be the ultimate source of finance for achieving climate stability, but the private sector would allocate society's scarce resources.

A Climate Stability Bond regime would express its aims in terms that people can understand. Its explicit goal would be climate stability. If people understand what a policy is all about, they can participate more in its development, refinement and implementation. This matters hugely when, as with climate change, government will probably have to rein in activities to which we have become accustomed. Current policy discourages buy-in to the extent that it is focused on the cutting back of net anthropogenic greenhouse gas emissions, which will impose heavy, and up-front, financial costs in pursuit of nebulous, much-delayed benefits.

Climate Stability Bonds, on the other hand, have a comprehensible, meaningful goal: the achievement of broadly- meaningfully-defined, climate stability. They would channel the market's incentives and efficiencies into the solution of our most urgent environmental problem. But with their focus on a set of meaningful goals, rather than a supposed means of achieving them, they would also encourage greater public participation and buy-in to the solutions they generate. We need a widely supported, coherent, and efficient response to climate change. Climate Stability Bonds have all those features. Paris and its predecessor, Kyoto, have none.

### **15.8.2 How to avoid a nuclear war (2018-08-05 17:12)**

Andrew Cockburn quotes a four-star general, Lee Butler, former head of the US Strategic Air Command, and who wrote recently:

Arms control is now relegated to the back burner with hardly a flicker of heat, while current agreements are violated helter-skelter. ...Sad, sad times of the nation and the world, as the bar of civilization is ratcheted back to the perilous era we just escaped by some combination of skill, luck, and divine intervention. [1]*How to start a nuclear war*, Andrew Cockburn, 'Harper's Magazine', August

Eric Schlosser's [2]*Command and Control*, bears this out, with its alarming tales of accidents and blunders that came close to bringing about catastrophe during the Cold War. It's quite disturbing how little incentive the people in control, *at all levels*, have to think about the potential impacts on society rather than on themselves or the organisation of which they were part.

The goal of sustained nuclear peace makes an ideal target for the Social Policy Bond idea. It's a complex, long-term goal that will require diverse, adaptive solutions. It's a goal that, from all indications, is unlikely to be reached under current policy. And it's an easy goal to verify.

My proposal would be to issue bonds that reward a sustained period of nuclear peace. This could be defined, as, say the non-detonation of a nuclear device that kills more than 50 people for 30 years. They could be backed by a combination of governments, non-governmental organisations, philanthropists and members of the public. With sufficient backing the bonds would help offset and (one hopes) outweigh the the incentives currently on offer, which essentially are those of the military and weapons manufacturers to maintain a nuclear posture.

Those billions of us who would benefit from nuclear peace are presumably a massive numerical majority, but we have few means of expressing our wishes in a way that is likely to

bring it about. The tendency is to assume that governments will do what's necessary, with the support of hard-working, well-intentioned people in the private sector.

But these people are not rewarded for success, which is not only problematic in itself, but also discourages people from investing in their efforts. More cogently, it's not working.

We need to reward those who achieve nuclear peace at least as much as those working to undermine it. We don't know exactly how to reduce the chances of a nuclear exchange, nor who will be best placed to do so, over the long period during which our goal is to be achieved, but we have no excuse for not encouraging people to find out. Nuclear Peace Bonds would apply the [3]Social Policy Bond principle to this goal. Investors in the bonds would form a [4]protean coalition of people dedicated to achieving it as efficiently as possible. Their goal would be exactly the same as society's. Human ingenuity knows no limits. Currently, too much of it is devoted to relatively [5]unimportant or socially [6]questionable. Nuclear Peace Bonds would encourage some of that ingenuity into helping avoid a global catastrophe.

My short piece on Nuclear Peace Bonds is [7]here. The links in the right-hand column of that page point to papers on similar themes: [8]Conflict Reduction, [9]Disaster Prevention, and [10]Middle East Peace

### 15.8.3 One size never fits all (2018-08-19 16:17)

Much of the world's strife originates in the emotional insecurities of the people in power. Piling up weaponry, seeing hostility when it's not there, stamping out any quibbles and dissent about the way things are done: these are not admirable traits, but they are widespread and destructive. Perhaps only the most psychologically secure leaders can allow a mixed economy

with a healthy business sector to flourish, or question the accepted ways of doing things: the ways that created the hierarchy that gives them the power they enjoy.

A revealing joke in Beijing elite circles describes how Deng Xiaoping, father of the past 40 years of reform and economic opening, assembled two teams, one comprising the country's best technocrats, and the other China's most ingenious Marxist theoreticians. Deng asked the first team what policies the economy needed, and commanded the second team to define those policies as socialist. Reform-minded elites fear Mr Xi has reversed that process. [1]How to read summer grumbles about China's swaggering leader, the 'Economist', 11 August

Deng was pragmatic, and his reforms remarkable, and they helped lift hundreds of millions of Chinese out of poverty. The current regime seems to be less secure:

[L]ocal experiments with reform have been cited by some Western scholars as examples of China's "adaptive authoritarianism". This is a way of describing the party's ability to avoid the fate of its counterparts in other communist-ruled countries by flexibly adjusting policy in order to satisfy public demands for greater prosperity. The pilot system has been an important means of achieving this. There are signs, however, that it is losing steam. [2]Local experiments with reform are becoming rarer under Xi Jinping, the 'Economist', 18 August

If this is accurate, then I think it's unfortunate. Society is so complex and our social and physical environments are changing so quickly, that old ways of doing things need to be questioned. One approach will rarely work effectively over a wide geographical area, or for extended periods of time. Unfortunately, people in the grip of an ideology - who may, indeed, owe their livelihoods or lives to their belief in an ideology - rarely consider approaches that conflict with their conditioning.

I'm all for ritual, belief and ideology when practised by consenting adults. Less so, when they dictate policy that denies our diversity and humanity. How often do we speak with good, well-meaning people who are committed to a particular political party, or who identify themselves with a particular political grouping? Then you come across their blind spot, where application of their ideology led to undeniably unfortunate results...but they can't see that. We probably all have such blind spots. The richness and complexity of history, and the application of selective memory mean that most of us can plausibly attribute all the bad things that

happen to the beliefs, politicians, countries or cultures that we don't like, and all the good things to the successes of the ideology that we favour.

It won't work any longer, if it ever did. In an increasingly complex world, relationships between policy programmes and their outcomes are ever more difficult to identify and the consequences of failure ever more disastrous. Our lazy tendency to impose a binary worldview on such potential crises as climate change, ownership and control of resources could prove disastrous. It would be a tragedy if the excerpt above, about China's stifling of experimental approaches is accurate. The Chinese people in particular have seen where a top-down, monolithic approach leads.

It's time to quit looking for an all-embracing ideology that tells us whom we can rely on, or how best to approach every political, social or environmental problem. We must accept that cannot rely on any god, religion, political approach or economic belief system - not when it comes to policymaking that affects people. We need diverse, adaptive approaches that transcend ideology.

My suggestion is that instead we subordinate policy to outcomes. It's much easier to get consensus on what we as a society want to achieve than on the ways to achieve it or on who shall be paid for achieving it. [3]Social Policy Bonds would allow this: governments would still get to raise revenue for achieving our social and environmental goals and still articulate society's goals. But under a bond regime they would relinquish control over how our goals shall be achieved and who shall achieve them. In this way, they could target long-term problems whose solutions have so far eluded us and for which there is no obvious single pathway. National problems such as poor [4]health, [5]crime, [6]unemployment. And global problems such [7]war, [8]climate change, or [9]nuclear catastrophe.

#### **15.8.4 Incentives to avoid long-term disasters (2018-08-27 18:36)**

Someone by the name of Amaxen comments on a recent [1]story about cybersecurity:

[T]o managers, security is not something you can point to as an achievement, isn't something you can really 'measure', doesn't make a contribution to the bottom line of whatever organizational goal you have, and ultimately you could spend infinite money on security and still not guarantee it, while on the other hand a system in development slipping schedule is very visible to managers, so there's always a tendency throughout the organization to push the priority for security down when it comes to making tradeoffs, and this despite the full knowledge by IT managers that this is a thing they should account for. [2]Source

We overuse narrow, short-term, readily available numerical indicators, often to the exclusion of the bigger picture. Managers do it with cybersecurity but it happens universally; for instance when it comes to valuing equities or, more critically, when we target, implicitly or explicitly macro-economic variables such as Gross Domestic Product. We focus on aspects of reality that can be captured by numbers even when any correlation between those numbers and the well-being of a society or ecology is incidental or even negative.

This tendency works against our best interests, because those things that we can't accurately monitor can be crucial. An organisation cannot measure the probability of a cyberdisaster, but it can measure the money it spends on cybersecurity. We can't accurately measure societal well-being but we can measure economic growth. We can't measure the probability of a nuclear war, but we can measure the funding of bodies ostensibly aimed at reducing it.

So where do [3]Social Policy Bonds come in? They would change the identity of the people doing the measuring and they reward success and, just as crucially, terminate failures. An organisation wanting to reduce the threat of cyberdisaster could take out some form of broadly defined insurance against that sort of disaster: one that would apply beyond the career horizons of the security officers in that organisation. But, unlike a conventional insurance policy, the issuers of the policy would take an active role in monitoring the organisation's systems. It would be highly motivated to do so effectively, because its contract with the organisation would penalise any failure.

At the policy level, instead of (or as well as), for example, paying bodies of the United Nations or non-governmental organisations to turn up for work and write papers, we could issue [4]Nuclear Peace Bonds that would reward people for achieving a sustained period of nuclear peace, *whoever they are and however they do so*.

What about societal well-being? Trickier. Thinking aloud: We could stop assuming it's correlated with Gross Domestic Product (or GDP per capita) and put more effort into measuring it and its components. We could stop ignoring things like inequality and levels of trust that

are (currently) not that easy to measure but that, on all the evidence, are crucial components of social well-being. We could compile something like the [5]Human Development Index with objective measures that correlate strongly with well-being. Government could target improvements in this and other objective indicators, rather than blindly aim for economic growth at all costs, which seems to be the default activity. Alternatively it could also concentrate solely on such undisputed components of well-being ([6]health, for instance or, at a global level, [7]absence of conflict) and, as in the previous examples, issue bonds that reward the absence of large falls in those components.

The important points are that the people doing the achieving of our goals should have incentives to be efficient and to take a long-term view. Social Policy Bonds, being [8]tradeable, allow us to target remote goals, because the composition and structure of our motivated coalition of goal-achievers can change in response to changing events and circumstances. We need diverse, adaptive solutions to our problems, which are exactly the sort of solutions that government at any above the least aggregated level, can't provide. Social Policy Bonds would give people incentives to find those solutions and implement them.

## 15.9 September

### 15.9.1 Armed conflict and astrology: root causes distract (2018-09-03 18:56)

Just because we don't know everything about cause and effect, that doesn't mean we throw up our hands in frustration and decide to do nothing. Or, the more common reaction when a social problem becomes inescapably visible: or create ineffectual bureaucracies ostensibly aimed at solving them (climate change, nuclear proliferation) but actually doing very little.

Take armed conflict: it's not difficult to reel off whole screeds of plausible reasons for its occurrence, or even its inevitability. Poverty, ignorance, despair, and differences of wealth, ethnicity, religion, class, culture or ideology: all these are

thought to be some of the 'root causes' of war and violence. As also are: inequalities in access to resources, scarcity and economic decline, insecurity, the violation of human rights, exclusion or persecution of sectoral groups, and state failures including declining institutional and political legitimacy and capacity. Other key foundations for conflict could be historical legacies, regional threats, the availability of weapons, economic shocks, and the extension or withdrawal of external support. Demography is also significant: large numbers of unemployed males can catalyse conflict.

Sometimes

inward factors are cited; such as individual pathologies; perhaps a history of being abused that predisposes someone to take up violence in later life. Often blamed too are the media, and the frequency with which our children are exposed to images of violence - especially when violence is presented as an acceptable and effective way of solving problems.

No doubt all these factors can and do play a part in fomenting and fanning the flames of conflict. But (1) every 'root cause' will have its own root cause and (2) even aside from the impossibility of eliminating every potential cause of conflict, there is no inevitability that these causes will lead to armed conflict. Selective memory has strengthened these linkages in the collective mind, but for each of these 'root causes' there are examples that disprove any simple cause-and-effect relationship. There are, for example, dozens of countries in which people of different ethnicity and religion live happily side-by-side.

Perhaps Tolstoy summed it up best:

The

deeper we delve in search of these causes the more of them we discover, and each single cause or series of causes appears to us equally valid in itself, and equally false by its insignificance compared to the magnitude of the event. [1]War and Peace, page 85, Leo Tolstoy, 1867

Searching for alleged root causes, then, might not be the best way of trying to solve a problem. Applying the [2]Social Policy Bond principle could be the answer. For instance, instead of policymakers' trying to look for and deal with root causes of armed conflict, they could raise the revenue to back [3]Conflict Reduction Bonds. Then it would be up to bondholders to identify the most cost-effective ways of reducing conflict. That might involve looking for root causes, but *only if doing so will be the most efficient way of achieving the outcome we seek.*

As an aside, I'll quote the former Grand Archdruid, John Michael Greer on the subject of astrology :

Why do the positions of the planets relative to the 30° wedges of the ecliptic that astrologers call the zodiacal signs, and the position of these relative to another set of wedges of space, the mundane houses, which are calculated from the point of view of the observer, predict the future? Why do those 30° wedges have the effects they do, even though the stars that occupied those wedges in Babylonian times have moved on due to the precession of the equinoxes? And why should the chart cast at the moment of the spring equinox of 2019 in London provide insight into how Britain will fare through Brexit? There's a simple answer to this, which is that *nobody knows*.

Astrology didn't come into being because somebody decided to cook up an elaborate theory about planetary influence. It came into being because people who watched the skies in various parts of the world in ancient times noticed that certain relationships among those little bright dots in the night sky provided reliable advance warning of certain events down here on Earth. [4]An astrological interlude, John Michael Greer, 29 August (my emphasis)

My point: the important thing is to solve problems, not try to work out why they have arisen. It might be a good idea to look for root causes, but it might be more efficient instead to aim for the outcome that we want without doing so. Trying to understand fully the relationships between cause and effect may be a waste of time, or actually delay and impede the achievement of our social and environmental goals. Outcomes are more important than theory, whether we are talking about ending war or predicting the future.

### 15.9.2 Conflict Reduction Bonds ex machina\* (2018-09-11 18:08)

The *Economist* foresees an imminent human catastrophe in the Syrian city of Idlib:

In the battle last year for Mosul, an Iraqi city of [fewer] than 1m[illion], the American-led coalition killed at least 1,000 civilians despite using mainly precision-guided, or “smart”, bombs. Idlib, whose population is three times larger, will face Russian bombs that are almost entirely unguided, or “dumb”, meaning they are quite likely to miss their targets and instead hit civilians. [1]The battle for Syria’s last rebel redoubt looms, the ‘*Economist*’, 8 September

Meanwhile Katherine Bourzac writes about research into an innovative way of dealing with the brine generated by reverse osmosis, which would otherwise be dumped into the sea with possibly damaging effects on the marine environment:

[A]llowing forward, not reverse, osmosis [makes] it possible to get more and more water to flow across a salt-excluding membrane into a container of brine, increasing the pressure. That pressurised water can be used to drive a turbine and generate electricity in a process called pressure-retarded forward osmosis. [2]Our thirst for water is turning the oceans saltier, Katherine Bourzac, ‘*New Scientist*’, 8 September

The details aren’t important. My point is the contrast between the two visions for humanity. On the one hand, we face a human-induced scene of carnage, avoidance of which is assumed to be beyond our capabilities. On the other, we have scientists and engineers researching ingenious ways of improving the environmental consequences of extracting fresh- from sea-water.

Is it too simplistic and naive to think that the immense human costs of the forthcoming Idlib catastrophe outweigh any benefits that might accrue to the competing factions in the Syrian conflict? And, if we accept that, why do we assume that we can’t do anything about avoiding them?

The answer, I think, is that our multitudes of political systems aren’t fit for purpose. They are incapable of aggregating the wishes of ordinary human beings, and weighting them against the perceived, narrow, self-interest of (in this case) politicians, warlords and arms merchants in Syria and beyond; maybe a couple of hundred guys who could halt the catastrophe, but choose not to. The problem, as we see from *New Scientist*, is not a lack of human ingenuity. The problem is that, while some of it’s channelled into schemes that benefit humanity, far too

much is channelled into endeavours you might think of as low priority or - much worse - into creating and prolonging human catastrophe.

We could, and many of us do, sneer at the profit motive as a solution to human problems. There are many, especially on the left, so blinded by ideology that they see monetary incentives as unacceptable ways of solving our human problems. Presumably these people are waiting for some sort of psychological revolution, or *deus ex machina*\* or maybe they feel it more important to belong to a tribe of believers in their bankrupt ideas than actually pay people to solve problems that in their view, shouldn't exist and wouldn't exist if we were all nice to each other.

I don't think we can afford those views. The challenges we face on all fronts - environmental, as well as political and military - are too huge and too urgent. As well, just as teachers (these days) are paid, so too would providing incentives for people to, for instance, eliminate war, bring more people and more resources into that endeavour. Some might become rich by helping eliminate war (is that so terrible?); others might simply earn the same salary as they would say, by [3]advertising pet-food or working as a warehouse person in a plant that manufactures chemical weapons.

For centuries religious leaders, monarchs, ideologues, international organisations and politicians of all stripes have failed to end war. Even now, as with Idlib, we think we are powerless to prevent it. Why does violent political conflict continue to cause untold suffering, despite most people's deeply-felt wish to live in peace?

We cannot answer these questions now, but I don't think we need to. What we can do is reward peaceful outcomes, *however they are achieved and whoever does so*. Nobody can possibly identify and remove all the possible causes of violent political conflict. But what we can do is reward the sustained periods of peace and leave it to a motivated coalition to explore potential solutions and implement the most promising ones. Currently, instead of rewarding peace, governments finance activities, or institutions, or programmes, or policies that are supposed to work for peace, but have signally failed to achieve it. The answer, I think, is to make the rewards conditional on the ending of war.

Conflict Reduction Bonds would do this. Backed by governments, philanthropists, non-governmental organisations and the public, possibly under the auspices of the United Nations, they would be issued on the open market for whatever price they would fetch, and would be tradeable at all times. They would be redeemed for a fixed sum only when the number of people killed or injured by violent political conflict reached a very low level. Importantly, the bonds would make no assumptions as to how to bring about greater peace - that would be left to bondholders. Unlike normal bonds, Conflict Reduction Bonds would not bear interest

and their redemption date would be uncertain. Bondholders would gain most by ensuring that peace is achieved quickly. The broad effect would be twofold:

- More resources would be devoted to achieving the outcome of peace
- Market incentives and efficiencies would be injected into every stage of peace building.

Many peace-building bodies, whether public- or private-sector, work in admirable and diverse ways, but their efforts are relative to the size of the problem, small-scale and uncoordinated. For all such bodies, the financial rewards from building peace are not correlated with their effectiveness in actually doing so. This negatively affects not only, as some would have it, the salaries of employees, but their number, the resources they have at their disposal, and their incentives. Conflict Reduction Bonds, in contrast, would explicitly reward movement toward a targeted peace outcome. They would focus on an identifiable outcome and channel market efficiencies into exploring ways of achieving it. They could be the most effective means of achieving the peace that people all over the world yearn for and deserve.

For more on Conflict Reduction Bonds and variants see [4]here.

### 15.9.3 The importance and neglect of sustained personal care (2018-09-21 17:45)

Michael Hobbes writes:

In 2017, the U.S. Preventive Services Task Force...found that the decisive factor in obesity care was not the diet patients went on, but how much attention and support they received while they were on it. Participants who got more than 12 sessions with a dietician saw significant reductions in their rates of prediabetes and cardiovascular risk. Those who got less personalized care showed almost no improvement at all. [1]Everything You Know About Obesity Is Wrong, Michael Hobbes, 'Huffpost', 19 September

Markets can't readily capture things like 'personalised care', so our political system gives them little weight. Yet they prove to be crucial in determining not only meaningful outcomes like physical and mental well-being, but also more measurable quantities, such as morbidity; elements of which *can* be monetarily valued. Just as reducing crime doesn't - or shouldn't - mean simply giving more cash to police forces, so improving a nation's health shouldn't just mean dispensing spending more on doctors, hospitals, dietary advice or encouraging more exercise. Unfortunately, institutions have their own goals, and that includes government itself (the bodies that dole out taxpayer funds) and the public- or private-sector agencies (that allocate these funds). These bodies have little incentive to do things that fall outside their purview, however beneficial or efficient they might be. So if more 'personalised care' is found to be the best way of tackling not only obesity but also, say [2]mild depression, or attention deficit disorder in children, then it's unlikely to be promoted over the diets or drugs that show an immediate, financial benefit to existing organisations.

Our large, complex societies need to take a broader approach; one that rewards social outcomes. Social goals should have primacy over institutional goals. We should reward approaches that solve our social problems, *even if there is currently no organisation following that approach.*

Enter [3]Social Policy Bonds. Under a bond regime, it is the social goal that's targeted, and we do not assume that existing bodies can implement the best ways of achieving it. Non-market approaches - such as personalised care - often fall through the cracks. And finding the best approach for a particular problem at a particular time in a particular place needs a suppleness that large, top-down organisations usually lack. Our social and environmental problems need diverse, adaptive approaches. Social Policy Bonds would stimulate the research, experimentation and adoption of the best of these approaches. They would reward people for solving our problems, rather than for simply turning up to work and carrying out an approved activity. They would reward innovative approaches if they are the most efficient and, if current bodies can't implement them, they will give rise to a [4]new type of

organisation: ones whose protean composition and structure would be entirely subordinate to their goals - which would be exactly those of society. It's unlikely that existing health bodies in most countries would find room for the sort of sustained, personalised dietary advice that Mr Hobbes mentions. Social Policy Bonds targeting [5]health, on the other hand, would encourage people to investigate such an approach and, if they find it as beneficial as it appears, see that it's adopted.

#### 15.9.4 Giving greed a chance (2018-09-29 18:11)

Looking at the scale of social and environmental problems that mankind faces, you might think that we don't have the resources necessary to make fundamental changes in the way we operate. Changes such as eliminating extreme poverty, improving health outcomes, dealing with environmental problems, and reducing violent political conflict. The good news, though, is that we are not short of funds to address these, and other, challenges.

Brooke Harrington in *Capital without borders*, writes about people working in the wealth management industry:

Their work radically undermines the economic basis and legal authority of the modern tax state.... Using trusts, offshore firms, and foundations, professionals can ensure that inequality endures and grows in a way that becomes difficult to reverse short of revolution. Brooke Harrington, [1]*Capital without borders*, September 2016

And then there is corporate welfare. Nathan Jensen writes, about the US:

Every year, states and local governments give economic-development incentives to companies to the tune of between \$45 billion and \$80 billion. Why such a wide range? It's not sloppy research; it's because many of these subsidies are not public. [2]*Do Taxpayers Know They Are Handing Out Billions to Corporations?* 'New York Times', 24 April

People are behaving perfectly rationally given the incentives on offer. In most cases they are behaving perfectly legally too. But the result, from an ordinary person's point of view is a massive misdirection of resources into activities that are destroying our social and physical environment. We have [3]greed - otherwise known as self-interest - and we have untold wealth. It's my contention that we could solve the world's problems without having to rely on changing human nature, by redirecting our greed and that wealth into unambiguously useful activities.

The vehicle by which we could do this is the [4]Social Policy Bond. The idea is that Social Policy Bonds direct self-interest into achieving socially beneficial outcomes. Governments don't have to try to work out how to achieve these outcomes, nor who shall be charged with doing so. It is the self-interest of bondholders that ensures that resources flow only the most efficient ways of achieving our goals. With just a little bit (relative to the magnitude of the problems at hand) of tinkering, we can substitute 'our goals' meaning humanity's goals, for those individual and corporate goals, the pursuit of which is not only diverting resources from more useful activities, but is actively undermining our chance of survival. Social Policy Bonds would channel our self-interest into the achievement of these goals. It would seem to be safer and more humane to do issue Social Policy Bonds and give greed the chance to solve our problems, than to carry on as we are and hope that the revolution Ms Harrington fears turn out not to be catastrophic.

## 15.10 October

### 15.10.1 Human nature is peaceful (2018-10-06 16:08)

People (like me) who believe world peace is possible are often put in a box labelled 'Idealists.' So weapons continue to pile up and when we see the horrors of war on our tv screens, we sigh as though violent human conflict were inevitable. The wealthiest amongst us plan escape routes or [1]prepare for war's aftermath. The rest of us dutifully contribute to peacekeeping efforts by such bodies as the United Nations, though with no expectation that they will actually achieve very much.

In [2]War, Peace and Human Nature, Douglas Fry et al argue that (1) the belief that war

is part of human nature is itself destructive and (2) war is not part of human nature.

A view, erroneous though it may be that war is ancient and presumably thus reflects some natural feature of humankind or human social life, feeds a suspicious and hostile view toward other peoples and countries, making the preparation for war and the practice of war that much easier. The reasoning, or in many cases “gut reaction,” seems to be: if war is in human nature, then we’d better be prepared to fight and perhaps strike first. This implicit assumption, in great part simultaneously stemming from and reinforcing of the violent view of human nature, can be seen as contributing to arms races, preemptive strikes, excessive spending on weapons, hostility toward others, and inordinate fear of other nations or groups, who are by this thinking, naturally inclined to attack. I am suggesting, in other words, that in widespread assertions that war is ancient, we are seeing a cultural belief with very important real world ramifications. Such a view may be in the short-term self-interests of a minority (e.g., arms dealers), but it is not in the long-term interests of humanity overall.

It’s an important point. And much of the rest of the book backs up the assertion, that over the whole period of human existence, war is not an intractable feature of humanity, Mr Fry has this to say, summing up the evidence gathered and written up by other contributors to the book:

[Steven] Pinker’s [3]thesis that chronic war stretches back over the far-reaching millennia before the agricultural revolution is not substantiated by the actual data. ... The worldwide archaeological evidence shows that *war was simply absent over the vast majority of human existence* ... —the time period beginning far to the left side of [an n-shaped] curve. But with a gradual worldwide population increase ..., the shift from universal nomadic foraging to settled communities, the development of agriculture, a transition from egalitarianism to hierarchical societies—and, very significantly, the rise of state-level civilization five thousand to six thousand years ago—the archaeological record is clear and unambiguous: war developed, despots arose, violence proliferated, slavery flourished, and the social position of women deteriorated. This comparatively recent explosion in pre-state and then state-based violence is represented on the rising left side of the letter n in the curve, but taking place within the last 10,000 years. (My emphasis.)

Conclusions? People who believe world peace is possible are not being irrational or going against human nature. Violent political conflict is not inevitable.

Where does the [4]Social Policy Bond idea fit in? Simply: knowing that world peace is possible, we can issue [5]World Peace Bonds as a way of rewarding the people who help achieve it. There are reasons why such bonds have not been issued (they're untried, they threaten existing institutions ...etc) but a big one is that people think that world peace is some Edenic, idealistic vision, not for this world. What Mr Fry and the other contributors to his book show is that world peace is not only possible, but it was, for the greater part of man's existence, a reality.

### 15.10.2 The finance curse (2018-10-12 18:15)

Nicholas Shaxson writes about the UK's 'finance curse':

A [1]growing body

of economic research confirms that once a financial sector grows above an optimal size and beyond its useful roles, it begins to harm the country that hosts it. The most obvious source of damage comes in the form of financial crises - including the one we are still recovering from a decade after the fact. But the problem is in fact older, and bigger. Long ago, our oversized financial sector began turning away from supporting the creation of wealth, and towards extracting it from other parts of the economy. To achieve this, it shapes laws, rules, think tanks and even our culture so that they support it. The outcomes include lower economic growth, steeper inequality, distorted markets, spreading crime, deeper corruption, the hollowing-out of alternative economic sectors and more. [2]*The finance curse: how the outsized power of the City of London makes Britain poorer*, Nicholas Shaxson, "The Guardian", 5 October

It's not just the finance sector that works to influence policy in ways that drain resources away from ordinary people and small businesses: governments the world over are in thrall to big business. They act as though the interests of big corporations coincide with those of the citizens they are paid to represent. Our economies and societies are so complex that they can believe this, or act as though they believe it, with impunity. The Social Policy Bond idea is

an attempt to re-orientate policymakers so that they again think in terms of the well-being of citizens, rather than the financial health of private- or public-sector bodies whose operations might, or might not, generate net welfare gains.

Almost all of us want to see a healthy business sector and an effective welfare system for the most disadvantaged. Government, and often, only government, can and should do the basics: infrastructure, education, health up to certain levels. But when things become complicated we should be targetting ends, rather than the supposed means of achieving them. The finance sector, which should be the financial *services* sector, has become grotesquely enlarged because of this confusion. So:

Lending to businesses outside the financial world – which many people might think the principal activity of a bank – represents about 3pc of the activity of British banks. [3]The City services only itself, John Kay, 'The Telegraph' (London), 9 September 2015

Fine if the bankers want to do other things, but they shouldn't siphon funds from the rest of the economy, nor manipulate the regulatory environment, to do them. A Social Policy Bond regime wouldn't confuse ends with means, and wouldn't subsidise big business at the expense of ordinary citizens and small businesses. As Mr Kay puts it: 'We do not need an army of the overpaid and overbonused buying and selling from each other.' We don't need it and we certainly shouldn't tax people to pay for it.

### **15.10.3 They got away with it in agriculture, so why not everywhere else? (2018-10-14 18:09)**

George Monbiot writes about the European Union's corrupt, insane Common Agricultural Policy:

I'm a Remainer, but there's one result of Brexit I can't wait to see: leaving the EU's Common Agricultural Policy. This is the farm subsidy system that spends [1]€50 billion a year on achieving none of its objectives. [2]*Farmed Out* , 12 October

(I would say "*stated* objectives".) I'm [3]not a remainer, and the CAP is one reason why. There's little to add to Mr Monbiot and others' litany of the CAP's disastrous effects on the [4]environment, [5]small farmers, [6]animal welfare, [7]Africa and human [8]health, but the persistence of the CAP is illustrative:

(1) It's been widely challenged for decades, yet its beneficiaries are wealthy and powerful enough to resist any meaningful reform.

(2) Agriculture in all the rich countries is a sector in which government involvement has been pervasive and long lasting.

The key question is: in whose interests are these agricultural policies? The answer is clear: agribusiness and landowners (especially the biggest). The losers? The rest of us: [9]people who eat, taxpayers, plus the farmed animal population, plus the physical environment. Even would-be farmers don't benefit: they have to buy land at prices inflated by government subsidies.

It's not just agriculture.

Increasingly, the complexity both of society and our policymaking process is being weaponised in favour of the people who own and run corporations, or the people they pay (in or out of government) to understand and influence policy. Government and their paymasters can get away with this because we accept a policymaking system that doesn't explicitly target outcomes that are meaningful to ordinary people. Currently policymakers can - indeed must - express their decisions as vague declarations of intent and changes in institutional funding and composition, or legislation. Their focus is on the supposed means of achieving vague outcomes, rather than on the outcomes themselves.

Issuers of Social Policy Bonds would in contrast have to be explicit about their objectives: transparency and accountability are built into a bond regime, as surely as they are excluded from the current policymaking apparatus. Insane, corrupt programmes, such as Europe's Common Agricultural Policy, have platitudinous, vague, mutually [10]conflicting goals, which sound lofty and high-principled but actually end up shovelling vast sums of taxpayers' and

consumers' money into the bank accounts of agribusiness corporates and their lobbyists. If outcomes were built into policymaking, as they would be under a Social Policy Bond regime, such policies would get nowhere. Instead they have lasted for decades, at great cost to everybody except a few millionaire businessmen and landowners, a burgeoning, parasitical bureaucracy and lobbyists . [11]Oh, [12]and [13]fraudsters.

It's the persistence of such stupid policies as the CAP, which swallows up about the 40 percent of the EU budget, that makes imperative a systemic change in the way we formulate policy. Twenty-seven years ago, P J O'Rourke could write this, about the American political system in general, and that country's Farm Bill in particular:

I spent two and a half years examining the American political process. All that time I was looking for a straightforward issue. But everything I investigated - election campaigns, the budget, lawmaking, the court system, bureaucracy, social policy - turned out to be more complicated than I had thought. There were always angles I hadn't considered, aspects I hadn't weighed, complexities I'd never dreamed of. Until I got to agriculture. Here at last is a simple problem with a simple solution. Drag the omnibus farm bill behind the barn, and kill it with an ax. [14]*Parliament of Whores,*

P J O'Rourke, 1991

Since then, little has changed in agriculture, but the complexities in society and policymaking have proliferated and continue to perplex ordinary people. Consequentially, the gap between our corporate-political caste and the people they are supposed to represent has continued to widen. Clarity and transparency about policy objectives are essential if that gap is ever to close. Rewarding people who actually achieve these goals, rather than bodies who merely say they will, will also be necessary. Social Policy Bonds would fulfil both requirements.

#### **15.10.4 Say no more (2018-10-25 19:03)**

Excerpts from two sources show just how wide the gaps between our political systems and citizens have become. First, from the UK:

I looked at the Bank of England data and it was 3.5 % of business lending went to manufacturing, a century or so ago that number would have been more like 80 % and that's a trend that has been going on for a long time. And you compare this 3.5 % going to manufacturing with 75 % going to either finance or real estate and you can see that something's wrong, finance has become kind of unmoored and disconnected from the real economy. [1]*How oversized finance sectors are making us poorer*, Nicholas Shaxson, September

And from the US, Jane Mayer writes about the role of the [2]Koch brothers in the presidential election of 2016:

In fact, amazingly, in 2016 the Kochs' private network of political groups had a bigger payroll than the Republican National Committee. The Koch network had 1,600 paid staffers in thirty-five states and boasted that its operation covered 80 percent of the population. ...[T]he Koch network was sponsored by just four hundred or so of the richest people in the country. [3]*Election Night 2016*, Jane Mayer, 2017

There's little more to be said, except that that within our current policymaking systems, there is no self-correcting mechanism. People become wealthy within the system, and use that wealth to manipulate the system to make themselves even more wealthy. Even if the gap between politicians and people were seen to be a problem, there's nothing within our current political systems to close it. It keeps growing wider. It's clear now that anything that, on the one side, billionaires big business and politicians can do to extract resources from ordinary people and small businesses, they will do. Our ruling caste gets away with it because policymaking, by accident and design, has become an arcane, protracted process, comprehensible only to those directly involved in it or paid to follow it.

That, and society's increasing complexity, is why I suggest politics be rejigged to focus on outcomes that are meaningful to ordinary people, and that market forces, currently subverted or gamed by the wealthy, be instead channelled into the public good. That's where Social Policy Bonds would enter the picture. It's true that, under a bond regime, many investors in the bonds would be rich and, if their bonds were redeemed early, they would become richer. But this would be a socially beneficial way of acquiring wealth. The value of their bonds would rise only if society's targeted outcome, as articulated by democratic governments, become more likely to be achieved quickly. The goals of investors in the bonds and society would be exactly congruent.

A less obvious benefit of a bond regime is that, being a socially beneficial way of acquiring wealth, it would divert human and other resources away from other less socially beneficial ways, like, for instance, much of banking or speculation in real estate.

## 15.11 November

### 15.11.1 Between gods and government (2018-11-03 18:44)

*The Actuary* interviews [1]Maurice Ewing, managing director of *Conquer Risk*:

"I thought economics would be talking about 'big picture' issues, but realised that, over time, the profession had become focused on purely academic questions. What was noticeable was the inability of neo-classical economics to explain financial crises." Richard Purcell quotes [2]Maurice Ewing, 'The Actuary', October

I share Dr Ewing's disenchantment with the economics profession, and have written elsewhere ([3]here, for instance) about how all institutions, including not only universities, but also government agencies, religious bodies, trade unions, large corporations and the rest have as their over-arching goal that of self-perpetuation. Which is why I advocate instead a [4]new type of organisation; one whose structure and composition are adaptive and determined

solely by their effectiveness in achieving society's goals. Mr Purcell's article continues:

To help monitor risk culture and policies designed to nudge behaviour, Ewing thinks we also need to change key performance indicators so that they are not arbitrarily set and are designed with the people meeting the target in mind.

This makes sense if we take the 'people meeting the target' as a given - which presumably will be the guiding assumption for companies. Extrapolated to the achievement of broad social goals, however, it doesn't work. Our larger goals should not be limited by the capabilities of people currently charged with helping to achieve them. We can and should aim for ambitious targets: eliminating [5]poverty, universal [6]literacy, the [7]ending of war. These are long-term goals, but we can target them by issuing Social Policy Bonds. Under a bond regime, the coalition that works to achieve our goals would not take 'the people meeting the target' as a given. The coalition would be a protean body; its composition and structure changing adaptively, wholly determined by their efficiency in achieving its targeted goal.

Sadly, we all seem to share the limited purview of governments. The goals that I espouse, (world peace, universal literacy etc), we assume are beyond the reach of mortal man and delegate responsibility for achieving them to deities or their supposed representatives on Planet Earth. People do good work in making incremental gains in social and environmental well-being but, for the big picture goals, we need to do things differently. A Social Policy Bond regime need not be constrained by the unambitious and self-interested goals of existing organisations. Rather than rely on divine intervention it could realistically target our most ambitious goals by deploying the best way of allocating society's scarce resources yet devised - market forces - in ways that encourage and reward only the most efficient and effective initiatives.

### **15.11.2 Metrics and their limits (2018-11-11 18:45)**

Stefan Collini summarises the most important weaknesses of using quantifiable data - metrics - as described in Jerry Z Muller's book [1]*The Tyranny of Metrics*:

Misdescription of purpose is fundamental: in the attempt to find outcomes that are measurable, complex characterisations of purpose are replaced by quantifiable results. 'Goal displacement' is also a major problem: where a metric is used to judge performance, energy will be diverted to trying to improve the scores at the expense of the activities for which the metric is supposed to be a proxy. ... But there are less obvious effects too, such as discouraging risk-taking, undervaluing co-operation and common purpose, and the degradation of the experience of work. [2] *Kept alive for thirty days*, Stefan Collini, 'London Review of Books' (subscription), 8 November

I see the need to rely on metrics as a product of big government, itself a function of the highly complex, highly aggregated societies in which we live. What is termed multiculturalism doesn't help either. Lacking a common history and common values, our needs are less readily appreciated by any large centralised body. So our politicians have to rely on quantifiable data. In this, our national governments have more in common with other big organisations (corporations, trade unions, other governments) than with the people it's supposed to represent. All these institutions have two main things in common: first, that their over-arching objective is that of self-perpetuation, about which I've written [3]before. Second, that they rely heavily on easily quantifiable data.

Things were simpler in earlier days:

[W]e prefer to take our chance of cholera and the rest than be bullied into health. A leading article from the [London] *Times*, 1 August 1854, in response to government measures to provide basic sanitation.

Problems themselves were more obvious; the causes of problems could be more readily identified, and so could solutions to some of them. Governments were largely successful in their policy interventions on behalf of the disadvantaged: they instituted basic health and education for their own populations. They provided other public goods, such as law and order, and sanitation. And they did so with great success and sometimes, as the quote shows, against strident opposition.

In our industrial societies, with their large, complex economies, government bodies have far more complicated tasks, but they still believe that the best way solving problems is to look for causes and try to treat those. And they still believe that they are best placed to perform these tasks. Government has enlarged its role and largely supplanted families, extended

families and local people in supplying a range of welfare services to those who need them. Increasingly government is turning to numerical indicators to manage its resource allocation.

But this use of indicators is relatively recent, unsystematic and unsophisticated, as Messrs Collini and Muller relate. Few indicators are targeted explicitly for a sustained period: the targeted range of inflation in, for instance, the UK, is a rare (and not especially helpful) exception. Other indicators, such as the size of hospital waiting lists, don't measure what matters to people, or are prone to manipulation. Even when numerical goals are clear and meaningful they are rarely costed, they are almost always too narrow and short term, and they are largely driven by existing institutional structures. Those broad targets that are targeted with some degree of consistency tend to be economic aggregates, such as the inflation rate, or the rate of growth of Gross Domestic Product — which appears to be the *de facto* measure of success of rich and poor countries alike.

But GDP's shortcomings as a single indicator of the health of an economy are well known: amongst other failings, GDP does not take into account changes in the quality of the environment, or the distribution of income, it ignores human capital (the education and skills that are embodied in the work force) and leisure time, and it ignores such social problems as crime and homelessness.

Much of what matters most to us - family, relationships, connection with nature, meaningful work etc - is impossible to quantify. Unfortunately, the underlying assumption, as Mr Collini tells us, is that:

...the right structure of incentives and penalties will ultimately improve the bottom line of any business. Organisations whose rationale is not the maximisation of profit, such as schools, hospitals, universities, museums and so on are a challenge to this idea because their 'product' does not take financial form. So some equivalent has to be found - the numbers passing certain exams or being treated within certain times - on the basis of which quantitative targets can be set and performance rewarded or punished accordingly.

What's to be done? My suggestion is that we target broad, long-term goals that are meaningful to ordinary people. They should be quantified by indicators or targets that are *inextricably* linked to people's well-being. Achievement of these goals must be exactly congruent with achievement of society's wishes, as articulated by democratic governments in consultation with its citizens. And the achievement of these goals should be contracted out in a way that lets market forces - the most efficient way yet devised of allocating our scarce resources - play

their role in maximising efficiency.

I suggest that we issue Social Policy Bonds to target such goals as: stabilising the [4]climate, achieving universal [5]literacy, improving citizens' [6]health, and preventing [7]nuclear conflict. By issuing the bonds, a government, or coalition of governments and others, need not specify how such long-term goals are to be achieved, nor who shall achieve them. Broad national or global goals can be more reliably quantified and are much less costly to monitor than narrow, short-term goals which, amongst other deficiencies, allow problems to be shifted to non-targeted areas or time periods.

What about things that cannot be readily or reliably quantified? Family, mental health, some aspects of the Commons? Perhaps government's role here should be that of laying down minimum standards based on those criteria that can be measured, and then backing off: making sure it doesn't discourage diverse approaches, ensuring that its regulations do not favour the large at the expense of smaller concerns, be they voluntary, non-profit, co-operative or smaller businesses. Neither this approach, nor a Social Policy Bond regime, will come about easily. They would mean government relinquishing some of its power to create bodies, allocate funding, and have a large say in how to solve our social problems. But, in our ever more complex world, it's not particularly good at these things, and a bond regime would still need government to articulate society's wishes and to raise the revenue for their achievement. These necessary functions, democratic governments are actually quite good at. If all this sounds far fetched the question to ask is: in a world of increasing social and environmental complexity, facing urgent, huge challenges (climate change, nuclear proliferation etc), and rising political impotence and extremism... what is the alternative?

### **15.11.3 The jellyfish are taking over (2018-11-23 20:10)**

Bill McKibben writes about the shrinking world:

Until now, human beings have been spreading, from our beginnings in Africa, out across the globe—slowly at first, and then much faster. But a period of contraction is setting in as we lose parts of the habitable earth. Sometimes our retreat will be hasty and violent; the effort to evacuate the blazing California towns along narrow roads was so chaotic that many people died in their cars. But most of the pullback will be slower, starting along the world's coastlines. Each year, another twenty-four thousand people abandon Vietnam's sublimely fertile Mekong Delta as crop fields are polluted with salt. As sea ice melts along the Alaskan coast, there is nothing to protect towns, cities, and native villages from the waves. [1]*How extreme weather is shrinking the planet*, Bill McKibben, 'New Yorker', dated 26 November

Human, animal and plant life is under siege on many fronts. Any species closely attuned to its environment and incapable of moving to a different one is vulnerable. Loss and degradation of habitat, climate change: the human race is, in effect, prioritising current quality and quantity of (human) life at the expense of the long-term survival of the natural world, of which we are part. It's not been a deliberate choice, but it's what's happening.

The issues are too complex and slow moving for politicians to understand. Our policymaking systems are too cumbersome and corrupt to adopt policies that threaten the short-term interests of big corporations. Rather (or: as well as) despair at our collective fate, I suggest that we bypass our usual policymaking mechanisms and explicitly target the goal of long-term human survival.

The practical form of this could be the issuing of Social Policy Bonds that target an array of environmental indicators, including the well-being of human, animal and plant life. It's practical, in the sense that it doesn't require detailed scientific surveys or guesses as to how our targets will be achieved. Only the outcome - in the form of an acceptable range for each indicator - need be targeted; each indicator remaining in that range for a sustained period of, say, thirty years. Politicians could still play a role in raising the revenue for the achievement of this goal, and in articulating our species' exact wishes.

But it's not going to be happen. Governments aren't going to relinquish their power to allocate resources to favoured bodies. True, there is a good number of [2]Social Impact Bonds around, but politics in general is ever less concerned with outcomes, and more with image, identity, personality and ideology. I don't think philanthropists either are going to fund anything that [3]threatens the status quo. But on the off chance that there is any interest in aiming for the long-term survival of humanity and our planet, these [4]two [5]papers suggest how it could be done.

And the jellyfish? As Mr McKibben writes: "we have found ourselves unable to swim off beaches, because jellyfish, which thrive as warming seas kill off other marine life, have taken over the water."

#### **15.11.4 A new type of organisation (2018-11-29 17:44)**

Jerry Z Muller writes about the use of metrics in medicine:

But metrics tend to be most successful for those interventions and outcomes that are almost entirely controlled by and within the organization's medical system, as in the case of checklists of procedures to minimize central line-induced infections. When the outcomes are dependent upon more wide-ranging factors (such as patient behavior outside the doctor's office and the hospital), they become more difficult to attribute to the efforts or failures of the medical system. Jerry Z Muller, [1]*the Tyranny of Metrics*, February

One of the advantages of the Social Policy Bond idea, in my view, is that they could target things that are outside the remit of most existing institutions. So, for instance, holders of bonds targeting the [2]health of a population would have incentives to encourage non-medical health-improving practices. Not limited to the more obvious interventions - exercise and diet, for instance - bondholders could, for instance, aim to lobby local authorities to make neighbourhoods more walkable, or to subsidise employment for people who would otherwise be at high risk of becoming depressed. And not only in medicine: *the most efficient ways of solving our social and environmental problems may currently lie outside the remit of any of our existing institutions*. Only a broad, long-term approach, as encouraged by Social Policy Bonds, would encourage people to investigate this possibility.

What Social Policy Bonds would do, in effect, is redraw the boundaries of the organisation to take in factors that are currently untargeted, or targeted only incoherently and unsystematically. By focusing on broad metrics, applying to large populations, the bonds would encourage investors to consider *all* the important potential influences on the value of their bonds. A [3]new type of organisation would come into being, composed of a protean

coalition of bondholders, all of whose activities would be devoted to achieving our social goals as efficiently as possible. They would have powerful incentives to investigate and implement measures that achieve these goals regardless of whether or not they currently fall under the remit of existing bodies. Under a Social Policy Bond regime, efficiency and effectiveness in meeting our challenges would determine the structure and composition of our goal-achieving bodies.

## 15.12 December

### 15.12.1 It's not just nappies (2018-12-03 17:38)

Nappies, cloth or disposable, just won't go away. I've blogged about nappies before ([1]here and [2]here). A recent article in *New Scientist* revisits the issue, citing an updated [3]report done in 2008: [4]

...if cloth nappies were washed in full loads, air-dried on a washing line and reused on a second child, they resulted in 40 per cent lower greenhouse gas emissions than using plastic disposable ones. These benefits are likely to be even greater today [ie 2018] now that half the UK's electricity comes from low-carbon sources. [5]Are disposable nappies really so terrible for the environment?, Alice Klein, 'New Scientist', 21 November

The question posed by the article raises a general question here as to policymakers go about legislating or regulating in order to solve social and environmental problems. Most of these problems are complex: they have multiple causes whose significance changes radically over space and time. Our current policymaking system usually looks at a problem, or a symptom of a problem, tries to identify a cause, then goes about trying to legislate or regulate that cause so as to moderate its adverse effects. That works well when the relationship between cause and effect is easy to identify. But such is rarely the case today, as the nappies example shows.

It's not just nappies. Climate change is the same: we cannot rely on government to identify the causes of a complex problem, then do the right thing and, eventually, regulate it. There is too much scope for mis-steps along the way. The causes might be many and varied, with time lags and linkages impossible to verify. Legislating is nowadays a cumbersome and arcane process, and is often opposed or delayed by powerful interests that stand to lose if it goes forward. Results of policies are rarely monitored; still less are policies modified in the light of their impacts.

These flaws are inevitable in the way we make policy today. Fortunately, I believe there's an alternative. We need to focus on outcomes, and let the ways in which these outcomes be achieved be decided, on a continuous basis, by people rewarded only for achieving them. So: rather than government trying to deal with the problem of (say) landfill by commissioning a one-time study of the comparative benefits of cloth versus disposable nappies using fossilised data, it would instead target for reduction the volume of landfill. Rather than try to work out why there are more adverse climatic events, government should [6]reward reductions in the number and severity of such events. And rather than try to work out some alleged 'root causes' of violent political conflict, we could instead [7]reward the sustained absence of such conflict, *whoever achieves it and however they do so*.

Not only would this be intuitively more efficient than current the policymaking process, it would also be much quicker. It's taken decades to get to where we are now with regard to the causes of climate change and...adverse climatic impacts are [8]worsening. And we haven't even begun to identify root causes of war. We don't even know if there are any...

What I'm advocating is, of course, the Social Policy Bond idea, whereby we issue bonds that become redeemable only when a targeted social or environmental goal has been achieved. Investors in the bonds would themselves work out the best ways of achieving these goals, and they would be motivated to do so *efficiently and continuously*. It's a simple idea, but the ramifications are many and varied, and I've written about some of them in this blog and on the Social Policy Bonds [9]website. As I say: it's not just nappies. The traditional way of doing things just isn't working any more. It's time to focus on outcomes.

### **15.12.2 Health: begin with our goal (2018-12-15 19:21)**

Jerry Muller writes:

If ...doctors are remunerated based on the procedures they perform, that creates an incentive for them to perform too many procedures that have high costs but produce low benefits. But pay doctors based on the number of patients they see, and they have an incentive to see as many patients as possible, and to skimp on procedures that are time-consuming but potentially useful. Compensate them based on successful patient outcomes, and they are more likely to cream, avoiding the most problematic patients. Jerry Z Muller, [1]*The Tyranny of Metrics*, February 2018

It's perfectly understandable. People react rationally to the incentives on offer. For reasons that might be politically incorrect to suggest, we live in societies where the incentives are increasingly [2]extrinsic - mainly financial - rather than intrinsic, which has to do with the satisfaction of doing a job well. It's a trend, rather than an absolute, but it leads to perverse incentives in many, perhaps most, professions including, as Mr Muller tells us, medicine.

What's to be done? How should healthcare professionals be paid? Leaving it to the market, as some might propose, is not a workable solution. One reason - there are [3]others - is that the information asymmetry is too great. So: let's start with our goal: we want to see improvements in the long-term health of a country's population, and we want such improvements to be made as cost-effectively as possible.

My suggestion is that we apply the [4]Social Policy Bond idea to health. This could be done at a national level. A government would issue [5]Health Bonds that would become redeemable for a large sum once national health levels reach a targeted level, sustained for a period of years or decades. 'Health' would be measured by objective criteria, such as longevity, [6]Quality Adjusted Life Years, infant mortality rates etc. Each of these measures would have to fall into a targeted range before the bonds could be redeemed. Investors would buy the bonds and in doing so find themselves members of a protean coalition all with the same goal: to bring about improvements in the country's health. Having done their bit and (hopefully) having seen the value of their bonds rise, they'd sell their bonds to people willing to bring about further health improvements.

Bondholders' goals would therefore be exactly congruent with those of society: to improve the nation's health with maximum efficiency. Note that, while bondholders might hold the bonds only for short periods, the bonds could be in issue, depending on their redemption terms, for decades. Unlike current policy, they'd be long term in nature.

There are other advantages, one of which is that the government (or other issuing body) would not dictate how our health goals shall be achieved, nor who shall do so. Doctors and hospitals would certainly have some involvement. But bondholders, being motivated to find the most efficient pathways, might find that, for instance, subsidising youth clubs in certain areas, or providing cheap taxi services in others, or giving out free e-cigarettes, or paying doctors differently, would be the least costly ways of seeing results. The possibilities are endless and no government, nor any conventional organisation, can be relied on to investigate, experiment and implement the innovative, diverse, adaptive long-term solutions that will help achieve our goal. Health Bonds would see the creation of a [7]new type of organisation: one whose composition, structure and activities are entirely subordinate to society's goal: improving the nation's health as efficiently as possible.

### 15.12.3 Why I go on and on about nappies (2018-12-17 22:48)

Why do I keep [1]blogging [2]about [3]nappies? Because decrying the use of disposables rather than cloth (or vice versa), does not make for sensible policy. As such, the seemingly simple question of disposable versus cloth embodies in microcosm the inescapable difficulty of making policy about bigger concerns. There are always angles that we cannot foresee. Cleo Mussi, for instance, writes to the *New Scientist*:

.... I wonder whether the research comparing [cloth] to disposables took into account the fact that babies using cloth nappies tend to be toilet-trained day and night at a much earlier age – there is little more uncomfortable than a wet cloth nappy. A difference of six months to a year would lead to a child using 1100 to 2200 extra disposable diapers or nappies – a lot of extra landfill. Cleo Mussi, [4]Letter to the editor of 'New Scientist', 12 December

Our environment and society are too complex and changing too rapidly for us to favour even one of two types of nappy. Our knowledge of existing and new scientific relationships is also rapidly expanding. Yet the way we make policy makes little allowance for such difficulties. Typically, a government (heavily influenced by corporate interests or ideological baggage) makes a top-down, one-size-fits-all decision, ostensibly based on fossilised science, and then moves onto something else, rarely revisiting or even [5]monitoring (pdf) its performance.

When bigger challenges than nappies loom, this way of doing things generates commensurately bigger problems. Whether it's climate change or health or global conflict, neither government nor any single conventional organisation can know all about the relevant human and scientific relationships, let alone keep up with them. Nor can they anticipate the diverse effects their policies will have over both time and space. The complexities are too great, and any single body is going to be too pre-occupied with its image, the latest events, or its members' individual goals to care much about outcomes.

Yes, outcomes. Even obscure wrinkles, of the sort about which Mussi tells us, can have big, unforeseeable impacts. Only people who are *continuously* motivated to achieve our goals, to look at the effects of their initiatives, and to adjust their ideas accordingly, can develop the diverse, adaptive approaches that we need to solve our social and environmental problems. Social Policy Bonds are one way in which we could stimulate such initiatives. They have other benefits: most significant here is that issuers of the bonds do not need to specify how a problem is to be solved in order to get people started on solving it. Our goals are stable: the optimal ways of achieving them, especially when complicated by time lags, feedback loops, a multitude of known, unknown and unknowable variables, are not. We can and, in my view, should, issue Social Policy Bonds targeting such goals as dealing huge, urgent problems such as climate change or global conflict even though the ways in which they are to be solved are beyond - well beyond - the purview of our current policymakers and their paymasters.

#### **15.12.4 Climate change: surrogate surrogate indicators (2018-12-26 20:55)**

I've blogged [1]before about surrogate indicators, or surrogate markers:

A surrogate marker is an event or a laboratory value that researchers hope can serve as a reliable substitute for an actual disease. A common example of this is blood cholesterol levels. [2]Evidence-based medicine in disguise: beware the surrogate, '[3]MD Whistleblower ' (blog by Michael Kirsch), 1 August 2010

And, more broadly, in economic policy:

Instead of targeting anything as meaningful as human well-being, the *de facto* target of most governments is gross domestic product (or GDP per capita). [4]26 July 2015

But there are also surrogate surrogate indicators. In climate change, we have [5]agreements primarily aimed at limiting emissions of greenhouse gases:

[6]Framework Convention on Climate Change (UNFCCC), New York, 1992, including the [7]Kyoto Protocol, 1997, and the [8]Paris Agreement, 2015

I submit that these agreements are surrogate surrogate indicators: they are not targeting climate change; they are not even targeting the many hundreds of hard-working people who strive to achieve consensus over these agreements understandably measure success by the number of signatories to their final agreement texts. They are not, though targeting climate change. And, even assuming that greenhouse gases, as identified by current science, are responsible for climate change, the politicians and bureaucrats who, through considerable effort, get an agreement signed, have done nothing to see that even their surrogate indicator, reductions in greenhouse gas emissions, take place. Michael Le Page tells us where we are at today:

Early in the new year, if not sooner, the world will set a most unwelcome record. Global oil consumption [9] will pass 100 million barrels per day for the first time – and keep climbing. To have any chance of limiting warming to 1.5°C, greenhouse gas emissions need to start falling now, and fast, the latest UN climate report warned in October. **But emissions are still increasing.** They rose 3 per cent in 2018 and look set to keep rising in 2019. [10] Renewable energy race to ramp up as oil use skyrockets, Michael Le Page, New Scientist, 18 December (my emphasis)

And the climate itself?

[11]

Last four years are 'world's hottest'

There's a genuine problem here, despite the good intentions of the characters involved, be they scientists, politicians or bureaucrats. We have little chance of avoiding the climate disruption about which we are being warned while we are committed to the usual way in which policy is made. I don't think it's enough, when faced with a hugely complex and urgent problem, to use the science of 20 years ago as a base for a one-size-fits-all, top-down approach to its solution. We *are* undertaking multitudes of smaller initiatives to, for example, limit emissions and create carbon sinks. But our intense focus on greenhouse gas emissions is doing nothing to stop outrages like the destruction of the Brazilian rainforest:

Between August 2017 and July 2018, 7,900sq kms were deforested, according to preliminary figures from the environment ministry based on satellite monitoring – a 13.7 % rise on the previous year and the biggest area of forest cleared since 2008. [12] *Brazil records worst annual deforestation for a decade*, Dom Phillips, The Guardian, 24 November

While the goal of limiting the rise in the Earth's temperature to 1.5 degrees C is sound, *there are no reasonably upfront financial incentives for people actually to achieve it.* There are some, as we have seen, ineffective agreements to try to limit greenhouse gas emissions, or fossil fuel exploitation and consumption. But people react to the incentives on offer, and there are no explicit rewards to anyone contingent on the climate stabilising for a sustained period. We can take expert advice about what sort of 'stabilising' we want to see, but the important thing is that we set in place a meaningful climate stability goal and reward people for achieving it. We are not doing that right now, with the disastrous consequences that we are already seeing and more, many more, to come.

Which is why I suggest adapting the Social Policy Bond idea to deal with climate change. The essentials of Climate Stability Bonds are (1) that they reward the achievement and sustaining of a more stable climate (however defined), and (2) they will encourage the use of market forces to allocate society's scarce resources to meet our goal most efficiently. I have written more about Climate Stability Bonds [13]here, on which page there are links to a range of my other writings on the subject.

# 2019

## 16.1 January

### 16.1.1 Social Policy Bonds: the outlook for 2019 (2019-01-01 20:24)

After about thirty years in the public arena, how is the Social Policy Bond concept faring? Not that wondrously, to be frank. As far as I'm aware, no Social Policy Bonds as I conceived them have ever been issued. The *Financial Times*, though, does [1]tell us that more than 100 [2]Social *Impact* Bonds have been launched across 24 countries, raising \$400m. SIBs are a 'lite' version of Social Policy Bonds. The main difference between them and Social Policy Bonds is that they are not tradeable which, in my view, greatly diminishes their scope and opens them up to favouritism, gaming and manipulation. I've had no involvement with SIBs and have written before in this blog ([3]here, for instance), and more definitively [4]here and [5]here, about why I am ambivalent about them.

Nevertheless, via SIBs, the idea of rewarding better performance is making tiny inroads into the public sector; that is, into the achievement of social goals. This feature, so long a feature of the private sector, is now being deployed to help solve social problems, though in very limited circumstances. I'd be more optimistic if this small change were being used to do something other than favour existing bodies in pursuit of narrow goals, but I suppose we should be grateful that there are some steps, however tentative, in the right direction.

Frankly, I don't see much else to be positive about where policymaking is concerned. There's little in the way of constructive dialogue, and much in the way of Manichaeian name-calling. Take immigration: it's at least arguable that immigration reduces wages and raises housing costs. It has benefits of course, also, but too often people trying to discuss the downsides are dismissed as xenophobes or worse. There's a genuine question too, over whether national governments should put the interests of their own citizens over those of would-be immigrants. But these questions can hardly be raised, such are our rancorous politics. The broader problem is that the determinants of the policies we make are determined primarily by ideology, emotion, personality, televisual footage, and sound-bites.

Anything except outcomes, in short. And that gives me grounds for tentative optimism. Our current ways will self destruct. They are unsustainable. Out of the rubble, it's possible - just - that we shall target and reward the achievement of social and environmental outcomes. I mean long-term outcomes that are meaningful to ordinary people, rather than the narrow short-term goals that characterise corporations, financial traders, billionaires and, these days, politicians. Such a trend is unlikely to begin in the year 2019, but it's possible. If it *were* to occur, then we might also give priority to achieving our goals cost-effectively. At that point Social Policy Bonds, in their full tradeability, could step onto the stage and at last begin to play their role.

### 16.1.2 Climate change, war and celibacy (2019-01-08 17:46)

Why do wars happen? Why do crime rates go up and down? The answers to these and other complex social and environmental questions are many and varied. What about climate change? It appears that it is most probably caused by mankind's greenhouse gas emissions. But not definitely - and that uncertainty partly explains why, despite all the conferences, treaties, entreaties, agreements and commitments, our greenhouse gas emissions are at [1]record levels.

I think we face these challenges using outdated thinking. For historical reasons, policymaking is almost entirely a top-down activity. Politicians and public servants see a problem, try to identify its causes, then decide what needs to be done about them. If they aren't certain what needs to be done, either they guess at the causes or ignore the problem. 'Ignoring' takes the usual costly bureaucratic forms: setting up bodies, forming committees, holding meetings, and generating worthy but useless reports and agreements.

The problem is that no single body can identify the causes of such problems as war or crime or even climate change, and then work on them in the ways that used to work on more obvious social and environmental problems. Our biggest and most urgent problems are too diverse, and their causes change too rapidly, for the old ways of making policy to address them adequately.

The question then becomes: do we need to identify a problem's root causes before we try to solve it?

John Michael Greer asks why celibacy fosters the long-term survival of monastic systems:

Perhaps celibacy works because it prevents sexual jealousies from spinning out of control, as they so often do in the hothouse environment of communal living. Perhaps celibacy works because pair bonds between lovers are the most potent source of the private loyalties that so often distract members of communal groups from their loyalty to the project as a whole. Perhaps celibacy works because all that creative energy has to go somewhere — the Shakers birthed an astonishing range of artistic and creative endeavors.... Perhaps it's some other reason entirely. The point that needs to be kept in mind, though, is that in a monastic setting, celibacy works, and many other ways of managing human sexuality in that setting pretty reliably don't. The question "does x happen?" is logically distinct from the question "why does x happen?" *It's possible to be utterly correct about the fact that something is the case while being just as utterly clueless about the reasons why it is the case.* (My italics.) [2]After Progress , John Michael Greer, 2015

So, do we really need to identify the causes of climate change or war or crime, before we try to eliminate them? I don't think we do (and, incidentally, I don't think we can, definitively).

I suggest that instead of opting, in effect, for inaction by sending people off on a fruitless, never-ending search for 'root causes', we take steps to reward the solution of these complex problems, and let a motivated coalition work out the most efficient ways of solving them, whether or not such ways have anything to do with root causes.

[3]

[4]Social Policy Bonds are a way in which we can do this. The bonds would target outcomes, rather than the alleged means of achieving them. Instead of targeting climate change, they would target for reduction the negative impacts of adverse climate events on human, animal and plant life. Instead of trying (or pretending to try) to prevent conflict in Africa or the Middle East, a Social Policy Bond regime would target for reduction the numbers of people killed and made homeless in those regions and reward whoever achieves and sustains such reductions. Complex social and environmental problems require diverse, adaptive approaches for their solution. They don't require that we identify their real or mythical 'root causes' before doing anything. By contracting out the achievement of solutions to a motivated coalition of

holders of Social Policy Bonds, we could avoid endless searches for nebulous root causes and instead devote our energies to finding solutions to the problems they create.

*For more about my approach to climate change see [5]other [6]posts [7]on [8]this [9]blog, or this [10]essay. For more about my approach to achieving peace, follow this [11]link.*

### 16.1.3 Channelling viciousness (2019-01-17 18:15)

From a letter to the editor of today's *Financial Times*:

Bernard Mandeville, the 18th century Dutchman who left Rotterdam to live in England, was not only an early modern crossover representative, he also understood the psychological roots of humankind. In his *Fable of the Bees* he asserts that rationality is not necessarily virtuous. In fact, individuals acting viciously can bring about positive aggregate results such as higher investment, employment and economic growth. Dr Jacob Borheim, Financial Times, 17 January 2019

For sure, the accidental effects of human actions can be beneficial as well as disastrous. Adam Smith's [1]Invisible Hand apodictically generates material wealth. But pursuit of our individual goals can and does create serious social and environmental problems too. A benign, quick-acting, and impartial government can regulate away the worst excesses arising from our pursuit of happiness. But governments aren't quick acting, and rarely are they benign and impartial. In fact, society is now so complex that even such an ideal government *couldn't* react quickly enough to the negative impacts of economic growth. As well, the world is too small now for the solution of social and environmental problems to be left to chance: with a human population of more than 7 billion, and difficult-to-identify feedback loops and time lags, no single body can anticipate or successfully regulate the world economy's adverse impacts. Yes, 'positive aggregate results' can result from individuals acting in our own interest. They might even be *net* positive results. But (1) that still implies a lot of negative results and (2) we'd do better to minimise negative results before they occur.

This is what Social Policy Bonds could do. One of the great advantages of the bond approach is that we can encourage people to achieve social goals without anyone knowing in advance how they will do so. A subset of such goals would be the targeting for reduction of the negative impacts of economic growth however they arise. Investors in the bonds would then have incentives to scrutinise current and proposed private- or public- sector projects with a view to minimising their negative impacts. Taking a broad, long-term, global approach, we could, for example, aim to [2]reduce disasters of any sort, *without having to specify how or where they occur*.

Under a Social Policy Bond regime, then, people would still be acting rationally and even viciously, but we'd be channelling such behaviour into the pursuit of society's well being. In short: [3]giving greed a chance.

#### 16.1.4 Hyper-manicured public spaces (2019-01-28 19:32)

Colin Tosh, lecturer in ecology, writes about hyper-manicured public spaces in the UK. He gives examples:

The wildlife value of a particular tree species in cities is often disregarded when a decision is made to remove it. In parks, plant species which are exotic to the UK such as the New Zealand cabbage tree (*Cordyline australis*) are [1]intentionally planted because no native wildlife can use them, so they are low maintenance. ...

Leaves are swept up immediately before their nutrients can return to the ground and the insects that lay their eggs on them are doomed to certain death. Road verges are cut back to the bone several times each year and the clippings are left lying, minimising their use as a habitat for wild flowers. [2]*How hyper-manicured public spaces hurt urban wildlife*, Colin Tosh, 'The Conversation', 22 January

Part of the reason is that the wishes of local people conflict with those of the bodies charged  
1236

with maintaining these spaces:

It doesn't help that grounds management is often subcontracted to private firms in the UK. In these cases, grounds management is more likely to be insensitive to expert advice as the function is out of the hands of the democratically controlled body and with a private company that needn't care what the public thinks.

We see this all the time: corporate bodies have goals that conflict with those of ordinary people. Often their goals are short term and narrow. Qualities important to the public fall through the cracks: in this instance, the local environment; more generally the global environment, social cohesion and other things that make up the [3]Commons.

Social Policy Bonds could work quite well in targeting broad, long-term goals, such as the dealing with [4]climate change or its impacts. For local goals, such as the well-being of public spaces, the remedy would appear to be, as indicated by Mr Tosh, ensuring that the bodies responsible are accountable to the people directly affected. Both approaches entail taking ordinary people's long-term goals seriously, and giving a lower priority to the short-term goals of corporate bodies, including government agencies.

Interestingly, even on their own terms, efforts made to satisfy the short-term accountancy-type goals local authorities, fail:

The irony of it all is that measures to improve public areas for wildlife essentially involve less effort overall. All that really needs to be done is to allow public areas to be a little more unkempt, because unkempt areas are what nature likes.

Again, there is a larger-scale parallel:

If shareholder primacy theory is correct [ie, that the over-arching goal of corporate managers is to maximise shareholder value] corporations that adopt such strategies should do better and produce higher investor returns than corporations that don't. Does the evidence confirm this? Surprisingly, the answer to this question is "no." [5]*The Shareholder Value Myth*, Lynne A Stout, 'European Financial Review', 30 April 2013

And the reasons are similar and include: the differing goals of the many stakeholders, not all of which are readily quantifiable; and, very often, conflict between long- and short-term objectives. Corporations, of course, are supposed to be in competition with each other, so should be penalised if they fail to meet consumer demand. But, as Jonathan Tepper [6]tells us, competition is now an ever more rare feature of today's mixed economy. A [7]Social Policy Bond approach might be the answer, whereby investors form a [8]new sort of organisation and enrich themselves if and only if they help achieve the long-term goals of society as a whole.

## 16.2 February

### 16.2.1 Perceptions and reality: no easy answers (2019-02-05 20:19)

A retired MD writes to the American journal [1]*Consumer Reports*:

AS A RETIRED M.D. (30 years in emergency medicine), I agreed with most of your article about too many tests. However, you forgot to point out one of the big reasons for overtesting: hospital, clinic, and provider "scorecards." Medicare providers are still being ranked by "patient satisfaction," which is often driven by whether patients get all the tests they want— even after you explain why they aren't necessary. Doing an X-ray on every sprained ankle is a classic example in emergency medicine. — Emma K Ledbetter, MD, 'Consumer Reports', March

There's s a genuine problem for policymakers: should we target for improvement only those goals that can be objectively measured, or should we also aim to improve something far more subjective: people's happiness or satisfaction? Ideally there wouldn't be a conflict, but in matters of health there is often a discrepancy between what's actually happening, and what

people think or fear is happening. Crime too:

One would imagine that if crime was high, fear of crime would be as well, and alternatively, if crime was low, fear of crime would follow this pattern. What has been found over the years, however, is that crime and fear of crime rarely match up. [2]*Fear of crime*, Nicole Rader, Oxford Research Encyclopedia, March 2017

In both health and crime, perception and reality aren't easily disentangled. In health, we all know about the [3]placebo effect, whereby an objectively useless pill or procedure does actually improve a patient's condition and his or her perception of that condition. Crime rates might be low, but perceived crime high for a valid reason: people are afraid of, for instance, venturing onto the streets after dark. To add to the confusion: people's perceptions are difficult to measure accurately.

How to deal with perceptions when they might conflict with reality is crucial when trying to formulate policy for anything other than a very small number of people. Take, for example, the question of whether we should incorporate perceptions of crime into an overall crime index that we target for reduction? I'm minded to say no because perceptions can easily be gamed at the expense of objective reality. In today's political climate, it's all too easy to imagine an interested body to work on perceptions - via a massive advertising campaign, perhaps - and doing nothing to reduce crime rates. Similarly with health: we could weight the physically verifiable results of testing, or a placebo, say, more highly than their psychological impacts. (The latter could perhaps be given zero weight, as over-testing and other unnecessary procedures can have negative physiological impacts.) In general, then, perhaps the best approach is to target objectively verifiable indicators and hope that perceptions begin to match them more closely. When it comes to something like our crime example, where people are afraid to walk in the streets because of the fear of being mugged then we'd need to be more creative in coming up with objective targets in addition to goals such as 'reduced number of assaults'.

No easy answers then, to this question that's relevant not only to a Social Policy Bond regime, which relies on targeting explicit, verifiable and meaningful goals, but to any body implementing social policy that uses aggregated data to help formulate policy.

## 16.2.2 Humanity versus vested interests (2019-02-13 18:17)

A correspondent asks me why the Social Policy Bond concept hasn't yet been implemented. A good question, especially as the non-tradeable version ([1]Social Impact Bonds, also known as Pay for Success Bonds, etc) is becoming more [2]widely [3]deployed and much [4]discussed. So...why not Social Policy Bonds?

I suspect part of the answer is that Social Policy Bonds are a threat to existing institutions: politicians, because they would have to relinquish their control over who shall achieve social goals and how they shall be achieved; and government agencies, such as education, police, health departments, because investors in the bonds would subordinate all their funding decisions to efficiency and, in many cases, new organisations and new techniques will be more efficient than existing bodies with their entrenched ways of doing things and fairly limited remits. Just one example: the best way of reducing crime rates in a disadvantaged area might be to subsidise employment there, rather than increase funding for the local police force. Or a cost-effective way of reducing the numbers of people killed or injured in car accidents might be to lay on free mini-cabs or taxis or have teams of dedicated, paid drivers whose sole job would be to ferry people from pubs, bars, nightclubs, home at night. That might be really cost effective but, under our current system, *there's nobody to speak up for such a policy*, and it would be opposed by vested interests. More dramatically: nobody really want to live under threat of nuclear war, but currently there are no bodies with sufficient influence and motivation to ensure that won't happen. Sure, there are teams of dedicated people in international bodies striving valiantly to reduce conflict but, the resources, including brainpower, just aren't there. Big money has less interest in avoiding nuclear catastrophe than it does in devising imaginative ways of [5]selling [6]dog-food. And why not? It's reacting rationally to the incentives on offer - which (I think) are perverse in that they prioritise the narrow short-term interests of a few corporations (and, arguably, a few dogs) over the survival of millions of human beings.

Another reason for the absence of Social Policy Bonds from the scene could be the hysterical nature of today's politics, where shrieking abuse at the opposition has supplanted making policy to improve society's well-being as the prime activity. So solving social problems is seen as a 'left-wing' goal, and using markets is seen as 'right-wing'. In more enlightened times, you'd think a policy that uses markets to improve social well-being would unite both left and right; but that's not happening. So while I'm partly encouraged by the slow spread of Social Impact Bonds, I'm also concerned that - especially if they become so common as to escape public scrutiny - they will end up serving vested interests at the expense of society as a whole.

For more about Social Policy Bonds see my [7]home page. For my concerns about SIBs see [8]here and [9]here, as well as some [10]previous [11]blog [12]posts.

This post is very interesting. Thank you.

### 16.2.3 Why don't we target trust and empathy? (2019-02-16 16:48)

Dr Elliott Barker asks *How do we prevent crime?*:

It seems incredible to me that as a society we don't publicly advocate those values upon which all harmonious social interaction depend - trust, empathy, and affection. Why shouldn't society - all of us collectively - reinforce our own latent awareness that these values are where it's at, and why shouldn't we do this at least as frequently and effectively as we allow ourselves to be reminded to drink Coca-Cola? [1]*How do we prevent crime?*, Dr Elliott Barker, 'The Natural Child Project', February

Dr Barker calls for scrutiny of policies affecting infants and toddlers and a recognition that capacities for trust, empathy, and affection are more important than superlative exam results or musical virtuosity. Indeed, achieving such goals can conflict with child rearing practices that produce an adult capable of harmonious, co-operative human existence.

What's this got to do with [2]Social Policy Bonds? Quite a lot, I think, and not just in respect of crime. Social and individual well-being are legitimate targets for government - at least as legitimate as educational achievement. It's entirely plausible that Dr Elliott is correct in that trust, empathy, and affection contribute mightily to well-being but my point is that, under our current system, *few of us are motivated to find out whether he is or not*, and that even if it could be shown that he is, *few are motivated to do anything about it*. At the individual

level, sure, there are parents who have the time and energy to devote to child-rearing and who share Dr Elliott's insight. But they still have to contend with social forces, heavily influenced by government policy and its *de facto* [3]targeting of economic growth at the expense of our social and physical environment.

Social well-being, trust, empathy, affection: these are difficult qualities to measure. The effects of their absence, though, *are* measurable, and politicians try to deal with some of them - especially those that could be televised - with an array of short-term measures: more money for the police, more prescription drugs, decriminalising narcotics, and so on. But they have little inclination to think long term. A Social Policy Bond regime, because the bonds are [4]tradeable, could help in achieving such long term goals as social cohesion and the other contributors to well-being described by Dr Elliott. It could, for instance, target for reduction such pathologies as crime, mental illness, and other effects of social alienation and lack of trust. Our current political systems are inescapably short term, though and they focus on more immediately and readily quantifiable indicators - such as GDP and academic achievement - regardless of the longer-term cost to individuals and society of doing so. As Dr Elliott says:

It seems peculiar in a society in which schooling is mandatory from age 6 to 16 that we turn out graduates who have no preparation for the one job they are almost certain to have - raising children. Surely, before conception is a possibility, boys and girls should appreciate the permanent emotional damage that can result if the emotional needs of a young child are not met.

Dr Elliott is pessimistic about whether we will do anything to avoid such emotional damage. I will leave the last word to him:

Why won't such preventive measures be taken? There are many factors. In part, it is because we are presently attuned to a shorter time frame politically and psychologically than prevention necessitates. In part we are misled by the excitement and drama of intervention after a problem has occurred. The cops and robbers game for example is the stuff of much of our entertainment. In part it is because today's casualties have greater motivation to lobby for their own immediate needs than for prevention of tomorrow's victims. In part it is because an impossible level of proof is demanded whenever we discuss changes that appear to tamper with our present values. But mostly we just know that such proposed solutions to crime prevention are "naively idealistic."

#### **16.2.4 Climate change: the people have spoken (2019-02-23 20:27)**

Consider the destruction of a rainforest to make room for a palm oil plantation. Or some island jurisdiction changing its tax laws. Or catching a plane from London to New York. All have effects, some of which can be captured by a market, some of which cannot. If globalisation means anything, it means that these effects can have ramifications far beyond the territory in which they take place.

Many of our actions have impacts on the physical environment, and most of these aren't captured by the market. Economists call these externalities. The negative impacts of fossil fuel use include air pollution. Even limiting ourselves to the impacts of air pollution, we don't know all the long-term effects. We suspect that they are or will be deleterious to human, animal and plant life. (In net terms, that is: some populations will benefit.)

The problem policymakers face is that the positive externalities of, say, fossil fuel use are upfront and of similarly huge dimensions to the negative. Every plane flight hugely benefits the passengers on board, their pals, the crew, and the others employed by the airline

industry ... and then there's the freight. A fraction of these positive impacts, but not all, is captured by the market. At least as compelling are the positive externalities resulting from fossil fuel use in general: the benefits of electricity, heat, air conditioning.

To summarise: the market captures and quantifies some but not all of the impacts of a transaction. It misses a lot of positive and negative impacts. It fails to capture any impacts of anything we do that is not a transaction. All this is to say that fossil fuel use has huge positive impacts as well as negative, and we cannot say whether the negative effects outweigh the positive. The market does not, and cannot help us, because there's no way we can know and weight all the objective impacts accurately, but also because many impacts are subjective and unquantifiable.

Climate change: do we care?

Take climate change. The net negative impacts on human, animal and plant life of climate change - probably better termed [1]climate breakdown[2] - are incalculable and massive. Possibly catastrophic. We are pretty sure, but not certain, that greenhouse gas emissions cause some, maybe much, maybe all, of climate change.

We can, though, be more certain about whether we really care about the threat of climate change. And the answer is a resounding: not really. Lots of conferences, exhortations, subsidies for renewables (though not as many as for fossil fuels - see below), stirring rhetoric and doom-laden prognostications. Some change? Sure, at the margins. But meaningful results? [3]No, [4]no, [5]no.

It's true that our political systems are so corrupted by their proximity to the ultra-rich that the long-term interests of millions of ordinary people count for less than the short-term goals of billionaires. The ultra-rich and their lackeys in and out of government are responsible for some of this: fossil fuel subsidies are [6]estimated to be worth \$160-200 billion per annum, and we are pretty indulgent in letting billionaires [7]dictate policy. But that cannot be the

complete answer. It's more like a cop-out.

The billionaires people have spoken

The fact is that we have collectively chosen not to do anything significant about climate change. We've chosen quality and quantity of life in the short run, over quantity and quality of life in the longer term. We find it easy to do this, in my view, because:

- 'Climate change' is too abstract. and
- We focus too intensely on greenhouse gas emissions, whose effects aren't fully known, and whose reduction might or might not do anything significant to bring about a more benign climate at some indefinite future time.

My suggestion is that rather than address or pretend to address what we suspect, but don't know for certain, and cannot prove, is the principal cause of climate change (greenhouse gases emissions), we should try to deal with environmental depredations, *whether or not they they are caused by climate change*.

Limiting greenhouse gas emissions isn't happening and isn't going to happen. Even if the billionaires were to switch sides, [8]most of us don't really want it to happen. The costs are upfront, the benefits nebulous and long term. What we want, what we can understand, relate to, and identify with, are reductions in the more tangible environmental pathologies: flood, wildfire and other adverse climatic events, loss of biodiversity, loss of wilderness, pollution of the air and seas. It's not solely an issue of presentation. We are more ready to pay taxes to help human, animals and plant life than we are to do something that *might* reduce the increase of some measure of global temperature some decades hence.

So I suggest that we divert resources from trying to reduce greenhouse gas emissions to solving other environmental problems, *including those caused by climate change*.

One way we could do this is by massively backing global [9]Environmental Policy Bonds. These could target our biggest environmental challenges, regardless of their supposed source.

The bonds would reward the achievement of verifiable, meaningful environmental outcomes. Examples: cleaner air, cleaner seas, reduced losses of biodiversity and habitat. We could target for reduction those environmental ravages that we now attribute to climate change including species loss and the impacts of adverse climatic events. The way the bonds would work means that investors would work out for themselves at all times, whether or not the best way of dealing with our environmental challenges is to tackle what we think are their root causes.

We need diverse, adaptive approaches. No single, top-down, one-size-fits-all policy will work. Environmental Policy Bonds can encourage the array of diverse, adaptive approaches that we need to begin to solve our environmental problems.

## 16.3 March

### 16.3.1 The metrics of tyranny (2019-03-05 18:40)

In our complex, populous societies we're not going to escape the use of metrics as indicators of

social well-being. Social Policy Bonds aim to target targets that are meaningful to ordinary people. They therefore need metrics that are carefully devised, robust, verifiable and, preferably, easy and cheap to monitor. A Social Policy Bond regime, ideally, would use reliable metrics in a considered, coherent manner. There are dangers in taking metrics as ends in themselves, in using them incoherently, and in ways that conflict with people's well-being. Unfortunately, that's the direction in which we're moving. Having read [1]*The tyranny of metrics* by Jerry Muller I've written about the [2]limitations of metrics. I've also mentioned [3]Campbell's Law. An article in the *Economist* does much to justify Mr Muller's and my skepticism:

Take the World Bank's annual comparison of business regulations around the world. One country stood out in its latest ranking: China, which had languished in 78th place the previous year, jumped to 46th. India seemed to have improved, too, rising 23 spots, to 77th. Those remarkable ascents have less to do with the ease of doing business in those places than with their governments' determination to achieve good grades. **Some 40 people work in a Chinese government unit dedicated to improving its World Bank score; perhaps 200 toil in India's. At least 60 countries have teams that focus on the index.** (My emphasis) [4] *Life and society are increasingly governed by numbers*, 'The Economist', 23 February

Our societies aren't going to return to the times when policy is made for groups of 150 (see [5] Dunbar's number). It follows that metrics will be the means to determining how well society is doing. Currently our governments rely on a motley array of narrow, short-term, [6] Mickey Mouse micro-targets, including the *de facto* target of [7] Gross Domestic Product, with their many flaws, some of great consequence. A Social Policy Bond regime, by contrast, would channel people's goals and expertise into answering fundamental questions: what should we target? What are the essential elements of social and environmental well-being? Where do we, as a society, want to be heading? Our obscurantist political systems allow our rulers to duck these questions and distract us all with spurious arguments about ideology, personality, image and sound bites.

The tyranny of metrics metrics of tyranny

It gets worse. In some societies metrics are already explicitly weaponised (from the same article):

In China, for example, Zhima Credit, a popular private service, measures "personal characteristics", "online behaviour" and "interpersonal relationships", among other things. A high rating entitles people to a fast-track visa for Singapore.

### **16.3.2 Climate change and the environment (2019-03-08 20:40)**

Climate change could be tackled in various ways. We could aim to throttle its causes. We could aim to keep the climate, as measured by a wide range of physical, biological and financial indicators stable. Or we could aim instead to target for improvement all aspects of the environment, whether or not their degradation has been caused by climate change.

Policymakers have mostly gone for the first option: to try to reduce greenhouse gas emissions, believing that they are the main driver of climate change. Myself, I've advocated in the past the targeting of an array of indicators, including the impacts of adverse climatic events, but also physical, social and financial measures of climate change.

I'm now more inclined to the third option, and think we should try to solve our environmental problems however they are caused, rather than focus on trying to prevent climate change. My thinking is partly a result of humanity's having done almost nothing actually to stop the climate changing.

For buy-in we need meaningful outcomes

What's wrong with targeting greenhouse gas emissions?

- We don't really know what's happening to the climate;
- We don't really know why it's happening;
- We don't know whether trying to reduce greenhouse gas emissions will solve whatever the problem might be;

- We do know that targeting greenhouse gas emissions will have large upfront costs, and that any benefits will be way into the future, uncertain and, even on the best advice of the experts, tiny.

Admittedly the science appears to say that greenhouse gas emissions are changing the climate in ways that adversely affect human, plant and animal life, though it's less convincing about the effects of reducing these emissions. But that's not really relevant. There'll be no action taken, and indeed there have been no significant actions taken (see here, here and here), because, in my view, the relationship between greenhouse gas emissions and adverse impacts is too tenuous and abstract to generate buy-in. And buy-in is what we urgently need.

Note that I am not suggesting we don't target greenhouse gas emissions: only that any decision to do so needs to be made on the basis of whether it's the most efficient way of achieving our environmental goals. Professor Jem Bendell paints a cataclysmic picture:

The evidence before us suggests that we are set for disruptive and uncontrollable levels of climate change, bringing starvation, destruction, migration, disease, and war...

>My suggestion is that planetary well-being would be better enhanced by aiming explicitly to reduce such scourges - starvation, destruction, disease and war, than by targeting, or pretending to target, greenhouse gas emissions. Reduced starvation, disease and war are goals that are less abstract and more meaningful to ordinary people than climate change. By targeting them we're more likely to generate the buy-in that is essential to bring about changes that will create, at least in the short term, losers. All the evidence tells us that, after many years of exhortation, dire warnings, and extreme climatic events, there's very little buy-in to the goal of reducing greenhouse gas emissions.

As well as aiming to reduce starvation, disease and war, we could explicitly target also environmental goals that mean something to the non-experts whose buy-in is necessary. These could include reduced air and water pollution, less noise, reduced impacts of adverse climatic events, and reduced loss of biodiversity.

It's not so difficult: we re-frame and, if necessary, re-orientate policy to meet these goals, rather than a target level of greenhouse gas emissions which is, at best, only a putative means of achieving some of them.

## Environmental Policy Bonds

I propose that we reward the sustained achievement of our environmental goals. Further, I propose that we do so in ways that channel market forces – the most efficient way we yet know of allocating society’s scarce resources – into the achievement of our environmental goals. I further suggest that we do this is by nationally or globally backed Environmental Policy Bonds. These could target our biggest environmental challenges, regardless of their supposed source. A bond regime would allow us to target long-term goals, and stimulate research into diverse approaches to solving our problems.

Importantly, the bonds wouldn’t dictate how our environmental goals shall be reached. It’s quite possible that investors in the bonds will find that targeting greenhouse gas emissions for reduction is the most cost-effective way of solving some of our environmental problems. The crucial distinction between such targeting, and the way emissions are being targeted today, is that bondholders will target emissions only if doing so – at the time and in the areas they decide to do so – is the best way of achieving our goals. They will be making their decisions on the basis of the science (and economics) of the relevant time and place, rather on the fossilised science of today. Their solutions, unlike today’s non-solution, will be diverse and adaptive. And – another important difference – the people who look for and implement them will be rewarded only if they are actually successful in improving our environment.

### **16.3.3 Link to essay on Environmental Policy Bonds and climate change (2019-03-16 18:20)**

My previous post described how we might fold the effects of climate change into goals for Environmental Policy Bonds, so that we could tackle all our urgent, big, environmental challenges, *regardless of their cause*, in ways that are more likely to generate buy-in than the current intense focus mainly on greenhouse gas emissions. I’ve written a longer essay on that theme, which is more suitable for people unfamiliar with the Social Policy Bond principle, [1]here.

1. <http://socialgoals.com/climate-change-and-the-environment.html>

#### 16.3.4 Perverse incentives in healthcare (2019-03-22 20:01)

The perverse incentives in healthcare are pervasive, worrying and unsustainable. Joseph Jarvis speaks eloquently about those that afflict the American healthcare system [1]here. One example: he points out that investment in urgently needed new antibiotics is too low because the pharmaceutical industry prefers to develop drugs that will be taken for a lifetime, rather than a couple of weeks.

What the US and many countries have is a market not for health, but for treatment. It's nothing like a free, competitive market, being subject to the usual distortions and inefficiencies that ensue when big business manipulates the government and regulators. It's called a market, because much of it's run, nominally, by the private sector. But we are seeing worldwide a convergence of the interests of the public sector and big business, which often takes the form of policies that conflict with the goals of ordinary people.

The 'market' is often evoked rhetorically, and that unfortunately discredits the whole notion of the market as the most efficient way we have of allocating society's scarce resources. There *is* a market in the US for healthcare, in the sense that the industry reacts rationally to the incentives on offer. But the incentives have little to do with the well-being of citizens, and a lot more to do with the short-term, narrowly measured, goals of doctors, insurance companies, hospitals and pharmaceutical companies. The perversity is that the healthier the citizenry, the more parlous the state of the medical industry.

Where does the [2]Social Policy Bond idea come in? My starting point would be to define and reward the achievement of society's health goal, so that the structures and activities of the sectors that support that goal would be entirely subordinated to that goal rather than, as now, the other way round.

On a national level, physical health could be defined as a range of targets, all of which would have to be reached and sustained before we can say we have achieved our goal, at which point Social Policy Bonds targeting health could be redeemed. My suggestion is that our goal would include such targets as: longevity, [3]Quality Adjusted Life Years, and infant mortality. There would be others, to be decided by experts in consultation with ordinary citizens.

Where does this get us? It puts in place a system whereby people are rewarded for bringing about actual improvements in health. Not for screening, or curing or treating disease, nor for selling drugs or health insurance. Those are indirect means to an end, rather than ends in themselves and the results are lamentable: pills that are no better than placebo (see [4]here

and [5]here). Or incentives to [6]over-diagnose and [7]over-treat. Or to falsify or otherwise [8]manipulate the results of drug trials.

[9]Health Bonds would change all that. All the activity they stimulate and reward would be entirely subordinate to society's health goal. There would be a market - for the bonds - but it would be society's servant, not its master. The Social Policy Bond principle uses the market as a means to society's goals. It doesn't view the market as an end in itself. Under a Health Bond regime, the the end that the market serves under a bond regime will be society's health, as defined and targeted by society itself. The goals of those working in any field impinging on society's health would be exactly congruent with those of ordinary citizens: to improve society's health as quickly and efficiently as possible.

## 16.4 April

### 16.4.1 What should we target? (2019-04-09 18:00)

Policymakers rarely use explicit targets and still more rarely do they use them in a coherent  
1252

manner. Take two high-level targets: the inflation rate, targeted by the [1]UK, and the less-than-two degrees Celsius warming targeted by the [2]Paris Agreement. Near explicit and implicit targets – *de facto* targets – are more common. National governments routinely target economic growth. As well as these macro-targets, there is a proliferation of micro-targets: in the UK, [3]waiting times at hospital Accident and Emergency departments, for instance.

What do all these targets have in common? One is that they are set by people who are not charged with achieving them, and will be little affected whether they are achieved or not. Another is that they have little *directly* to do with social or environmental well-being. There *might* be a strong correlation between, for instance, GDP and material prosperity; there is likely to be a strong correlation between the two-degrees Celsius target and plant, animal and human well-being. But it's my view that, because there is no direct link, these targets fail to achieve societal [4]buy-in. The two degrees target is [5]too abstract. If more than two degrees leads to unacceptable depredations, why not aim directly to reduce the severity of those depredations? That would be a goal with which people other than scientists and policymakers could identify.

The implicit GDP target is also rapidly becoming discredited. It says nothing about the distribution of the gains from economic growth, and with the dramatic divergence between incomes of those at the top of the scale from all others, risks becoming as detached from social well-being as are indices of share prices – and for much the same reason.

If anything, the micro-targets are worse. Again, they are set by people who have little direct interest in seeing them achieved. As well, they are very easily manipulated or gamed, leading to [6]perverse outcomes, none of which benefit people, and some of which worsen well-being.

Where does that lead us? Most components of social well-being are not explicitly targeted. Sadly, as society grows more complex and diverse, unless things are explicitly targeted they tend to fall through the cracks. The environment has throughout recent history has suffered this fate, as have other essential, but similarly unquantifiable determinants of well-being such as social cohesion. In smaller societies, these elements of [7]The Commons would be the subject of informal arrangements, often arrived at after a long evolutionary process.

That won't work in today's highly aggregated and increasingly diverse societies. People in positions of power are increasingly detached from everyday concerns – the things that microtargets or, more importantly, the market, fail to capture. Unlike in traditional societies, when things are neglected by the people who lead today's societies they are ignored. Political discourse and resources get channelled into the few things that are targeted, including economic growth, and away from those elements that escape the market or some other form of quantification. As well as the environment, and these include some important components of mental and physical health. They aren't targeted directly, so attract fewer resources than they should.

But, given that a return to traditional societies is not going to happen, targets based on aggregate numbers are essential. So: what should we target? My thinking is that we need to target *broad social and environmental goals whose achievement would be inextricably linked to improved social well-being and generate buy-in*. Economic growth doesn't cut it; nor does the two degrees target. So what would qualify? Alleviation of poverty, improved physical and mental health, reduced impact of adverse climatic events on human, animal and plant life: these are all broad, meaningful goals, whose achievement would be both meaningful to all, and generate the buy-in sadly lacking when we target GDP, two degrees, or hospital waiting times. I am more ambitious even than such targets would indicate though. If, as I hope, we begin to target genuine, verifiable, meaningful outcomes, why stop at national goals? A Social Policy Bond regime, not having to specify how

our goals shall be achieved, or who shall achieve them, could and should aim for global goals. I suggest that we explicitly target for reduction the adverse effects of both [8]natural disasters and [9]violent political conflict.

## 16.4.2 Make votes matter (2019-04-16 18:36)

*Make Votes Matter*, is the title of a leaflet being distributed in the streets of the UK. It is the name of a 'cross-party [1]campaign to introduce Proportional Representation to the House of Commons'. Currently, UK General Elections use the First Past the Post voting system, which has the merit of being immediately comprehensible, but the apparent disadvantage of under-representing small parties whose votes are widely distributed, and wasting the votes of people who oppose the occupiers of 'safe' constituencies. There's a lot more to be said for and against PR and FPTP. I suppose it's understandable, though regrettable that, in today's politics, people think their Member of Parliament cannot be expected to represent them if s/he is from a party they oppose. There's little magnanimity in party politics these days.

I actually don't think the differences between PR and FPTP are worth bothering about. We'd still be voting about things that don't really matter: for Members for Parliament, for their party, for what they say in their manifesto. For people, parties, promises, image, ideology, sound-bites and slogans, rather than meaningful goals. About those goals, I believe, there's far more scope for consensus than about all the paraphernalia that characterise current election campaigns. Politicians rarely do what they say they will do; still more rarely can they be held to account for what transpires to our economy, society or environment. But their campaigning and subsequent activities, as well as consuming great gouts of brainpower, sow the seeds of division: the '[2]narcissism of small differences'.

I advocate refocusing our attention on goals, and the inevitable trade-offs between them,

rather than political parties or the voting systems. I think we should be choosing between outcomes that are verifiable and meaningful to all of us, rather than allow our policymaking to be steered by interest groups - be they billionaires, corporations or government agencies - which are the only bodies that have the resources and motivation to understand our arcane, protracted, policymaking mechanisms. You might almost think that the obscurantism of our political systems is a ploy to keep ordinary people away from positions of power. A political system focused on social and environmental outcomes would represent a threat to the political hierarchy but, I believe, it's necessary for reasons of both efficiency and [3]buy-in.

What would such a system look like? A [4]Social Policy Bond regime would be one such system. It would set broad, long-range targets about which there is almost universal agreement. At the national level it could target better [5]health, universal [6]literacy, a cleaner [7]environment. At the global level it could target [8]conflict reduction, and the prevention and alleviation of [9]disasters, whether natural or man made. Political debate would be about the exact definition of these goals rather than, as now, the supposed means of achieving them or peripheral issues such as institutional structures and funding arrangements. There would be healthy debate, under a bond regime, about priorities and time frames, but the way the bonds work would mean that there need be little discussion of who shall achieve society's goals or how those goals shall be achieved. The market for the bonds would ensure that they are always be held by the most efficient operators. And efficiency is a moving target: what is efficient today or in one part of the world today might be highly inefficient in future years or in a different region. Long-term goals will most probably require an array of diverse, adaptive approaches for their achievement - exactly the sort of approaches that government, or any single ordinary organisation, is incapable of encouraging, but that a Social Policy Bonds regime would stimulate. The bonds would lead to the creation of a [10]new type of organisation, whose structure, composition and activities would be entirely subordinate to its goal, which would be exactly the same as that of the society that set it; a stark contrast with today's organisations, which have their own goals, independent of, and sometimes in direct conflict with, those of ordinary citizens.

### 16.4.3 Disaster in the antibiotics market (2019-04-22 17:00)

Jeremy Farrar writes:

There is no viable route to market for new antibiotics, however valuable they may be to society. [1]A disaster is unfolding in the antibiotics market, Jeremy Farrar, 'Financial Times, 21 April

Incentives matter, which is why we urgently need to overhaul the ways in which healthcare is currently managed. Typically, the rewards to companies developing a drug are directly proportional to sales of that drug. Antibiotics are typically prescribed only for short periods: days and weeks,

Private investors backing such [drug development] companies counted on revenues being buoyed either by growing need for their products or by governments responding to calls to fix the market.

What would it take to 'fix the market'? My suggestion, more radical than it should be, is that we reward anybody who improves society's health, including drug companies, in ways that correlate to their success in improving society's well-being. This could be done by (1) explicitly targeting 'improved societal well-being', and (2) setting up a system that supplies incentives for people and companies to do just that. We are getting to the stage where step 1 is a possibility. [2]Quality Adjusted Life Years are one attempt to measure well-being. Step 2 is more difficult. My suggestion is that we apply the [3]Social Policy Bond concept to health and that, at a national level, governments issue [4]Health Bonds, which would reward those who bring about improvements in the long-term health of a country's citizens. For less developed countries, funds for the backing of Health Bonds could come from philanthropists, NGOs or rich countries.

'Anybody who improves society's health', I say above, because worthwhile improvements can originate in people and companies whose remit does not explicitly extend to health. A factory opening in a region of high unemployment, for example, might do a lot to improve the well-being of people living nearby. Under our current system, the factory would reap little reward for such a positive externality. Under a Health Bond regime, though, investors in the bonds would have an incentive to help an otherwise hesitant company to get their factory up and running. At all times, Health Bonds would encourage people to focus on the outcome we want to achieve - improved health - rather than the fortunes of drug companies, doctors, hospitals or other [5]surrogate endpoints.

## 16.5 May

### 16.5.1 A Mickey Mouse micro-objective from Mexico (2019-05-01 20:29)

Why we need to target broad indicators that either actually are, or are inextricably linked to, the goals we actually want to achieve:

A 2014 law compelling parties to nominate equal numbers of men and women for elections has led to a phenomenon known as *Juanitas*—women who participate as candidates, only to resign after their election to give way to men. [1] *The Mexico tragedy*, Shephard Barbash, 'City Journal', Spring 2019

I don't myself think that diversity is necessarily a helpful goal but, if people genuinely value it, they need to be explicit about what their diversity goal actually is. This emphatically applies to a Social Policy Bond regime, where there would be direct financial rewards to people who successfully manipulate or game targeted indicators. But it also applies to our current policymaking systems in which where the relationship between a policy and the beneficiaries of its perverse effects can be more readily obfuscated.

To be useful then, indicators and targets should be inextricably correlated with well-being – and it is the well-being of natural persons that we should be targeting, not that of corporations or institutions, which have entirely different goals; nor that of abstract entities like 'the economy'. With national governments being the size they are, and with global social and environmental depredations bound to assume greater importance, poorly thought out global policies could be a lot more serious than Mexico's *Juanita* phenomenon. Some years ago, George Monbiot wrote about the rush to subsidise biofuel production:

It used to be a matter of good intentions gone awry. Now it is plain fraud. ... The reason governments are so enthusiastic about biofuels is that they don't upset drivers.

They appear to reduce the amount of carbon from our cars, without requiring new taxes. It's an illusion sustained by the fact that only the emissions produced at home count towards our national total. The forest clearance in Malaysia doesn't increase our official impact by a gram. [2]*If we want to save the planet, we need a five-year freeze on biofuels*, George Monbiot, 'The Guardian', 27 March 2007

I was inclined to think insanity rather than dishonesty but Mr Monbiot may well be right. The implications for the planet are the same either way. Unfortunately, big government is far more concerned with adhering to its own agenda than it is about actually achieving worthwhile outcomes. And what is this agenda? What animates all this perverse policymaking, the targeting of meaningless micro-objectives, of means rather than ends, and the persistent, destructive subsidies to vested interests? Confusion, certainly, but there is also what I consider to be the ultimate goal of government, or indeed that of any big organisation, private- or public-sector, once they are old enough for their founding principles to be forgotten: self-perpetuation. Policymakers and their paymasters can get away with ineffective or - let's be frank - corrupt policies (see for instance, [3]this more recent Monbiot piece) because ordinary people haven't the time, energy, resources or legal expertise to master the arcane and protracted policymaking process.

A Social Policy Bond regime would change that. Policymaking would focus on meaningful outcomes, rather than the supposed means of achieving them. We can all understand outcomes, so we can all take an interest, if we want to, in which ones should be given priority. A policymaking process centred on outcomes would, in my view, be far more enlightening and generate far more - essential - [4]buy-in, than the current political circus, which is failing the non-millionaires amongst use quite spectacularly.

### **16.5.2 Make them tradeable (2019-05-06 15:29)**

I've explained [1]why I don't like Social Impact Bonds and it turns out that, ten years after the issue of the first SIB - Peterborough Social Impact Bond - others don't either.

Professor James W Williams, in a report he summarises [2]here, looks at the record of SIBs in Canada, the UK, and the US.

[A]lthough SIBs promise a win-win-win scenario in which providers, government, and investors all benefit, in practice the circumstances in which this alignment of interests is possible (what respondents described as the "SIB sweet spot") are much more limited than is often acknowledged. In practice, the interests of these groups have been difficult to align with many prospective projects foundering between feasibility and execution. [3]*From visions of promise to signs of struggle: social impact bonds in Canada, the US, and UK*, James W Williams, 2 May

The key, I think, is that the issuers of SIBs nominate the providers, who are generally the current providers, and whose identity will not change during the lifetime of the bonds. Crucially, SIBs aren't tradeable, so the set goals are short term, and providers can profit only if they become more efficient during the short time period before the bonds' term expires. They cannot profit by realising any appreciation in the value of their SIBs before the bonds expire. Making the bonds tradeable, as I have argued [4]here, would greatly enhance the range of social problems that we can solve, and would do so partly because it would allow new providers, who think they will be more efficient than current providers, to buy the bonds and benefit from their greater efficiency. Competition for the bonds in an open market would ensure that all providers would be kept on their toes: would-be investors in the bonds who think they can be more efficient would bid more for the bonds than they are worth to current holders, and get a chance to prove, and benefit from, their greater efficiency.

Social Policy Bonds are, essentially, tradeable SIBs. A Social Policy Bond regime would not assume that the best achievers of social goals are the current providers - a fatal assumption, in my view and one that, as well as restricting the value of the bonds, makes them liable to gaming and manipulation.

Professor Williams allows that "SIBs could be reserved for testing programs that are truly innovative and preventative in nature with an emphasis on systems-level change." They could, in other words, be a way of rewarding successful innovative approaches that can scale up. I would say, though, that the scope for innovation would still be constrained by the short time horizons built into the SIB mechanism. So I agree with Professor Williams' conclusion that "SIBs are, and are likely to remain, a relatively small, niche market."

Another recent paper for, as far as I can tell, different reasons, is even less enthusiastic. It concludes:

We do not think that [SIBs] can facilitate the maintenance and development of public services that meet society's needs, particularly the needs of its vulnerable members. In [5]*Finance and the Good Society*, Nobel laureate Robert Shiller (2012) argues that "we need more financial innovation not less." We disagree. We have had quite enough financial innovation. Nor do we agree with [his] contention that we can "reclaim finance for the common good." A quarter-century after first making its appearance, the Private Finance Initiative, a previous example of financial innovation—once popular among policymakers but derided by critics—has at last fallen from favor.... We do not want to wait a similar period to witness the popular discrediting of SIBs: our policy recommendation is that the experiment ends now. S Lilley et al, [6]*Using derivative logic to speculate on the future of the social investment market*, Journal of Urban Affairs, 18 April

Despite my reservations, I do see pluses in the Social Impact Bond experiment. The first is that they compel us to think in terms of outcomes; the second, that they reward more efficient achievement of these outcomes. These qualities, a commonplace in the private sector, are revolutionary when applied to our social and environmental goals, where 'more efficient' applies to the improved well-being for ordinary citizens, rather than the narrow, short-term, accountancy goals of corporations.

The danger, from my point of view, is that SIBs' failings will discredit, in the public eye, all approaches that reward efficiency in the public sector. But it could go the other way, and I hope that it will: policymakers might come to see SIBs as a step towards Social Policy Bonds and, though it would involve ceding their power to choose service providers, [7]make them tradeable.

### 16.5.3 Transcending narrative (2019-05-15 17:03)

We waste a lot of energy trying to identify the root causes of social and environmental problems; energy that would be better spent trying to solve those problems. With climate change we think we know that greenhouse gas emissions are the culprit: it's scientifically plausible, but not certain. It is even less certain that we have correctly identified all the greenhouse gases, and correctly weighted them according to their long-term impact on the climate. And it's even less certain that reducing these emissions will stop climate change or reduce its negative impacts. (And which of [1]those options do we actually want?) This uncertainty, or the appearance of uncertainty, is probably the reason that, despite years of apocalyptic rhetoric, high-profile conferences, celebrity calls to action and all the rest, nothing has been done to curb greenhouse gas emissions. I quote [2]myself:

We can, though, be more certain about whether we really care about the threat of climate change. And the answer is a resounding: not really. Lots of conferences, exhortations, subsidies for renewables (though not as many as for fossil fuels - see below), stirring rhetoric and doom-laden prognostications. Some change? Sure, at the margins. But meaningful results? [3]No, [4]no, [5]no.

We'd get more traction, I believe if, instead of focusing on what probably are, but might not be the causes of climate change, we clarify exactly what we want to achieve in regards to the climate and its effects, and then reward people who achieve it.

Trying to identify root causes is at least as dangerous when we're talking about human conflict. After a several chapters on the structure of the mammalian brain, Professor Alex Rosenberg sums up:

If the historical record is anything more than a chronology, it's not verifiable. It's wrong. And wrong in the most dangerous way, the way pretty much guaranteed to ensure that the mayhem of the last 5,000 years of recorded history will continue into the future. Narrative history is not verifiable because it attributes causal responsibility for the historical record to factors inaccessible to the historian. And they're inaccessible because they don't exist. The causal factors narrative history invokes—the contentful beliefs and desires that are supposed to drive human actions—have all the reality of phlogiston or epicycles. So narrative history, even at its best, is just wrong about almost everything besides the chronologies it reports. [6]*How History Gets Things Wrong*, Alex Rosenberg, October 2018

More succinctly:

By and large, the historian will get the kind of facts he wants. History means interpretation. EH Carr, quoted in [7]*History according to EH Carr*, Helen Carr, 'New Statesman', 8 May

So what does all this mean? This: *trying to identify the root causes of a social or environmental problem might not be helpful*. With climate change, it's (currently) impossible to identify the root causes sufficiently to convince enough people to solve the problem. The lack of obvious root causes serves as an excuse for inaction. It's possible also that even if we can correctly and apodictically remove root causes, doing so might not be the best way of solving a problem.

In the social sphere the real or spurious identification of root causes is even more dangerous. The debates never end. Clair Wills writes about Northern Ireland:

Who began the killing? At root, arguments about the genesis of the Troubles are arguments about responsibility for murder, and that's one reason it has proved so hard to disentangle history from blame in accounts of Northern Ireland since the late 1960s. [8]*No Waverers Allowed*, Clair Wills, 'London Review of Books', dated 23 May

How about we take another seemingly intractable goal - Middle East Peace - and let a coalition of motivated investors decide whether or not trying to identify root causes is the most efficient way of achieving it. Our current political systems fail to do that, but [9]Social Policy Bonds could succeed where they fail

Issuers of Social Policy Bonds targeting [10]peace in the Middle East would first have to define what they mean by peace. They could do this in consultation with politicians, technical experts and, crucially, ordinary people. Once achieved, peace should be sustained for a period of, say thirty years. Because Social Policy Bonds are [11]tradeable, holders would benefit by doing what they can to achieve such a long-term goal, then selling their bonds once they have seen their value rise as a result of their efforts. The investors in the bonds would all be animated by the fact that the important thing is to solve the problem of conflict in the Middle East - and not to try to work out how it started.

In general, it *might* be a good idea to look for root causes of social or environmental problems, but it might be more efficient - and generate more [12]buy-in - instead to aim directly for the outcome. Trying to understand fully the relationships between cause and effect may be a waste of time, or actually delay and impede the achievement of our social and environmental goals. Outcomes are more important and less inflammatory than history, whether we are talking about dealing with climate change or ending war. Social Policy Bonds would focus all of our attention and ingenuity on achieving our goals and less on what policymaking today seems to be all about: blaming the other side.

Anonymous (2019-05-20 00:14:08)

Hello,

Kindly could you explain what do you mean exactly by saying Social Policy Bonds? Especially bonds of course.

Thank you.

Ronnie Horesh (2019-05-20 20:12:46)

Hi Aze and thank you for your comment. Social Policy Bonds are a financial instrument, which I first talked about in 1988. You can find a short introduction here: <http://socialgoals.com/overview,-600-words.html>. Other overviews and most of my articles and papers on Social Policy Bonds can all be read for no charge through my the same website <http://SocialGoals.com>. If you have any queries or comments you can always contact me directly, through the "Contact me" link at that site.

Anonymous (2019-05-31 21:02:29)

I'll check it. Thank you very much. If I have any further questions I wanna ask again. Have a nice day.

#### **16.5.4 Buy-in vs big government (2019-05-27 16:02)**

Making

policy is very much like thinking, in that it's limited by the way it abstracts from reality the finite range of facts available to it. For makers of policy whose remit covers more than a family, clan, tribe or village, this should be a lesson in humility, because policymaking for large numbers of people inevitably entails the use of quantifiable data. Such data are equivalent, at the level of the individual, to our thoughts. Either way, they are extremely limited; what our minds can grasp, articulate and work on do not describe reality. They are individual facts, selectively taken from memory or, when making policy, aggregated, quantifiable information. Unfortunately, as the saying has it, 'if the only tool you've got is a hammer, you're going to see every problem as a nail'. And the only policymaking tool we have is our intellect backed up, sometimes, by statistics, themselves often contentious.

In

the individual our thoughts have not (yet) completely crowded out our insight. We know, most of us, at some level, that our well-being is not defined by a set of discrete quantifiable circumstances, but is rather a state of mind, which we'd find very difficult to describe using the limited vocabulary of whatever language we speak.

Policymaking

though is in a more parlous state; at the national and super-national levels anyway. For a start, it cannot interpret unprecedented threats, such as climate change or nuclear proliferation, in any but its own terms: that is, things to be negotiated, dealt with through the political process by existing institutional structures or new ones modelled on them. It cannot see social well-being as anything other than aggregated targets, with maximum Gross Domestic Product (or GDP per capita) as the target above all others. But GDP is grotesquely [1]flawed for that purpose, and most other numerical goals are hardly more reliable indicators of social welfare. There *are* quantifiable measures that do correlate fairly strongly with meaningful social goals, but these tend to be at the lower levels of wealth, income, nutrition or education. At these levels, quantifiable increases *do* generate real, meaningful rises in opportunity and welfare.

But

government has expanded far beyond helping the disadvantaged. It's expanded into areas where its reliance on aggregated data is not only leading it awry, but into activities that crowd out the more adaptive, responsive and responsible instincts of real people. At the same time, the planet is confronted with challenges, such as climate change and nuclear proliferation, that government cannot meet. Most of the population is now so used to handing over responsibility to a large and remote public sector that we think that government will solve such problems. Or we think that if government cannot solve them, they cannot be solved. The remarkable ability of humans to adapt and survive, our prodigious energy and ingenuity, is stunted, or channelled into cynicism, despair or such flippant, but lucrative, pursuits such as the marketing of dog food, where the goals are immediate, identifiable and no threat to the existing order.

There

is a widening gap between government and the people it's supposed to represent. It wouldn't matter very much if the public sector were small, and satisfied to remain so, and if real people controlled their own destiny. But the public sector is none of those things. It's big, remote and intrusive, and it's failing to meet our most urgent challenges. This combination could mean calamity, not just for millions, or hundreds of millions of human beings, but for the entire planet.

[2]Social Policy Bonds could help close the ever widening gap between politicians and people. By targeting social and environmental goals, rather than the supposed means of achieving them, they could bring ordinary people into the policymaking process. Ends are meaningful; means are not, especially when they are (deliberately?) obscured by complex, arcane and protracted policymaking processes. By focusing on ends we should be clarifying exactly what we want to achieve. But perhaps more important than clarity and even their advantages of greater efficiency, transparency and policy stability over time, Social Policy Bonds would generate [3]buy-in. By participating in making policy, people would be more readily accepting of the trade-offs that are inescapable when choosing which social and environmental goals should have priority.

## 16.6 June

### 16.6.1 Kicking the (nuclear) can down the road (2019-06-03 18:54)

Sometimes we can achieve a short-term goal only by worsening prospects for the long term. Kicking the can down the road, in other words. It's something we may be doing when it comes to peace:

[1]It's the same with [Steven] Pinker and war. 2011's *Better Angels of Our Nature* argued that violence had been in decline steadily and we are now living in an unprecedented era of peace and prosperity. It was an absurd book, because it required readers to treat our own era, when thousands of nuclear weapons are stationed around the world ready to be fired, as "peaceful." This is like saying that if somebody puts a gun to your head, they are being "nonviolent" until they actually fire it.

A

"Mexican standoff" is "peace" in the Pinker sense. [1]*The world's most annoying man*, Nathan J Robinson, 'Current Affairs', 29 May

We can't say whether the nuclear weapons deployed over recent decades have increased or decreased the probability of a catastrophic nuclear exchange. But for me the more important question is how do we best ensure nuclear peace now and in the future? At first glance, current trends are encouraging:

The good news is that, as poverty has receded worldwide, the proportion of humankind who die in wars and civil strife has fallen sharply, from nearly four per 100,000 each year in the 1980s to less than one in the past decade. [2]*How to think about global warming and war*, the 'Economist', 23 May

I wouldn't link poverty with war so unambiguously: there's no proof that poverty leads to war, and we don't really know why war and civil strife have declined, nor anything about whether it will continue to decline, whatever happens to poverty. Again, though, the question is how to ensure that the benign trend continues. It's quite possible that some proportion of the world's nuclear

weapons stockpile will be used any time now, and the *potential* for catastrophic war [3] doesn't seem to have diminished. It's quite possible, as many believe, that piling up nuclear weapons did ensure the peace (for a while). It's also quite possible that these weapons will be used, to catastrophic effect, some time soon. Indeed, the period of 'peace' might in future be seen as nothing more than a period of re-armament or proliferation: a period during which a future war became more likely and more deadly. We simply don't know.

Conflict reduction makes an ideal application for the [4]Social Policy Bond idea because ending war is one of those complex social goals whose causes (1) cannot be reliably identified, (2) vary considerably according to region, and (3) change with time. But the holders of [5]Conflict Reduction Bonds wouldn't need to go about trying to find and address war's supposed root causes. Their goal would be to keep the peace, by whatever means are most cost-effective. Sometimes, in some places, it might be most efficient to try to identify root causes. Sometimes, in some places, it might be best to reduce the number of weapons in the protagonists' arsenals; in other circumstances it might be better to increase the number of weapons. As with many of our social and environmental ills, we need a mix of diverse, adaptive solutions: exactly the sort of solutions that don't come easily to governments or supra-national bodies like the United Nations. It doesn't help that the employees of these bodies aren't rewarded in ways that encourage long-term success in their peace-keeping mission. We need to be rewarding a *sustained* period of peace, so that short-term peace is not achieved by kicking the can down the road.

The past few decades have seen a heartening reduction in conflict. But have they merely been the prelude to a catastrophic global conflict? Conflict Reduction Bonds that reward a period of [6]nuclear peace sustained for several decades would put in place a system of incentives that would channel our resources and ingenuity into achieving what must surely be one of our most important goals: the removal of the threat of nuclear catastrophe.

## 16.6.2 Climate change: do we care? (2019-06-13 16:17)

Do we care about climate change? We know that some do, passionately, and most of us, if asked, will say we do. But the evidence is clear that our collective, honest, answer to the question *Do we care about the threat of climate change?* is a resounding *no, not really*. Despite innumerable high-level conferences,

apocalyptic rhetoric, doom-laden prognostications and worthy-sounding declarations, what have we actually achieved?

David Wallace-Wells [1]tells  
it like it is:

The Kyoto Protocol achieved,  
practically, nothing; in the twenty years since, despite all of our climate  
advocacy and legislation and progress on green energy, we have produced more  
emissions than in the twenty years before.

Recent headlines confirm this:

· [2]Faking  
it on climate change;

· UK is [3]failing  
to meet almost all of its climate action targets;

· [4]Accept  
people don't, and may never, give a toss about climate change.

Why, if climate change is likely to be as catastrophic as  
the scientific consensus paints it, are we so reluctant to do anything about  
it?

One answer is that the issue is so politicised that changing  
your mind on the issue is seen as a sign of weakness.

The other answer, though, is a bit more subtle. Science appears to tell us that it's our emissions of carbon dioxide and other greenhouse gases that are causing changes in the climate, and accompanying changes like rising sea levels. Accordingly, these emissions have been the focus of our climate change policy, to minimal effect.

It's not working, because:

1. the science is not convincing,

2. our goal is not really to stop the climate changing, so we have very little buy-in, and

### 3. focusing

on the alleged root cause might not be the best way of achieving what we actually want to achieve.

## Not convincing

When I say the science isn't convincing, that's not my personal opinion. I mean that the science is literally unconvincing. It's not convincing most of us to allocate our scarce resources into solving a problem that could well be catastrophic but, the way it's formulated, requires big upfront costs for uncertain gains that that will probably be nugatory, slow to materialise, and whose provenance will never be able to be confidently attributed to past sacrifices.

## No buy-in

*The way it's formulated.* To solve this potentially calamitous problem, requiring spending huge sums now, we need buy-in. Saying that the problem is to do with the composition of the atmosphere might be accurate, but neither the proportion of greenhouse gases in the atmosphere, nor the average rise in our planet's temperature have meaning for ordinary people; you know, the vast majority of the human population who have more pressing concerns, but whose backing for the huge task ahead is critical. Limiting the Earth's rise in temperature to two degrees Celsius, or reducing the level of carbon dioxide to 350 parts per million: these are not goals with which ordinary people can identify. They are abstractions. They are means to ends, and we'd do better to decide exactly what ends we want to achieve and aim to achieve *them*.

Our problem is not the composition of the atmosphere nor the planetary temperature: it's adverse climatic events, *however they are caused*, and their impact on human, animal and plant life. That is how the problem should be formulated to generate popular support for policies addressing climate change. There's no good scientific or moral reason for a policy that prioritises the adverse impacts possibly attributable to man over those caused by nature. It doesn't matter whether the floods, hurricanes or rising sea levels that kill people or make them homeless are caused by man-made contributions to carbon dioxide levels in the atmosphere or anything else. We should aim to reduce the impacts of adverse climatic events on ourselves and our environment rather than what current - or rather, 1990s - science tells us is its most likely cause.

## Tackle the symptoms as well as the cause

We waste a lot of energy trying to identify the root causes of social and environmental problems when it might be more efficient to address the symptoms. Even when we do know the root cause of a problem, getting rid of it isn't always the best way to go. Take a weather-related example: people with vitamin D deficiency in northern latitudes. The root cause is readily identifiable: lack of exposure to the sun's rays. But the solution isn't to shoot laser beams upwards on overcast days to vaporise the cloud layer. In this instance, at least, we do the sensible thing and dispense vitamin D tablets. Often it's best to tackle symptoms and causes simultaneously, which is how we approach most serious health problems. With climate change we think we know that greenhouse gas emissions are the culprit. It is scientifically plausible, but not certain. It is even less certain that we have correctly identified all the greenhouse gases, and correctly weighted the ones we can directly control according to their long-term impact on the climate. And it's not at all certain that reducing these emissions will stop the climate changing. We've staked so much on trying to identify and deal with greenhouse gas emissions that we have lost sight of what should be our priority, which is to look after our environment, rather than try to stop the climate changing. It's a serious distraction. Our almost obsessional focus on greenhouse gases led the UK to cut the duty on diesel fuel, which emits less CO<sub>2</sub> than petrol but more nitrogen oxides and particulates. This switch contributed to 12 000 premature deaths in the UK attributable to nitrogen dioxide emissions. We seem now to be considering a similarly indirect and demented approach - this time on a global scale - by taking geoengineering seriously.

## Outcomes versus root causes

In summary: *trying to identify and eradicate the root causes of adverse environmental impacts might not be the best way of preventing them.* With climate change, it's (currently) impossible to persuade enough people that cutting back greenhouse gas emissions is going to make an appreciable difference to their quality of life or that of the environment. Focusing on the supposed root causes serves, at best, as an excuse for inaction; at worst, as a distraction from, or cause of, serious environmental problems. And we need to be clear that even if we can show that greenhouse gases are the root cause of adverse climatic events, cutting emissions might not be the best way of solving that problem. Scientists, politicians and bureaucrats talk endlessly about degrees Celsius, parts per million, climate models and scenarios. They should be talking instead about the actual, current impacts of adverse climatic events on human, animal and plant life.

### 16.6.3 Metrics in mental health (2019-06-21 22:40)

An interesting article from two years ago looks at the use of simple questionnaires, metrics and big data in psychotherapy. It's a field that is in need of objective data:

Risk alerts [derived from clients' feedback] allow therapists to adjust treatment, and can help them compensate for natural overconfidence and clinical blind spots. In one study, 48 therapists, seeing several hundred clients at a single clinic, were asked to predict which of their patients would "get worse." Only one of the therapists accurately identified a client at risk. [1]*What your therapist doesn't know*, Tony Rousmaniere, 'The Atlantic', April 2017

Dr Rousmaniere points out that for the therapist merely to ask clients how they think they're doing doesn't work. Clients aren't willing to tell therapists face-to-face that their treatment isn't working, but they are more honest when completing a questionnaire before appointments. Metrics derived from these performance feedback questionnaires 'significantly improve the effectiveness of psychotherapy, reducing dropout rates and shortening the length of treatment.'

In our large and complex societies metrics, with all their potential [2]flaws, are the only really robust way in which we can measure outcomes and progress toward them. I've wondered about the use of metrics in mental health, but this article points to the ways in which carefully crafted and aggregated metrics and their aggregation (big data) can be used not only to measure outcomes objectively, in what one would think would be an inescapably subjective field, but also to help improve those outcomes.

### 16.6.4 'Recruit to deny' (2019-06-27 15:28)

This is what happens when we blindly use badly-thought out metrics:

[M]any of our [ie, the US'] greatest universities have lately adopted an even more

egregious new practice—“recruit to deny,” a policy in which schools actively encourage students whom they know will be turned down to apply anyway, despite the waste of time and money and effort and the disappointment that such a process must entail. This seems to be done mostly in order to increase each school’s rejection rate, a figure that plays a key role in where they end up in *U.S. News & World Report’s* annual rankings of American colleges and universities. [1]*What we do in the shadows*, Kevin Baker, ‘Harper’s Magazine’, 27 June

I write quite a bit about metrics here, but how are the blog’s own metrics doing? Not very well, is the answer. The number of readers looking at this blog daily has dwindled into the single figures. Not many more look at my [2]home page, or access any of the essays, papers, book chapters, linked to thereon. That’s according to the (free) analytic tools that I use.

Nevertheless, the non-tradeable [3]version of Social Policy Bonds, about which I’ve [4]expressed [5]ambivalence, is in the policy mainstream and, largely because of that, I’m hopeful that, in time, the much greater possibilities that the tradeable bonds offer will be discussed and implemented. Until that hope is realised, mainly for my own edification and as a discipline, I will continue to post here and to maintain the SocialGoals.com site.

## 16.7 July

### 16.7.1 The JAMES Bond (2019-07-06 17:43)

Cao Honghui writes about a new type of bond that may be about to be issued in Hong Kong. The original Chinese is [1]here; this is from the Google

[2]translation

:

Inspired

by socially functional bonds, the concept of Justice Achievable Market Enabler Savings Bond (JAMES BOND) can be used as a starting point for the financing of infrastructure companies.

The justice market savings bond is inspired by the [[3]Social Impact Bond] SIB and can be said to be SIB 2.0. The justice market savings bonds are different from the social function bonds. The justice market savings bonds will have a larger amount of funds, but the expected social benefits will be greater. Justice Market Savings Bond: JAMES BOND, Cao Honghui, Master-Insight.com, 3 July

I can't tell from the translation whether these bonds are actually being issued, nor whether they would be tradeable. Would any reader who understands the Chinese be able to comment? Tradeability is the crucial distinction between the (non-tradeable) Social Impact Bonds currently in issue in about fifteen countries, and the original [4]Social Policy Bond idea. I write about the importance of tradeability [5]here and [6]here.

## 16.7.2 Targeting economic indicators is a cop-out (2019-07-12 19:29)

Vassilis Serafimakis writes to the *London Review of Books*, telling us why focusing on one particular economic variable - the fiscal deficit - is misguided:

...Diana Stone [1]notes that 'Zimbabwe's fiscal deficit is around 12 per cent of GDP' and that a country 'can't run a deficit that size without stealing from the future' ... Deficits cannot be assessed in isolation. We need to examine the whole economy, especially productivity, whose prime indicator is the level of employment. And we need to focus on the real aspects of the economy rather than worrying about economic conventions. The whole concept of 'sound finance', with its corollaries of 'fiscal discipline' and 'prudent finance,' all code words for austerity, must be discarded and

replaced with functional finance. Japan is the outstanding example of a state that has done this, albeit inconsistently. It has continuously low interest rates, low unemployment, low yet steady growth, and most important, an unmatched standard of living. All this despite the fact that every year the budget hits deficits in excess of 15 per cent of GDP, while Japan's Treasury has amassed a debt of some 230 per cent. Yet if, geography aside, Japan were to apply for Eurozone membership its application would be rejected outright because the country is in violation of the Eurozone's deficit and debt limits. This is evidence enough of the folly behind the Eurozone set-up.... Vassilis Serafimakis, [2]Letters, 'London Review of Books', 4 July

There's a large and, I think, growing gap, between such measures as fiscal deficits, debt levels, GDP; and social well-being. An increasingly out-of-touch political caste has little knowledge or experience of the world in which live the people they are supposed to represent. So they rely on these economic aggregates for information about how society is doing. Along with many others I've [3]inveighed against GDP or GDP per capita and its *de facto* targeting by politicians. As well as their inherent deficiencies, such measures as GDP and the fiscal deficit are subjects to [4]Campbell's Law, which tells us that:

The more any quantitative social indicator is used for social decision-making, the more subject it will be to corruption pressures and the more apt it will be to distort and corrupt the social processes it is intended to monitor.

Which is why I believe we should target outcomes that are meaningful to ordinary people: goals that are inextricably bound up with social and environmental well-being. Goals such as better health, universal literacy or, at the global level, regional or world peace. We should be targeting and rewarding the achievement of such goals, rather than abstract entities like deficit reduction or GDP growth. Economic variables are, at best, means to ends. They are increasingly inadequate as such but worse is that they enable politicians to distract us by deflecting our attention to those measures that have improved under their governance, or deteriorated under the governance of the other side.

[5]Social Policy Bonds are a way of channelling the market's incentives and efficiencies into the achievement of our social and environmental goals. That's one of their big advantages. But the other is more fundamental: the bonds require us, as a society, to clarify what are our goals and to come up with some sense of their priority. You would think this would be an essential feature of any democratic political system but no: what we experience today are sound bites, character assassination, personality cults or, as a very poor best: the targeting and manipulation of economic variables that don't really matter and about which none of us really care.

### **16.7.3 The status quo is a tragedy (2019-07-15 19:06)**

Tim Harford writes about healthcare in the US:

The US healthcare system is a monument to perverse incentives, unintended consequences and political inertia. It is astonishingly bad — indeed, it's so astonishingly bad that even people who believe it's bad don't appreciate quite how bad it is. ... Reforming American healthcare will require an almighty effort. With politics gridlocked and soaking in lobbyist money, it's not obvious that the US government is [1]capable of running the kind of healthcare system that works elsewhere — even if Congress decides to try. But try it must, because the status quo is a tragedy. [2]*US healthcare is literally killing people*, Tim Harford, Financial Times, 13 July

It's not just healthcare. Our political systems are comprised of, and help to sustain, institutions of all kinds that start out as well intended but, almost inevitably, become fossilised. They invest too much, emotionally and financially, in ways of doing things that might have been efficient at one point, but then become outdated as society and technology change. Eventually their overarching raison d'être becomes that of self perpetuation. They become adept at resisting threats to their survival. In the private sector competition is supposed to keep businesses on their toes, but too often the smaller enterprises are smothered by big business which, with its pals in government, regulates them out of existence. Nevertheless, there are still parts of the private sector where competition does its work, and creative destruction goes on.

It's much worse in the public sector or, rather, in the provision of social and environmental services, where people have much less information and power than service providers (healthcare) or where competition otherwise cannot operate effectively. The vested interests are government bodies, trade unions, big companies or, more and more these days, NGOs and charities. All have entrenched hierarchies and ways of doing things, and tend to resist changes that threaten their existence. So we get monstrosities like US healthcare, or the EU's Common Agricultural Policy, both of whose corrupt [3]lunacies have been well documented for decades but about which little of significance has been done.

[4]Social Policy Bonds might be the answer. They would inject competition into the solution of our social and environmental problems. They would lead to the creation of [5]new sorts of organisation, comprising protean coalitions whose every activity would be aimed at achieving society's goals with maximum efficiency. They would have incentives to ensure inefficient approaches would be terminated - not, as nowadays, bailed out with eye-watering sums of taxpayers' money in order to save the face of their instigators.

To focus on health specifically: we need to reward the achievement of successful health outcomes, which, for a country, should be a combination of variables, each of which will have to fall into a specified range before the targeted outcome can be deemed achieved. The variables would be likely to include: longevity, [6]Quality Adjusted Life Years, infant mortality and other objective data. Consider how far removed are the incentives in current healthcare systems - not only in the US - from rewarding good health. Today's incentives are, essentially, to screen, test and intervene - whether or not the intervening does any good at all. There's more about the application of the Social Policy Bond concept to health [7]here.

More generally, a bond regime would undermine the powerful institutions in the public- or private sector, whose existence is predicated on blocking reform. To give these bodies time to reform, and to shift their goal from self-perpetuation to serving the public, the bonds could be phased in over time, as I describe in chapter 4 of my book (all chapters downloadable free of charge [8]here). Social Policy Bonds, at first sight, seem a radical, even zany, approach to the solution of the problems that we face. The question, though, is whether there's anything better. In health, the environment, nuclear proliferation, violence in poor countries, to take obvious examples, the challenges are huge and urgent, and it would doubtless be difficult to overcome the obstacles to progress. But, as Mr Harford would say: try we must, because the status quo is a tragedy.

## 16.8 August

### 16.8.1 Re-jigging the incentives (2019-08-01 17:05)

George Monbiot writes:

The largest fortunes are now made not through entrepreneurial brilliance but through inheritance, monopoly and rent-seeking: securing exclusive control of crucial assets, such as [1]land and buildings, privatised utilities and intellectual property, and assembling [2]service monopolies such as trading hubs, software and social media platforms, then charging user fees far higher than the costs of production and delivery. In Russia, people who enrich themselves this way are called oligarchs. But this is not a Russian phenomenon, it is a global one. Corporate power still exists, but today it is overlain by – and is mutating into – oligarchic power. [3]*Killer clowns*, George Monbiot, 'The Guardian', 26 July

Imagine a political system in which people became wealthy by helping to solve society's problems rather than by the anti-social activities about which Mr Monbiot writes. Human ingenuity and entrepreneurial skills, currently channelled into self-enrichment via destructive or [4]frivolous activities, would be channelled instead into achieving society's goals.

[5]Social Policy Bonds could usher in such a system. The bonds would reward the achievement of targeted goals that are inextricably linked to improved social and environmental well-being. There are many benefits to a Social Policy Bond regime. **Efficiency** is the main one, as the market for the bonds would ensure that the people who can do most to achieve society's goals do so at the lowest cost. The bonds will always be in the hands of the most cost-effective operators who can out-bid the less efficient investors. Another advantage of the bonds is **stability**: whereas the best ways of achieving our goals vary over time and according to geography, the goals themselves are consistent, and there is far more consensus about our goals than about the supposed means of achieving them. The bonds would create a stable policy environment, in which long-term goals, including very remote goals such as [6]world peace, could be targeted. Another advantage of the bonds is **transparency**: clarity of goals should be a first, essential step in policymaking, but too often it's, perhaps deliberately, obscured by the arcane, legalistic tactics beloved by today's policymakers.

These are all valuable benefits. But there's another one, less obvious. Social Policy Bonds would constitute a way of making money that is inextricably bound up with achieving society's goals. A government could therefore choose to tax any gains from holding Social

Policy Bonds more lightly than other, similarly lucrative but less socially beneficial, operations. It would then be explicitly recognising that not all profit-making ventures are equal. Some, though they might raise that very [7]flawed indicator and *de facto* target - GDP - contribute very little to social or environmental well-being, while others are [8]destructive of both. This advantage of Social Policy Bonds might not seem important compared to the bonds' other pluses, but it could become increasingly significant as society grows more complex, resources more limited and we perforce become more concerned about meaningful outcomes than the short-term goals of big business and politicians.

## 16.8.2 How to make capital gains ethical (2019-08-07 20:45)

A conference nearly three years ago looked at the ethics and morality of Social Impact Bonds. A concise summary of some of the issues discussed raised the question of:

...moral

dilemmas that can arise when we place a financial value on social outcomes, and begin to see interventions in the light of the money they can save rather than on their inherent public value. Will it lead to us prioritising certain policy areas simply because they can save us money? Are we giving away too many decisions to unaccountable consultants and investors - and do the service users themselves get a say in any of this? Is it right that investors can gamble on the fortunes, or misfortunes, of others? [1]*Social Impact Bonds: are they ethical?*,

James Ronicle, 28th September 2016

Social Impact Bonds (SIBs) are a non-tradeable version of my original conception: Social Policy Bonds. Tradeability matters more than you might think. As I've explained [2]here and [3]here, when the bonds become tradeable the range of goals that we can target expands greatly, and

our time horizons stretch much further into the future. The qualitative effect of a bigger range means that our social and environmental targets can embrace outcomes that a narrower, shorter-term target will exclude. Take for example recidivism rates, targeted by SIBs in the UK and elsewhere. Whereas a SIB regime will reward their reduction, even a large number of such SIBs would do nothing for the long-term health of society as a whole. For a start, narrow, short-term goals increase the likelihood of effective manipulation - a simple example springs to mind: investors in the bonds could subsidise superior legal representation to an offender accused of a new crime. But, more importantly, when we embrace broad, long-term goals, there is *no need* to prioritise 'certain policy areas simply because they can save us money'. *Under a Social Policy Regime there need be no conflict.* The policy 'areas' we can prioritise are large enough to include everybody.

It's not so different in other policy areas. SIBs currently [4]target, for instance, academic performance among at-risk three- and four-year olds in Utah, or the number of housing units for the homeless in Massachusetts. Very laudable but, again, apart from these narrow goals being susceptible to crude manipulation (by [5]fiddling test results for instance), they also reward the shifting of resources from untargeted goals to those that will generate short-term gains for bondholders.

This is the key. Social Impact Bonds have to focus on narrow short-term goals that are easily measured. Social Policy Bonds, in contrast, can take a broader, long-term view. They can encompass the goals of society as a whole. Rewards to holders of carefully crafted Social Policy Bonds might still benefit wealthy investors, but *only as a by-product of benefiting all of society.*

There are bigger possibilities: one of the participants at the above conference asked:

...whether development bonds, where investment is made in developing countries, create a new form of colonialism, as the West profits from interventions in developing countries.

Again, there need be no conflict. Social Policy Bonds targeting, for instance, regional or global [6]conflict, or [7]disaster prevention could benefit both western investors *and* developing countries. Large capital gains, though widely and understandably viewed with disdain in today's society, don't have to be unethical.

For more on this last topic see my [8]previous post. For more on the topic of rewarding people for performing the socially useful function of, for instance, teaching see my blog post [9]here. All my essays on the bonds are accessible from the main [10]Social Policy Bonds site.

### 16.8.3 Who thinks long term these days? (2019-08-19 16:16)

Social Policy Bonds haven't gone very far. It's true that their non-tradeable variant, [1]Social Impact Bonds are being issued around the world and are the subject of much academic outpouring. ([2]Academia.edu tells us that there are more than *190*

*000* papers mentioning 'Social Impact Bonds'.) But Social Policy Bonds? None have been issued that I'm aware of, and they generate little in the way of literature - apart from my own [3]work, of course.

There are several reasons. One is that, while the tradeability of Social Policy Bonds sounds like a technical issue, in political terms it's a bit of a time-bomb. It means that whoever issues the bonds doesn't get to choose who will be rewarded for achieving the targeted goals. In this, Social Policy Bonds are quite different from the SIB model, under which only chosen service providers will benefit from investing in the bonds. These are generally existing service providers. This obviously limits the scope for innovation and the efficiencies it would bring about. Existing service providers have a vested interest in maintaining current ways of doing things. (Indeed, combined with the inherently short-term nature of SIBs, lack of tradeability creates a perverse incentive not to be too efficient, lest issuers of future SIBs targeting the same social problem consequently tighten their efficiency criteria.) In our current political systems there are few incentives to allow new, potentially much more efficient, operators

into solving our social and environmental problems. The inherently short-term nature of SIBs mirrors too neatly the short-term goals of politicians and current service providers.

Other reasons for the absence of Social Policy Bonds? One that I've experienced is the disdain of those on the political left for anything that smacks of profit or capital gains, especially in the provision of benefits to the disadvantaged. A sentence from a recent [4]post by Charles Hugh Smith sums it up: *we substitute self-righteousness for problem-solving*. The thinking is as simplistic as it is injurious to the disadvantaged: 'markets are right wing and therefore bad'. I am still hopeful though that there will come, in time, a government, a non-governmental organisation, or a group of philanthropists who will take a long-term view, forgo the pats on the back by established bodies in the public and private sectors, and put the interests of their country, our environment, or the world above their own.

For more about why I am skeptical of Social Impact Bonds see [5]here and [6]here.

#### **16.8.4 How to prevent crime (2019-08-25 16:16)**

Dr Elliott Barker asks how we can prevent crime:

There should be a clear recognition that the only meaningful measure of success in child rearing is an adult with highly developed capacities for trust, empathy, and affection. It follows that the current worship of child rearing practices that evoke the highest possible I.Q., or the child with the greatest possible number of factual crumbs by the lowest age, or the child who can play the cello best at the earliest age should be suspect. [1]*How Do We Prevent Crime?*, Dr Elliott Barker, the Natural Child Project

The question is not whether we believe (as I do) that we can reduce crime and other social pathologies by taking Dr Barker seriously but *whether people have sufficient incentive* to investigate how valid his argument is and then to act on their research. I don't think they do. Crime is today largely seen as a matter for policing and punishment. There may or may not be academic research pointing the validity of Dr Barker's arguments. But even if there is, who has the incentive to examine this research, check its validity and act on the results? Very few, and almost nobody with the financial clout to influence the way we bring up our children. Of course, there is good work being done by people such as Dr Barker, and eventually some of their findings do percolate through to a few dedicated researchers and parents. But work on the scale necessary to see widespread changes? The bodies, including government, that could fund such work are far too focused on the short term. And [2]who thinks long term these days?

[3]Social Policy Bonds targeting [4]crime could be one answer. Under a bond regime, we could target a long-term halving of crime rates, sustained for a period of, say, thirty years. A combination of government, NGOs and philanthropists could back these bonds, which could be swelled by public contributions. Once issued, bondholders would form a *de facto* coalition, whose composition would most probably change over time, but all of whose activities would be aimed at achieving the targeted reduction in crime rates at lowest cost to society.

Long-term thinking and the notion of a coherent society that persists over decades: any attempt to improve social welfare and the environment requires both these qualities. They're not at all prevalent but policies like Social Policy Bonds that need them to work can also create and encourage their proliferation.

## 16.9 September

### 16.9.1 It's not just dog-food (2019-09-02 17:24)

There is probably more human ingenuity going into devising new ways of [1]selling [2]dog-food than avoiding nuclear war or eradicating poverty or achieving universal literacy. But it's not

just dog-food:

For decades, increasingly large numbers of America's smartest and hardest-working businesspeople have toiled in extractive pursuits, and the result is an economy that benefits an increasingly smaller percentage of its participants. Many structural reforms are necessary to change this. With regard to education, it is time to reform the top MBA programs. These schools shape our business culture, and, in so doing, exert an outsized influence on the business practices and the career pursuits of some of our most talented young people. The schools should begin with an explicit renunciation of shareholder capitalism. [3]*The Financialization of the American Elite*, Sam Long, 'American Affairs', Fall 2019

By 'extractive pursuits' Mr Long means 'value extraction and short-term financial speculation'. There's nothing wrong with people choosing to make a career of financial shenanigans (see [4]here for another example) or advertising dog-food. They're not greedy. They have children to bring up, elderly parents to look after.... These intellectual giants are simply reacting rationally to the incentives on offer. But it's a shame for the society that a high proportion of the smartest people on the planet their goals cannot meet their individual goals by helping to solve our huge, urgent social and environmental problems.

Social Policy Bonds are a way of aligning the incentives smart individuals face with those of society. They work by channelling our self-interest into the solution of our social problems. They do so by injecting market incentives into the solution of these problems. In economic theory, and on all the evidence, markets are the best way of allocating society's scarce resources. So it is unfortunate that, largely for historical reasons, we leave the achievement of national and global social and environmental goals to a command-and-control mechanism that is often inefficient and open to abuse.

Sure, a Social Policy Bond regime would probably see some enrichment of wealthy corporations or individuals, *but only as a side-effect of their achieving society's agreed social and environmental goals*. The incentives of the people owning Social Policy Bonds and the people they employ would exactly align with those of society. All their activities would be aimed at achieving society's goals as efficiently as possible.

A Social Policy Bond regime represents a new departure. It would not reward people merely

1288

for undertaking activities that *sound* worthy, nor for belonging to organisations whose ostensible aims are to help people but are, in reality, less edifying. Rather, a bond regime would reward the achievement of society's goals. Yes, it would divert some of society's scarce resources, including brainpower, away from marketing pet-food or maximising short-term share prices or other super-sophisticated, zero-sum financial manipulation. But we are talking about the potential solution to some of mankind's biggest and most urgent problems: [5]poverty, [6]climate change; even the [7]ending of war. I think it's a worthwhile trade-off.

## 16.9.2 Government+big business+judges vs. the people (2019-09-10 17:41)

Christopher Caldwell writes:

Once the judiciary rules politics, all politicians are just talkers....The transfer of competences from legislatures to courts is a superb thing for the rich, because of the way the [British] constitution interacts with occupational sociology. Where the judiciary is drawn from the legal profession, and where the legal profession is credentialed by expensive and elite professional schools, judicialization always means a transfer of power from the country at large to the richest sliver of it. [1]*Why hasn't Brexit happened?*, Christopher Caldwell, claremont.org, 15 August

Mr Caldwell is writing in the context of Brexit, but this insight applies more broadly. I've often railed against the widening gap between politicians and the people they are supposed to represent. The gap between ordinary citizens and the judiciary is at least as wide. We, the public, have even less buy-in when decisions are made by judges rather than politicians. What happens with contentious issues on which ordinary people have no say? Here, the *Economist* writes about the abortion debate in the US:

Why did the two sides become so polarised? The main reason is the way

abortion was legalised. In many countries, abortion laws were voted for by elected politicians or in referendums. In America, a seven-to-two majority of justices declared abortion a constitutional right. Anti-abortionists question the interpretation of the constitution that produced that ruling and are furious their voices were not heard. Abortion advocates remain fired up by the knowledge that *Roe* could yet be overturned. *What explains [2]Donald Trump's war on late-term abortions?*, the 'Economist', 24 August

Buy-in is important and, with big government, complex societies, and our emphasis on how policy is made and who makes it rather than outcomes, there's very little buy-in remaining at the national level. Corporations, politicians and, increasingly, the judiciary define the economic and social environment in which we live.

Social Policy Bonds, by targeting outcomes with which people can identify could bring about more public participation in the policymaking process. That is an end in itself (see [3]here (pdf) for example), as well as a means by which decisions become acceptable even to those who opposed them. Importantly too, there's more consensus about outcomes than about the supposed means of achieving them. A bond regime would focus policy debate on our social and environmental goals, and which ones shall be prioritised. The process itself would generate more mutual understanding and less of the anger and contempt that are such a feature of today's policymaking.

As well, a bond regime would encourage us to think long term: our goals are far more stable than the ways in which we think we can best achieve them. They are also more transparent as, with Social Policy Bonds, would be their funding. Corporations, their lobbyists and the people in power whom they influence all have an interest in obscuring how funds are allocated, and in failing to monitor whether policies succeed or fail (see [4]*Why States Believe Foolish Ideas: Non-Self Evaluation by States and Societies*, by Stephen Van Evera (pdf)). It's even more difficult to believe that our new policymakers - the judiciary - will be any more responsive to the needs and wishes of ordinary citizens. With government, big business and now the judiciary determining our economic and social environment, what hope is there for the rest of us? The gap between ruler and ruled is becoming ever wider. Social Policy Bonds could help close it.

For general information about Social Policy Bonds see [5]here. For more about Social Policy Bonds and buy-in see [6]here.

### **16.9.3 It's too dam complicated (2019-09-23 18:46)**

Some things are too complicated to understand, even for experts, let alone policymakers.

Dams have been thought a good way of reducing greenhouse gas emissions while satisfying our ever-increasing demand for electricity. Indeed, dams built in cool, dry places probably do reduce emissions per watt compared to fossil fuel generation. So, in 2012 the Intergovernmental Panel on Climate Change (IPCC) said that, taking into account construction and operation, hydroelectric power produces less than 3 percent of the warming of fossil-fuel power plants that burn coal, oil or natural gas. But, as Daniel Grossman writes:

That is true for some dams, such as those built in relatively cool, dry places with relatively little vegetation, which rots and turns into greenhouse gases. But the IPCC report ignored dams built in lowland tropical forests, where luxuriant jungle produces an unusually large amount of emissions. Daniel Grossman, [1] *the Sunken Rainforest*, 'New Scientist', 21 September

In tropical dams, microbes digesting submerged trees produce methane as well as CO<sub>2</sub>. An expert based in Brazil says that "hydroelectric dams in tropical lowlands are a climate disaster."

Why do we continue to make policy about systems that are too complex for us to understand? Partly it's historical. A century or two ago the link between the cause of a social or environmental problem and its effect would be more obvious. Effective policy could be made accordingly. But today the complexities have grown so profoundly that even the direction of causation isn't always clear. Policymakers, though, still make policy based on hunches or scientific knowledge that necessarily becomes out of date.

My suggestion is that, instead of making policy about complex but important issues as if we know what's going on, we should target outcomes, rather than the ways in which most experts currently think is the best way of achieving them. So, instead of targeting, say, 'proportion of electricity generated by renewable resources', we target for reduction the negative impacts of adverse climatic events. A [2]Climate Stability Bond regime would leave it up to motivated bondholders to work out the most efficient ways of achieving our climate goal; and they would do so in ways that both generate and act on the basis of rapidly expanding scientific knowledge. They would have incentives to look more closely and on a continuing basis at, for example, where dams can help achievement of our goal and where they would hinder it.

The [3]Social Policy Bond principle would stimulate, diverse, adaptive initiatives: projects that would take into account the differing and changing circumstances that any single conventional body, such as government at any level, just cannot.

Overwhelming complexity doesn't just affect big global problems. Here, Dr Malcolm Kendrick writes:

[1]In truth, almost all diets are perfectly healthy. Vegetarian, paleo, keto, vegan (with a few essential nutrients thrown in, so you don't die), HFLC [High Fat Low Carb], etc. In fact, the only non-healthy diet would be the one recommended by all the experts around the world. Namely, High carb, low fat (HCLF). The 'eat well plate', 'the food pyramid' - whatever it is now called. Stay away from that, and you will be fine. [4]*What causes heart disease (blog) part 65*, Dr Malcolm Kendrick, 23 September

Government and their scientist advisors, would serve us better by showing a bit of humility. Targeting outcomes, rather than the ways they currently think we'll achieve them, would be a good start.

## 16.10 October

### 16.10.1 Harlem trendsetters (2019-10-02 16:27)

Years ago John Fund asked:

“If you had a financial windfall and wanted to help the poor, would you even think about giving time or a check to the government?” [1]Source

A story from the current *Economist* reinforces the sentiment behind that question:

Harlem is a neighbourhood in upper Manhattan that was once a byword for poverty, crime and urban failure. It was a place where, as recently as 1980, black men had a lower life expectancy than in Bangladesh. Large parts of it look different today. Life expectancy has soared, and the neighbourhood has improved dramatically. Although a considerable share of children there—35 %—remain poor, their life chances still look much better than a generation earlier.

That is in no small part because of the efforts of the Harlem Children’s Zone (HCZ), a non-profit group which has “adopted 100 blocks” and set itself the goal of breaking the intergenerational chain of poverty by providing good parenting advice, healthy food and education. New parents who attend the zone’s Baby College learn about proper nutrition and reading habits for their infants. Older children can attend free, full-day pre-kindergarten and some go on to attend the HCZ network of charter schools. Their impressive initial results are seen as a national model. The zone serves 14,000 children and 14,000 adults at a cost of just \$4,600 per person per

year (raised from a mix of public and private sources). That is not a large sum of money, points out Anne Williams-Isom, the zone's boss. "We spend \$167,000 on an inmate in Rikers [jail]. [2]*How much can enterprise and philanthropy help alleviate American poverty?*, 'Economist', 26 September

When I first came up with Social Policy Bonds I thought that government bodies, at any level, would be the issuers. They have far more resources than private charities, non-governmental organisations and philanthropists.

It's true that they, along with other donors, back most of the [3]Social Impact Bonds currently being issued in about 25 countries. But they have shied away from issuing SIBs that target long-term, large-scale goals like raising life expectancy or universal literacy. Imagine the possibilities if government funded such bodies as the Harlem Children's Zone, with their ambitious goals that can be reached only after many years.

I think the main reason Social Policy Bonds haven't been issued is that, unlike SIBs, they are tradeable. This means that the bodies that would receive funding for their projects need not be the same throughout the lifetime of the bond, which could be decades for remote goals such as the elimination of poverty or the achievement of universal literacy. *A government that issued Social Policy Bonds would therefore be relinquishing its power to choose the recipients of funds.* Under a bond regime the allocation of funds would be up to the market, which would have incentives to choose only the most efficient operators and to terminate failed projects. Bodies currently favoured by government would, if they were inefficient and incapable of adapting, lose their funding under a Social Policy Bond regime. That is a contrast today's funding arrangements. In conventional policy, outstanding failure is rarely penalised (and often rewarded). Even under a SIB regime, inefficient operators, while they wouldn't maximise their returns, wouldn't see their existence be threatened.

Under both conventional policy and SIBs there is the possibility that even bodies as the HCZ well-meaning, hard-working and idealistic as they are at the beginning of their mission, become inefficient. The tendency is for any organisation, be it a trade union, religious body, university, public sector body or monopolistic private sector corporation, to become inefficient or corrupt; forgetting its ideals and devoting most of its energies to [4]self-perpetuation. Examples abound: only today for instance, we read of the huge salaries being paid to top charity employees. Just one recent example:

Former Labour Foreign Secretary David Miliband is being paid almost \$1 million a year to run a humanitarian charity that receives massive sums from British taxpayers. His astonishing pay package as chief executive of International Rescue Committee has soared to \$911,796 (£741,883) ... according to the US-based organisation's latest tax return. [5]*Million-dollar Miliband!*, mailonline, 1 October

Social Policy Bonds would eliminate that risk. They would generate a [6]new type of organisation - one whose survival would depend absolutely on its efficiency, and whose composition and structure would adapt to changing circumstances. This organisation would be a formal or informal coalition of bondholders, whose every activity would be devoted to achieving society's targeted goal with maximum efficiency. It's unlikely that governments will take the lead here; they are far more comfortable dealing with established players. What about philanthropists? I haven't made much headway there - they probably filter out messages from unconnected members of the public. However, I did publish this [7]article in one of their journals last year. I'm not aware of any follow-up....

## 16.10.2 They've weaponised complexity (2019-10-08 19:19)

When people's wishes clash with vested interests it's the vested interests (aka 'the deep state') that win every time. Our political systems are too complex, arcane or corrupt for ordinary people to stand a chance. One result is obvious: ever-rising income and wealth

inequality. It's been seen as a problem for years, but where are we now? From yesterday's *New York Times*:

[T]he 400 wealthiest Americans last year paid a lower total tax rate — spanning federal, state and local taxes — than any other income group, according to newly released data. [1]*The Rich Really Do Pay Lower Taxes Than You*, David Leonhardt, 'New York Times', 6 October

It's not only the US. Here Martin Lukacs writes about Canadian Prime Minister Justin Trudeau:

In late 2018, this avowed friend of labor legislated away the right to strike of a postal union that wanted safer working conditions; this champion of equality gave profitable multinational corporations giant hand-outs, maintaining multibillion-dollar subsidies to oil companies and granting \$10.5 billion in tax breaks on the heels of similar measures by Trump; and this advocate of women's rights set a record selling weapons to the theocratic, patriarchal Kingdom of Saudi Arabia, even as their war on Yemen escalated. Private wealth continued to soar, without any discernible benefit to the public good. Much-needed universal social programs like childcare or the extension of healthcare to cover the costs of medicines in Canada—which are the second highest of any country—never materialized.

[2]*Justin Trudeau, Liberal Let-Down*, Martin Lukacs, NYR daily, 7 October

Voting makes little difference. And, while we don't really know the intentions of the people in power, I suspect that whoever they are doesn't make much difference either. The vested interests are too powerful. They have perpetuated a policymaking process that effectively excludes influence from people outside their exalted circle. They have weaponised the complexity and obscurity of our systems of government for selfish ends.

They can get away with this because our political discourse centres on sound-bites, personality, and image. Actual policymaking is an entirely distinct process: much of it focuses on the structures and funding of government bodies, law and regulation; all of which are opaque to non-professionals - which is to say, ordinary people. The public. The rest of us. The only people who now really understand policymaking are those who are paid to do so, and the only people who influence it are those who have the millions of dollars necessary to pay them. You

might even think the system has been specifically designed to keep ordinary citizens out of it.

So I suggest that policymaking instead focus on outcomes, rather than the alleged means of achieving them. Outcomes that are meaningful to ordinary people, so that we can engage with discussion about them, their funding, their relative importance. Such discussion would be more accessible than current policymakers' emphasis on legal pathways, funding arrangements, institutional structures and composition, and other arcana.

Meaningful outcomes: they form one essential element of the Social Policy Bond idea. The other is the injection of market incentives into their achievement: rewarding those who achieve our goals according to their efficiency in actually achieving them. The idea might sound outlandish at first hearing: handing over the solution of our social and environmental problems to investors. But our goals would be discussed and articulated by government - something that democratic governments are quite good at doing. Only their achievement would be subject to the market, which economic theory and all the evidence suggest is the most efficient way of allocating society's scarce resources. No doubt the Social Policy Bond idea could do with some discussion and refinement. But the real question is: what is the alternative? To continue as we are doing, where the gap between vested interests and ordinary people grows ever wider, risks, in my view, social collapse.

### **16.10.3 We don't like being held in contempt (2019-10-16 16:23)**

Concluding their study of daily life in colonial Latin America, Ann Jefferson and Paul Lokken write of the conflict between the Roman Catholic Church and those advocates of political and economic liberalism associated with Enlightenment thinking:

Conservative leaders often succeeded in rallying support for their program from native peoples and other marginalized members of society because liberal advocates of “progress,” much like Spain’s “enlightened” Bourbon reformers in the late 18th century, generally made clear their disdain for the supposedly backward aspects of popular culture. [1]*Daily Life in Colonial Latin America*, Ann Jefferson and Paul Lokken, August 2011

I think the authors are onto something here; something that applies as much to today’s politics in western democracies as those of 200 years ago in the newly independent countries of Latin America. In the absence of a policymaking system that engages ordinary people, we react emotionally to the candidates and parties on offer. When we sense disdain from a political party, we vote for the other lot. The smugness of elites can be seen across the entire range of the spectrum, and our reaction to that combination of condescension and contempt explains much of contemporary politics.

We need a policymaking system that encourages us to further our understanding of the policy choices on offer - not the personalities, the sound-bites, the images or the rhetoric. We can do this by formulating those choices in terms of outcomes: outcomes that are meaningful to all of us; outcomes that we can understand and put into some order or priority.

Social Policy Bonds are one way in which we can specify such outcomes, and have people vote for those they support. A bond regime would be a way of bypassing the neuroses and insecurities of the people in power and those who manipulate them. By targeting outcomes with which people can identify Social Policy Bonds could bring about more public participation in the policymaking process. That is an end in itself (see [2]here (pdf) for example), as well as a means by which decisions become acceptable even to those who opposed them. Importantly too, there’s more consensus about outcomes than about the supposed means of achieving them. A bond regime would focus policy debate on our social and environmental goals, and which ones shall be prioritised. The process itself would generate more mutual understanding and less of the anger and contempt that are such a feature of today’s policymaking

As well, a bond regime would encourage us to think long term: our goals are far more stable than the ways in which we think we can best achieve them. They are also more transparent as would be their funding. Corporations, their lobbyists and the people in power whom they influence all have an interest in obscuring how funds are allocated, and in failing to monitor whether policies succeed or fail (see [3]*Why States Believe Foolish Ideas: Non-Self Evaluation by States and Societies*, by Stephen Van Evera (pdf)). With government, big business and now, increasingly, the judiciary determining our economic and social environment, what hope is there for the rest of us? The gap between ruler and ruled is becoming ever wider.

Social Policy Bonds could help close it.

#### **16.10.4 The new caste system (2019-10-26 18:02)**

Michael Hobbes writes:

“The sense that there’s a self-sustaining and self-dealing group at the top isn’t wrong,” Reeves said. “When you create a ‘meritocratic’ selection process where the production of merit is increasingly skewed by parental income, you end up with a hereditary meritocracy.” [1]*The ‘Glass Floor’ Is Keeping America’s Richest Idiots At The Top*, Michael Hobbes, ‘Huffington Post’, 13 October

True, but what is a meritocracy in one set of circumstances becomes something different when history moves on. What happens to what was (perhaps) a meritocracy is exactly what happens to any other organisation when faced with significantly changing circumstances: it begins to devote its time and energy to self-perpetuation rather than its stated, original, goals. Every organisation does it: be it a government body, a trade union, church or university. In the private sector too, large corporations, especially monopolies, find it more expedient to spend their time stifling competition and manipulating the regulatory environment to favour big, established firms like themselves. So I would not use the phrase ‘hereditary meritocracy’ to describe our ruling class: rather ‘hereditary elite’. A caste, in fact.

We are beginning to see the result: a self-entrenching elite. In the English-speaking world (and perhaps beyond) we have a bifurcated society, in which those whose parents own

property can aspire to own property, and those whose parents don't own property have very little chance of ever being able to buy a house, however hard working they might be.

Inequality in Britain is “now entrenched from birth to work”, according to a damning report by the government's social mobility commission[.] [2]*Social mobility in UK 'virtually stagnant' since 2014*, Richard Adams, the 'Guardian', 30 April

Part of the problem is that we [3]have government of the people, by the people rich, and for the people rich. And one reason for that is that our policymaking processes are so obscure and protracted that only the rich (or their employees) have the means or capacity to follow it closely and thereby influence it. Ordinary people are alienated from the decisions that affect our lives.

One of the two underlying principles of the [4]Social Policy Bond idea is that we - that is, society - should target goals that are meaningful to ordinary people; goals that we can understand and with which we can identify. So instead of politicians making themselves feel important by spending hours tinkering with various bodies' funding and regulatory arrangements, they would concentrate on articulating society's goals and raising the revenue for their achievement: things that government is actually quite good at. The *achievement* of these goals, on the other hand, is best done via a market. In economic theory, and on all the evidence, markets are the most efficient way of allocating society's scarce resources. By issuing Social Policy Bonds, government could target long-term, ambitious goals, without having to think about how to achieve them. That means, of course, that it would relinquish its power to decide who receives funding, and that is the sticking point. People rarely surrender power voluntarily.

So perhaps the more likely vehicle for the Social Policy Bond idea will be driven by philanthropists. I've [5]tried to reach them, but so far without success.

## 16.11 November

### 16.11.1 It's all about outcomes (2019-11-06 17:34)

From *Harper's Magazine*:

Percentage of [US] Democratic voters who cite a personal characteristic as the most important factor in selecting a president :  
28

Who cite a policy consideration : 27

Harper's Index, *Harper's Magazine*, November, derived from Pew Research Center (Washington).

What could we expect? Policymaking is so removed from ordinary people that we have little else to go on, other than what can be seen in the media. We choose our politicians according to their perceived personality. Promises, rhetoric come into it but outcomes? Not at all. This isn't specific to the US. The gap between policymakers and the public grows ever wider. We focus on crises in the same way as we choose our politicians: according to their profile in the media. Slow-moving, complex crises, like climate change or the ballooning of public and private debt, deteriorate over the years, until they manifest themselves unequivocally forms that can be covered in a short news bulletin. There's an inevitability about this, and it's perfectly explicable in a world in which we are bombarded by information. But it is not efficient, because resources are devoted to avoiding images of failure, rather than actual failure. Serious but non-visual crises, as we have seen in finance and the environment, slowly and undramatically gather pace until their effects become unavoidable. By that time, of course, it might be too late to do much about them, even with enormous quantities of spending.

A [1]Social Policy Bond regime could be different. It would target society's social and environmental goals, such as dealing with [2]climate change, extending [3]nuclear peace, the

mitigation of any sort of human [4]catastrophe, however caused. We need to be given the chance to express our political views in the form of desirable outcomes, rather than in terms of personality.

### **16.11.2 Effective policy needs experiments (2019-11-09 17:12)**

Long-term, remote goals, such as universal literacy, the ending of war, or the elimination of poverty in developing countries, will require a range of solutions, varying over time and space, for their achievement. Conventional approaches to large-scale, complex problems rarely rely on hard evidence. Too often we read about the supposed 'root causes' of, for instance, violence being poverty and violence, with little supporting evidence. Sure, in some circumstances, tackling such alleged root causes might be the most efficient way of solving a problem. But in others such faith might be misplaced, or even counterproductive. Even [1]Social Impact Bonds are limited when it comes to large-scale, remote goals, because they are inherently short term in nature, and don't allow for new entrants into the problem-solving services. (See [2]here and [3]here for why I am ambivalent about SIBs.)

[4]Social Policy Bonds are different. Because they're tradeable, they can target long-term goals whose achievement might take years beyond the planning horizon of investors. This allows bondholders to benefit from copious research aimed at finding, and funding, only the most efficient initiatives.

This sort of research and experimentation in matters of policy is rarely encouraged or rewarded, so I'm pleased that this year's Nobel prize for economics was awarded to three economists, Abhijit Banerjee, Esther Duflo and Michael Kremer, who used experiments to look at approaches to health care, education and entrepreneurship.

In the mid-1990s Mr Kremer ...began studying poverty with methods more commonly associated with chemists and biologists: randomised trials. If human capital—health, education, skills and so forth—is essential for development, then economists had better make sure

they understand where it comes from. In Kenya he conducted field experiments in which schools were randomly divided into groups, some subject to a policy intervention and others not. He tested, among other things, additional textbooks, deworming treatments and financial incentives for teachers linked to their pupils' progress. .... Educational resources—textbooks, say—turned out to do little for learning outcomes. Making pupils healthier improved their attendance, but did not necessarily mean they learned more. The experiments had a larger result, however: they taught the economics profession that randomised trials could work in the field. [5] *A Nobel economics prize goes to pioneers in understanding poverty*, the 'Economist', 17 October

Right: they can work if the incentives are there to conduct them. The governments of all too many countries seldom think of offering such incentives. Philanthropists sometimes do, though (see [6] here for example). They could take the lead in issuing Social Policy Bonds for the big, urgent goals that existing bodies are too small, too selfish or too incompetent to target effectively. See [7] here for my piece on Social Policy Bonds published by a journal for philanthropists.

### 16.11.3 It's worth investing in nuclear peace (2019-11-23 23:16)

There's very little to cheer about here:

As China makes its nuclear forces more credible—less vulnerable to pre-emption, and more likely to get through missile defences—America grows nervous, argues Caitlin Talmadge of Georgetown University. If America cannot hope to destroy most of China's missiles, then it cannot easily threaten China with a nuclear strike without putting its own cities at risk. American policymakers worry this will embolden China and unnerve American allies like Taiwan and Japan.... Chinese officials are overconfident about their ability to prevent a

conventional war from turning nuclear, they argue, while American ones are overconfident about their subsequent ability to keep a nuclear war limited in scope. Making things worse, the two countries lack a dedicated nuclear dialogue, largely because China is wary of giving away too much information. [1]*China's nuclear arsenal was strikingly modest, but that is changing*, the 'Economist', 23 November

The stakes here are enormous, but we are proceeding haphazardly toward an unknown, perhaps catastrophic, destination. There *are* people and resources aimed at minimising the risk of nuclear conflict but I think there are too few, given the potential for calamity. Unfortunately, we have no way, under our current national and supranational political systems, to channel more resources - more *effective* resources, that is - into minimising the risk of nuclear conflict.

Actually, the goal of sustained nuclear peace makes an ideal target for the Social Policy Bond idea. One, because it's a complex, long-term goal that will require diverse, adaptive solutions. Two, it's an easy goal to verify. And lastly, it's a goal that, on all the evidence, including that of the *Economist* article, is unlikely to be reached under current policy.

My proposal would be to issue bonds that reward a sustained period of nuclear peace. This could be defined, as, say the non-detonation of a nuclear device that kills more than 50 people for 30 years. They could be backed by a combination of governments, non-governmental organisations, philanthropists and members of the public. With sufficient backing the bonds would help offset and (one hopes) outweigh the the incentives currently on offer, which essentially are those of the military and weapons manufacturers to maintain a nuclear posture.

Those billions of us who would benefit from nuclear peace are presumably a massive numerical majority, but we have few means of channel our wishes effectively. The tendency is to assume that governments will do what's necessary, with the support of hard-working, well-intentioned people in the private sector. But the rewards to all these people are not linked to their success. This is unhelpful in itself but, more importantly, it discourages investors who, seeing little opportunity to benefit from working to reduce nuclear conflict, will focus instead of less edifying enterprises. Most important of all is that our current strategy is just not working.

We need to reward those who achieve nuclear peace at least as much as those working to undermine it. We don't know exactly how to reduce the

chances of a nuclear exchange, nor who will be best placed to do so, over the long period during which our goal is to be achieved, but we have no excuse for not encouraging people to find out. Nuclear Peace Bonds would apply the [2]Social Policy Bond principle to this goal. Investors in the bonds would form a [3]protean coalition of people dedicated to achieving it as efficiently as possible. Their goal would be exactly the same as society's. Human ingenuity knows no limits. Currently, too much of it is devoted to relatively [4]unimportant or socially [5]questionable goals. Nuclear Peace Bonds would channel our ingenuity, and stimulate more of it, into minimising the risk of a global catastrophe.

My short piece on Nuclear Peace Bonds is [6]here. The links in the right-hand column of that page point to papers on similar themes: [7]Conflict Reduction, [8]Disaster Prevention, and [9]Middle East Peace

## 16.12 December

### 16.12.1 Improve health by spending less on health care (2019-12-10 19:23)

Richard Smith, the former editor of the *British Medical Journal* gets it:

Another common mistake is to confuse health care and health. Health care accounts for perhaps 10 % of health. Income is the main determinant of health. Spending more on health care crowds out spending on things like housing, education, the environment and benefits, which are more important for health. The NHS doesn't need

more money, it needs a radical rethink. Richard Smith, [1]*Letters to the editor*, the 'Economist', 7 December

Exactly. The best, most efficient way, of achieving our health goals is not necessarily to spend more on healthcare, just as the best way of reducing crime might not be to spend more on policing. In health, as in other policy areas, suffers from its inherently uniform, top-down approach, heavily influenced by large corporations. Government can also be short term in its thinking, reactive rather than proactive, and disdainful of innovation while favouring tried, tested but failed approaches. It has to make its resource allocation decisions on the basis of data that are necessarily incomplete. How can it know in detail the effect that spending on, say, sophisticated ultrasonic diagnostics will have on the overall health of the nation, as compared with nudging us to floss our teeth daily?

Health expenditure is influenced by groups of medical specialists with little incentive or capacity to see improvements in the *overall* health of a large population as an objective. Funding decisions are also heavily influenced by the public profile of a disease or its victims, rather than on what would best meet the needs of society. As Dr Smith says, health is also a function of housing, income, education and the environment, as well as more factors such as diet, and exercise. Research shows the beneficial effects on health of green spaces in our cities (see [2]here (pdf) for instance). The way government is currently structured, with its discrete funding bodies all being lobbied by the medical industry, makes it unlikely that such difficult-to-quantify benefits will influence funding decisions.

We cannot expect a government nor any single organisation to identify the huge numbers of variables, with all their time lags and interactions, that influence the nation's health. We can, though, devise a system that rewards people who explore and implement the most cost-effective health solutions, even when circumstances and knowledge are changing continuously. I have tried to do this with my essay on [3]Health Bonds, which would aim to distribute scarce government funds to where they would do most good, as measured by such indicators as [4]Quality Adjusted Life Years.

By issuing Health Bonds, government would reward successful initiatives for improving health *regardless of how these initiatives work or who implements them*. Government would still articulate society's broad desired health outcomes, and still raise the revenue for their achievement. But it would contract out the achievement to motivated investors in a way that rewards success, and only success. Health Bonds, would stimulate diverse, adaptive ways of achieving goals, in ways that we cannot anticipate, and that could well entail dealing with problems such as those identified by Dr Smith.

### 16.12.2 Give up control over the 'how' (2019-12-15 17:04)

Joseph O'Neill looks at US politics and how wealthy left/'liberal' donors' support differs from their conservative counterparts' in the US:

[T]he liberal political apparatus is “largely guided by the moral whims of rich people.” ...Liberal megadonors with private foundations are reluctant to invest in uncharismatic, long-haul grassroots projects. They are typically afraid of appearing “political.” Instead, they favor ameliorating the plight of the visibly needy ... [whereas] right-wing donors have spent their money more productively. They have created and supported entities (the American Legislative Exchange Council, ... the State Policy Network, Americans for Prosperity, the Federalist Society, etc.) dedicated to developing durable structures of power and fanaticism. [1]*No More Nice Dems*, Joseph O'Neill, 'The New York Review of Books', dated 19 December

I'm not sure about either strategy. Well, I *am* sure they work for the donors, and there's an argument that the left already has much of the media, schools and universities in their grip anyway, and not only in the US: it doesn't have to create new ones. To quote Thomas Sowell:

The most fundamental fact about the ideas of the political left is that they do not work. Therefore we should not be surprised to find the left concentrated in institutions where ideas do not have to work in order to survive. Thomas Sowell, 'The Survival of the Left', in [2]*The Thomas Sowell Reader*, 2011

But the point is that the wealthy donors of neither the left nor right seem to care about outcomes. They fund glamorous, high-profile projects or buildings, foundations, think-tanks. They lobby government. They have in common that, even if they genuinely wish to improve the well-being of certain groups, they won't target the *outcomes* that those people most care about. Why not? Because, I think, in this respect donors resemble politicians and bureaucrats: *they will not willingly relinquish control*. They think they know how best to achieve results, or they want everyone to associate them with identifiable buildings, institutions or ideas - whether they do any long term good or not.

Social Policy Bonds are a means by which the wealthy could both articulate society's wishes and channel funds into satisfying those wishes, without actually doing the work themselves. Rich philanthropists could, instead, reward the *achievement* of our goals, without dictating who shall achieve them nor how they shall be achieved. They would still have the power to articulate these goals but, under a bond regime, they would have to relinquish the control over *how* these goals are to be achieved. That would be probably be difficult for billionaires to accept. But to address our most serious problems we need diverse, adaptive solutions, with time horizons longer than those of individual lifetimes.

As a species, we now have massive potential to solve those problems that have bedevilled mankind for millennia: war, for instance, poverty, illiteracy, disease. Social Policy Bonds are a means by which we could motivate people toward solving these problems. Governments, unfortunately, aren't likely to be the first to issue them. They owe too much to existing career paths, methods, and institutions. But billionaires? They could be more amenable to persuasion. They want to see the right thing done. All it would take is a bit of humility on their part so that they don't feel they have to be the ones doing it. 'Letting go' of the need for acknowledgement and short-term results, could be as helpful to society as letting go of emotional hurts can be to the individual.

### 16.12.3 Politics as career drama (2019-12-27 16:11)

There's much that's worthy of quote in Greg Jackson's latest article in *Harper's Magazine*, but I will limit myself to this for now:

As things are, the job of politicians is to feed the emotional-entertainment industry that we call "news," which is accomplished by grandstanding and self-promotion. Reporters and pundits cover politics by analyzing how politicians succeed and fail as *spokespeople and media figures*. Interest shifts, by turns, to how the game is played, how the media fits into this game, and, eventually, how journalists do their jobs. The news today, properly understood, is about the careers of politicians and journalists. It is career drama. (My italics) [1]*Vicious Cycles*, Greg Jackson, 'Harper's Magazine', dated January 2020

In the absence of any more meaningful measure of politicians' competence, we focus on how they appear in the media. But what else can we do? The links between what politicians say, what they mean, and what actually happens are tenuous, obscure or non-existent. Only rarely can we say that this politician did something that led to that outcome. Society is just too complex to identify cause and effect with certainty. There are exceptions: decisions to go to war, for instance. But for the most part, when wondering whom to vote for we depend on the news or, as Mr Jackson accurately puts it, "news".

When seeing the wide, and widening, gap between politicians and ordinary citizens, we are right to draw attention to the baleful influence of the wealthy organisations - public- and private-sector - who, along with their lobbyists, are the only people that have the time and motivation to understand how policy is made and how they can manipulate it for their own benefit. If only there were a means by which we could make politicians enact policies that benefit the people they are supposed to represent.

[2]Social Policy Bonds are one such means. You might have heard of [3]Social *Impact* Bonds, which are the non-tradeable version of my [4]original (long pdf, scroll to page 266) idea. There are several reasons why I think we need the bonds to be tradeable if they are going to make significant gains in policy effectiveness and efficiency. I write about those reasons [5]here and [6]here. The important point is that the bonds reward outcomes: outcomes, moreover, that are meaningful to ordinary people and which, in fact, ordinary people can help identify and prioritise. Because Social Policy Bonds are tradeable they can target long-term goals, whose pathway to achievement is unclear. We can therefore target remote goals, such as universal literacy or [7]world peace, because we do not have to specify in advance how those goals shall be best achieved, nor whom we shall charge with achieving them. The market for the bonds would ensure that only the most efficient projects will be rewarded. The long-term nature of the bonds means that investors will have incentives to research a wide range of initiatives, and persist only with the most efficient.

Our biggest, most urgent challenges - such as climate change or conflict reduction - will require a mosaic of diverse, adaptive projects. These are exactly the sorts of projects that government at any level implement. The top-down approach is good for articulating society's wishes, and for raising the revenue for their achievement, but when it comes to actually achieving any but the most obvious goals - the ones with the clearest link between cause and effect - it fails. A Social Policy Bond regime would see politicians doing what they do well: helping society define its goals and raising taxes. But it would contract out the achievement of these goals to more motivated investors, who have a sustained interest in achieving their goals - which are exactly the same as those of society. Economic theory and all the evidence tell us that competitive markets are the most efficient way of allocating scarce resources to achieve prescribed ends. Under a Social Policy Bond regime it is society that would determine these ends, and market forces would channel the market's incentives and efficiencies into achieving them.

# 2020

## 17.1 January

### 17.1.1 Input legitimacy: the Swiss approach (2020-01-04 22:10)

The *Economist* writes:

One of the great arguments for democracy is what Fritz Schapf, a German scholar of politics, calls “input legitimacy”. Even if a system does not give people what they want, the fact that those running it reflect a democratic choice is legitimising. [1]*Can technology plan economies and destroy democracy?*, the 'Economist', 18 December 2019

This chimes with some decades-old research done in Switzerland. It is a shame that the Swiss model of ‘direct democracy’ is something of an outlier. Switzerland has a federal structure whose 26 cantons have use assorted instruments of direct democracy, notably initiatives to change the canton’s constitution, and referendums to stop new laws, change existing ones, or prevent new public spending. Cantons vary in the ease with which these instruments can be used. Research by Bruno Frey and Alois Stutzer of the University of Zurich showed that, even after allowing for other variables, the more democratic the canton, the more people living there reported being happy. The effect is significant:

[T]he marginal effect of direct democracy on happiness [was found to be] nearly half as big as the effect of moving from the lowest monthly income band (SFr980-1,285, or \$660-865) to the highest (SFr4,501 and above).

[2]*Happiness is a warm vote*, the 'Economist', 15 April 1999

By looking at the reported happiness of foreigners (that is, people who cannot vote in the referendums) living in the Swiss cantons, the researchers found that it wasn’t just the effect

of the decisions made by direct democracy that led to greater well-being. The *participation in the process itself accounted for most of the increased happiness.*

This is a position I have long advocated. Social Policy Bonds would target outcomes: transparent, verifiable outcomes that are meaningful to ordinary people. Discussion and debate about these outcomes and their priority is inherently more accessible to ordinary people. The current political systems in most democracies rarely declares their goals (if they have any) in terms that mean anything to natural persons. Their goals have more to do with retaining power, and usually mean favourable treatment for the most powerful, especially government agencies and big business, at the expense of small businesses and ordinary citizens. The system gets away with this, because its goals are expressed vaguely if at all, and policymaking takes the form of recondite, legalistic discussion about institutional structures and funding. Social Policy Bonds in contrast would subordinate all such processes to meaningful, explicit goals. This would draw more people into the political process. As the long-standing research into Swiss direct democracy shows, *this is an end in itself*, as well as a means to greater well-being.

### **17.1.2 Mickey Mouse micro-objectives: rape statistics (2020-01-13 21:06)**

In our complex societies, the alternative to coherent, meaningful, goals expressed in numbers are incoherent, meaningless goals expressed in numbers. That's bad enough, but there are times when numerical targets are devised such that they are not just devoid of meaning, but work in ways contrary to their ostensible intention. Here is one recently reported example:

[1]Pinellas Sheriff's Office boosts its rape stats without solving cases, Allison Ross, 'Tampa Bay Times', 5 January

[2]

The details aren't important: it's a familiar story. The problem with this, and other Mickey Mouse micro-objectives, is that the numerical target is uncorrelated to any aspect of societal well-being. They sound good, these targets, and they might have started out as well intentioned. But they are too easily devised or perverted by people with an interest in avoiding

effort. People can get away with this because few of us will challenge such high-sounding goals as 'reducing rapes', or 'dealing with crime', or 'reducing climate change'. Only in retrospect do we see how the targets and indicators associated with such ideals are so poorly or cynically designed that they have the effect of nullifying their stated goals.

The case for Social Policy Bonds rest on two pillars. One is the channelling of market forces into the achievement of our goals. The other, though, is the precise definition of these goals. For any quantitative measures of progress, our goals should not only be meaningful to ordinary people. They should be *ends in themselves or inextricably linked to those ends*. They need to be broad and long term, so that solving one problem can't occur simply by creating others, or shifting the problem into another region, or kicking the can down the road.

So how would Social Policy Bonds deal with rape? One way forward could be to target for reduction - nationally - the numbers of people in anonymous surveys who respond 'yes' when asked whether they have been raped. That could form one of an array of indicators, which could include some that are currently used. All such indicators would have to fall within a prescribed range for a sustained period before the bonds would be redeemed. Choosing these indicators wouldn't be simple. But what is the alternative?

### **17.1.3 The sad, infuriating, truth about our climate target (2020-01-25 17:02)**

David Roberts writes:

Humanity has put more CO<sub>2</sub> in the atmosphere since 1988, when climate scientist James Hansen first testified to Congress about the danger of climate change, than it did in all of history prior.... No country has implemented anything close to the policies necessary to establish an emissions trajectory toward 1.5°C; many, including the US

and Brazil, are hurtling in the other direction. [1]*The sad truth about our boldest climate target*, vox.com, 3 January

What can I say without repeating myself? Six years ago I wrote that [2]Kyoto is doomed. and that Kyoto is a [3]dog's breakfast. Four years ago I repeated myself, saying wrote that current climate policy is [4]doomed to fail.

Less irritatingly, I've [5]asked whether we should be more concerned about the effects of climate change than on climate change itself. One of the advantages, as I see it, of a [6]Social Policy Bond regime is that it perforce, and *at the outset*, specify very clearly what we want to achieve. As applied to the climate change problem we would express our policy goal as a combination of physical, social, biological and financial measures that must fall within specified ranges for a sustained period. Only then would holders of [7]Climate Stability Bonds be paid out. These bonds would, in effect, contract out the achievement of our multiple climate goals to the private sector, leaving it to respond to our ever-expanding scientific and technical knowledge. Current policy is rigid and arrogant, in that it is based entirely on current science and assumptions about future trends. It cannot adapt to new knowledge. These are other reasons why it's failed to capture the public imagination and hasn't, in fact, achieved anything. We need a multitude of diverse, adaptive approaches to achieving our goals relating to climate change and its impacts - many of which will have nothing to do with greenhouse gas emissions. Climate Stability Bonds would encourage them. Current policy, as well as being politically divisive, imposing extremely high upfront costs, and achieving nothing, will not.

## 17.2 February

### 17.2.1 Locusts, potato crisps, and nuclear catastrophe (2020-02-01 17:23)

The Economist writes:

The last big locust crisis, in north-west Africa, lasted from 2003 to 2005 and caused an estimated \$2.5bn worth of damage to harvests. Getting it under control cost almost \$600m, with donors footing much of the bill. That is enough to cover preventive measures in the same region for 170 years, say experts. But prevention does not attract much funding. "This is a Catch-22," says Keith Cressman, the Senior Locust Forecasting Officer at the FAO. "Donors are interested in funding big emergencies, big problems." And governments, unlike locusts, move slowly. [1]*East Africa is reeling from an invasion of locusts*, the Economist, 1 February

So it goes. We pay attention to fast-moving problems that make a vivid visual impact. Slow-moving, unglamorous problems that cry out for policy initiatives go neglected. Prevention of emergencies, like locusts, are one example; climate change, and loss of habitat for the world's animal and plant life are others. By the time their worst effects are known and we belatedly respond, the problems have taken on overwhelming dimensions.

We respond to events if they are fast moving enough. That is a failure, in that early response to less obvious problems would be more efficient. But it's a failure too in that we are wedded to responding to noticeable events. We do not have policies that to deal with unknowable disasters whose provenance and scale we cannot foresee. We need to recognise that the maintenance of the status quo is worth targeting, even if we cannot foresee how it is threatened and especially if we cannot think about how best to go about dealing with those threats.

This is where Social Policy Bonds can play a role. They can motivate people not only to solve visible but slow-moving problems, but also to work so as to prevent those unforeseeable problems. Take, for instance, the threat of nuclear conflict. We know one would be catastrophic but we have so few ideas about how to lower the threat level that we devote far more ingenuity (and quite possibly, funding) into digital marketing strategies for [2]dog-food, or into developing [3]new flavours for potato crisps. There *are* well-intentioned, hard-working people working to reduce threats like nuclear conflict, but their resources are limited by our historic and inefficient practice of responding only to events that are actually occurring. And we have no mechanism for rewarding the institutions that are working for peace in ways according to how well they do so. This means they are not as motivated as they otherwise might be, but more importantly that these bodies *do not receive funding commensurate with the importance of their goal*. Everybody in the world would suffer grievously from a nuclear exchange, but there is no means by which we can currently channel our well-founded fears into ways that will help avoid one. We have to rely on bodies such as the United Nations, non-governmental organisations, and philanthropists, most of which are - inevitably, and in common with all organisations - pre-occupied with self-perpetuation.

The answer could be [4]Nuclear Peace Bonds. Targeting nuclear catastrophe they would be backed by governments, NGOs, philanthropists and anybody with a strong interest in human well-being. Floated on the open market they would become redeemable for, say, \$1m each only after a thirty-year period during which no (lethal) nuclear explosion takes place. Floated on the open market, they might initially fetch just \$10000 each, if the market thinks the probability of thirty years' nuclear peace is low. But these bonds would be tradeable: their value would rise and fall according to how likely people think the peace target will be reached.

Initial investors would buy the bonds and do whatever they can to increase that probability. Even helping existing ways of monitoring nuclear material might see the value of their bonds double. Others, with expertise in different areas, would buy their bonds and do what they can to raise the value of the bonds still further. At every stage, the bonds would be in the hands of those most able to bring about nuclear peace. The bondholders' goal is exactly congruent with society's: *they make money only by achieving society's goal*. At every stage of every process required to achieve that goal, incentives will motivate people to be as efficient as possible.

Rather than encourage endless speculation about what projects will make the world more peaceful the bonds would, in effect, contract out the achievement of world peace to the market. They would encourage a wide range of *adaptive* projects, whose sole criterion for funding would be that they would raise the probability of world peace being achieved. In this way, the governments and others who back the bonds would do what they are best at: articulating society's goals and raising the revenue for their achievement. At the same time, the market would be doing what it is best at: allocating resources as efficiently as possible.

If nuclear peace sounds too lofty a goal, then we could start by aiming for something like peace in the Middle East. The same principle would work for natural disasters or climate change. In every case, we'd be rewarding the successful achievement of a sustained, desirable outcome, even if it's as unglamorous as maintaining the status quo in the shape of nuclear peace. It is a shame that few people seem to think along these lines.

My short piece on Nuclear Peace Bonds is [5]here. The links in the right-hand column of that page point to papers on similar themes: [6]Conflict Reduction, [7]Disaster Prevention, and [8]Middle East Peace

### **17.2.2 It's too complicated for current politics (2020-02-08 22:35)**

James Fenton writes to the *New Scientist*, questioning whether planting trees will mitigate climate change:

It may not always work. Planting trees on open ground may change the reflectivity, or albedo, of land. At higher latitudes this can cause a warming effect, as three-dimensional woodland absorbs more radiation than the essentially two-dimensional open ground that it replaces. In many places new planting is likely to be targeted at upland areas, which generally possess stratified soils with a high organic carbon content. In the UK there is an order of magnitude more carbon stored in soil carbon than plant biomass. Tree planting on such soils can oxidise this carbon, potentially releasing more than the amount taken up by the trees. And practices such as ploughing land before planting can dry out the soil, causing carbon release. At the other end of the forestry cycle, modern tree extracting machines can similarly churn up the soil. So it isn't clear to me whether tree planting will benefit the climate. [1]*Can planting trees combat climate change very much?*, James Fenton, letter published in New Scientist, 8 February

When scientists can't be certain about relationship between tree planting and atmospheric levels of carbon dioxide, we need a climate change policy that allows for such uncertainty. For many years I've been advocating that we need clarity over what we are trying to achieve. Let's assume that we are trying now to slow down and stop the climate changing by reducing the level of greenhouse gases in the atmosphere. (That sidesteps the question of whether we should be concentrating on reducing climate change, or reducing the negative impacts of climate change - see [2]here.) Planting trees might have an important, even crucial role, in determining climate outcomes. But *we don't have a policymaking system that allows for the uncertainties* that Mr Fenton cites, nor for any other massive uncertainties such as the effects of certain sorts of cloud - see my post [3]here.

Our policymaking system relies on our being able to identify with reasonable certainty the relationship between cause and effect. But our society and environment are now too complex for that blithe assumption to work. We just don't know whether planting trees will mitigate or accelerate climate change, but we cannot currently make policy in any other way. I.

Which is why I suggest we target the goal we want to achieve, and reward the people who find the best ways of achieving them: ways that we cannot now identify with any certainty. Any efforts, then, must be long-term in nature, and they must encourage research, experimentation and, finally, implementation, all of which means that policy must be consistent over time. We cannot at this point convincingly advocate, say, tree planting, but what we can do is provide a system of incentives that will reward tree planting (more accurately: the right sort of tree planting) to the degree that it helps achieve society's climate change

goal. We reward the outcome, and let investors work out the best ways of achieving it, giving assurances that their successful long-term efforts, which will doubtless entail many failed experiments, will be rewarded.

Long time readers will know that, of course, I'm advocating the application of the Social Policy Bond concept to climate change. We urgently need to reward people who (1) are investigating exactly the sort of relationships about which Mr Fenton writes and (2) are implementing the most successful of their activities and terminating those that are less promising. We need to encourage a wide range of diverse, adaptive approaches and we need to reward the most useful of these. Our current policymaking system is too sclerotic to contemplate such a flexible approach.

It's not just climate change, where at least we *think* we can identify many of the likeliest explanatory variables. There are just as urgent, big issues, such as nuclear peace, or disaster reduction, where the complexities are so obvious even to policymakers that any activities now being undertaken to address them are half hearted, scattered, incoherent, and too poorly-financed to achieve anything useful. The Social Policy Bond concept can be applied to those issues too.

Climate change, conflict reduction, nuclear peace: these are huge, urgent problems whose causes we cannot identify with any certainty, and vary with time and geographic area. Conventional policy cannot cope with the diverse, dynamic nature of these problems, which are going to be solved only with an array of diverse, adaptive approaches. Social Policy Bonds, by targeting outcomes rather than the supposed ways of achieving them, can deal with uncertain, complex relationships between cause and effect. Current politics can't.

See [4]here for links to my papers on Climate Stability Bonds, and [5]here for my work on conflict reduction.

### 17.2.3 Enough with the dog-food (2020-02-19 21:19)

[1]Qatar has a population of about 2.6 million. Amongst other facts and figures about weapons sales to the Middle East, the Economist this week tells us that:

Qatar already has Chinese-made ballistic missiles. [2]*From muskets to missiles*, the Economist, 15 February

Not, thankfully, nuclear. Not yet anyway - nuclear is available only to larger, responsible players on the world stage. Like Pakistan and North Korea. What are the odds, I wonder, against a nuclear attack in the near future? Luisa Rodriguez summarises her findings:

...I get a rough sense of how probable a nuclear war might be by looking at historical evidence, the views of experts, and predictions made by forecasters. I find that, if we aggregate those perspectives, there's about a 1.1 % chance of nuclear war each year, and that the chances of a nuclear war between the US and Russia, in particular, are around 0.38 % per year. [3]*How likely is a nuclear exchange between the US and Russia?*, Luisa Rodriguez, Effective Altruism Forum, 20 January

You'd think that we'd put a bit more effort into avoiding a nuclear attack and its dire consequences than we do. But much of our ingenuity is instead devoted to activities of comparatively little social merit: financial trading, property speculation or (one of my hobby horses) clever advertising campaigns aimed at [4]selling more [5]dog-food.

This is not just a question of efficiency. It's quite possible that the activities of peace-making organisations (like [6]this one) are as cost-effective as they can be, given their limited resources. The question is more one of human priorities and translating what I (presumptuously) see as the likely wishes of most of the world's population for nuclear peace into funding for those bodies working to achieve it. The disconnect here between ordinary people and the politicians supposed to represent us is near total.

The answer could be [7]Nuclear Peace Bonds. Targeting a sustained period of nuclear peace, they could be backed initially by a combination of governments, NGOs, philanthropists, and subsequently members of the public. Floated on the open market they would become redeemable for, say, \$1m each only after a thirty-year period

during which no nuclear detonation killing more than fifty people takes place. They might initially fetch say just \$10000 each, if the market thinks the probability of thirty years' nuclear peace is low. But these bonds would be tradeable: their value would rise and fall according to how likely people think the peace target will be reached.

Initial investors would buy the bonds and do whatever they can to increase that probability. Even helping existing ways of monitoring nuclear material might see the value of their bonds double. Others, with expertise in different areas, would buy their bonds and do what they can to raise the value of the bonds still further. At every stage, the bonds would be in the hands of those most able to bring about nuclear peace. The bondholders' goal is exactly congruent with society's: *they make money only by achieving society's goal*. And at every stage of every process required to achieve that goal, incentives will motivate people to be as efficient as possible.

Rather than encourage endless speculation about what projects will make the world more peaceful the bonds would, in effect, contract out the achievement of world peace to the market. They would encourage a wide range of *adaptive* projects, whose sole criterion for funding would be that they would raise the probability of world peace being achieved. In this way, the governments and others who back the bonds would do what they are best at: articulating society's goals and raising the revenue for their achievement. At the same time, the market would be doing what it is best at: allocating resources as efficiently as possible.

### **17.2.4 It's not just agriculture (2020-02-28 20:59)**

They're still doing it! After at least forty years of being universally seen as corrupt, wasteful and stupid, the European Union's Common Agricultural Policy continues to subsidise aristocrats and wealthy landowners:

An analysis by Greenpeace in 2016 revealed that the Queen was one of the top recipients of EU money, with her Sandringham farmland alone coining in £557,707 that year, with a similar sum every year. [1]... *And What Do You Do?*, Norman Baker, October 2019

Prince Khalid Abdullah al Saud, who owns champion racehorse Frankel, has reportedly described his farming interest as a hobby. Juddmonte Farms, which he owns through an offshore holding company in Guernsey, received £406,826 in farm subsidies [in 2015]. [2]Source

The CAP's disastrous effects on the [3]environment, [4]small farmers, [5]animal welfare, [6]Africa and human [7]health, have been well documented, but it is the *persistence* of the CAP, after years of its obvious failings, that should astonish us. It happens, in my view, because big government is remote government. It doesn't concern itself with the needs of ordinary people, because it's beholden to powerful vested interests: not just big business, but its own government agencies.

And it's not just agriculture.

Increasingly, the complexity both of society and our policymaking process is being weaponised in favour of the people who own and run corporations, or the people they pay (in or out of government) to understand and influence policy. Government and their

paymasters can get away with this because we accept a policymaking system that doesn't explicitly target outcomes that are meaningful to ordinary people. Currently policymakers can - indeed must - express their decisions as vague declarations of intent and changes in institutional funding and composition, or legislation. Their focus is on the supposed means of achieving vague outcomes, rather than on the outcomes themselves.

A Social Policy Bond regime would, in contrast, have to be explicit about its objectives: transparency and accountability are built into a bond regime, as surely as they are excluded from the current policymaking apparatus. Insane, corrupt programmes, such as the EU's Common Agricultural Policy (now accounting for 35 percent of the EU's budget), have plati-tudinous, vague, mutually [8]conflicting goals that *sound* high-minded but actually end up shovelling vast sums of taxpayers' and consumers' money into the bank accounts of agribusiness corporates and their lobbyists. If outcomes were built into policymaking, as they would be under a Social Policy Bond regime, such policies would get nowhere. Instead they have lasted for decades, at great cost to everybody except a few millionaire businessmen and landowners, a burgeoning, parasitical bureaucracy and lobbyists. [9]Oh, [10]and [11]fraudsters.

The CAP's continued existence is a clear signal that we need to make systemic changes in the way we formulate policy. Instead of allowing overworked or corruptible officials and politicians to guess how we can best solve our complex and dynamic social and environmental problems we would do better to target the outcomes themselves and reward the people who help achieve them. The goals of a Social Policy Bond regime would be clear and stable: the ways of achieving them would be up to bondholders who would at all times be motivated to be efficient in the pursuit of society's goals. Transparent, comprehensible, *meaningful* goals, and investors motivated to achieve them: that would be the most effective way of closing the gap between politicians and the people they are supposed to represent.

## 17.3 March

### 17.3.1 Tyres kill (2020-03-07 15:06)

For [1]decades now I've been saying that, when looking at complex social and environmental problems, we should reward solutions rather than try to guess the source of the problem then tax or regulate that. Current news gives another example as to why we might do better to act on my suggestion. By focusing exclusively on exhaust emissions, we are ignoring what is quite likely to be a much more dangerous source of vehicular pollution:

Emissions Analytics theorised that, based on 1.5kgs of mass being lost per tyre over a 30,000-mile life, a car emits 200 milligrams of tyre particulate matter every kilometre. At that level, tyre emissions would be 22 times higher than the permitted levels in current exhaust gas regulations, which are 4.5mg/km.

In testing, it stacked the odds up in case practice yielded immeasurably low results. Low quality tyres, high speeds, intense cornering, high load in the car and a poor surface quality, were intended to help produce a measurable result. The results were shocking - 5.8 grams per kilometre lost. That's 29 times the hypothesised result,

and more than 1,000-times the allowed particulate emissions from an exhaust pipe. [2]Tyre emissions 1,000 times WORSE than exhausts, Ethan Jupp, 1 February (or 2 January)

Governments have [3]form with this: their singular obsession with greenhouse gas emissions led them to encourage diesel engines, which emit higher levels than petrol of pollutants other than CO 2 that probably cause [4]more illness and death.

So what am I suggesting? That governments, instead of trying to identify causes of complex problems (a moving target anyway), target favourable outcomes and reward the people who reach them. When it comes to air pollution, then, rather than try (and fail) to identify the worst culprits, and regulate those, government should have targeted an air pollution goal, and motivated people to achieve it. Government would then have stepped out of the tricky, divisive and futile role of trying to stipulate how that goal could be best achieved, and who is best placed to achieve it. Government is too monolithic, too unwieldy and too fixed in its ways to come up with the diverse, adaptive approaches that we need to solve complex social and environmental problems.

A Social Policy Bond regime aiming at reducing air pollution, or environmental deprecations in general, could be the answer. Such a regime would reward the achievement of our environmental goals, without specifying how those goals shall be achieved nor who shall achieve them. To see how the Social Policy Bond concept can be applied to environmental problems see [5]here.

Targeting air pollution as a whole, rather than its more visible but less lethal components, would be an improvement over current policy. But perhaps an even better approach would be to target a range of broad indicators of health: see my essay [6]here.

### 17.3.2 Not only pandemics (2020-03-23 21:11)

You might think that we'd be well advised, as a species, to prepare for global disasters. And it's true that many people are working, sometimes heroically, at ways of doing so. There are quite a few organisations, for instance, that seek to reduce conflict or eliminate diseases, such as malaria. The difficulty I have is that their work is unsystematic, uncoordinated, and is rewarded in ways that bear no relationship to their success or efficiency. As well, and perhaps more dangerously, there are policies in play that can only accelerate disaster, such as: subsidies to fossil fuel extraction and consumption, the accumulation of weapons of all kinds; and the failure seriously to pursue one of the [1]main goals of the [2]Cairo Population Summit, where 179 signatory countries agreed to provide access to family planning services to all the women who want them. And last, there are ways in which the survival of millions is threatened by entirely new phenomena, such as COVID-19, whose full implications cannot be foreseen.

We need therefore to re-orient the incentives, and to do so in a coherent manner that rewards the survival of our species against calamities of all kinds. This is where the Social Policy Bond principle can help. The issuers of [3]Disaster Prevention Bonds need have no knowledge of the relative likelihoods of known or unforeseeable catastrophic events. Neither would they have to pre-judge, with our current limited scientific knowledge, the most efficient ways of ensuring our survival. Instead, the bond mechanism could target the sustained avoidance of any - unspecified - catastrophe. It would do so in a way that encourages the exploration and investigation of all threats, known and new, impartially. Policymakers would not (and anyway could not) have to decide on how

dangerous each threat is. That would be left to bondholders, who would have powerful incentives to do so continuously . Investors in the bonds would be rewarded only if they can adapt to rapidly changing events and to our ever-expanding scientific knowledge.

This

is a stark contrast to the current approach; the one that has led to highly intelligent people giving our survival a baleful [4]prognosis. The people who are currently working in favour of humanity do so in ways that, while worthy of great respect, are within a system that is heavily weighted to favour the short-term goals of large organisations, including governments, that have little incentive or capacity to care about our future in the long term. Disaster Prevention Bonds, issued with sufficient backing, could change all that.

## 17.4 April

### 17.4.1 Preparing for disaster (2020-04-02 16:05)

*This is a topical introduction to my paper on [1]Disaster Prevention Bonds.*

It's easy to criticize governments for not being prepared for the coronavirus pandemic. But consider what preparing for a pandemic actually means. Thousands of hospital beds lying empty for most of the year, nurses and doctors on standby waiting for a crisis that might never happen. Testing kits, protective clothing, vaccine manufacturing capabilities unused in a sterile storage facility, and deteriorating with time....

And what's so special about a pandemic? Why should we not prepare against other disasters that might arise with equal or greater probability?

An [2]electromagnetic pulse, an asteroid hitting earth, a volcanic [3]supereruption?

The truth is that the best our governments do is react to something that actually happens. Our problem is not that governments are slow, reactive, blundering, doing too little—or

too much—too late. It is that governments or supranational bodies like the World Health Organization are not necessarily the best bodies to trust with disaster preparedness. (Indeed, once this crisis is over, the WHO's role in [4]refusing to consider lessons from Taiwan needs to be looked at very carefully. It's clear already, though, that in common with most other organisations of any kind, the WHO is at least as interested in [5]self-perpetuation as in the health of the world's population. )

So what is the problem with government, especially government at levels high enough to deal effectively with national or global disasters?

- It has few incentives to watch out for disasters and react quickly and preemptively.
- It's is slow to react to crises, it prefers top-down, one-size-fits-all solutions, and is very slow to adapt its policies to changing circumstances.
- It has short time horizons, and though its individual members will be hard-working and well intentioned, it has no no incentive to correct its deficiencies.
- It is often concerned to prioritise actions that deal with visible problems at the expense of those that are too slow moving or unglamorous for television. Better solutions would not focus on appearances at the expense of societal well-being.
- Related to the previous point—and of particular relevance to the current pandemic—a government will over-react to problems that have an immediate, visible impact. Such an over-reaction might be more detrimental to societal well-being than the crisis.

In relation to this last point, a government over-reaction—the cure being worse than the disease—might have a baleful impact in the longer term too if, when faced with another serious threat, government, remembering previous over-reaction and the consequent public backlash, *under-reacts*.

[6]Disaster Prevention Bonds, in my view, would deal with all these weaknesses of humanity's current approach to disaster preparation.

### 17.4.3 Le risque, ce n'est pas la mort de Schengen (2020-04-14 09:39)

The confusion between ends and means lies at the heart of our political systems. Here, the French President tells us what matters to him:

'Le risque, c'est la mort de Schengen'

The risk is the death of Schengen.

Emmanuel Macron is certain: the foundations of the European Union (EU) are in danger owing to the epidemic of new coronavirus which strikes the Old Continent.

[1]'Opinion, 27 March

Actually I think most of us would rate the risk of thousands of people dying as more significant than that of having to impose national border controls. I am sure Mr Macron means well. But the EU project is a means to certain ends; peace and prosperity, most importantly. It is not an end in itself. Nor is 'proportion of energy derived from [2]renewables' a valid, meaningful end. Nor, more fundamentally, is [3]Gross Domestic Product.

Social Policy Bonds have several advantages over our current ways of making policy. One is the way they would channel society's scarce resources into the most efficient ways of achieving

social and environmental goals. But another is that they compel us to think about what those goals really are. If the goal, for instance, is to maintain a borderless European Union, or to keep the Euro going, then those are entirely different goals from improving the health and well-being of EU citizens. To an alarming degree, they are in conflict. There are plenty of other examples: school attendance, for instance, however measured, is not a social goal: better educational outcomes are. Shorter [4]hospital waiting lists, or more [5]mammography screenings, are not a social goal: better [6]health outcomes are.

The failure of our leaders to distinguish between means and ends is disastrous. It has led to a widening gap between government and the people whom is supposed to serve. The results, throughout the democratic countries, are becoming all too clear: a widespread disenchantment with conventional politics, a growing cynicism and despair over government ever being able to deliver what ordinary people want and need. Social Policy Bonds, by channelling society's resources into the achievement of agreed, verifiable, meaningful social goals are one way in which we might begin to close that gap.

#### **17.4.4 Why no Social Policy Bonds? (2020-04-27 21:07)**

Why have Social Policy Bonds not been issued?

Contrast Social Policy Bonds with [1]Social Impact Bonds, now being issued in about 25 countries. SIBs are the non-tradeable version of Social Policy Bonds. While tradeability sounds like a technical detail, it actually has a few critical implications about which I have written [2]here and [3]here.

A major difficulty with issuing Social Policy Bonds is that they don't readily lend themselves to experimentation; small-scale trials over a limited geographic area, which are short term in nature. Neither do they show much advantage over conventional policy when we already (roughly)

know how to achieve a specified social goal. For instance: take the goal of improving a lake's water quality. We could issue Social Policy aiming to reduce the levels of pollutants in the water. But, if the main sources of pollution are easy to identify, then there is no need to introduce middlemen, in the form of bond traders and investors in the bonds, to achieve that which regulation or taxes on polluters could do more simply.

No, where Social Policy Bonds work best is when we don't know how to achieve the goal, and where there is time for different approaches to be tried, the failures terminated, and the more promising ones implemented: goals that will require diverse (over different areas) and adaptive (varying with time) approaches, and a mix of them. That's what governments find difficult, but it's what is necessary to achieve broad, long-term, complex goals, such as ending war, or achieving universal literacy.

But when we basically know how to achieve a goal, Social Policy Bonds aren't necessary. In the lake example, and assuming we are talking of a time frame of no more than a few years, regulation or polluter-pays taxation would achieve our goal without the need for an untried, controversial, and somewhat unconventional financial instrument. With a broader goal—something like improving an entire country's inland water quality—and over a longer time period than a bond regime could play a useful role. There would be time for motivated bondholders to research, experiment and continuously refine an array of approaches, optimised for time and space, to achieve the goal as cost-effectively as possible.

The danger is that applying Social Policy Bonds in ways that don't show their advantages over other, simpler, approaches will taint the concept. People would then see the bonds as a fancy means of enriching intermediaries (bondholders, financial market players), rather than a solution to social problems. (This might be happening with SIBs.) If there is anything society doesn't need, it's a financial services sector enriching itself still further by sucking the best mathematical brainpower out of the real economy, and

contributing nothing of social value.

## 17.5 May

### 17.5.1 The Coronavirus Bailout - an alternative suggestion (2020-05-10 10:55)

[This was [1]published as a letter to the Editor of the Financial Times on 12 May, 2020. It has nothing to do with Social Policy Bonds!]

Already, it looks big businesses are preparing their appeals for bailouts from governments all over the world, to compensate for income lost because of COVID-19. And, most likely, they'll get them. These titans of industry and their pals in government everywhere are probably already drafting the terms. I think we can foresee the result: more industry concentration, and a further widening of the gap between the rich and well connected on one side, and small businesses and ordinary people on the other.

Here's another idea. If we want to keep competitive markets going, give people rather than politicians the opportunity to choose who stays in business. Instead of lavishing enormous sums on favoured giants, let people have some say as to where taxpayers' cash should go. Take the total national expenditure on things like aviation, hospitality, and personal services, divide it by the number of people in the country, and issue coupons worth that much to each adult, to be spent on that service or product. So, if the average sum spent by an adult on air travel in the UK, say, was £200 last year, give each adult a coupon

worth that sum, with the stipulation that it be spent on air travel over the next two years. Make the coupons tradeable, so that those of us who don't want to fly can exchange them for cash or swap them for a couple of sessions at a body piercing salon, or a few weeks' high street cappuccinos.

The alternative and, unfortunately, the more likely scenario, will be a form of central planning, in which government lavishes taxpayer funds on its favourites in exchange for some degree of control. We know what that will mean: inefficient, bloated and corrupt industries- and yet more cynicism. Instead, tradeable coupons for purchases of designated coronavirus-hit services would restore some much-needed competition and consumer power.

My [2]next post goes into a bit more detail about this suggestion.

---

Unknown (2020-06-14 19:06:23)

This is a fantastic idea. Have you thought about drafting how this might work? It could be a useful thing for small businesses to get behind if there's another round of bailouts.

Ronnie Horesh (2020-06-15 10:25:56)

Thanks for your comment. Though the *Financial Times* is an influential, international paper I haven't had any response to the idea, nor does any government anywhere seem to be contemplating it, though I might have missed something. My [1]blog post subsequent to this one, goes into a bit more detail as to how I think it could work. Frankly, I don't think the political will is there.

1. <https://socialgoals.blogspot.com/2020/05/the-coronavirus-bailout-alternative-how.html>

### **17.5.2 The Coronavirus Bailout alternative: how it might work (2020-05-17 16:31)**

My [1]previous post was a letter [2]published in the Financial Times, which suggested that instead of disbursing covid-19 bailout funds to businesses, the UK Government could instead issue coupons to people entitling them to spend the equivalent per capita sum in particular expenditure categories. Here I will sketch out some broad outlines as to how this scheme

might work.

## Guiding principles

- Aim for what's best for the country.
- Aim to compensate sectors for losses incurred.
- Aim to give consumers choice about which businesses to support within each expenditure category.

The starting point is the sums that Government would otherwise spend on bailing out businesses hit by covid-19.

Categories are broad, partly for simplicity, partly because coupon-holders should be able to choose between providers of services. Coupon-holders can choose within categories. All coupons are tradeable and exchangeable.

I would assume that all businesses have barcode or QR scanners but that many consumers don't.

- I suggest as examples of categories:
- Air travel
- Surface travel
- Personal services (hair, nails, massage, body-piercing, tattoos, any similar one-to-one service)

- Hospitality
- Private healthcare, including dentistry

Expenditure statistics per UK household for 2019 are given [3]here. To some extent categories will be decided by the statistics available.

Example: The ONS says each UK household spends £51.30\* per week on restaurants and hotels. Rather than try to assess and then compensate each business for any lost income, I suggest giving each household coupons worth 104 times £51.30\* = £5335 to be spent on restaurants and hotels, within the UK, within the next two years.

\* Bear in mind that the UK Government's aim is to compensate UK business, so a sum representing expenditure on overseas hospitality would have to be subtracted from the £51.30

There are other aspects that would need discussion. In particular, the entitlements of each household should be broken down to adults and children.

The scheme would be more complex and more contentious than the likely government plan of direct compensation to big business. But, in my view, if properly done, its advantages could outweigh the disadvantages. The advantages, as outline in my previous post, are mainly that it would stimulate competition, and help small businesses. It would also benefit consumers who aren't interested in, for example, air travel who could swap their coupons for a smaller amount of cash or for other services that they want or need. Under this scheme, an adult could exchange their air travel coupon for a coupon for childcare or private dentistry.

### **17.5.3 An honest politician (2020-05-26 20:16)**

An honest politician *or* Why we need to target outcomes

Michael Lind quotes Jean-Claude Juncker.

Jean-Claude Juncker, the prime minister of the tax haven Luxembourg who became the president of the European Commission from 2014 to 2019, described how the European Council systematically expanded its authority by stealth: *We decree something, then float it and wait some time to see what happens. If no clamor occurs.*

*. . . because most people do not grasp what had been decided, we continue—step by step, until the point of no return is reached.* Michael Lind, in an excerpt from his book [1]The New Class War, quoted [2]here.

The quote goes a long way to explaining the wide, and widening, gap between politicians and the people they are supposed to represent. Our policymaking system is just too complex, protracted and boring for anyone other than powerful people, or their paid lobbyists, to follow and influence. That means, on the one side of the gap: politicians, bureaucrats and big business. And on the other, ordinary people and small businesses.

We are not heading toward a more simplified policymaking system. Society and the environment are not becoming easier for the public to comprehend. The trend is toward more complexity and, therefore, more opportunity for powerful interests to influence policy in their favour. The world economy might shrink as a result of, say, the pandemic, or climate change, or some other disaster. But there no indication that the rich and powerful will voluntarily relinquish any of their share. The future, then, might seem to be bleak: even greater inequality and, quite possibly, [3]mass impoverishment.

I suggest that one way of avoiding such a miserable scenario is to re-orientate policy-making in such a way that most of us can understand it. Our current systems emphasise personality, image, spending pledges, legislation and organisational structures. These have in common one thing: they have nothing to do with outcomes that are meaningful to ordinary people.

Social Policy Bonds are a possible way in which we can express our policy goals in ways that people can understand and, in so doing, participate in their formulation and setting their relative priorities. So, for instance, rather than look at the sums spent on a health service, or at the numbers of people tested (or 'tested' - some of the results are spurious) for covid-19, or the quantity of protective (or 'protective'...) equipment acquired by a country, or other micro-targets, we would focus on the health of citizens, and target that for improvement. Social Policy Bonds would work by contracting out the achievement of our health goals to the market - which would include government bodies, so long as they are efficient. But the important first step would be to define our health goals, and let investment flow according to our health targets. My piece [4]here gives more detail.

The great advantages of Social Policy Bonds are twofold. One, the market will reward only the most efficient approaches to achieving society's health goals. Two, a bond regime would require that we have explicit, transparent, broad, long-term goals that would be understood, and contributed to, by any members of the public who wish to get involved. That, perhaps even more than greater efficiency, would be a worthwhile benefit. It would certainly help avoid the cynicism of a Juncker, and the outrage that his world view—widespread I am

sure among our leaders—ought to elicit.

## 17.6 June

### 17.6.1 Crime and alternatives to Punishment (2020-06-12 09:28)

The *Economist* writes:

Although the general call for "defunding" risks a backlash, the details of redirecting part of the police budget to arms of local government, such as housing or mental health, may make sense. [1]*The power of protest and the legacy of George Floyd*, the 'Economist' dated 13 June

Right. The best way of dealing with crime, is not necessarily to give more money to the police, or to imprison more people, or to impose more drastic punishments. By 'to deal with crime' I mean: to reduce the crime rate. That is a goal that, I think, most of us can agree on. Other supposed goals are nothing more than [2]surrogate indicators, or the product of sorrow, or anger, or revenge psychology. But if we accept that our goal is to reduce the crime rate, and admit the truth: that we don't have a clue how best to do so...well that is a good starting point.

We don't have a clue because the causes of crime vary from place to place, from person to person, from time to time. The best way of reducing crime in some small town might be to subsidise small businesses - which might be a lot cheaper and less divisive than beefing up the local police force. In another area, at a different time, the most efficient way of reducing crime might be to install surveillance cameras, or lay on free taxis for youths leaving nightclubs, or provide talking therapies rather than antipsychotic medication.... The problem we have is not only that the causes of crime are too complex and dynamic for any single organisation to address. It's that there is no incentive for anybody to take such a broad approach. Everybody—politicians, the police, psychiatrists—has their own agenda. Well meaning, hard working these people may be, but they are not rewarded for their success in

dealing with a major social problem. It's far too complicated for any single organisation to deal with. We need diverse, adaptive approaches.

My suggestion is that we apply the Social Policy Bond concept to crime. A short essay on how to do this appears [3]here. The paradigm fits other social and environmental problems. The first task is to clarify and articulate exactly what outcome we are looking to achieve. Because we are not concerned with *how* our goals shall be achieved, nor with *who* shall achieve them, we can target long-term goals that have eluded past efforts at achieving them, such as world peace or universal literacy or, indeed, reduced crime rates. The role of government would be to articulate society's goals and raise the revenue to achieve them. But the actual achievement of complex social goals should be done by a coalition of people who are motivated to find the most efficient solution, regardless of how many vested interests they have to undermine to do so. And that is where Social Policy Bonds enter the picture.

To read more, please go to the [4]Social Policy Bonds site. All my papers and book chapters are available there and can be downloaded for no charge.

## 17.6.2 Who really cares? (2020-06-14 14:51)

The problem with the worldwide protests is simple to state, difficult to solve: giving power to the people who say they'll help groups X and Y doesn't actually help people in groups X and Y. This is one of the few constants of history.

And that is even with the assumption that the leaders or spokespeople for these groups actually mean what they say, and care about the people they purport to represent. I have my doubts about the leaders of the current protests but, even if we assume their good intentions, the probability that they, or the people who shove them aside once their bid for power succeeds, can or will do anything to help their constituency is low. This is not a party political view: just a statement of fact. From the current US President's base to the idealists who fomented revolution in France or Russia...the gap between hopes and reality is wide and deep. There is very little correlation between the stated goals of people wanting power and the post-election or post-revolutionary facts.

Social Policy Bonds, at first sight, might seem a wacky solution to the problems we are *all* facing. I mean not only such global problems as climate change and threats of nuclear catastrophe, but also problems such as the systemic, self-reinforcing inequalities, between and within countries that should be unacceptable in their own right, as well as posing a threat to democratic political and economic systems that are the least worst in human history, when it comes to maximising the chances of a decent life for the largest number of people.

Social Policy Bonds? A new financial instrument? As if there aren't already enough ways in which the financial sector has invented new ways of obscuring the ways in which it syphons off resources - including some of the world's best mathematical brains - from the rest of society, for its own selfish purposes.

But Social Policy Bonds would be different. Yes, they would use the market's incentives and efficiencies, but they would be doing so to achieve society's goals. Their use of markets is secondary to their first essential element: that of clarifying and targeting our social and environmental goals. A Social Policy Bond regime doesn't need to take an opinion on the more controversial and divisive aspects of policy: how our goals shall be achieved or who shall achieve them. That would be left to investors in the bonds who would be rewarded exactly according to how successful they are in achieving our goals. Under a Social Policy Bond regime, politicians wouldn't be able to obscure the workings of government by making arcane, protracted, self-serving decisions about regulation, or institutional structures and funding—procedures that, you might think, are specifically designed to deter anyone other than powerful interests and their paid agents from following. On the contrary, Social Policy Bonds would target outcomes that are meaningful to ordinary people. On the national level these would include improved health, reduced crime rates, universal literacy. On the global level, the bonds could target nuclear peace, the prevention and mitigation of all kinds of disaster including adverse climatic events or, again universal literacy. The point is that these would be society's goals. Goals that are comprehensible and meaningful; goals that all can help in formulating and prioritising.

It is this aspect of Social Policy Bonds—the articulation and prioritising of our social and environmental goals—that needs to be emphasised if they are going to become acceptable, just as much as their use of markets which, rightly in many cases, have been discredited by their manipulation and subversion to the benefit of the already powerful. After thirty-plus years of advocating Social Policy Bonds, I remain hopeful. Well, put it this way: I certainly can't be hopeful about any of the other policymaking systems currently on offer.

anising society currently on offer.

Policy as if outcomes mattered

### 17.6.3 Sociopathic metrics (2020-06-18 15:55)

It still amazes me how badly metrics are thought out and used. I have railed for [1]years [2]against [3]Mickey [4]Mouse [5]micro-objectives. The problem is that the metrics our governments use are invariably too narrow and short term. It seems that they are chosen because:

- they sound good,
- they are easy to collect,
- they take, as given, current ways of doing things, and
- they take, as given, current institutional structures and responsibilities.

The result though, is even more concisely stated:

- they are useless, or worse.

Useless, in the sense that they do not target outcomes that are meaningful to ordinary people. Worse in that...well, let US writer Matt Taibbi give examples from policing:

In the same way our army in Vietnam got in trouble when it started searching for ways to quantify the success of its occupation, choosing sociopathic metrics like “body counts” and “truck kills,” modern big-city policing has been corrupted by its lust for summonses, stops, and arrests. It’s made monsters where none needed to exist. [6]Where did policing go wrong?, Matt Taibbi, 2 June

There’s no coherence about the construction of such metrics because I suspect, little thought goes into them. Government has become adept at obscuring the policymaking process so that even its stated goals don’t work, and its unstated goals go unexamined and unexaminable by anybody other than wealthy interests or the people they employ to follow and influence the process on their behalf.

[7]Social Policy Bonds might not seem the obvious solution to the serious problems this policymaking process has created: a widening gap between government and ordinary citizens, growing levels of inequality and growing cynicism. But, as I have said more fully [8]here, they would impose one discipline that is as essential as it's currently evaded, and that is to agree on broad, long-term, social and environmental goals. We are seeing the result of sociopathic metrics and the arcane policymaking process that has led to their creation; not just in riots and mayhem, but in heightened levels of cynicism and despair. Politics and policymaking have become the ultimate closed shop, closed to ordinary people because we just don't understand it. It's time to open it up and the first step is to ask, not tell, all of us *what are our policy priorities?*

#### 17.6.4 DIY biotech: something else to worry about (2020-06-24 15:38)

##### Biotech: DIY disaster zone...

...reads the header to an article in today's *Financial Times* (image at bottom of this page). It's a short article, but a frightening one:

Biotech is now within the grasp of hobbyists who can experiment with home-brewed opiates, DIY biohacks and even a mail order gene-editing kit to double the size of a tree frog. ...Modified microbes could damage ecosystems or trigger antimicrobial resistance.... A 'genetic engineering home lab kit' is marketed for just \$1845. Lex, *Financial Times* (subscription), 24 June

How should we deal the disasters that this, or any other technology, known or unknown, could unleash? We can't anticipate exactly where disasters will come from; our tendency is to let government take the lead. But government has little incentive or capacity to get it right - as we are seeing right now. Perhaps it's too much to expect government, an inherently big, cumbersome organisation, to deal efficiently with unforeseeable catastrophes. It doesn't appear

to be doing a great job managing even those that we know about but that are happening in ways that do not make television news: things like the always-present potential for a nuclear exchange; or climate change.

Yet there are things that only government can do, and things it does well. Managing disasters that are already happening, and have a readily identifiable cause and effect is one such. Raising the revenue (or, as now, borrowing) on a large enough scale to mitigate disasters is another. But what government cannot, and has no incentive to, do well is deal with complex problems that require diverse, adaptive solutions. Lex says that reinsurer Swiss Re 'reckons there is scope for havoc' arising from amateur biotech, and its dangers appear in the company's annual round-up of emerging risks. Right, and you'd think it would be in insurance companies' interests to do something to forestall such havoc. Maybe it is, in the short term, but if they did too much what would happen to insurance premiums and their revenue? Perhaps quelling brewing calamities wouldn't fit their business model. I don't really know.

But I can offer what I think is a less speculative solution: Disaster Prevention Bonds. These could be backed by government and swelled by contributions from philanthropists, NGOs and the public, and made redeemable only when no major disaster befalls human beings over a period of a decade or more. The type of disaster *doesn't have to be foreseen or foreseeable*. Backed by sufficiently large funds, the bonds would encourage investors to do whatever is possible to avert major disasters, including being alert to embryonic threats, such as those posed by DIY biotech. Incentives are important. Some people today benefit by doing things that reduce the likelihood of certain, specified disasters. But only specified disasters and, besides, there aren't that many such people, that's partly because the rewards on offer do not correlate with a successful, sustained, disaster-free outcome. That's where [1]Disaster Prevention Bonds could help.

I am grateful to Lex, not only for giving me something to blog about, and all of us something else to worry about, but also for this [2]quote from Eliezer Yudokovsky:

Every eighteen months, the minimum IQ necessary to destroy the world drops by one point.

economic support may be necessary. But it will contribute to an ever-growing horde of corporate zombies.

---

## Biotech: DIY disaster zone

Biotech is now within the grasp of hobbyists who can experiment with home-brewed opiates, DIY biohacks and even a mail order gene-editing kit to double the size of a tree frog. The tools to dabble in synthetic biology – engineering of biological entities – have become accessible. Reinsurer Swiss Re reckons there is scope for havoc.

The dangers of amateur biotech – and the accidental or deliberate release of synthesised organisms – merited a

slot in the Swiss company's last annual round-up of emerging risks. Such terrors and errors could have widespread consequences, including for insurers. Modified microbes could damage ecosystems or trigger antimicrobial resistance. The misuse of lab equipment and knowledge marketed by universities and other organisations could lead to big liability claims, warns Swiss Re.

That is not to gainsay synthetic biology's potential for good. Tailor-made microbes – typically made by inserting new DNA into a genome – could lead to new materials, advanced pharmaceuticals, including Covid-19 vaccines, and greener chemicals. The market is expected to grow to \$19bn by 2024, says BCC Research.

But the tools are becoming more

readily available to non-professionals less proficient in safety measures. A “genetic engineering home lab kit” is marketed for just \$1,845.

Chaos could resemble *The Sorcerer's Apprentice*, yet there is no magic remedy here. US regulators insist the sale of “do it yourself” gene therapy kits for self-administration are against the law. That might not cut much ice in the biohacking world. Restricting the sale of certain reagents to institutions is an option, though not fail-safe.

AI wonk Eliezer Yudkowsky modified Moore's Law to claim that every 18 months, the minimum IQ necessary to destroy the world drops by one point. That dictum related to computer power. As synthetic biology tools become more accessible, it might apply to biotech too.

## 17.7 July

### 17.7.1 Panoptics and experiments (2020-07-11 18:04)

Tim Harford writes:

From steroids to social policy, what works and what doesn't is often surprising. That is why rigorous experiments in real-world settings are invaluable. [1] *The risk of harm and the greater good*, Tim Harford, Financial Times (subscription), 27 June

Rigorous experiments are, as Mr Harford points out, more complicated and time consuming than just going with solutions that sound right, or seem obvious. With many of our goals requiring long-term research and experimentation, there are few incentives for people to do these things, and only a tenuous relationship between successful approaches and rewards. There are also few bodies of any kind that are motivated to take a panoptic view; looking, for instance, at efforts to reduce conflict worldwide, and adopt and adapt the more promising ones. There are some who do these things; charities, NGOs, United Nations agencies, perhaps. But they suffer from some or all of these deficiencies:

- they are poorly resourced
- they have their own agenda
- their rewards aren't correlated with their success at achieving meaningful outcomes.

This is not to say that these bodies aren't staffed by hard-working, well-meaning people. For the most part they are. But incentives matter. Take wars and civil wars: reducing such conflict is fine as a career option where job security and a steady income can give people a decent standard of living, regardless of what actually happens to the particular conflict within one's remit. But there is a glaring mismatch between the laudable efforts of these employees and the challenges that conflict, say, poses to human well-being. The potential for catastrophe requires that efforts be stepped up. More intellectual and financial resources are essential. We need the sort of brainpower that currently is devoted to lucrative but socially useless questionable activities such as [2]high-frequency trading or [3]advertising dog-food.

We need, therefore, a system that offers the possibility of worthwhile gain to people for whom that is a prime motivation. We need to channel their self-interest into solving our biggest problems. We need them to benefit from taking the panoptic view, investigating alternatives, conducting experiments, and implementing and refining potential solutions to our long-term social and environmental problems.

Social Policy Bonds would do this. A bond regime would address the three bullet points above. First, if there is more money to be made by solving our social problems, then more resources will be devoted to that end. Second, the agenda of investors in Social Policy Bonds that would be redeemed only when explicitly and transparently defined goals such as reducing conflict' (or similar) are achieved, would be exactly the same as those of society. Third, there would be the opportunity to buy bonds when the prospects for achieving the targeted goal are gloomy, to do something to make the prospects brighter, and to sell the bonds at a higher price, *even before the goal has actually been achieved*. So we can target remote goals, such as the end of world conflict, and still have investors interested in achieving them.

Underlying the approach that investors in [4]Social Policy Bonds would be motivated follow, and one that isn't being done frequently enough today, is to take that panoptic view, and conduct the sorts of experiments that Mr Harford writes about - and that are essential if we are going to come up with the diverse, adaptive solutions to our urgent, long-range, social and environmental problems.

### 17.7.2 Applying the concept to health (2020-07-18 16:56)

Emma Walmsley writes:

[T]he world needs to be better prepared for global health threats. ... Antimicrobial resistance is just such a threat... We risk returning to a time when a simple cut could have lethal consequences and common surgical procedures might be too risky to perform. ... The world needs commitment from pharmaceutical companies and new incentives to attract long-term R &D development. [1]*Antimicrobial resistance is the new battle for drug developers*, Emma Walmsley, Financial Times (subscription), 14 July

Ms Walmsley goes on to talk about a UK pilot plan to test a subscription model for new antibiotics, and to say that 'exploration of other incentives, such as an intellectual property-based extension voucher, or changes to health technology assessment methods for valuing antibiotics ...are promising options.....'.

This is true, so far as it goes. The problem is that it appears that not enough resources are being allocated to dealing with anti microbial resistance (AMR). Ms Walmsley suggests ways of addressing this. But what's missing is the broader context, with which I believe that the Social Policy Bond concept applied to health could deal with more efficiently.

Whether we are looking at global or national health, we need to know whether putting funds into reducing AMR is the best use of society's scarce health resources. Perhaps funds

would be better spent on preparing for epidemics or pandemics. The word *better* is the key: we need to know where our health pounds or dollars will generate the biggest improvements in health. More precisely, we need people to have incentives to find out this sort of information and, because circumstances, including our scientific knowledge, change rapidly, this has to be done on a continuous basis.

Governments have to make their resource allocation decisions on the basis of data that are necessarily incomplete. How can they know the effect that spending to oppose AMR will have on the overall health of the nation, as compared with allocating the same spending to preparing for epidemics? So, by default, health expenditure is influenced by groups of medical specialists with little incentive or capacity to see improvements in the general health of the nation as an objective. As a result, funding of health depends to a great and varying extent, on the strength of their lobby groups or on their public profile, rather than on what would best meet the needs of society.

The Social Policy Bond concept, applied to health, would change that. I have described how they would work in more detail [2]here. Essentially, they would give a coalition of investors incentives to look for and exploit the most efficient approaches to dealing with society's long-term health problems - *on a continuing basis*. Health would be defined broadly, using some index of which one component could be [3]Quality Adjusted Life Years. And the goal would be long term. The coalition of investors would be a [4]new type of organisation; one whose structure and composition could change over time, but who could profit with the long (perhaps 50-year) lifetime of the bonds by buying bonds, doing whatever they can to advance toward the targeted goal, then selling their bonds at a higher price.

Especially with health, we need people and governments who can take a long-term view, and have incentives to do so.

## 17.8 August

### 17.8.1 Nuclear peace: dogs and cats would also win (2020-08-05 15:46)

# Nuclear war is as likely as ever, says former defense secretary William Perry

America's nuclear weapons are thousands of times more powerful than the bombs that destroyed Hiroshima and Nagasaki 75 years ago. They're on hair-trigger alert: ready to be set off by a false alarm, computer malfunction, or by human error. President Trump has the sole authority to start a war that would end civilization as we know it. [1]KCRW, 31 July

That's really all we need to know, though the whole interview is worth a read. Nuclear proliferation demands a multiplicity of approaches. It's probably at least as great a threat to our survival as climate change, but there's no single, over-arching way of dealing with it. Government is especially bad at dealing with issues like this, where solutions are unlikely to come from the limited repertoire of command and control bureaucracy. Unless Government identifies solutions that it can implement, it's discouraged and tends not to follow through. It lacks the imagination to conceive of non-bureaucratic solutions, and it's not keen on relinquishing control. The result is our current perilous position.

Government cannot solve the problem, but it could set in place a system of incentives  
1350

that would encourage a solution - or rather, the necessarily diverse and adaptive array of partial solutions. Government could recognise that, while it doesn't have all the answers, it can at least mobilise the private sector to come up with solutions. Collectively, we have the brainpower and the desire: look at the ingenuity and resources that go into analysing the [2]pet food market, for instance. Or, worse, perhaps, see where even more of our best intellectual resources end up: in the, [3]arguably parasitic, financial services sector. To divert some of our talents away from almost-useless (or worse) activities into reducing the probability of a nuclear conflict would, you might think, be worthwhile. Government could do this by issuing something along the lines of [4]Nuclear Peace Bonds. It would define a set of nuclear peace targets, and back the bonds with rewards to be paid after specified periods during which a nuclear exchange does not occur. Bondholders would be motivated to bring about nuclear peace by whatever means they see as being efficient. They would not be limited to the solutions or activities that only government can implement. With a decent monetary incentive they could bring in our undoubted, boundless ingenuity to remove what is probably one of the greatest threats to our survival. If we're misanthropes, with a gloomy view our own species, its worth keeping in mind that nuclear peace would benefit our dogs and cats too.

## **17.8.2 Outcomes, not algorithms, should define policy goals (2020-08-22 15:00)**

There are sound reasons for being disdainful of quantitative targets in policymaking - something that forms the very basis of [1]Social Policy Bonds. But, perhaps unfortunately, in our highly aggregated, complex, societies, the alternative to targeting broad, explicit and, most important, *meaningful* goals is to target narrow, opaque goals that are devoid of meaning in that they do nothing to improve social well-being. The current *Economist* does a good job of illustrating the problems of consequences of using narrow, short-term, incoherent targets (what I have called [2]Mickey [3]Mouse [4]micro-targets):

They produce perverse results when people focus excessively on them. They tempt managers to manipulate numbers. The obsession with measurement diverts people from useful activity to filling in forms. The [UK] department of health provided a fine example of the first when it penalised hospitals whose emergency departments took too long to treat patients after ambulances had dropped them off. Hospitals responded by keeping patients waiting in ambulances rather than in emergency departments. The [London] Metropolitan Police illustrated the second, after it linked pay and promotion to achieving a crime-reduction target. A police whistle-blower

told a parliamentary committee that downgrading or underreporting crime had become “an ingrained part of police culture”. The universities to which A-level students are struggling to get admitted provide an example of the third. Tenure and promotion are awarded on the basis of the production of articles (which can be measured) rather than teaching (which can't), so students suffer. [5] *How the British government rules by algorithm*, the 'Economist', 22 August

The most important quality of a target is that it should be in itself, or be inextricably linked to, things that we actually want to achieve. In other words, they should not merely have (perhaps) been associated with social well-being in the past. They should be outcomes that are meaningful to ordinary people, because that's what matters most and that is what will encourage people's engagement with policymaking and hence our buy-in to policies that affect us. They need to be broad, so that achieving one target does not come at the expense of other social goals. The alternative? Well, it is what we have now: indicators defined not by society, but by vested interests within organizations who suspect that broad, meaningful targets - indicators of actual, meaningful outcomes - would threaten their way of doing things, their status, or indeed their existence.

## 17.9 September

### 17.9.1 Where is this going? (2020-09-15 10:00)

Social Policy Bonds haven't exactly set the world on fire. Despite my high hopes, or naivety, when I first came up with the idea, back in the 1980s, they have not not been issued anywhere. Social Impact Bonds - the non-tradeable variant - have, however, been issued in around 25 countries, according to [1]Wikipedia. They appear in different guises: pay-for-success financing, pay-for-success bond, social benefit bonds, etc. I've had no involvement with SIBs, and have expressed my ambivalence about them [2]here and [3]here. I have been lucky to be able to spend so much time working on Social Policy Bonds, mainly writing about them here, or on my main [4]website, or in books and papers. I've also given presentations about them at the Universities of Cambridge and St Andrews, and at OECD and think-tanks and conferences in the UK, Australia, and New Zealand.

However, book sales are in the single digits per annum, and there is a near-universal lack of interest from those whom I thought would be keen to take up the idea: politicians, bureaucrats, academics, philanthropists ...the list goes on.... So I am having now to focus more on earning

a living. No bad thing: it's a reminder of what it's like to work for slightly more than minimum wage doing something I do not enjoy, which has no prospects for advancement. That is what life is like for billions of people—if they're lucky! So this is just to serve notice that posting may continue to be thin for a while, though I will keep both this site and SocialGoals.com going. If you have questions, queries or comments on Social Policy Bonds I can always be reached my email, or you may find them addressed on this site or on SocialGoals.com. All my work is downloadable from there, free of charge.

## 17.10 October

### 17.10.1 Philanthropists: step forward! (2020-10-01 16:05)

One reason why Social Policy Bonds haven't been implemented, in contrast to their [1]non-tradable variant, is that it's difficult to experiment with them. To stand a chance of being implemented in preference to more-conventional policies, Social Policy bonds have to be shown to have been successful where other policies have failed. But the criteria for bonds' being an improvement over policy alternatives militate against small-scale trials. Social Policy Bonds will work best when:

- We have no real idea how to solve the problem;
- One or a combination of diverse methods need to be tried, refined and implemented, with resources being transferred from failed or inefficient approaches to more promising ones;
- The bonds must not simply transfer problem from one area (geographic or otherwise) to another;
- Goals must be robustly and verifiably quantifiable at low cost; and
- The time-scale must be long enough to enable objective-achievers to enter and leave the coalition of bondholders.

Social Policy Bonds can work s for things like climate change, improving health, reducing crime (in a country or large region: we don't want crims simply to travel a few miles). But none of these objectives lends itself to experiment. Nevertheless, there *is* a class of projects that the bonds could target at no risk: achieving those goals that have eluded policymakers, or indeed anyone and that, partly for that reason, receives resources that are minute in comparison to the benefits that achievement would bring. Such goals could include the ending of all

[2]violent political conflict, [3]nuclear peace, and [4]disaster prevention - which would include adequate protection against disasters that are foreseeable (like the current pandemic), and unforeseeable. These are goals that humanity as a whole would like to see reached, but that do not attract the funding that their achievement requires. Apart from the inescapable inability to conduct trials, the benefits of achieving these goals are too diffuse and long term to influence politicians or corporations. We need sources of funds that are wealthy, willing to take a chance on a new financial instrument, and willing to relinquish the power to dictate exactly who benefits from their largesse. Step forward, public-spirited philanthropists: humanity is waiting for you.

## 17.10.2 Buy-in, and that other global threat (2020-10-17 17:36)

From the current *New Scientist*:

The world has now already warmed about 1°C since the pre-industrial age... "Even at 1°C warming, climate change is bringing us to the edge, or even over the edge, of what we are able to cope with." says Friederike Otto at the University of Oxford. *Climate's make or break year*, Adam Vaughan, 'New Scientist', 17 October

As the political caste all over the world floats ever higher away from the concerns of ordinary people, it's perhaps time to look at its consequences for the long-running, not very televisual, slow-moving disaster that is climate change. I've written many times here and on the [1]SocialGoals.com website about the importance of [2]buy-in. For dealing with climate change, which is going to require the expenditure of massive resources, upfront, for an uncertain and inherently long-term benefit, buy-in is as elusive as it is crucial, but there certainly isn't enough of it at the moment. There are many worthwhile efforts going on, mostly aimed at reducing greenhouse gas emissions, but they are clearly not enough. I think the reason for this is that the objectives that are cited by climate scientists and activists are too abstract to generate much buy-in. I suggest that, instead of targeting degrees Celsius, or greenhouse gas emissions, or the composition of the atmosphere, we target climate goals that are meaningful to ordinary people. By this I mean broad goals, such as reductions in the numbers of people killed or made homeless by adverse climatic events, *wherever in the world they occur*.

The [3]Climate Stability Bond approach might also have presentational advantages and more palatable

money flows than such elegant solutions as a carbon tax. Any presentational advantages would be due to people's more readily identifying with the direct targeting for reduction of the impacts of adverse climatic events, whether they be short term - and televisual - such as hurricanes, or long term and drawn out, such as desertification. The money flows would be more palatable because, essentially, payment would be for results: Climate Stability Bonds would not be redeemed until all targeted goals had been achieved.

Goals that are meaningful to ordinary people, and more palatable money flows: with these two advantages, Climate Stability Bonds, would, I think, be better than the current, failing, approach.

### **17.10.3 Forget grand ideologies (2020-10-28 21:22)**

Haonan Li and Victor Yaw write:

If there is a lesson from Singapore's development it is this: forget grand ideologies and others' models. There is no replacement for experimentation, independent thought, and ruthless pragmatism. Haonan Li and Victor Yaw, [1]*The True Story of Lee Kuan Yew's Singapore*, 'Palladium', 13 August

Social Policy Bonds have been in the public arena for something like 32 years now and their non-tradeable variant, [2]Social Impact Bonds, are now being issued in about 25 countries. In my naivety, I thought in the early years that my original concept, which, simplistically is a right wing method (markets) aimed at achieving left-wing (social) goals, would appeal to everyone, rather than...not many people.

Unsurprisingly, perhaps, it's been the ideologues on the left that are most opposed to the concept. Often implicit, sometimes explicit, is their feeling, or argument, that Social Policy Bonds are a means by which investors make money out of doing what they should be doing anyway. It is true that some wealthy bondholders, whether they be individuals, corporations of government or non-government bodies, could become even more wealthy by first buying Social Policy Bonds, then doing something to achieve the outcome that they target, then selling their bonds for a higher price. This is what some call "profiting from others' misery" and it offends their sensibilities.

But it can also be called "working for a living while doing something socially useful". In the long run it's quite probable that only a few people or organisations would amass huge fortunes under a bond regime, even if they do successfully achieve society's goals and profit

from their bondholding. The way the market for Social Policy Bonds works would mean that excess profits could be bid away by would-be investors in a competitive market for the bonds. The market would openly transmit a huge amount of information about the constantly varying estimated costs of moving towards a targeted goal (see Chapter 5 of [3]my book for a full explanation). Barriers to entry into joining the coalition of bondholders and helping achieve the target could be low, especially if most bonds are held by investment companies who would contract out the many diverse approaches necessary to achieve most social and environmental goals.

The absolute sums of money at stake might be huge, particularly for Social Policy Bonds that target apparently remote, national or global goals, but there's no particular reason to assume that, in the long run, it would be shared out any less equitably than, say, teachers' salaries. Teachers? Yes, and nurses, doctors, nurses, and social workers, all of whom perform socially valuable services for which nobody begrudges payment—-not even those on the left

## 17.11 November

### 17.11.1 Defining peace, so that we can achieve it (2020-11-15 17:40)

They keep coming: Ethiopia, Azerbaijan/Armenia, Mali/Nigeria/Benin, etc.

It's too late to do anything much to stop the current conflicts or to avoid the imminent ones, but we can at least set in place mechanisms to prevent those wars and civil wars that are not yet inevitable.

There are links [1]here to my work on applying the Social Policy Bond concept to the elimination of war. An important question though, is what constitutes peace? This is not just an abstract point. A Social Policy Bond regime targeting peace would differ radically from the conventional, and not always successful, approaches. Most markedly it would not directly try to address war's alleged causes; or rather, *it would not prejudge what those causes are.*

Such an approach has (in my view) great merit. War is so complex that it is not always obvious, even after a long conflict has ended, what its supposed 'root causes' are, and perhaps the very notion of a 'root cause' needs questioning. It implies that factors such as 'poverty' or 'ethnicity' can be removed from their social context, and somehow dealt with, and that then a desired result will follow. But human societies are complex. Poverty can feed grievance, but grievance can be a result of poverty.

No single formula, no single set of parameters will always lead to conflict, and guarantee freedom from conflict. Indeed, even the notion of 'causation' in this context is questionable. Perhaps [2]Tolstoy summed it up best:

The deeper we delve in search of these causes the more of them we discover, and each single cause or series of causes appears to us equally valid in itself, and equally false by its insignificance compared to the magnitude of the event.

If we are going to issue Social Policy Bonds that target the elimination of violent conflict, how exactly would we define our goals? Peace - the absence of open war, the minimising of numerical casualties - would probably not suffice. Regimes can pile up armaments and blackmail neighbouring countries into making concessions or suffer the consequences. Under such circumstances, the open outbreak of military conflict would be unlikely, but it's hardly the sort of peace that we'd like to target.

I have no definitive answers, but I think that apart from the numbers of soldiers and civilians killed in armed conflicts, we could include elements such as the expenditure on armaments, numbers of full-time equivalents in the military, and mass media indicators of impending conflict. This last is interesting: there appears to be strong evidence that the underlying intentions of governments can be accurately gauged by a systematic analysis of opinion-leading articles in the mass media, regardless of the relative openness of the media in question. (See *Getting to war: predicting international conflict with mass media indicators*, W. Ben Hunt, University of Michigan Press, 1997.) Such analysis allows the prediction of both the likelihood of conflict and what form of conflict - military, diplomatic or economic - will occur. This sort of indicator could be useful as a target where military conflict has not begun, but appears possible, and where other data are scarce.

Once we have a set of indicators for peace, we could set about issuing Conflict Reduction Bonds, with national, regional or global objectives. We'd most probably have to refine the indicators over time, but the important point is that we'd be building a strong and highly motivated coalition for peace - in contrast to the current mess, under which the most dedicated individuals and groups seeking peace are the least rewarded, and the most highly rewarded are those who sell weapons of war.

### 17.11.2 How to minimise the risk of catastrophe (2020-11-20 16:14)

One typical manifestation of the 'New Optimism', is Steven Pinker's book [1] *The Better Angels of Our Nature*. According to the New Optimists, most of the indicators of human health, freedom, and educational achievement are improving. This is undeniably good news, but

as Adam Salisbury writes:

[W]e should not be complacent about our past trajectory, and not indulge in the New Optimist's flawed fixation on observed outcomes. Second, we should develop more holistic measures of human progress: ones that take into account our exposure to catastrophe. [2]*New Optimism Ignores Our Potential for Catastrophe*, Adam Salisbury, 'Palladium', 13 November

I agree that we underestimate the risk of catastrophe.

There are many people working hard to find vaccines, cures and treatments for disease, for example, or to prevent natural disasters or deal with their aftermath. There are peacekeepers, arms control talks, and other efforts to avoid human-made conflicts and disasters. But, in my view, this is not enough. The potential for catastrophe—the probability of a disaster of any sort, multiplied by its impact

— is high enough to warrant more resources devoted to reducing its likelihood. Efforts to contain nuclear weapons proliferation, for example, are minimal in relation to their potential for calamity.

Why is this? I think it's partly because the incentives aren't there for people to get involved. Much human ingenuity, and their attendant resources, go where people have the best chance of making a good living. Advertising [3]dog-food for instance, or the [4]useless (at best) financial services sector. It's only natural. But there is no correlation between where our best talents go, and the value to society of the activities they undertake when they get there.

[5]Social Policy Bonds would change that. Instead of the purely coincidental relationship between activity and social utility that we have nowadays, a bond regime would channel resources into *society's* goals. These goals would be long-term, broad and meaningful to ordinary people, who could then participate in allocating them a priority. One such goal that would, in my view, receive far more funding under a bond regime than at present would be disaster prevention. You can read more about how the Social Policy Bond concept could address the minimisation of the risk of disaster [6]here. The bonds could even bring into our purview those goals long considered to be unrealistic or idealistic; not because they are unattainable, but because they are not rewarded in ways that attract sufficient human and material resources. I am thinking now of that most noble but, in my view quite achievable, goal of [7]world peace.

### **17.11.3 Power and patronage (2020-11-30 11:17)**

Elang Adhyaksa, in a letter to the editor of the 'Economist' was writing about one particular country but, in truth, this could apply almost everywhere:

In such a fractured country as [\*see end of this post], leaders must contend with entrenched power bases, then cultivate patronage networks of their own if they are to govern at all. [1]*Elang Adhyaksa*, the 'Economist', 31 October

That's how things work. The power bases could be corporations or they could lie within government or the public service. I don't actually think things are drastically worse today in that respect than any other time. I do think, though, that we can do better. Power bases don't always share the same goals as ordinary people. The gap between power bases and the public may be widening. Often, the goals of the elite that constitute the power base (or are the people the power base has to listen to) and ordinary people are in conflict. Overall, trust in government is declining; it's not a hopeful trend.

There might have been good reasons for why our current political systems are weighted in favor of interest groups. Reasons to do with an uneducated population with not much free time to spend considering policy issues; the logistical difficulties of informing many people, and finding out what they think. The result is that government's goals depend on the bargaining power of special interests, whose influence is largely a function of how wealthy they are, but also such attributes as the personality of their spokespeople, and the emotions that can be generated from selective video footage.

I think we need policymaking systems now that prioritise the goals of ordinary citizens. These goals would be based not on emotion, but on the actual wishes and needs of the public.

[2]Social Policy Bonds could be the way forward. They target outcomes that are meaningful to ordinary people; outcomes such as [3]better health, [4]reduced crime rates, a [5]cleaner environment and, at a global level, [6]absence of war. There is more agreement about such outcomes than there is about how they shall be achieved, and which political party is best placed to achieve them. As well, these goals are more stable over time, so it is realistic to target them. A bond regime is well placed to target long-term goals, especially those that require research, experimentation, and refinement before they can be implemented. It would reward those who best advance these goals. Instead of self-entrenching power bases whose time, I believe, has passed, we'd have coalitions of bondholders; coalitions whose composition and structure would be subject to change, but that would always have as their goal, the maximising of their wealth. In that one respect, they would be similar to existing power bases. The crucial difference is that, under a Social Policy Bond regime, these [7]new types of organisation would become wealthy *only by achieving society's goals as efficiently as possible*. Their goals, in short, would be exactly the same as those of ordinary citizens.

\*Which country was Elang Adhyaksa writing about? Indonesia.

## 17.12 December

### 17.12.1 Make them tradeable (2020-12-16 18:38)

*This is a brief article, unpublished, about making [1]Social Impact Bonds tradeable.*

## Make Social Impact Bonds tradeable

It's fair to say that Social Impact Bonds have failed to live up to expectations. I think this is because they are not tradeable. This sounds like a minor technical issue, but it is a crucial flaw. It means that, if people are going to profit from investing in the bonds, the goals they target must be achievable within the time horizons of the people who buy them—a few years, perhaps. So SIBs inevitably target narrow, short-term objectives. But our social and environmental problems are complex, difficult to solve, and require long-term investment. They require a range of diverse, adaptive approaches to be tried, with the most promising ones refined and implemented, and the ones that don't work terminated (something that governments are reluctant to do). Creative destruction, allowed to operate in the private sector, has vastly improved the quality of life of a burgeoning world population. Making the bonds tradeable would allow it to work in the service of public goals too.

Because SIBs aren't tradeable, we'd expect to see what we do see: a lack of innovative approaches, the favouring of existing service providers, high transaction costs and not much in the way of increased efficiency. Yes, there has been some transfer of risk from taxpayers to the private sector, but the overall benefits are hardly enough to justify the high hopes they raised when they were first issued. And, as in other areas of the economy, the persistence of our social and environmental problems while the rich get richer is leading to increased cynicism about markets – the best way of allocating society's scarce resources.

A market for the bonds would mean people could buy bonds, do what they can to help achieve a targeted goal, see the market value of their bonds rise as a result, and sell their bonds at a profit to people who can take the next steps towards the achievement of the goal. Investors in the bonds would form a protean coalition, all interested in one thing: maximising the value of their bonds. With carefully specified social goals, investors' goals would be exactly the same as those of society. As with the owners of a company's shares, the membership of this coalition will change over time but, importantly, the way the market works will mean that bonds are always owned by those who bid most for the bonds: these would be investors who think they will be the most efficient at solving the targeted social or environmental problem.

One big benefit of making the bonds tradeable is that we can target goals that currently we have no idea how to achieve, and let bondholders and the market work out who is best placed to achieve them, and which are the most efficient ways of doing so. When I first developed the original bond concept, their tradeability was integral, and I had goals such as reducing national crime levels in mind. Without tradeability, we see SIBs targeting such short-term, narrow goals as reduced local levels of recidivism. Tradeable SIBs wouldn't be so limited: they could target national, or even global problems, such as natural or human-made disasters, or climate change.

There is more consensus over these goals than the ways of achieving them. They are more stable, and being broad, are comprehensible to ordinary people, who could participate in their prioritisation, and thereby help close the ever-widening gap between our political caste and the rest of us.

Much human ingenuity, and their attendant resources, naturally go into activities in which people have the best chance of making a good living, but whose value to society is (to be polite) questionable, such as the financial services sector. There is no

correlation between where our best talents go, and the value to society of the activities they undertake when they get there.

Making SIBs tradeable would change that. Instead of the purely coincidental relationship between activity and social utility that we see nowadays, a bond regime would channel resources into society's goals. These goals would be long-term, broad and meaningful to ordinary people, who could therefore participate in their prioritisation. Tradeability would extend the range of the goals we target to encompass those we now regard as unsolvable. It would attract resources into completely new areas, currently the responsibility of underpaid hard-working people who have few resources to play with, and are rewarded in ways that have nothing to do with their efficiency or success.

These elusive, yet urgent, goals have long been considered unrealistic or idealistic not, I contend, because they are unattainable, but because they are not rewarded in ways that attract sufficient human and material resources. With tradeable SIBs we could target such noble and, in my view, quite achievable goals, such as minimising the impact of all kinds of disaster, and the ending of war.

# 2021

## 18.1 January

### 18.1.1 Centrally planned goals are fine (2021-01-04 10:17)

I haven't read [1]*Seeing Like a State: [2]How Certain Schemes to Improve the Human Condition Have Failed*, by James C Scott, published in 1999. (There is a good review of it [3]here.) The description on the Amazon page sums it up:

Centrally managed social plans misfire, Scott argues, when they impose schematic visions that do violence to complex interdependencies that are not - and cannot - be fully understood. Further, the success of designs for social organization depends upon the recognition that local, practical knowledge is as important as formal, epistemic knowledge. The author builds a persuasive case against "development theory" and imperialistic state planning that disregards the values, desires, and objections of its subjects. He identifies and discusses four conditions common to all planning disasters: administrative ordering of nature and society by the state; a "high-modernist ideology" that places confidence in the ability of science to improve every aspect of human life; a willingness to use authoritarian state power to effect large-scale interventions; and a prostrate civil society that cannot effectively resist such plans.

While we're content to let the market's efficiencies work in the private sector, our current way of solving social and environmental problems is, in essence, centrally managed. The result is something like a [4]policy monoculture, and the results are predictably lamentable. But the important distinction to make is that between centrally planned outcomes and centrally managed ways of achieving them. We all want to see such *centrally planned goals* reduced poverty, the ending of violent political conflict, and universal literacy, for examples. Government does a good job at articulating our wishes in these and other areas. But *centrally planning the ways of achieving these goals* just does not work. We need diverse, adaptive solutions; ones that take into account circumstances that vary with time and space. Central planning can't do that and the results of its failure are widespread and tragic.

Which is why I advocate [5]Social Policy Bonds. Under a bond regime we would set goals and contract out their achievement to people motivated to investigate and implement the only the most efficient projects. These projects would adapt to changing circumstances, and be sensitive to local conditions. Under a bond regime, the complex interdependencies about which Scott writes, which cannot be understood by government, *need* not be understood by government. Instead, via an automatic system of cascading incentives, Social Policy Bonds would encourage diverse, adaptive initiatives that would contribute to achieving our large-scale - even global - goals.

### 18.1.2 How better to solve our global problems? (2021-01-11 11:34)

At the very [1]outset (pdf), I envisaged that [2]Social Policy Bonds could be used to solve global problems, because that is where their advantages over other policy mixes would be most marked. These advantages arise because:

- Current global solutions are lacking. Take climate change, or the possibility of nuclear war. There are many initiatives being undertaken by well-meaning, hard-working people in many institutions worldwide. But measured in terms of outcomes - reduced probability of adverse climatic events, or nuclear war - the results of all this endeavour are unimpressive.
- Under a bond regime, resources can readily shift to where they will do most good. 'Good' being measured as objectively as possible, with such tools as [3]Quality Adjusted Life

Years. Consider just two areas into which huge quantities of human ingenuity are concentrated: financial trading and marketing. The financial rewards from excelling in these activities far outweigh those who that accrue to people involved in efforts to diminish the prospects of, say, violent political conflict. The mismatch between what could be done, and what is being done can be seen by considering the co-existence of both [4]neglected tropical diseases and [5]high-frequency trading.

- A mix of diverse solutions are required. No single solutions, of the type favoured by governments or supra-national bodies, are going to solve humanity's global problems. We need a mix of diverse, adaptive solutions, which vary continually with both space and time - always with the aim of being maximally efficient. Governments can specify, and raise funds for, the ends of such solutions, not their means.
- Most global problems require long-term solutions; they extend beyond the lifetime of individuals, corporations or government bodies. But people today receive their income from such organisations, and organisations have goals that differ from those of humanity. Their prime goal, after their idealistic beginnings, often becomes self-perpetuation, which can not only be inconsistent with humanity's goals - it can even conflict with them.

For all these reasons, I believe Social Policy Bonds offer the best hope for humanity. Our goals are more stable than those means of achieving them currently thought to be optimal. Our governments are good at raising revenue, and they can articulate society's goals, but they are not very good at solving complex problems or thinking for the long term good of society, even when that is their goal. There is no shortage of human ingenuity or other resources, but we do need incentives to divert such resources into areas where they can do most good. Social Policy Bonds, backed by national governments and issued by a global body (it could even be an private-sector organisation) are, in my view, the best way forward. I cannot think of a better alternative.

### 18.1.3 We need to direct ends, not means (2021-01-19 11:30)

John Kay, reviewing [1]*Mission Economy*, discusses the author, Mariana Mazzucato's, contention that 'we need a "solutions based economy", driven and co-ordinated by more powerful governments engaged in every stage of the process of innovation' in order to solve urgent global problems as effectively as the Apollo space programme achieved its goal of landing men on the moon and returning them to Earth. But, Mr Kay writes:

Apollo was a success because the objective was specific and limited; the basic science was well understood, even if many subsidiary technological developments were needed to make the mission feasible; and the political commitment to the project was sufficiently strong to make budget overruns almost irrelevant. Centrally directed missions have sometimes succeeded when these conditions are in place; Apollo was a response to the Soviet Union's pioneering launch of a human into space, and the greatest achievement of the USSR was the mobilisation of resources to defeat Nazi Germany. Nixon's war on cancer, explicitly modelled on the Apollo programme, was a failure because cancer is not a single illness and too little was then — or now — understood about the science of cell mutation. Mao's Great Leap Forward, a vain bid to create an industrial society within five years, proved to be one of the greatest economic and humanitarian disasters in human history. At least 30m people died.

With political direction **of innovation** we regularly encounter grandiosity of ambition and scale; the belief that strength of commitment overcomes practical problems; an absence of honest feedback; the suppression of sceptical comment and marginalisation of sceptical commentators. [2]*Mission Economy by Mariana Mazzucato — could moonshot thinking help fix the planet?*, John Kay, 15 January (emphasis added)

I agree: political direction of innovation doesn't work. But political direction of the outcome, I believe, can work, if the necessary innovation is contracted out to motivated bodies, be they in the public or private sector. Governments are good at specifying goals, and democratic governments are good at specifying society's goals. They are also efficient at raising the revenue necessary for their achievement. Where they are not so effective is in dictating how that revenue shall be spent and who will do the spending. As Mr Kay continues:

All these were seen in Britain's experience with Concorde, the Channel Tunnel and the AGR nuclear reactor programme, some of the worst commercial projects in history. More recently, there is the £12bn wasted on the NHS computerisation programme ....

This is why I continue to advocate the [3]Social Policy Bonds concept, which allows governments to do what they are best at: specifying a desirable outcomes, while letting motivated bodies compete for the right to join a protean coalition that will co-operate, continuously, until the outcome has been achieved. In that way, goals can be long term in nature - see my piece on [4]global goals, for example. The composition and structure of that coalition can and, most likely, will change, but at every point in time, its attributes will be subordinated to the over-arching goals specified by government, in consultation with the public. Whoever issues Social Policy Bonds - and it needn't be government - cannot specify the diverse, adaptive policies that will be necessary to solve our most urgent, big, complex problems. But they *can* specify the outcome, and in so doing ensure that the most efficient problem solvers are rewarded in ways that directly correlate with their contribution.

## 18.2 February

### 18.2.1 Nuclear peace: no time to lose (2021-02-01 22:05)

The *Economist* recognises the threat posed by nuclear proliferation:

If the nuclear order starts to unravel, it will be almost impossible to stop. ...Stopping proliferation also requires spotting it. ...The International Atomic Energy Agency, the world's nuclear watchdog ... is **overburdened and under-funded**, and needs to keep up with technological change. The world ... cannot afford to downplay the dangers of nuclear proliferation. Today's nuclear diplomacy may seem a slog, but it is as nothing compared with the lethal instabilities that arise whenever regional nuclear-armed rivals confront each other. There is no time to lose. [1]*Who will go nuclear next?*, The 'Economist', 30 January (emphasis added)

My contention is that too much human ingenuity and attendant funding are channelled into activities of little, no, or negative social utility, such as advertising [2]dog-food, hedge funds or [3]high-frequency trading. People react rationally to the incentives on offer, and such activities, unfortunately attract some of the brightest minds on the planet.

The under-funding of the IAEA is not the only reason for the *Economist's* (and my) alarm at the nuclear threat. The Agency is like any other organisation. Though its employees are no doubt hard working and well meaning they are not rewarded in ways that are linked to their success or otherwise in carrying out the Agency's ostensible goal. Like every organisation, it has its own incentives, and one of its most important is likely to be [4]self-perpetuation.

I think that the nuclear threat is too significant to be left to one under-funded organisation. I suggest instead that :

- We clearly define what we want to achieve: most obviously the continuation of nuclear peace, but we could also encompass other goals, such as reductions in the number of nuclear warheads, and the number of nuclear powers.
- We reward the sustained, simultaneous, achievement of all these objectives.
- We supply adequate funding that encourage such achievement - and are prepared to increase those rewards if necessary.
- We then contract out the achievement of this array of objectives by means of Nuclear Bonds, made available to everyone - public- or private-sector - on the open market.

What would happen? Most likely a [5]new sort of organisation would arise: one whose goals are exactly congruent with society's goals. Its structure and composition could vary over time, but at every point would be those that would best achieve and sustain nuclear peace. As project-initiators and implementers, they will do what they can to achieve nuclear peace, see the value of the bondholdings rise, realise their gains from holding the bonds (or receiving payments from bondholders), and sell their bonds to others who can better carry out the next steps towards achieving and sustaining the specified goal.

For more about applying the [6]Social Policy Bond concept to nuclear peace see [7]here.

### 18.2.2 'Sustainability' is a meaningless goal (2021-02-15 11:07)

The *New Scientist*, in a feature about fishing, quotes an expert:

The word 'sustainability' doesn't mean anything. You can actually overfish sustainably - you can reduce the stock to a tiny fraction of its original abundance and fish the rest sustainably. It's like cutting an immense forest, but leaving a few trees standing, which you harvest sustainably. Daniel Pauly, quoted in *Plenty more fish in the sea?* by Graham Lawton, [1]'New Scientist', 13 February

One advantage of the Social Policy Bond concept is that it obliges policymakers to come up with clear, unambiguous, verifiable goals. 'Sustainability' just isn't good enough. You might almost think its elasticity and prevalence are designed to ensure that business can continue as usual, not only in fisheries but in forestry, climate change, or indeed any aspect of the environment. Unfortunately, setting verifiable goals is difficult for governments. There are genuine as well as spurious reasons as to why this should be. One is that there are too many unforeseeable variables that could affect movement towards targeted goals and that have little to do with government performance. We can hardly expect, therefore, government to do otherwise than promulgate vague, meaningless goals that have little to do with social well-being.

I advocate, instead, that government relinquish some of its goal setting role, and instead seek to articulate and refine society's goals. Such goals, I believe, would extend beyond the time horizons of particular government administrations. They would be broad and verifiable but, most importantly, they would be meaningful to ordinary people, in a way that such goals as

'sustainability' - or proportion of youngsters going to [2]university, or [3]waiting times in hospitals [4]etc - are not.

Discussing Social Policy Bonds I often emphasise the gains that could be made by injecting the market's incentives and efficiencies into the achievement of social and environmental outcomes. But perhaps even more important would be the bonds' role in obliging society as a whole to define clearly what those outcomes actually are. In such a policymaking environment goals as devoid of meaning as sustainability would not clear the first hurdle.

### 18.3.2 Markets can actually serve the public (2021-03-14 11:43)

Social Policy Bonds are poorly received by some, partly because they depend absolutely on markets. Markets have a bad reputation, especially in left-leaning circles for one reason that's justified, in my view, and two that aren't.

Market forces have been invoked to justify subverted, manipulated, and gamed interventions. One example: leading corporations often seek to change the regulatory environment in ways that inhibit competition. They may have attained their dominance within a competitive market, but once there, they abuse their power to stifle would-be competitors. Very often, they find allies within government, including individuals whom they will reward handsomely with directorships or consultancies once their government careers end. Though the claim is that such behaviour is merely in accordance with free market principles, it is actually the antithesis of competitive behaviour in a free market. We see the results everywhere: grotesquely huge

and powerful corporations, stifling or snapping up the competition, and abusing their dominance to influence government in ways that further concentrate their power and wealth. It's a valid reason for being sceptical when, say, a new financial instrument, such as Social Policy Bonds, enters the arena, claiming that the market's incentives and efficiencies can actually be channelled into the public good.

However, other reasons for people's disdain of markets are less valid. People see the rewards to those who succeed in a wide array of markets as almost as unjustified as lottery winnings. And there is some truth that those who do so succeed are those who are best placed to take risks. As in most human endeavour luck is important. But less appreciated is that there *are* risks, and also that profits take time to accumulate. We focus on the millions (or, now, billions) that accrue to the luckiest or most ruthless, or the most efficient operators, many of whom do provide goods and services that improve society's well-being - but we do not account for the time necessary to reap those rewards.

As well, people focus purely on the rewards, often inordinately huge, without seeing that these rewards don't merely enrich a few people at the top. They also increase the supply of the goods or services that generate those riches. Or, they should do, and would do, in competitive markets.

So while I understand people's doubts that markets can serve the needs of all in society, I'd ask them to be open-minded and look in detail at Social Policy Bonds, which, while they would probably make some already wealthy people or organisations even wealthier, at least in the short run, would do so only in strict proportion to their success in solving our social and environmental problems.

## 18.4 April

### 18.4.1 Electric cars: another misguided policy intervention (2021-04-06 18:45)

Basing policy on current science and technology is fraught with difficulties. I have [1]written about the problems of legislating to limit those gases currently thought to contribute to the greenhouse effect, and advocated instead rewarding people for achieving that which we actually want to achieve: a reduction in adverse climatic events. On a smaller scale, I am sceptical about governments promoting battery electric vehicles (BEVs). The reasoning is similar: our knowledge of the causes and the effects of our environmental depredations is incomplete and rapidly expanding. Take this excerpt from US research into a comparison of the environmental impacts of BEVs and internal combustion engine vehicles (ICEVs):

BEVs may be responsible for greater human toxicity and ecosystems effects than their ICEV equivalents, due to (1) the mining and processing of metals to produce batteries, and (2) the potential mining and combustion of coal to produce electricity. These results are global effects, based on the system boundaries and input assumptions of the respective studies. In addition to a review of the literature, CRS focused on the results of one study in order to present an internally consistent example of an LCA [Life Cycle Analysis]. This specific study

finds that the life cycle of selected lithium-ion BEVs emits, on average, an estimated 33 % less GHGs [greenhouse gases], 61 % less volatile organic compounds, 93 % less carbon monoxide, 28 % less nitrogen oxides, and 32 % less black carbon than the life cycle of ICEVs in the United States. However, the life cycle of the selected lithium-ion BEVs emits, on average, an estimated 15 % more fine particulate matter and 273 % more sulfur oxides, largely due to battery production and the electricity generation source used to charge the vehicle batteries. Further, the life cycle of the selected lithium-ion BEVs consumes, on average, an estimated 29 % less total energy resources and 37 % less fossil fuel resources, but 56 % more water resources. [2]*Environmental Effects of Battery Electric and Internal Combustion Engine Vehicles* (pdf), [US] Congressional Research Service, 16 June 2020

This is not to say that BEVs are worse than ICEVs. It is clear that there is no single way of weighting and aggregating the adverse environmental impacts that points to a clear winner. And, even if there were, that could change, depending on either developments in technology, or improved knowledge about how the environmental depredations affect human, animal and plant life. On that basis then, I would argue that legislation to promote BEVs is misguided. Instead we'd do better, in my view, to stipulate those environmental outcomes that we want to achieve, and reward those who bring about those outcomes, *however they do so*.

### 18.4.2 The coolness factor (2021-04-27 09:05)

The 'coolness' factor: not the coolness that [1]describes 'an aesthetic of attitude, behavior, comportment, appearance and style which is generally admired' but rather the [2]coolness 'marked by steady dispassionate calmness and self-control' at times of high emotion. Currently I'm working on applying the Social Policy Bond concept to health, and one advantage of [3]Health Bonds is that they would target outcomes decided on an unemotional, impartial basis at a time when the interests of the entire population are being considered dispassionately. That we are in dire need of such coolness is clear from this review of Nuclear Folly, by Serhii Plokyh:

... [Khrushchev's] Oct. 23 [1962] Kremlin outburst—which appears midway through Serhii Plokyh's superb "Nuclear Folly: A History of the Cuban Missile Crisis"—would appear to mark a significant contribution: an eyewitness account of one of the saga's two key decision makers exhibiting not only uncontrolled anger but delirium. Khrushchev's threat to "nuke" the White House, his "avalanche of contradictory orders," constitute the most troubling behavior we could imagine in a leader "managing" such a crisis. [4]'*Nuclear Folly*' Review: *The Big Red Gamble*, James Rosen, 'Wall Street Journal', 19 April 2021

Indeed; it is striking how, at the highest level of national government, big decisions appear to be made on the basis of reactive,

primal emotion. Rationality and the long-term interests of the people politicians are supposed to represent hardly figure at all:

...policies  
are often adopted on the basis of less careful analysis than their importance warrants, leaving wide room for mistakes and misperceptions . Forces of knowledge destruction are often stronger than those favoring knowledge creation. Hence states have an inherent tendency toward primitive thought, and the conduct of public affairs is often polluted by myth, misinformation, and flimsy analysis. [5]Source ( pdf )

This  
type of thinking is particularly dangerous when military conflict looms. An article about Henry Kissinger's role in US foreign policy quotes him saying to US President George W Bush's speechwriter, about radical Islamic opponents: 'We need to humiliate them'. Comments like this abound in high politics. George W Bush himself cried 'bring 'em on' at an early point in the invasion of Iraq. These are not examples of high-level thinking. The benefits of a Social Policy Bond regime would include the setting of social goals in a rational way. It's unlikely that random emotional outbursts would crystallise into policy in such a policymaking environment, however high up the hierarchy are the people who make them.

## 18.5 May

### 18.5.1 Winning elections is not the same as running the country (2021-05-12 21:26)

Henry Kissinger is supposed to have said:

One of the greatest dangers to democracy is the growing gap between those who can win elections and those who can run the state .

Quite so. I think there's also a growing gap between those who can win elections and those who *wish* to run the state, or have any interest in running the state *efficiently*. There are many reasons why people seek power, but running an efficient state doesn't seem to be an overriding one. Power for its own sake, something that will bring future lucrative directorships or

media appearances or promote sales of memoirs, or something to fill in those endless blank days after some other career- these seem to be more important as motivators for would-be politicians.

Part of the reason for this is that running a state is less fulfilling than it used to be. Our democratic societies are too complex for a single person's influence to count for much. There are always competing interest groups to consider and long time lags between cause and effect. So politics is increasingly driven by personalities, sound bites, and trivia. At the same time we are failing to address huge, urgent social and environmental challenges. Politicians and bureaucrats have little incentive to tackle these challenges until they become emergencies. Structural weaknesses are papered over until it's too late. It makes little difference who's in power, and ordinary people know that.

Here's another idea: instead of voting for political party, or for the politician who looks best in the media, or for the ones that avoid real issues in the most convincing manner, how about letting us vote for outcomes? Not for the politicians who say they'll deliver outcomes, or for the political party that, way back in history, did once deliver outcomes, but directly for outcomes. Take, for instance, the goal of avoiding catastrophic climate change. That option was not offered by any of the British political parties. It's not on offer, in fact, anywhere, as a policy for which people can vote. What is on offer are promises made by members of a political caste to do something that might do something to reduce greenhouse gas emissions, which in turn might, but probably will not, do anything significantly to stabilise the climate. Then these promises, however nugatory, are broken anyway.

That's where Social Policy Bonds can play a part. Under a bond regime, the currency of debate would be outcomes rather than political parties or well-meaning but hollow promises. Politicians then wouldn't have to run the state, though they would have to articulate society's targeted outcomes, and continue to raise the revenue for their achievement. Politicians can actually do those things quite well - in the democratic countries at least. Outcomes are inherently more amenable to the sort of consensus and buy-in that are essential if we are to avoid serious economic, social or environmental problems. And Social Policy Bonds, as well as increasing transparency and stability of targeted goals, would minimise the cost of achieving them. More could be done with society's scarce resources than under the current system. Efficiency, transparency and buy-in: exactly what are lacking in today's system. No wonder, then, that participation in a general election is so low.

### **18.5.2 Peace in the Middle East (2021-05-29 10:15)**

Who wants it? Ordinary people, mostly. It's difficult, though, for them to express that preference. We're all susceptible to anger and impulse, to propaganda and, especially, emotional television pictures of conflict, and it doesn't help that the financial and status incentives are overwhelmingly on the side of conflict. The arms sellers, the men of (so-called) religion, the state and non-state militias: all

have their own reasons for stoking conflict that follow logically from the premisses by which they live. What's missing are countervailing incentives: the unspoken and - in parts of the Middle East, unsayable, on pain of persecution - wishes of ordinary people to make something of the lives and those of their family members. That's where [1]Middle East Peace Bonds could enter the picture. Ordinary people in and outside the Middle East, perhaps following initial

contributions from philanthropists, could set up a fund to be used for the redemption of the bonds. The bonds could aim to achieve a sustained period of peace, defined and verified objectively. It would be up to bondholders to devise and investigate the multitude of possible ways in which conflict can be avoided. They would have incentives to deploy only the most efficient of such initiatives.

People often write about

'intractable' ethnic, religious, or territorial conflicts. But these conflicts do fizzle out and then it's apparent that the conflicts were not so intractable after all. The borders between England and Scotland, or England and Wales, are pretty quiet these days. Historical grievances, and notions of fairness or justice, loom large and play a part in perpetuating conflict. But not inevitably. People get tired; the old paradigms die with the ideologues that kept them going; deals are done, compromises made, other events assume greater importance, while time heals. Middle East Peace Bonds could accelerate all these processes. They could channel the wishes of the majority of ordinary people in the Middle East and beyond into the attainment of peace in the region. Incentives matter.

## 18.6 June

### 18.6.1 Electric vehicles and nappies (2021-06-07 09:03)

Will replacing vehicles powered by internal combustion engines (ICEs) by those powered by renewable electricity reduce greenhouse gas emissions? It depends on too many variables to justify the actions taken by governments worldwide. A researcher for Jefferies, an investment bank, pointed out that:

To

gain the environmental dividend that governments are looking for, users are going to have to keep them [ie EVs] longer, drive them further than they may have done with a conventional internal combustion energy vehicle.

When they leave the factory, these [electric vehicles] are at a disadvantage. They contain more steel. The brakes are bigger. The battery packs are certainly heavier.

[1]Source

Goehring & Rozencajg, a research firm focusing on contrarian natural resource investments [2]posted a blog in which they call into question a comparison of ICEs and EVs conducted by the Wall Street Journal and, citing the work performed by Jefferies, argue that there could literally be 'no reduction in CO<sub>2</sub> output' in some EV vs. ICE comparisons.

I have no opinion as to whether EVs are worse for the environment than ICEs. Even if they are, currently, technology is rapidly changing. As well, [3]brake dust and pollution from [4]tire wear are probably as toxic as engine emissions. These facts point to the need to stipulate the environmental outcomes that we want to achieve, rather than the supposed ways of achieving them. The next step would be to reward those who bring about those outcomes, *however they do so*.

The problem, and [5]solution, are similar to those concerning [6]nappies. The seemingly simple question of disposable versus cloth embodies in microcosm the inescapable difficulty of making policy about bigger concerns. There are always angles that we cannot foresee. Cleo Mussi, for instance, writes to the *New Scientist*:

.... I wonder whether the research comparing [cloth] to disposables took into account the fact that babies using cloth nappies tend to be toilet-trained day and night at a much earlier age - there is little more uncomfortable than a wet cloth nappy. A difference of six months to a year would lead to a child using 1100 to 2200 extra disposable diapers or nappies - a lot of extra landfill. Cleo Mussi, [7]Letter to the editor of 'New Scientist', 12 December

Our environment and society are too complex and changing too rapidly for us to favour even one of two types of nappy, just as we cannot say whether EVs or ICEs are preferable. Yet the way we make policy makes little allowance for such difficulties. Typically, a government (heavily influenced by corporate interests or ideological baggage) makes a top-down, one-size-fits-all decision, ostensibly based on fossilised science, and then moves onto something else, rarely

revisiting or even [8]monitoring (pdf) its performance.

When bigger challenges than nappies loom, this way of doing things generates commensurately bigger problems. Whether it's climate change or health or global conflict, neither government nor any single conventional organisation can know all about the relevant human and scientific relationships, let alone keep up with them. Nor can they anticipate the diverse effects their policies will have over both time and space. The complexities are too great, and any single body is going to be too pre-occupied with its image, the latest events, or its members' individual goals to care much about outcomes.

Only people who are *continuously* motivated to achieve our goals, to look at the effects of their initiatives, and to adjust their ideas accordingly, can develop the diverse, adaptive approaches that we need to solve our social and environmental problems. Social Policy Bonds are one way in which we could stimulate such initiatives. They have other benefits: most significant here is that issuers of the bonds do not need to specify how a problem is to be solved in order to get people started on solving it. Our goals are stable: the optimal ways of achieving them, especially when complicated by time lags, feedback loops, a multitude of known, unknown and unknowable variables, are not. We can and, in my view, should, issue [9]Social Policy Bonds targeting such goals as solving huge, urgent problems such as [10]climate change even though the ways in which they are to be solved lie are beyond the purview and time horizons of policymakers.

## 18.6.2 The evolutionary approach to policymaking (2021-06-20 15:31)

In today's polarised political climate [1]Social Policy Bonds suffer by being seen as a 'right-wing' way of achieving 'left-wing' goals, in that they use markets to achieve social and environmental objectives. Rather than appealing to both political ideologies, they appeal to neither. They are also quite unconventional in that they stipulate desirable outcomes and reward people for achieving them. This differs from the usual approach of governments - even those that care about their citizens - which is to take existing bodies (public- or private-sector) as a given, and try to negotiate their competing demands. I think Social Policy Bonds can improve on this approach for two main reasons:

Society is so complex, ever-changing and beset by time lags that it is more efficient to reward evolutionary solutions to our social problems than it is for any single body to try, using current knowledge, to develop solutions that will necessarily be top-down and once-size-fits-all. Just as evolution in nature leads to diverse, adaptive solutions to the problem of surviving in a complex, changing environment, so would an evolutionary approach lead to diverse, adaptive solutions to our social problems. Such approaches are unlikely to be conceived by any single conventional organisation, which is why I expect issuing Social Policy Bonds would generate a [2]new type of organisation, one whose structure, composition and activities would be solely dedicated to achieving society's social and environmental goals at least cost to the taxpayer.

A Social Policy Bond regime would encourage long-term thinking because (unlike Social Impact Bonds) they would be tradeable, so that the time-till-redemption of the bonds could be much longer than any investor's time horizon. There would be time for bondholders to try an array of innovative approaches, and the incentives would be there for them to refine and implement the most efficient of these approaches - and, importantly, to terminate those that are unpromising. Once the Social Policy Bond concept has been used at the national level, lessons learned could be applied to solution of global problems, including those often thought to be intractable, such as regional or global [3]conflict.

## 18.7 July

### 18.7.1 Ending war: imagery or incentives? (2021-07-09 08:34)

We often hear war correspondents say that they undertake their gruelling assignments so that others will come to realize the horror of armed conflict. I don't doubt their sincerity, nor their bravery in embedding themselves in military campaigns and recording the carnage that is the outcome of man's inhumanity to man. I do, however, doubt whether widely disseminated graphic reports and pictures are the best way, or even an effective way, of bringing about an

end to war. They may be the best we have come up with - but they patently haven't ended any form of violent political conflict.

Piling up weapons, unfalsifiable 'deterrence' doctrine, peace talks, talks about talks: these are roundabout methods of addressing our tendency to destroy others of our species and a big chunk of the natural environment too. They lack even the grim entertainment value of the reporters' images and commentary. Here's a question: if we are truly serious about ending armed conflict, why don't we reward the ending of armed conflict rather than the failed means of preventing it? Incentives matter, and the current incentives are all for arms merchants to sell more arms, for bureaucrats to engage in endless talks, for fanatics and governments to inflame aggressive religious and nationalistic passions.

Humanity would benefit if there were countervailing incentives, by which I mean financial incentives. The wish that almost everyone has, when we are not reacting to propaganda or provocation, to live in peace, has not been monetised and so, sadly, counts for very little when set against the interests of the weapons manufacturers, bureaucrats and zealots.

Which is where the [1]Social Policy Bond concept, applied in the service of world peace, could make a contribution. Under a bond regime targeting a combination of such metrics for reduction as numbers of people killed and made homeless, people would be rewarded for the achievement of sustained periods during which wars are reduced or eliminated.

World Peace Bonds would channel the market's incentives and efficiencies into ending war. Governments, institutions and anyone else with a genuine interest in peace would contribute to a fund that would be used to redeem the bonds, which would create a coalition of interests with a powerful incentive to reduce the level of violent political conflict. For more about how the bond concept can be applied to conflict reduction, and links to short essays on the subject, see [2]here.

## **18.7.2 Social Policy Bonds: an evolutionary approach to social policy (2021-07-28 17:47)**

This post was intended for publication:

# Social Policy Bonds: an evolutionary approach to social policy

Society today is so complex and ever changing that it would be more efficient to reward evolutionary solutions to many of our social problems than it is for a government, or any single body to try to develop top-down solutions, which are necessarily out of date, uniform and inflexible. Just as evolution in nature leads to diverse, adaptive solutions to the problem of surviving in a complex, changing environment, so would an evolutionary approach - given the right incentives - lead to diverse, adaptive solutions to our social and environmental problems.

No conventional policy approaches, with their emphasis on fossilised science, self-interested institutions and insufficiently flexible funding arrangements can adapt in a timely way to changing circumstances including our expanding knowledge. Take health: our understanding of the scientific relationships and our technological capabilities are constantly expanding. Most of the interdependencies between intervention and outcome are impossible to identify. In former times links between cause and effect, while not always obvious, were at least discoverable by dedicated medical individuals, such as John Snow who could trace an outbreak of cholera in London in 1854 to one water pump. Today, no single conventional body, public- or private-sector, can effectively monitor all relevant new developments and react accordingly. But while our understanding of the determinants of our health is constantly changing, the *goal* of better health, as measured by an array of metrics including longevity, infant mortality and quality adjusted life years, is stable. It is some combination of these goals that I believe government should target, not the means by which current science thinks we can achieve them.

The same applies to other social and environmental problems, including those that are deemed intractable, such as eliminating crime, climate change and war. Our ingenuity is boundless: witness the superbly creative television adverts for dog-food, or the ballistic missiles whose nuclear warheads can accurately target and destroy thousands of members of our species on the other side of the planet. I have no doubt that, channelled into more edifying outcomes, our ingenuity could achieve what today seem like remote, impossible, goals.

In economic theory, and on all the evidence, market forces are the most efficient way of allocating our scarce resources. Sadly, markets have a bad press, having been undermined, abused and manipulated so that they now are seldom associated with the public interest.

To ensure that the market's efficiencies

and incentives are directed into public benefit, I suggest that governments issue Social Policy Bonds: a new financial instrument that would inextricably link the rewards gained by efficient resource allocation to the achievement of our social goals. These non-interest bearing bonds would be redeemable for a fixed sum only when a specified social goal – such as improved health – had been achieved and sustained.

Whereas their non-tradeable variant, Social Impact Bonds, favour existing institutions, are inherently narrow and short-term in scope, and impose relatively high monitoring costs, Social Policy Bonds' tradeability would allow the targeting of national, or even global, long-term goals, using approaches many of which will require years of research, trials and refinement before they can be successfully implemented. Investors could buy the bonds and make a profit on them within a limited time frame:

the time-till-redemption of the bonds would be much longer than any investor's time horizon. This would encourage long-term planning: bondholders could try an array of innovative approaches, and the incentives would be there for them to refine and implement the most efficient of these and, importantly, to terminate those that are unpromising. This is how evolution selects those species that are best adapted to an ever-changing environment.

The optimal mix of approaches cannot be conceived by any single conventional organisation, which is why I expect that issuing Social Policy Bonds would generate a

[1] new type of organisation

, whose protean structure, composition and activities would at all times be solely dedicated to achieving society's social and environmental goals at least cost to the taxpayer.

Under a Social Policy Bond regime government would be doing what it does best: articulating society's social and environmental goals and raising the revenue for their achievement. But the actual achievement of these would be contracted out to the market, which would continuously direct society's scarce resources into their most efficient use – all for the benefit of ordinary citizens and the environment.

## 18.8 August

### 18.8.1 Bees, war, and root causes (2021-08-03 09:49)

From the current issue of the Economist:

Detecting covid with bees, meanwhile, involves a method that goes back to Ivan Pavlov and his dogs. The insects are offered sugar-water alongside SARS-CoV-2-infected saliva samples, but not with uninfected samples. They thus learn to extend their probosces when they sniff covid. [1] *The nose knows: Flies, worms and bees could help detect illness*, the 'Economist', 31 July

What does this have to do with [2] Social Policy Bonds? It's often suggested that in order to tackle such social and environmental problems as crime, violence, war or climate we need to identify the 'root causes' before we can devise ways of solving them. I disagree. I think our first step should be to clarify exactly what we want to achieve, and then reward the achievement. Let investors in the bonds decide whether it's worth looking for root causes or whether it's more efficient, and quicker, to find different ways of solving our problems. We could (and, effectively, do) delay, say, reducing conflict, by postulating some ideal world in which there is no poverty and everyone is nice to each other. The implicit assumption is that war is an intractable part of human nature, as the ancient Greeks thought. It's a convenient excuse, especially as the search for root causes - usually the task of people whose lifetime earnings are correlated with the time taken to find them - need never end. As Tolstoy put it:

The deeper we delve in search of these causes [of war] the more of them we discover, and each single cause or series of causes appears to us equally valid in itself, and equally false by its insignificance compared to the magnitude of the event.  
Leo Tolstoy, 'War and Peace', Norton Critical Editions, New York, 1996 (page 536)

Just as we can train bees to detect covid without knowing about the mechanisms underlying how they do so; so we can target such goals as [3] world peace, [4] reduced crime, or the [5] elimination of poverty without wasting time and energy on endless searches supposedly aimed at identifying their root causes.

### **18.8.3 Social goals and the Karpman Drama Triangle (2021-08-13 09:54)**

I've written about the crippling limitations imposed on Social Policy Bonds by making them non-tradeable [1]here and [2]here. And I'm sometimes asked why Social Policy Bonds haven't yet been issued, either by government or the private sector, whereas their non-tradable variant (most often known as [3]Social Impact Bonds), are now issued in about 25 countries.

My thinking goes like this. Governments and non-governmental organisations including charities, do not want to relinquish their power to decide *who* shall supply the goal-achieving services (and so benefit from redeeming the bonds). Nor do they wish to lose complete oversight over *how* the targeted goals shall be achieved. Ultimately, in my view, it's about power and control, which to many of us are not key drivers, so we may find it difficult to understand their potency. This also, and more disappointingly, applies to philanthropists as well as politicians: it is gratifying to be seen to be granting funds directly to beneficiaries or to people who help those beneficiaries. It is not so appealing merely to contribute to a fund whose eventual beneficiaries cannot be identified. As well, Social Policy Bonds are best deployed when they aim to achieve long-term goals and on a large scale, where the beneficiaries are even less easy to identify and, indeed, might not yet be born.

Another explanation is that, at some level, governments, foundations and philanthropists might be playing the role of Rescuer in what is known as the "Karpman Drama Triangle", involving a Victim, Persecutor and Rescuer, as modelled in transactional analysis. Perhaps this paragraph, from [4]here is pertinent in some cases:

**The Rescuer:** The rescuer's line is "Let me help you." A classic enabler, the Rescuer feels guilty if they don't go to the rescue. Yet their rescuing has negative effects: It keeps the Victim dependent and doesn't allow the Victim permission to fail and experience the consequences of their choices. The rewards derived from this rescue role are that the focus is taken off of the rescuer. When they focus their energy on someone else, it enables them to ignore their own anxiety and issues. This rescue role is also pivotal because their actual primary interest is really an avoidance of their own problems disguised as concern for the victim's needs.

I had hoped that SIBs would be stepping stone on the way to Social Policy Bonds. That is still possible, and new technologies are generating are encouraging more interest in my original concept. However, it is also possible that the [5]lack of evidence (pdf) justifying the SIBs that have been issued could discredit the whole bond concept. We shall see.

Gideon (2021-08-20 16:25:34)

I've been reading up on your concept of Social Policy Bonds and am very intrigued. I couldn't find another more appropriate way to reach you, so I will just ask this question here as it seems to be a fundamental blocker for me.

What happens in the event that the terms of the bond are not met. There is no redemption of the bond, I understand, but what happens to all that capital?

Thanks for sticking with this interesting idea all these years. It's very intriguing.

Ronnie Horesh (2021-08-21 15:37:38)

Hi Gideon

Thanks for your message. I can be reached via the email address given on this page: <https://www.socialgoals.com/blog-contact.html>.

It will be interesting to see how successful will be the marriage of the bonds to the blockchain.

Now to your query. The backers of bonds that target goals that just aren't being achieved can (1) do nothing, and watch the value of the bonds fall to virtually zero, at which point someone might buy them and do some small thing that advances the goal, and so benefit from the value of their bonds multiplying. The issuers could also hope for improvements in technology or knowledge or both (depending on the goal) that would reduce the cost of achieving the goal, so making the bonds a more attractive investment. But what if the bonds are almost without any value, and still nothing happens? Then the issuers could (2) top up the redemption funds. They could either issue more bonds, or simply undertake to redeem the bonds already in circulation for  $(1 + x)$  times the redemption value quoted when they were issued. (I describe this in Chapter 3 of my book, and also here: <https://www.socialgoals.com/world-peace.html> - scroll down to the section headed 'Efficient costing'.) In all this time, the redemption funds could be in an escrow account. Note that the topping up of redemption funds, or the issuing of more bonds, could be done using sources other than, or in addition to, the original backers, who could, for instance appeal to the public to supplement the initial funds.

#### **18.8.4 Social Policy Bonds and their variants (2021-08-23 10:34)**

Partly to simplify the exposition of the bonds, I haven't delved into variants of the basic Social Policy Bond principle. These variants include such possibilities as:

- bonds that expire; ie, if the targeted social or environmental goal isn't achieved by a certain date, they become worthless;
- bonds that yield a partial payout if the goal is only partially achieved;
- redemption funds that are not placed in escrow, but guaranteed, either by public- or private-sector bodies; and
- payouts indexed to some measure of inflation.

There are many other possible variations on the basic theme: the Social Policy Bond concept is a versatile one and, because it is best deployed on large scale and for long-term social problems, it would be worth exploring the potential of variants on a case-by-case basis.

On a related note, I have been asked what would happen to the funds intended to be paid out if the terms of a Social Policy Bond issue were not met. I would think that much would depend on who is undertaking to redeem the bonds. If it's a government body, or some supranational body (like the United Nations), I would imagine that any funds placed in escrow could be diverted to other uses within that body. More likely, though, such bodies, being credible, would merely guarantee payout, as in my third bullet point above. These bodies would want to minimise any perception that they will not pay out, partly to reduce their costs (ie, bolster the float value of the bonds) and partly to maintain faith that they will pay out in future bond issues.

What about smaller bodies, such as a group of philanthropists, with less credibility? In such an instance the funds could remain in escrow, hopefully earning interest, until the goal is actually achieved and sustained. It's likely that these smaller bodies would target goals with a shorter overall time horizon. If, say the goal were the elimination of serious armed conflict: while a UN body, say, could target a sustained period of peace of, say 30 years, I could envisage that a

group of philanthropists or non-governmental organisations would have a less ambitious target; perhaps peace in the Middle East sustained for a period of five years. Then, if a conflict were to erupt within that five-year period they need do nothing with the funds; they could patiently wait until a five-year period of peace arises. Or when issuing the bonds, they could have specified the time period during which the goal had to be achieved and, if the bonds fail to achieve the goal within that period, they could simply withdraw their funds from escrow.

For this and further queries see the bonds' [1]FAQ page.

### **18.8.5 Prioritising health rather than hospital design (2021-08-27 16:56)**

Sadly, but not unexpectedly, my 9500-word essay submitted to a [1]competition concerned with hospital design failed to progress into the final stages of the competition. The question posed was: *How would you design and plan new hospitals to radically improve patient experiences, clinical outcomes, staff wellbeing, and integration with wider health and social care?* I gave an example, early on in the essay, showing how *what is good for the hospital can conflict with what is good for the patient*, and went on to explain how the Social Policy Bond concept could maximise what, in my view, we should be trying to achieve: improvements in health, rather than hospital design. The essay can be seen on my website [2]here, and a pdf downloaded from [3]here. A shorter treatment, also describing the application of the Social Policy Bond concept to health is [4]here.

## **18.9 September**

### **18.9.1 Paying people not to shoot (2021-09-18 15:44)**

Charles Fain Lehman writes:

San Francisco [1]has a new plan to stem [2]a recent surge in deadly shootings: pay potential shooters. That's the principle behind the city's new Dream Keeper Fellowship, which will enroll 30

individuals deemed at high risk of shooting or being shot and pay them a \$300 monthly stipend. They can collect an additional \$200 per month for completing such milestones as taking job interviews, complying with probation, or meeting with the life coach assigned to them. [3]We'll pay you not to shoot, Charles Fain Lehman, City Journal, 17 September

Mr Lehman is unenthusiastic:

[W]e shouldn't pay people specifically for their willingness to refrain from deadly violence—any more than we should pay them for not selling drugs or abusing their children.

My position? I don't have one. Social Policy Bonds reward outcomes, whoever achieves them and, so long as the means are within the law, *however they are achieved*. If paying a small number of people not to inflict casualties on others is more cost-effective than heavy policing, and interventions by the justice and corrections departments, then why not do so? Careful crafting of [4]Crime Prevention Bonds' redemption terms could minimise some of the risks, and allow resources to be diverted into preventing or punishing activities that currently seem to receive little attention, such as [5]white-collar [6]crime.

However, Social Policy Bonds are versatile. If the ethical or moral arguments against paying people not to commit crime are thought to outweigh those in favour, then the bonds' redemption terms could stipulate that such payments would invalidate the bonds.

More likely, in my view, is that Crime Prevention Bonds targeting the sorts of violent crime committed by a small number of people in the long term might see such direct payments at first, but these would be replaced by or co-exist with other, less controversial but more long-lasting projects, such as subsidising employment in crime-ridden districts, setting up sports or youth facilities, and other more creative routes out of crime.

## 18.9.2 Decentralized Impact Organizations for the Climate (2021-09-20 15:05)

'Olliten' has written an essay proposing that a pilot Decentralized Impact Organization be formed to test the Social Policy Bond concept as applied to climate change:

Crypto has transformed grassroots-level organizing. For the first time in history, it is possible to economically align networks of strangers into working together by using programmable incentives and by providing them with tools to make decisions and govern shared resources in a decentralized manner. These new organisms are [1]called by many “DAOs”, Decentralized Autonomous Organizations.

[A Social Policy Bond]and its bondholders together form an entity very similar to a DAO: the bondholders form a grassroots level organization and share an economic fate via the bonds they own. What is special about this type of "DAO" is that its token (the bond) derives its value from the quality of a public good. To distinguish them from generic DAOs, we'll call these organizations "DIOs", Decentralized Impact Organizations.

The technology for creating crypto-native DIOs already exists. Six months ago, [2]UMA Protocol launched a new crypto-derivatives product called "Key Performance Indicator Options". [3]KPI options were [4]originally created so that crypto protocols could trustlessly guarantee that their community receives rewards for hitting milestones such as increasing Total Value Locked (TVL). However, their design allows them to be used for SPBs, too.

KPI options are synthetic (ERC-20) tokens that will pay out rewards if a KPI reaches predetermined targets before the given expiry date. Every KPI option holder has an incentive to improve that KPI because then their option will be worth more.

The complete essay can be found [5]here.

## 18.10 October

### 18.10.1 Whole Environment Bonds (2021-10-09 17:50)

George Monbiot writes:

The living world is being hit by everything at once: the only way to stop our full-spectrum assault on Earth systems is to reduce our economic activity. [1]*Level down*, George Monbiot, 4 October

David Allen said is [2]quoted as saying ‘You can do anything, but not everything’. In much the same way, we can solve any environmental problem, but not every environmental problem. The linkages are too tight and too complex; the time lags too obscure. Mitigating one problem is likely to worsen another. So, as Mr Monbiot writes:

[1]f we were to build sufficient direct air capture machines to make a major difference to atmospheric carbon concentrations, this would demand a massive new wave of mining and processing, to make the steel and concrete.

Mr Monbiot’s solutions to this broad environmental crisis are to ‘ramp down economic activity’ and to redistribute wealth. He indicates how unlikely this is to happen by calling it secular blasphemy. I agree with his assessment of the likelihood of its occurring. So I try here to offer a more positive vision.

The first thing to emphasise is that Mr Monbiot coyly (and, from the point of view of his own well-being, wisely) avoids the question of population. Yet this need not be contentious. At the 1994 Cairo Summit, more than 180 countries [3]promised ‘access to reproductive and sexual health services including family planning’ to all their citizens. That should be done for ethical reasons; it would also alleviate future environmental pressures. I do not see a reduced population as a goal in itself; rather it is one way in which environmental depredations could be reduced.

I now believe that targeting even such broad problems as climate change or atmospheric pollution is inadequate.

Current environmental deprecations are too complex, linked and pervasive so that, as Mr Monbiot implies, any attempt at solving one problem could well worsen others.

What I propose here is a possible way in which we can provide incentives for people to tackle *all* environmental problems, simultaneously, over a very long time period.

It is essentially a more panoptic variant of my [4]Environmental Policy Bonds and [5]Climate Stability Bonds ideas. However, rather than target a single group of metrics such as those encompassing climate change and its impacts, the aim here is to improve all aspects of the environment over the entire planet Earth.

I suggest that we take an inventory of a random sample of the Earth's sea and land resources. We could take, say, 5000 areas of 1km squared over the entire globe and thoroughly inventory them for biodiversity, degree of air or water pollution (at different heights and depths). Every ten years thereafter we could take a random sample of, say, 100 of these areas, conduct exactly the same environmental inventory and note the direction of the environmental indicators for each area. As a starting point, we could target every metric for improvement in every sampled area. If every metric in every sampled area shows a sustained improvement, then the bonds would be redeemed. It would take many decades before such a widespread improvement had been achieved. Nevertheless, because such *Whole Environment Bonds* would be tradeable, people could make improvements and expect to be rewarded for doing so.

There would need to be intense, informed discussion as to which metrics to include. There would, for instance, be the question of whether we take temperature (air or sea) as a metric for targeting, or whether the concerns we have about the climate would be fully subsumed within the other indicators (biodiversity, for example), being targeted. ([6]Are we concerned about climate change, or the impacts of climate change on plant, animal and human life?) Much work is being done on environmental indicators: see, for example, [7]this pdf document.

More those unfamiliar with the [8]Social Policy Bond concept, the basic idea is that a group of people (governments, non-governmental organisations, philanthropists, the public) contribute to a fund that will be used to redeem non-interest bearing bonds only when a specified goal has been achieved and sustained.

I don't think I'm quite as pessimistic as Monbiot and other environmental commentators, but I recognise that the chances of Whole Environment Bonds ever being issued as I envisage are remote. After more than thirty of years, very little in the way of outcome-based incentives is being offered in a way that encourages broad, long-term solutions to our social and environmental problems. (See [9]here and [10]here for why I think the [11]non-tradeable version of my idea, which *is* being implemented, has little to offer.) The relevant question though is: what is the alternative?

### **18.10.3 An alternative to the blah, blah, blah approach (2021-10-30 17:00)**

The current *Spectator* using figures from *Our World in Data*, tells us how much 'carbon' the world was emitting at the time of previous climate summits:

1992, Rio 22.44 bn tonnes

1997, Kyoto 24.19 bn tonnes

2002, Johannesburg 25.91 bn tonnes

2009, Copenhagen 31.46 bn tonnes

2015, Paris 35.21 bn tonnes

2021, Glasgow (2019) 36.44 bn tonnes

Taking greenhouse gases (ghgs) as a whole, more figures from *Our World in Data* confirm this trend: according to that source global emissions totalled 35.0 bn tonnes in 1990, rising to 49.4 bn tonnes in 2016.

The current *Economist* tells us that in 1992:

78 % of the world's primary energy—the stuff used to produce electricity, drive movement and provide heat both for industrial purposes and to warm buildings—came from fossil fuels. By 2019 the total amount of primary energy used had risen by 60 %. And the proportion provided by fossil fuels was now 79 %. [1]*What the Paris agreement of 2015 meant*, The Economist, 30 October

The same publication tells us that 1002 coal-fired electricity generating plants are planned or under construction around the world.

I have been skeptical about ghg emission targets for [2]many years. My thinking is that we need, [3]first of all, to be clear about whether we are more concerned about climate change, or about the impacts of climate change on human, animal and plant life. We should then define exactly what we want to achieve and reward the people who help achieve it, whoever they are and however they do so. We should not assume that cutting back on ghg emissions is either necessary or sufficient to bring about the solution to whatever combination of depredations we deem to be the climate change problem. That is what these summits purport to do. They don't actually do it, as shown by the statistics above. Nor do they do anything else. In the words of another, more prominent, summit skeptic, they are just so much [4]blah, blah, blah.

My suggestions for addressing climate change are conceptually quite simple:

- define the problem, and
- reward people for solving it.

[5]Climate Stability Bonds use the market’s incentives and efficiencies to channel our limited resources into where they will do most to solve the problem. Were they to be issued with the appropriate backing they would stimulate exploration of diverse, adaptive initiatives with the clear goal of solving the climate change problem as efficiently as possible.

## 18.11 November

### 18.11.1 Self-interest can help the environment (2021-11-11 12:01)

Patrick J. Buchanan points out the similarity of the current COP26 talks, supposedly aimed at addressing climate change, to the [1]Kellogg-Briand Pact of 1928:

On Aug. 27, 1928,  
15 High Contracting Parties signed on to renounce war as an instrument of national policy. The signatories that day were the United States, Britain, Germany, Italy, Japan, France, Poland, Belgium, Czechoslovakia, Canada, South Africa, Australia, New Zealand, Ireland and India. Within 15 years, all 15 nations, Ireland alone excepted, were ensnared in the greatest war in history. Like the pledges at the climate summit, the Kellogg-Briand Pact provided for no means of enforcement or sanctions against nations that failed to live up to their commitment.

‘No means of enforcement’ - true - and no incentives either. It is unfortunate to some degree that money is such a critical driver of behaviour but, if we recognise that climate change and other environmental problems are largely caused by financial incentives, then we can make efforts to withdraw those incentives or, if that’s too difficult, offer countervailing incentives that would help offset our environmental depredations. We can do this only when there is an over-arching, inextricable link between the financial incentives we offer and the outcomes we wish to see. It is not simply a case of rewarding behaviour that directly improves the environment. [2]Environmental Policy Bonds, globally backed, would reward such indirect approaches as lobbying governments or paying bad actors to cease their destructive activities.

Just as big corporations can manipulate regulations to achieve their ends (including stifling competition), so could bondholders encourage government to strengthen environmental legislation. The alternative - the current approach, frankly - is to say nice things in the full knowledge that our destruction of the environment will continue unimpeded.

### **18.11.2 Complexity provides cover for inefficiency and corruption (2021-11-21 09:41)**

[1]Robert Bryce testifies on electric vehicles before the US Congress, House Select Committee on the Climate Crisis. Two brief points from his [2]testimony of 30 June (pdf):

- The average household income for EV [electric vehicle] buyers is about \$140,000. That's roughly two times the U.S. average. And yet, federal EV tax credits force low- and middle-income taxpayers to subsidize the Benz and Beemer crowd.
- Lower-income Americans are facing huge electric rate increases for grid upgrades to accommodate EVs even though they will probably never own one.

It's a familiar story. Government sees a problem (climate change) and thinks it knows best how to solve it (emission controls, electric vehicles) - or perhaps that's not cynical enough. Maybe the reasoning goes: government identifies a possible problem, then is told how to appear to be solving it by vested interests (big corporations) in exchange for favours (directorships, cash). The problem isn't solved, but the rich do get richer.

Here's another idea. If the problem is, say, climate change, let's reward people who prevent climate change. If the problem is too much crime let's reward the people who reduce crime. Government doesn't have to take a view on *how* to solve these problems, or which people are best placed to do so. When it does take such views government adds to the confusion, creating a cover behind which favours can be disbursed without public scrutiny.

I am suggesting that society's complexity can be, and is, used to disguise inefficiency at best and corruption at worst. The explicit targeting of verifiable outcomes that are meaningful to ordinary people, in the way that [3]Social Policy Bonds do, would be one way in which we could ensure that taxpayer funds are used to benefit everyone, not just an already wealthy elite. When it comes to climate change we need to be very clear what we want to achieve. Most [4]importantly, are we more concerned about the climate, or about the impacts of climate change on human, animal and plant life? Once we are clear about our goals, we can issue [5]Climate Stability Bonds, that reward the achievement of our explicit, verifiable goals.

As well as clarifying and targeting society's actual goals, rather than the supposed means of achieving them, the Social Policy Bond concept injects the market's incentives into every

stage of the processes necessary for their achievement, meaning that more can be done with society's scarce resources.

## 18.12 December

### 18.12.1 Cascading incentives (2021-12-06 18:07)

Dr David Healy, towards the end of a long article entitled [1]*The Eclipse of Medical Care*, summarises how medical science has been eclipsed:

1. Clinicians do not have access to clinical trial data on medicines or vaccines.
2. Close to all of the medical literature reporting trial results for on-patent drugs and vaccines is ghostwritten, hyping the benefits and hiding the harms.
3. Clinical trials of these treatments that are negative on their primary or their most common outcomes are often published in prestigious journals as positive.
4. Clinical trials have their harms airbrushed out of ghostwritten publications.
5. Regulators (FDA, Health Canada, MHRA, EMA) do not get to see the full trial data.
6. Regulators approve treatments as working even when more people die on active treatment than on placebo.
7. Regulators approve medicines on the basis of negative studies and agree not to let the wider world know about this.
8. Regulators say nothing when companies publish negative studies as positive and make adverse effects of treatment, including death, vanish.
9. For many trials there are more deaths on active treatment than on placebo, but this does not lead regulators to warn about hazards as to do so would in their stated view deter people from seeking a benefit (even when the benefit is better characterized as a commercial benefit to a company rather than a benefit to the individual in terms of a live saved or a restoration of function).

10. Regulators do not have pharmacovigilance expertise and a variety of factors inhibit them from linking a treatment to a hazard after that treatment comes on the market.

[2]*The Eclipse of Health Care*, David Healy, 29 November

This is typical of the sort of corruption that blights so many of our public- and private-sector bodies. How does this happen? Often cited is regulatory capture which [3]occurs when a regulatory agency that is created to act in the public interest, instead advances the commercial or political concerns of special interest groups that dominate an industry or sector the agency is charged with regulating. But why does that happen?

I do think that there's been an erosion of trust in western societies, but that is subjective and does not point toward an actionable solution. So I'd like to suggest that, rather than rely on nebulous mission statements to guide our public-sector agencies (or an apparently weak moral compass), we instead focus on the outcomes that society as a whole wishes to achieve. In this example, then, medical care would be subordinate not to the goals of the organisations supposed to supply it, but to the broader and more meaningful goal of the health of society's health.

Doing so using the Social Policy Bond concept would replace organisations' goals (essentially that of [4]self perpetuation) with those of society. Incentives to improve society's health would cascade downwards from that over-arching goal. These incentives, as under the current system, would largely be financial, but that does not mean that the people responding to them be entirely motivated by greed. Rather, it means that they would find a way of making a living compatible with society's goals, the goals of the bodies for which they work, and ethical behaviour.

*For a short piece on how the Social Policy Bond concept can be applied to health, see [5]here. For a longer treatment, see [6]here.*

### **18.12.2 Is organic farming better? (2021-12-13 22:15)**

Dan Conable writes, in a letter published in the *New Yorker*, about his organic grain farming operation:

[T]hough my practices may have a relatively benign impact on my surroundings as compared with conventional farming, their larger environmental impact is not so

clear. Controlling weeds without herbicides generally requires more tillage. Turning the soil more frequently means using more diesel fuel per ton of grain, as well as freeing more of the carbon stored in the soil. More important from a climate-change perspective, organic farmers' reliance on manure as the critical nitrogen source for crops in the grass family (corn, wheat, oats, barley) makes us utterly dependent on animal agriculture. If the world were to feed itself wholly by organic methods, an increase in cattle, pig, and poultry production would be needed to provide the necessary fertilizer—at least until scientists can genetically modify grasses to capture their own nitrogen. But, then, G.M.O.s aren't organic. [1] *Letter from Dan Conable, 'New Yorker'*, dated 20 December

The sort of life-cycle analyses (LCAs) required to establish the environmental benefits or otherwise of shifts in our behaviour are bedevilled by boundary issues, measurement difficulties and the difficulty of weighting one type of environmental impact against another. They *might* be better than going on the gut feeling that organic agriculture is 'better' than the conventional kind, or that vegan clothes are better than animal fabrics, rail is better than air travel, solar power is better than coal-fired power stations, etc, but for the making of robust policy LCAs would need to be continually reassessed in the light of our ever-expanding knowledge of the environment, our ever-changing environmental priorities, and our every-changing technological endowment.

Government policy cannot ever be so responsive nor, probably, can any single organisation - at least not as currently structured. If government were to use life-cycle analysis with the aim of altering our behaviour, it would necessarily do so on the basis of a one-time, limited, and possibly subjective assessment of environmental costs and benefits. It's not good enough, but even worse would be what we largely have now: environmental policy based on corporate interests, 'what feels right', media stories and the launching of visually appealing initiatives that attract air time but are otherwise useless. These often focus on trendiest problems, of which the current one is climate change, which tends to crowd out other, possibly more urgent crises.

The Social Policy Bond concept as applied to the environment would take a different approach. It would first clarify what environmental goals, national or global, we wish to achieve. Say, for instance, that we wish to preserve the Earth's marine environment. A Social Policy Bond issue that rewarded the sustained achievement of such a goal would generate incentives for bondholders to bring it about at least cost. They might well carry out life-cycle analyses in their attempt to do so. But there is an important difference between the way do they would conduct their research and the way government, or any supra-government body would do so: bondholders have continuous long-term incentives to achieve our goals efficiently. This is likely to mean responding to and stimulating increased knowledge of scientific relationships, and technical advances.

Investors *might* conduct LCAs, but they would do so in ways that optimise the benefit to the marine environment per dollar spent.

Effective environmental policy must take a long-term view and for national or global goals, will need to encourage diverse, adaptive approaches. The environment and our knowledge about it are just too complex for the simplistic 'it feels good', command-and-control approach that, for instance, brands 'organic farming' as good, or plastic shopping bags as bad. Diverse, adaptive approaches to addressing complex problems are precisely the sort of responses that government does very badly. However, government does have crucial roles in articulating society's environmental goals and in raising the revenue to pay for their achievement: in the democratic countries government performs these functions quite well. But actually *achieving* society's social and environmental goals is a different matter. Such achievement requires continuous, well-informed and impartial decisions to be made about the allocation of scarce resources. For that purpose, Social Policy Bonds, with their incentives to achieve targeted outcomes efficiently would, I believe, be far better than the current ways in which environmental policy is formulated.

For more about applying the Social Policy Bond principle to the environment see [2]here. (For a personal policy paper on organic agriculture, see [3]here.)

### **18.12.3 Incentives and health (2021-12-15 18:30)**

The first step is to give up the illusion that the primary purpose of modern medical research is to improve Americans' health most effectively and efficiently. In our opinion, the primary purpose of commercially funded clinical research is to maximize financial return on investment, not health. John Abramson, Harvard Medical School, quoted by Robert F Kennedy Jr in [1]*The Real Anthony Fauci*, November 2021

Government funding for health innovation is subsidising drug industry profits while providing little public health benefit, a report from leading health economists says. Most new drugs are not meeting public needs while economic and regulatory incentives have created a "highly inefficient pharmaceutical sector" which spends more on marketing than research and development, and focuses the research it

does do on profits, the report explains. [2]*Drug companies are incentivised to profit not to improve health, says report*, Melanie Newman, summarising [3]*this paper* published 16 October 2018

Incentives are crucial. If people have incentives to improve the health of the population, then that is what they will work towards. If they have incentives to increase the short-term profits or revenues or funding of the organisations for which they work, public- or private-sector, then all their activities will be in pursuit of that goal. The dysfunctionality of our healthcare systems begins at the top. There may be vague goals in the form of soundbites or mission statements, but there is no link between them and the incentives on offer.

The Social Policy Bond concept, applied to health, would change that. I have described how they would work [4]here, or in a lot more detail [5]here. Essentially, they would give a coalition of investors incentives to

look for and exploit the most efficient approaches to dealing with society's long-term health problems - *on a continuing basis*. Health would be defined broadly, using some index of which one component could be [6]Quality Adjusted Life Years. And the goal would be long term. The coalition of investors would be a [7]new type of organisation; one whose structure and composition could change over time, but who could profit with the long (perhaps 50-year) lifetime of the bonds by buying bonds, doing whatever they can to advance toward the targeted goal, then selling their bonds at a higher price.

#### **18.12.4 Regulatory capture: the perversion of our public bodies (2021-12-30 12:21)**

James Lyons-Weiler writes about regulatory capture in the US:

When the airline industry has a disaster, it goes under review by the National Transportation Safety Board. When corporations dump a toxic brew of chemicals into ground surface waters, they are supposed to answer to the EPA. When drug companies' products -

drugs and vaccines - cause more health problems than they prevent or cure, they are supposed to be subject to recall by the FDA.

When

regulatory agencies become dominated by the corporations they are supposed to control, that agency has been captured by the industry. The public interest becomes a lower priority than the bidding of the will of the industry, and the industry flourishes - most of the time at the cost of human health. [1]*Regulatory capture is killing us, and we are two steps away from the totalitarian fascist Regulatory States of America*, James Lyons-Weiler, 24 December

Of course, this is not just a US phenomenon, and perhaps there is an inevitability about it, even in the absence of some coherent conspiracy influencing each or all regulatory agencies. People are paid to turn up at the office, and at some point, perhaps years or decades after the founding of the organisation for which they work, the aggregated individual incentives of employees to keep their job and to expand or at least maintain their remit, supplant the stated objectives of the organisation. Then conflict arises between - and within - the employees. Do they stay faithful to the ideals that drove them to take on the job and the stated goals of the organisation? Or do they take the safer option, put their own priorities and those of their family first? Unfortunately, as organisations, be they public- or private-sector, the conflict grows worse with time. In the private sector and in theory, competition should see older, sclerotic corporations die, to be replaced by more nimble upstarts. But regulatory capture means larger corporations have more in common with larger public agencies: neither wishes to rock the boat. The result is a slew of regulations that stifle competition and cement in place the bigger companies and their outdated and anti-competitive ways of doing business. The losers are the public.

There might be ways in the current environment to prevent regulatory capture, but if so they are piecemeal and ineffectual. We are seeing the results everywhere: extreme polarisation in politics, in the academic world; an extreme reluctance by salaried professionals - who owe their livelihoods to the ossified regulatory framework within which they work - to question the prevailing narrative, whether it concerns public health measures, identity politics, climate change or just about anything else. Too many people have a vested interest in avoiding necessary reform.

Short of revolution, which usually doesn't lead to improved social or environmental well-being, what can be done? Even western-style democratic elections change nothing. The identity of the politicians might change, but their commitment to a sclerotic system doesn't.

I propose two major steps:

First: we refine the mission statements and objectives of existing government agencies. We should aim to express their goals in verifiable, quantifiable terms that are meaningful to ordinary people.

Second: we should inject incentives into the achievement of such goals. My suggestion is that we issue [2]Social Policy Bonds. These bonds would reward the achievement of each organisation's stated goals, regardless of who achieves them and regardless of how they are achieved.

These are both radical suggestions. If implemented they are likely to bring about a [3]new sort of organisation: one of protean structure and composition, whose every activity would be devoted to achieving its targeted goals as quickly and efficiently as possible. The immediate

replacement of our current, corrupted public bodies with those solely aimed at improving people's well-being is highly unlikely to happen. But if Social Policy Bonds were to be issued, whether by groups of interested persons or government, then a transition from the current system to a bond regime is feasible. I outline how that might occur in chapter 4 of my [4]book.

# 2022

## 19.1 January

### 19.1.1 Cutting out the middlepersons (2022-01-09 18:29)

Charles Hugh Smith writes:

Maybe it's time to eliminate the politicians who soak up hundreds of millions of dollars in campaign contributions from corporations and the super-wealthy and just elect Pfizer, Merck, Amazon, General Dynamics, etc. directly. Since corporate lobbyists write most of the legislation anyway, why not cut out the intermediaries in the process?

The super-wealthy buy political power via Political Action Committees (PACs and Super-PACs), think tanks and philanthro-capitalist foundations (Gates Foundation, et al.). Now that it takes tens of millions of dollars to buy the conventional "winning campaign," the political class spends much of its time fund-raising, i.e. lavishing kisses on the derrieres of corporations and the super-wealthy, implicitly promising to do their bidding better than the alternative candidates that the corporations and super-wealthy could buy .

There are several plausible explanations for why this has happened. Mostly, I think, it's because society does not have clear, verifiable broad goals on which our politicians and public servants are judged. Society has become so complex that the relationships between government activity and outcomes are difficult to identify, and it would actually be unfair to judge an administration according to whether broad, long-term social and environmental goals have been achieved. But what governments can do, and should be doing, is articulating society's goals, and raising the revenue for their achievement. Democratic governments can do these quite well, while actually achieving complex, long-term goals is often beyond them.

As this [1]summary of *At What Cost* by Nicholas Freudenberg has described:

[G]lobalization, financial speculation, monopolies, and control of science and technology have enhanced the ability of corporations and their allies to overwhelm influences of government, family, community, and faith. As corporations manipulate demand through skillful marketing and veto the choices that undermine their bottom line, free consumer choice has all but disappeared, and with it, the personal protections guarding our collective health. *At What Cost* argues that the world created by 21st-century capitalism is simply not fit to solve our most serious public health problems, from climate change to opioid addiction.

So much for the diagnosis. What can be done? My suggestion is two-fold:

- Articulate society's broad goals, and
- Supply market incentives into the achievement of these goals.

Explicit, verifiable goals that are meaningful to ordinary people rarely feature in today's politics, but they should. Rather than let the activities of large organisations be dictated by those organisations, we ought to embed these bodies in a system that rewards the achievement of society's goals. In a [2]Social Policy Bond regime, such goals need not be achievable within the time horizons of governments, political parties or even the lifespan of any individual. So, for instance, we could target long-term improvements in the [3]health of a country's population in a way that rewards every initiative that helps achieve that goal.

The other essential element of a bond regime is the injection of market incentives into the achievement of social goals. In economic theory, and in actual practice, all the evidence shows that markets are the most efficient way of allocating society's scarce resources. For obvious reasons markets have a sullied reputation currently; too often they've been invoked to justify behaviour that has, in fact, undermined free, competitive markets, leading to the extreme industry concentration that Mr Freudenberg and others have described. That would not happen in a Social Policy Bond regime, unless such concentration were the most efficient way of achieving our goals. More likely, we should see a protean coalition of bodies, all co-operating with the aim of achieving our social and environmental goals as cost-effectively as possible: this would represent [4]a new type of organisation, one whose every activity would be subordinated to society's wishes.

### **19.1.2 The biggest surrogate indicator of them all (2022-01-26 15:48)**

A [1]headline from the current *Economist*:

Do vaccine mandates actually work? The Canadian and European experiences suggest they do

How does the *Economist* define 'work'? In its view, the mandates work in that more people are or 'nudged' or coerced into being jabbed. It's unfortunate, then, that the link between proportion of the population jabbed and health of that population is tenuous. (See for instance [2]here, [3]here and [4]here.)

My approach is different. I think that, for a health intervention to 'work', it must improve people's health, as shown by measurable, meaningful, objectively verifiable health improvements. Definitely not [5]surrogate indicators, such as cholesterol levels or numbers of people receiving jabs.

My starting point would be to define and reward the achievement of society's health goal, so that the structures and activities of the sectors that support that goal would be entirely subordinated to that goal rather than, as now, the other way round. On a national level, physical health could be defined as a range of long-term targets, all of which would have to be reached and sustained before we can say we have achieved our goal, at which point Social Policy Bonds targeting health could be redeemed. My suggestion is that our goal would include such targets as: longevity, [6]Quality Adjusted Life Years, and infant mortality. There would be others, to be decided by experts in consultation with ordinary citizens.

That would be the first step. The second would be to put in place a system whereby people are rewarded for bringing about such improvements in health. Not for jabbing, screening, or curing or treating disease, nor for selling drugs or health insurance. Those are indirect means to an end, rather than ends in themselves and the results are lamentable: pills that are no better than placebo (see [7]here and [8]here). Or incentives to [9]over-diagnose and [10]over-treat. Or to falsify or otherwise [11]manipulate the results of drug trials.

Applying the Social Policy Bond concept to health would change all that. All the activity they stimulate and reward would be entirely subordinate to society's long-term health goal. There would be a market for the bonds, but it would be society's servant, not its master. The Social Policy Bond principle uses the market as a means to society's goals. It doesn't view the market as an end in itself. Under a Health Bond regime, the the end that the market serves under a bond regime will be society's health, as defined and targeted by society itself. The goals of those working in any field impinging on society's health would be exactly congruent with those of ordinary citizens: to improve society's health as quickly and efficiently as possible. I have described how applying the Social Policy Bond idea to health would work [12]here, or in a lot more detail [13]here.

## 19.2 February

### 19.2.1 Visibility versus effectiveness (2022-02-12 17:32)

Just as young children want to work for the fire brigade or become footballers when they grow up, so too are politicians in the developed world as well as aid organisations in poorer countries keen on putting their resources into initiatives that are visible to everyone:

According to Lant Pritchett at Oxford University, aid organisations often define success as creating tangible assets (building schools) as opposed to practical benefits (higher literacy). They can create the impression of helping without actually achieving much. In fact, foreign aid can sometimes make things worse. [1]*Foreign aid has done little to help Haiti*, the Economist, 5 February

I think the same applies to philanthropic people and organisations, and I find it disappointing that their focus on projects with high visibility crowds out efforts to improve people's wellbeing by means of more effective, though less glamorous, initiatives.

One advantage of a [2]Social Policy Bond regime is that people would be rewarded for achieving *societal* goals - such as higher literacy. The bond mechanism would channel resources into where they will achieve the highest societal return per pound or dollar outlay; that, not visibility or kudos, would be the sole criterion underlying the choices made by bondholders and their agents. This would be unpopular with many in aid organisations or governments who would have to relinquish control over where society's scarce resources are spent. But the benefits

to society of targeting our social problems coherently and impartially would far outweigh such costs.

Society as a whole is unlikely to wish for prestige projects that do little to alleviate underlying, complicated, long-term social or environmental problems. Nevertheless, even under a bond regime, philanthropists and their supporters could continue to fund their foundations and pet projects themselves; they'd probably achieve less for society than if they instead contributed to Social Policy Bonds' redemption funds, but that would be their choice. There's no need for the more altruistic aid bodies or government agencies to do the same.

### 19.2.2 More subsidies for the rich (2022-02-18 15:57)

Madeleine Cuff writes:

A shift to more sustainable farming methods, which would make space for wildlife rich hedgerows, meadows, and peat bogs, could cut greenhouse gas emissions equivalent to taking 900,000 cars off the road, WWF said this week. [1]*Farming subsidies: Farmers can double their money by going organic under plans to protect nature*, Madeleine Cuff, 9 Febru

ary

Governments the world over have been engaged with agriculture for many decades. (I was tempted to say 'supported', but I doubt whether governments' involvement has been a net benefit to farmers or farming: it's certainly had many negative effects and not much has changed since I wrote [2]this or [3]this.) This involvement can teach us about governments' intervention in other sectors. One lesson we can learn is that once government entangles itself in a sector, it doesn't go away. Another is that such involvement can be an end in itself - can, indeed, be the whole *raison d'être* - for the government agencies that shape the regulatory environment or disburse taxpayers' funds.

There's a total lack of transparency. If our aim is to increase the area of hedgerows, meadows and peat bogs and to reduce greenhouse gas emissions, why not reward those who increase the area of hedgerows, meadows and peat bogs and reduce greenhouse gas emissions? If, on the other hand, government wants consumers to pay more for their food and ordinary people to pay more tax so that some of the wealthiest people in the country can become even more wealthy, then government should be open about it.

There is a third way, and that is to reward those who achieve an improved environment *whoever they are and however they do so*. It may be that paying wealthy landowners to convert to organic farming is one way of achieving environmental goals. But there might well be more

efficient methods, and we can be fairly certain that the ideal mix of such methods will change over time and cannot be anticipated by any government or any single conventional organisation (see here for how a [4]new type of organisation, working in a [5]Social Policy Bond regime, could operate). We need diverse, adaptive policies in the service of society's environmental goals, not government employees dreaming up policy initiatives following the 'advice' of vested interests.

My suggestion is that we issue [6]Environmental Policy Bonds to channel self-interest into the achievement of our goals. Even eschewing the bond approach, however, much can be said in favour of subordinating means to ends in relation to organic farming, and I have written about this in [7]Policy for organic farming.

### 19.2.3 Avoiding catastrophe (2022-02-23 17:52)

Martin Rees writes about risk and the UK Government's approach:

The Covid-19 pandemic has been a wake-up call. We now have a choice: carry on as before or find a way to ensure we are better prepared for extreme risks. ... The government's main tool for evaluating risk is the National Risk Register, which rated any pandemic other than influenza as unlikely to cause more than a few hundred deaths. It needs a total overhaul. Astonishingly, the register only has a two-year time horizon. Many threats cannot be neatly anticipated and prepared for within such a narrow window. [1]*After Covid, Britain must learn to plan properly for extreme risk*, Martin Rees, 'Financial Times', 21 February

Lord Rees goes on to say that the Register, as well as being too short term in its focus, is excessively secretive and highly centralised. I think these deficiencies bedevil any single conventional organisation dealing with complex, long-term social or environmental problems. The optimal mix of solutions, and in this instance, the problems themselves, cannot be anticipated by any such organisation. People working in these organisations are paid for their activity, not their success in achieving what should be their overall objective: reducing the numbers of people killed or suffering as a consequence of an adverse event.

[2]Disaster Prevention Bonds would use the [3]Social Policy Bond concept to reward the absence of catastrophic risk to national (or global) populations. The UK government, for

instance, could raise funds that would be used to redeem the bonds once such an absence had occurred over a sustained period. This period could be several decades. A [4]new type of organisation would probably arise, comprising bondholders, whose every activity would be subordinated to the goal of ensuring the absence of catastrophic adverse events affecting the UK population over that period. It would have a protean composition and structure that would not be determined by government, but would instead be optimised for success. The important point is that everyone charged with anticipating and avoiding potential catastrophe would have incentives to be efficient and effective in all steps necessary to prevent disaster.

## 19.3 March

### 19.3.1 World peace or ideological purity: pick one (2022-03-15 18:09)

We are not concerned with feeding, clothing, and sheltering man but engrossed in a particular system which will guarantee food, clothing and shelter for all. The extreme left or the right are wrangling over a formula that will assure man's security; so they are not concerned with man's happiness, but with which formula will guarantee him happiness. J Krishnamurti

The allure of a system or ideology is understandable. It gives us a sense of security; it's something bigger than us with which we can identify, and over which we can bond. But the downsides are baleful and inevitable: no formula can adapt readily and appropriately to every circumstance and, very often, formulas, algorithms and ideologies function as substitutes for intelligence, an excuse to build a hierarchy, or a means of enforcing conformity.

[1]Social Policy Bonds, right from the start, have been regarded with disdain by those on the left of the political spectrum. They aim to encourage people to solve social and environmental problems, but in the eyes of the ideologues, they fail at the first hurdle because they offer financial incentives to those who do so. Financial incentives equal money equals profit, and so, to the ideologically pure, they are suspect. This is, in my view, has tragic consequences. We need diverse, adaptive approaches to our complex social problems. Ideological purity should not even be a consideration, let alone the sole relevant criterion.

We see the results, most spectacularly now, while war rages again in Europe, and the possibility of even worse disasters looms large. The ancient Greeks, and many since, have regarded bloody conflict as an inevitable attribute of humanity. I question that; the whole thrust of the Social Policy Bond idea is that we encourage diverse, adaptive approaches to problems that have no clear solution. This we are not doing. Who is currently charged with reducing conflict?

An array of organisations ranging from the United Nations to well-meaning, hard-working non-government organisations, who try a wide range of initiatives such as trying to reduce arms shipments, or reporting on atrocities. The employees of such bodies are no doubt diligent and motivated by high ideals. But they are rewarded for their activity, not by results. This doesn't just limit the possibility of most of them making an above-average living; it also limits the resources that flow into their activities. Meanwhile, the financial and other incentives on offer to the very few who foment conflict are large and immediate.

The results of this mismatch between what almost everybody wants - in this instance, world peace - and what is actually happening are devastating and threaten us all. I suggest that instead of, or in parallel with, current efforts to limit conflict, we issue Conflict Reduction Bonds, about which I have written [2]here. It would be a tragedy for everyone if the delusions and insecurities of the ideologically committed stifle the possibility of new, successful approaches to human conflict.

## 19.4 April

### 19.4.1 The tragedy of spurious micro-targets (2022-04-03 20:34)

In the absence of broad, explicit goals that are meaningful to ordinary people, we get narrow, short-term goals that mean a great deal to those who devise them, but nothing to everyone else. A UK Government investigation into the maternity care provided by Shrewsbury and Telford Hospital to 1486 families, mostly between 2000 and 2019. It found that 131 stillbirths, 70 neonatal deaths and nine maternal deaths might have been avoided, had care been better over two decades. The *Economist* concludes its column:

When one woman pregnant with twins requested a Caesarean, a doctor is said to have replied: "We've got the lowest Caesarean rate in the country and we are proud of it and we plan to keep it that way." One of her twins died. [1]A report castigates the National Health Service, 'Economist', 2 April

Our large, complex societies need to target aggregated indicators of well-being. But I think we should as far as possible target meaningful outcomes themselves, rather than indicators that are not strongly correlated with well-being. In particular we need to avoid targeting spurious measures, such as Caesarean rates, that are too narrow to reliably measure anything that we really want to achieve.

I have written about applying the Social Policy Bond principle to health [2]here. In summary: in the rich countries we could use broad health indicators such as longevity and infant mortality.

In the poorer countries we might encounter problems gathering reliable longevity data, but objective sample data on, for instance, infant mortality, weights of young children, nutritional intake, could be available and useful. Refinement by experts, and aggregation into something like the Human Development Index, would see the creation of much targets that would be both more sound and more meaningful than the current array of indicators ranging from such narrow targets as local Caesarian rates to GDP per capita the latter of which, in the absence of sensible targets has, [3]unfortunately, become the *de facto* over-arching target of governments everywhere.

### **19.4.2 World Peace Bonds, while we have the chance (2022-04-12 21:25)**

We are living before the first nuclear exchange. The probability that a nuclear weapon will be detonated in the next few years is, sadly, high. Indeed, looking at the way our species has developed, it seems inevitable.

A world in which North Korea and other small, poor countries acquire nuclear weapons is not going to be safe for the liberal values under which most of us, mainly in the west, are lucky enough to live. We can see the pessimistic scenarios as a clash of civilizations, or a clash of values, or shifts in geopolitical power, but I choose to see it as a problem of perverse incentives.

For most of the people in politics, holding on to power, or increasing it, is an end in itself. Solution of social problems can be a means to that end but whipping up nationalistic fervour *at the expense* of improving your citizens' well being can work just as well, with the Russian leader being the current obvious example. Our political systems reward those most adept at acquiring power. Threatening the use of nuclear weapons is one way in which a regime can hold on to that power.

What can ordinary people - those of us who are content not to have the power to kill millions of human beings - do, faced with the realistic possibility that the nuclear taboo will be violated some time soon? My suggestion is that we issue [1]World Peace Bonds. These bonds would be redeemable for a fixed sum only when a targeted array of indicators of peace had been achieved and sustained for a long period. They would reward people who do what they can to end violence. Backed by a combination of governments, non-governmental organizations, philanthropists and ordinary people, they would encourage a vast number

of peace-generating approaches. Some would inevitably fail; the way the market for the bonds would work means that these efforts would be terminated and resources diverted into more promising initiatives.

The effect of World Peace Bonds would be to give incentives to accelerate and guide our progress toward a less violent world more efficiently than has happened so far: a protracted, haphazard and bloody path that has, true, given us a less violent world *until now*, but also one that has left us fearful of self-induced catastrophe. We can do better than that. By acknowledging that not all approaches are going to work, and supplying incentives for those that do, we can guide and accelerate evolutionary processes to bring about, quickly and efficiently, what is surely our most urgent goal: world peace

### **19.4.3 Is Hydrogen the solution? Nobody knows (2022-04-17 17:37)**

We just don't know how to deal with some environmental problems. A recent UK government study points to some of the uncertainties about the impact that use of hydrogen as an energy carrier could have on the atmosphere and the greenhouse effect. Thus:

Leakage of hydrogen into the atmosphere will decrease the tropospheric concentration of hydroxyl radicals (OH), the major tropospheric oxidant, and thereby increase the atmospheric lifetime of methane and its impact on climate. [1]*Atmospheric implications of increased Hydrogen use*, Nicola Warwick, Paul Griffiths, James Keeble *et al*, Universities of Cambridge and Reading, April

Other uncertainties could arise from more hydrogen leaking into the atmosphere and increases in the concentration of both tropospheric ozone and stratospheric water vapour, boosting a 'radiative forcing' effect that raises temperature.

The key concept here is uncertainty. It would seem foolish, but not inconsistent with government behaviour, to go all out for a 'hydrogen economy', which might end up creating more environmental problems than it solves. Or it might not. Nobody knows. In circumstances like this, where the science is uncertain, I would advocate Climate Stability Bonds. These would

target what we want to achieve for the world's climate, but not how to get there. Bondholders would have incentives to work out the best ways of achieving our climate goal, even over the necessarily long period that such achievement will take. Most likely a range of technologies, including hydrogen, will need to be researched, refined, experimented with and implemented. No government policy can bring about the diverse, adaptive range of activities that will be necessary to achieve a climate goal. Our knowledge is too scanty and ever expanding to determine how best to proceed. But what government can do (perhaps with the help of supra-governmental bodies, non-governmental organisations and the public) is to raise funds that, in a Climate Stability Bond regime would ultimately reward those who help reach our goal.

The aim of Climate Stability Bonds isn't to create a stable climate: it's to reduce the probability of catastrophic climate breakdown, now being seen by some as climate emergency. In the face of the uncertainties that bedevil almost every aspect of this emergency (some question even whether it even qualifies as an emergency), it is tempting to do nothing, or make only token, highly-publicised gestures in the right direction. A Climate Stability Bond regime would address the reluctance (or hypocrisy) of governments to channel taxpayer funds into possibly solving a long-term problem when there are so many more immediate claims on society's scarce resources. It would do so because, under a bond regime, until our climate goal has been achieved, government need spend nothing. All risks would be borne by bondholders.

I have written extensively on Climate Stability Bonds. Links are [2]here.

#### **19.4.4 Rationality + badly-designed incentives = poor health (2022-04-25 15:43)**

In the absence of broad, coherent, long-term goals that are actually meaningful to ordinary people, we end up with [1]Mickey Mouse [2]micro-objectives that, a cynic would believe, are designed to channel society's resources into purely private goals. This can be seen clearly in health care, where there are few incentives to increase well-being as measured by such indicators as longevity, or [3]Quality-Adjusted Life Years, and all sorts of incentives to encourage professionals to prescribe medications regardless of how beneficial they are to the population. Several recent commentaries exemplify this point:

Writing about the Number Needed to Treat (NNT) of prescribed drugs, Sebastian Rushworth says:

Doctors have been conditioned by the pharmaceutical industry to think that drugs that provide very low probability of benefit are effective. An NNT of 10 is often considered good, and an NNT of 5 is considered excellent. Even an NNT of over 100 is often considered acceptable!

Patients are rarely informed that the odds of them getting any benefit from the new drug they're being prescribed are far less than 50:50. And they're rarely informed about what the harms are, and how likely they are to experience them. [4]*What defines a good drug?*, Sebastian Rushworth, 14 April

Malcolm Kendrick writes about the Quality and Outcomes Framework (QOF) system was being used by doctors in the UK's National Health Service:

Replace it with carefully crafted treatment algorithms, based on the best possible evidence.

To explain in a little more detail. QOF itself is a system whereby GPs can earn points for reaching various targets. They are then paid money for each point gained. [5]*Evidence Based Medicine - it was a good idea*, Malcolm Kendrick, 25 April

The problem is that these targets have little to do with health, and much to do with the goals of the pharmaceutical companies:

[Y]ou can gain points for such things as lowering the blood pressure to a 'target' level in the *approved percentage* of patients. Or driving the cholesterol level down below the 'target level', or getting the blood sugar (HbA1c) level below the 'target' level in the approved percentage of patients.

In short, for QOF to work, the GP needs to create database after database of different diseases. Then carry out audit ... after audit. What a great use of clinical time it all is. Appointment after appointment filled with patients called in to have their annual blood pressure check, which just sneaks in just below target level - every single time.

For the pharmaceutical companies this is manna from heaven. Every patient with diabetes logged and audited. Every one driven to reach a 'target'. A target that will inevitably require medication. Medication that the pharmaceutical company just, ahem, happens to have developed. Medication where they just, ahem, happen to have done all the clinical trials.

Dr Kendrick's skepticism is borne out by his quote from an analysis done by Imperial College London:

A substantial number of English communities experienced a decline in life expectancy from 2010-2019, Imperial College London researchers have found ... For such declines to be seen in 'normal times' before the pandemic is alarming.

Finally, Guy Hatchard writes about the *Wall Street Journal's* new-found skepticism about Covid vaccines:

The *WSJ* article described the effect of boosters as fleeting, mild and short-lived. It sounded a note of alarm saying that neither the CDC [US Centers for Disease Control] nor the US National Institutes of Health (NIH) had made a priority of studying vaccine complications. Moreover their VAERS [Vaccine Adverse Event Reporting System] data collection and analysis process is incomplete and inadequate. In other words, the safety investigation to date of adverse effects of mRNA vaccination is incomplete and potentially misleading. The central question raised by the *WSJ* opinion piece is, why wouldn't the US regulators wish to undertake accurate and complete investigation of adverse effects of mRNA vaccination? Have pharmaceutical interests been able to influence decision-making at the FDA [Food and Drug Agency] to their own commercial advantage at the expense of safety considerations? [6]*When will these vaccine zealots wake up to the truth?*, Guy Hatchard, TCW, 24 April

I share all these authors' skepticism, bordering on cynicism. It's clear that apart from a few outspoken commentators such as these, all players throughout are reacting rationally, if ignobly, to the incentives on offer. My suggestion? In place of indicators and targets designed, in my view, by vested interests, including government agencies to enhance their profits and power, we target for improvement the well-being of all citizens. We need to channel our ingenuity and society's scarce resources into improving the physical and mental well-being of whole populations and to create incentives to do so. I have written about applying the [7]Social Policy Bond principle to health [8]here and, more extensively, [9]here.

## 19.5 May

### 19.5.1 We need the freedom and incentives to experiment with policy approaches (2022-05-10 18:24)

Stephen Bush writes about the difficulties the UK's New Labour Government faced when conducting trials of different policy initiatives:

In the early years of New Labour... the literacy and numeracy hours ... were initially trialled only in a handful of areas, while the "London challenge", a bid to improve the capital's state schools, provided a test bed for a number of policies since rolled out nationwide. But this can create problems of its own: when a policy programme doesn't work, it is often politically painful for a government to abandon it, so all that a "pilot scheme" really does is expose one part of the country to a bad policy slightly earlier than the rest. When, as with the London challenge, the policy works, other parts of the country can quickly come to resent not feeling the benefit earlier. [Such a trial] is difficult in a democracy because it leaves governments either facing the embarrassment of abandoning an expensive, sometimes high-profile scheme, or resentment from voters at not rolling out an effective one earlier. [1]A-B or not A-B? Why democracies struggle to innovate, Stephen Bush, *Financial Times*, 10 May

Exactly: these trials are difficult for *governments* to perform, for the reasons Mr Bush cites. What we should be doing is providing incentives for any number of bodies; first to conduct their own trials; and second to terminate those that fail, and refine, implement and replicate those that are most promising. Efficiency in achieving the policy goal should be the main criterion determining which initiatives should be dropped, and which should be promoted.

Incremental adaptation and historical accident have left us with the decision-making bodies of today. These include not only government and its myriad agencies, but private sector corporations, religious bodies, interest groups, non-governmental organisations and individuals. The way they operate gives them no financial incentive to try different approaches and prioritise and adapt the most promising. It is not simply a matter of giving more money to the people working for those bodies that conduct the most promising trials: it is - possibly more importantly - a matter of making sure that more resources are channelled into the most promising approaches and away from those that show signs of failing.

The current policymaking world has little scope for the competition that sees an end to unfortunate mutations. As well as the public relations problems cited by Mr Bush, governments find it difficult to terminate failing initiatives. The vested interests are so deeply entrenched that the Darwinian method of allowing optimal solutions to emerge from a range of possibilities isn't given a chance to work.

Social Policy Bonds could be the solution. Under a bond regime people have incentives to explore, refine and try out new ways of doing things, and to exploit only the most successful approaches. There would be more trials conducted of more diverse possible policy initiatives, and the bonds would give incentives for the mix of promising approaches to change over time,

in pursuit of long-term goals that are considered so remote as to be unachievable in today's policymaking environment. Such goals, as for instance, world peace.

Mr Bush concludes:

Democracies will never be able to move fast and break things in the way businesses can — but giving different players freedom to experiment can help share out the benefits.

I would slightly alter that sentence: '...giving different players freedom **and incentives** to experiment...'

For another post about the need for experiments in policymaking see [2]here. For a piece on applying the Social Policy Bond principle to world peace, see [3]here.

## 19.5.2 Actually, people do care (2022-05-18 16:33)

This graph appeared recently in the *Financial Times*:

## CO2 rising

Carbon dioxide global monthly mean (parts per million)

Source: NOAA

Levels of carbon dioxide continued to soar in 2021, with an annual average of 414.7 parts per million. That is the 10th year running that CO2 rose by more than two parts per million, the fastest sustained increase in 63 years of monitoring

I'm skeptical about the targeting of greenhouse gas emissions (see [2]here) but as that has been almost the entire focus of the climate change debate, the graph seems to imply that:

- People share my skepticisms, or
- Nobody really cares.

There is another possibility though, and that is that there is a massive gap between what most people want to see and what governments implement: between the stated goals of policies and outcomes. This applies to many other social and environmental goals, especially those that can be achieved only in the long run, and whose achievement requires a mix of approaches, the most efficient of which cannot be known in advance.

So: almost nobody wants to see a nuclear war, yet the probability of a nuclear exchange hasn't vanished and may be increasing. Non-nuclear conflict, disease, crime, illiteracy, environmental depredations, extreme poverty...these social and environmental problems remain large and, in many areas, are growing despite our undoubted ingenuity, noble aspirations and effort put in by many individuals, government and non-government agencies and others.

In my view, this disconnect is a result of the inability of any conventional organisation - government or not - to cope with such society's complexity and long lead lines. My suggestion: we should be targeting outcomes, and rewarding people who achieve them, however they do so. Social Policy Bonds are one way in which this could be done.

For more about the Social Policy Bond concept see [3]here. From that page there are links to its application to [4]climate change, [5]conflict, [6]crime, [7]literacy and the [8]environment. For a new sort of organisation that could arise to help achieve targeted outcomes see [9]here.

## 19.6 June

### 19.6.1 Rewarding nuclear peace (2022-06-03 17:19)

The *Economist* writes:

Nuclear-armed states may begin to believe that they can gain by copying Vladimir Putin's tactics. One day, someone somewhere will surely turn their threat into reality... [1]Source

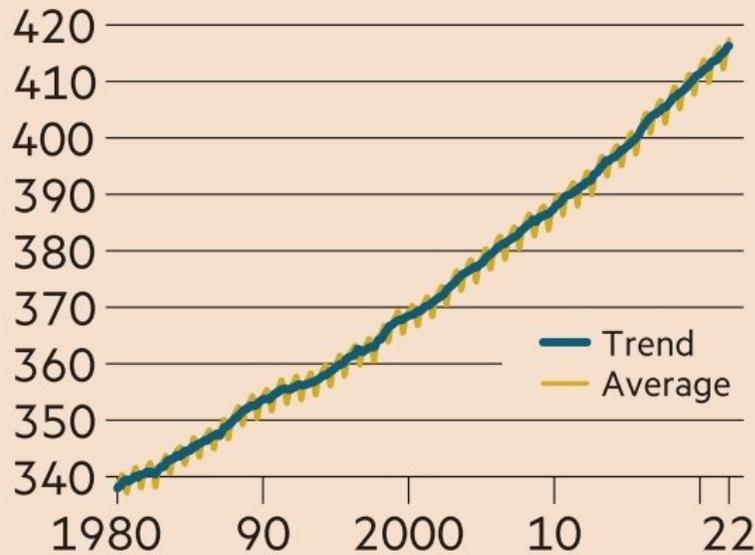

Consider the incentives on offer to those in power today: if they possess nuclear weapons they can initiate a conflict knowing that they can dictate its course by threatening, implicitly or otherwise, to deploy them. If the target of their aggression doesn't possess nuclear weapons *or if the target cares more about its civilian population than the aggressor*, then at some point in the future, the reality feared by the *Economist* will come to pass. It might be today, it might be in a few years, but the number of countries with nuclear weapons continues to [2]proliferate and we should not have to rely on those in power to continue to exercise restraint at all times. The taboo against threatening use of nuclear weapons has been broken. It now appears inevitable that, before long, the taboo against their use will also be broken.

My previous post [3]highlighted the continuing rise in the level of greenhouse gas emissions, despite the many agreements, protocols, treaties and hard-working organisations devoted to reducing their level:

[4]

## CO2 rising

Carbon dioxide global monthly mean (parts per million)

Source: NOAA

Levels of carbon dioxide continued to soar in 2021, with an annual average of 414.7 parts per million. That is the 10th year running that CO2 rose by more than two parts per million, the fastest sustained increase in 63 years of monitoring

Fig.1 Atmospheric carbon dioxide level/Probability of nuclear conflict (?)

It seems that the probability of a nuclear strike of some sort is on a similar upward trajectory. What is to be done?

My suggestion is that we we offer incentives for people to achieve that which we want to achieve: sustained nuclear peace *whoever they are and however they do so*. If people think that continuing along our present pathway isn't working, they should have incentives to research into and experiment with different approaches, refining those that appear most promising, and terminating those that don't work. This could be done with [5]Nuclear Peace Bonds, an application of the [6]Social Policy Bond concept. As with climate change, the aim is to encourage diverse, adaptive approaches to solving a complex, long-term problem that poses a great risk to large numbers of people and the environment.

## 19.6.2 A better way of achieving environmental goals (2022-06-14 18:39)

We need to target environmental outcomes, not the alleged best ways of achieving them.

Text shared thousands of times on social media claims green energy is "more destructive to the Earth's environment than meets the eye." But the posts make various inaccurate claims, including that ... solar panels or wind turbine blades cannot be recycled.

Elias Huuhtanen, [1] *Posts mislead about environmental impact of green energy*, AFP Factcheck, 31 March

The source also questions claims about the quantity and environmental cost of minerals used for electronic car batteries.

My conclusion from such debates about the costs and benefits of different ways of generating electricity or powering vehicles is simple: advocating one option over another is just too complicated. [2] Life-cycle analyses can be done, but they come festooned with boundary issues and are unlikely to be robust against changes in technology and our knowledge of environmental impacts, and other variables that change over time and space. And how shall the different costs of, say, child labour be weighed against possible reductions in greenhouse gas emissions?

Can you imagine any government doing that? And getting it right? And continuing to get it right when new technology or new information about, say, mining or carbon dioxide emissions and their effects becomes available? It's not going to happen.

Which

is why we need, urgently, an outcome-driven approach. The old way of doing things, with government doing what it thinks is best, might have worked when government was well intentioned, and relationships between cause and effect on the environment much simpler to identify. It just doesn't work nowadays, when government is subject to powerful corporate interests and environmental relationships are much more complex. Government is not up to the job of working out whether climate change is best tackled by subsidising rail, electric vehicles, windmills, or catalytic converters. It's not what government is good at, and it's not what people go into government to do.

What government can do, though, is set up a regime whereby people are rewarded for improving the environment or helping bring about

climate stability, however they do so. In other words, it could contract out the achievement of a better environment or a more stable climate to a motivated, diverse, adaptive private sector. Government could stipulate the environmental outcomes it would reward, which is a simpler and less contentious task than trying to work out how best to achieve them. If it did so by issuing [3]Environmental Policy Bonds, or [4]Climate Stability Bonds, then it's likely that a [5]new sort of organisation would arise: ones that would research, experiment, refine and implement an array of diverse, adaptive approaches to society's environmental goals. They could perform their own life-cycle analyses if they wish; but whatever they do would be done with the aim of achieving our goals as cost-effectively and quickly as possible.

### **19.6.3 Philanthropists want to be in control. Just like governments. (2022-06-28 18:09)**

Emma Saunders-Hastings, in her recent book about philanthropy, asks an important question:

Before Parisian firefighters had fully extinguished the blaze that ravaged Notre-

Dame in April

2019

, lavish pledges rolled in from phi

lanthropists eager to support the cathedral's reconstruction:

€

100

million

from Bernard Arnault, France's richest person; ...

commitments in the millions and tens of millions of

euros from individual and corporate donors in France and abroad.

T

he

pledges were greeted with a mixed reception: conventional expressions

of gratitude in some quarters but swift criticism from others. Why, some skeptics asked, were private funds so readily available to repair a building but not to address rising inequality in French society?

Emma Saunders-Hastings,

[1]*Private Virtues, Public Vices: Philanthropy and Democratic Equality*, March 2022

Or, indeed, other social and environmental problems such as unemployment, crime, or global concerns, such as war?

Later, Ms Saunders-Hastings grants that ' some donors have a better grasp of the measures that would best pro

mote people's substantive interests than the elected officials whom they are seeking to influence or bypass'. She concludes:

Democratic societies need different ways of promoting reciprocity and long-term attention to the public good—

ones that do not require reliance on the

competence and goodwill of hereditary or economic elites.

Contemporary philanthropy has not yet solved this problem.

It seems to me that Ms Saunders-Hastings' first question is relatively easy to answer: philanthropists are unlikely to want to undermine the system that allows them to accumulate and maintain their vast wealth; including by influencing government policy. Also important, I believe, is that philanthropists are biased in favour of projects that are highly visible, where their contributions can be easily identified. In this, it is not very different from governments, which also favour the glamorous and photogenic over more mundane goals that require multiple approaches and much experimentation and refinement before they can be achieved: hence the persistence of some of our most grievous social problems.

I have [2]tried, with no success, to interest philanthropists in the [3]Social Policy Bond concept. It seems to me that they are reluctant to relinquish control over the destination of their funds. In this respect, also, they are similar to governments. It's an understandable bias - though regrettable. My wish is that all funding bodies, private or public sector, would reward those who solve our most persistent, long-term problems, rather than insist on dictating who shall receive their funding and how they shall allocate it.

## 19.7 July

### 19.7.1 I don't need to know about electric vehicles (2022-07-11 15:37)

Rich Barnett [1] writes to the editor of the *Spectator*:

Martin Vander Weyer might continue to bang the drum for electric cars and their 'green' credentials but the problem is that in the drive for such cars we have effectively seen a cessation in development of petrol and diesel engines....[Y]our correspondent swerves the issue of just how clean these [electric] cars are, especially when we follow the production process back to the raw materials. In reality, the cleanest cars are those already built and maintained.

Rich Barnett, the *Spectator*, 9 July

Mr Rich may be right or wrong. I don't know. But, as an advocate of policy that targets meaningful environmental outcomes, I don't need to know. It might be true that the environmental costs of electric vehicles is higher than that of petrol and diesel vehicles now; but that could change. What is the probability that legislation made today can correctly calculate even today's relative environmental costs, let alone those of any future time period?

My suggestion is that instead of trying to work out the best ways of improving the environment when our knowledge of ever-changing relationships between cause and effect is inescapably scanty, we target those environmental goals we want to achieve and reward people for achieving them. This makes better sense for two main reasons:

- There is far more consensus about what those goals should be than the supposed means by which they can be achieved.
- Technology, and our knowledge of the relationships between cause and effect are changing constantly in ways that nobody and, in particular, no regulatory body, can anticipate.

When governments favour, whether by subsidy or other means, what they believe to be the most efficient way of achieving certain ends they are often looking only at current technology and short-term goals. Our environmental problems, though, require a long-term approach. [2]Environmental Policy Bonds aim not only to re-focus policy on long-term goals but to inject the market's incentives into their achievement.

## 19.7.2 There's no need to quantify everything (2022-07-24 18:36)

ESG stands for Environmental, Social, and Governance, and investors are increasingly considering these non-financial factors when identifying companies' risks and growth opportunities.

About ESG, the *Economist* writes:

[M]uch of ESG is deeply flawed. The concept's popularity has been partly fuelled by real-world concerns, especially climate change. Yet it has had a negligible impact on carbon emissions, especially by the biggest polluters. Its attempt to address social issues such as workplace diversity is hard to measure. As for governance, the ESG industry does a lousy job of holding itself to account, let alone the companies it is supposed to be stewarding. It makes outsize claims to investors. It puts unmanageable demands on companies. [1] *ESG investing: A broken system needs urgent repairs*, *Economist*, 23 July

I share the *Economist's* scepticism; I dislike the over-formalising and quantification of things that are best left to people's discretion. When certain ESG concerns, or such matters as affirmative action become over-formalised, then politics steps in, the debate becomes polarised and meaningful discussion becomes impossible.

However, a Social Policy Bond regime would revolve around the targeting of broad, meaningful outcomes, and just about any measure of such outcomes can be gamed and manipulated. (There are workarounds, though. For example, when targeting for improvement the [2] literacy rate of teenage girls in Bangladesh, participants in random surveys would not be specified in advance. so that they couldn't be given more attention than other girls.) As well, there is [3] Campbell's Law to consider: 'The more any quantitative social indicator is used for social decision-making, the more subject it will be to corruption pressures and the more apt it will be to distort and corrupt the social processes it is intended to monitor.' I'd like, therefore, to see a panel of trusted, impartial experts confirm that any recorded improvements are genuine. Because Social Policy Bonds work best at a large scale - national or global, say - the costs of monitoring and verification would be relatively low.

## 19.8 August

### 19.8.1 Time to reward health outcomes (2022-08-17 10:02)

Given the widespread, [1]and [2]justifiable, distrust of pharmaceutical companies, it would seem that this is the time to move towards rewarding those who achieve favourable health outcomes, rather than those who merely engage in activities purporting to deliver those outcomes. Those currently employed in healthcare are reacting rationally to the incentives on offer, to the detriment of our [3]physical and [4]mental health. And those incentives encourage [5]over-[6]screening and [7]over-treatment, and the neglect of commercially [8]nonviable [9]preventive [10]interventions. As the British Medical Association put it:

Despite the clear acknowledgement across the UK of the need to prioritise ill-health prevention and public health activities, the data analysed in this briefing show this is not matched by funding commitments. [11]*Funding for ill-health prevention and public health in the UK* (pdf), British Medical Association, 2017

It's the same, or worse, in the US:

Almost 1.3 million people went to U.S. emergency rooms due to adverse drug effects in 2014, and about 124,000 people died from those events. [R]esearch suggests that up to half of those events were preventable. ... An estimated \$200 billion per year is spent in the U.S. on the unnecessary and improper use of medication, for the drugs themselves and related medical costs.... [12]*Too many meds?*, Teresa Carr, 'Consumers Reports', dated September 2017

It's time for a new approach. My suggestion is that rather than policymakers' focusing on the means by which they think good health can be achieved, they instead focus on targets for good physical and mental health, and provide incentives for people to achieve those targets. The Social Policy Bond concept, applied to health, would do this, and more: it would inject the market's incentives and efficiencies into all the processes necessary to improve a nation's health. [13]Health Bonds

would channel our scarce resources into the most efficient means of improving our health, including those currently neglected or not even considered by our current healthcare bodies, most of which have little incentive or capacity to consider broad health outcomes that fall outside their increasingly specialised remit.

Health Bonds wouldn't stipulate how our health goals shall be achieved, nor who shall achieve them. This allows a broader approach. For example: our current compartmentalised accountancy-driven policy approach would not take into consideration the adverse health impacts of subsidising advanced courses for young drivers of motorbikes or cars. But holders of Health Bonds would look at such measures, investigate their possible health impacts, and make an informed decision as to whether any improvement they might bring to the nation's health is worthwhile, compared to other possible interventions.

## 19.8.2 Rewarding Nuclear Peace (2022-08-20 17:15)

Below is a short article suggesting that Nuclear Peace Bonds be issued to reward a sustained absence of nuclear conflict.

Nuclear Peace Bonds are an application  
of the [1]Social Policy Bond concept:

# Rewarding nuclear peace

It's possible that Russia will have to confront comprehensive defeat in Ukraine, maybe even facing the prospect of losing Crimea. How likely is Putin going to say 'OK, it's a fair cop, we lost fairly and squarely, it's all over.' and refrain from launching 'tactical' nuclear devices to change the course of his war? It could happen; we might get lucky, and we might also get lucky when other nuclear-armed powers throw their weight around. But do we really want to gamble on it? Once any one of these countries breaks that taboo, how long will it be before governments begin to see nuclear weapons as just like any other weapon, despite the likelihood that they will devastate an already parlous planet? There's little or nothing that the international community can do to lower that probability. National policymaking systems can work well when the relationships between cause and effect are readily identifiable. But for large-scale, complex, global problems like the risk of nuclear catastrophe we need to encourage investigation of a wide range of possible solutions.

## Nuclear Peace Bonds

You may be familiar with Social Impact Bonds (also known as Pay for Success Bonds), designed to reward investors who achieve socially beneficial goals. Bondholders who achieve an improved outcome receive higher returns. They are limited by their lack of tradeability, whereas the Nuclear Peace Bonds that I propose would be tradeable, which greatly enhances their potential. It allows for bondholders to do what they can to achieve the targeted nuclear peace goal, see the market value of their bonds rise, and then sell their bonds to those best able to take the next steps towards the goal. To make a profit, they do not have to hold the

bonds for the decades that such a long-term goal would take to achieve.

## Nuclear

Peace Bonds would be backed by funds be raised from the public or private sector, or both. These bonds would be floated on the open market for whatever price they fetch. They would be redeemable for a fixed sum only when there has been nuclear peace for a sustained period of, say 30 years. This goal, being remote, would mean that the bonds would sell for very little when first offered to the market. So any activity that increases the likelihood of sustained nuclear peace would see an improvement in the bonds' value. Nuclear Peace Bonds would create a protean coalition of bondholders that would have a powerful incentive to co-operate with

each other and to research, refine and implement those measures thought to be, at any given time, those most likely to bring about nuclear peace. With such a big, remote objective, no single approach will work. A Nuclear Peace Bond regime would stimulate a wide range of diverse, adaptive approaches to the threat of nuclear catastrophe. All bondholders' initiatives would be in service of the one over-arching goal: a sustained period of nuclear peace. The secondary market for the bonds would ensure that, at all times, the bonds would be in the hands of those who believe they can help achieve the goal most efficiently. Inefficient operators, or those who had done their bit, would sell their bonds to more efficient operators, to whom they would be worth more. Unlike some other global problems, the Nuclear Peace Bonds would have a clear and verifiable metric, such as avoidance for 30 years of a military nuclear explosion that kills more than 100 people within 24 hours.

## Incentives

Currently,

there's a jarring mismatch between on the one hand the fears of, and risks to, almost everyone on Earth from nuclear conflict and on the other, the efforts devoted to mitigating them. A shift in resources away from, for example, ingenious ways of exploiting financial markets or selling dog-food, would benefit all of us. But our current policymaking system doesn't encourage such a re-orientation of priorities. Incentives now are for those few who have acquired power – including psychopaths - to do whatever they can to retain it. The wish of the billions of people who don't want to live in a world of nuclear conflict is too diffuse to prevail. Of course, there are many hard-working employees of existing organisations who are trying to achieve peace. But – let's be frank – they are paid for turning up at the office and putting in the hours, rather than success.

## A Nuclear

Peace Bond regime would reward those who achieve peace, whoever they are and however they do so. It's an admittedly unconventional approach. But the conventional approach has brought us to the brink of nuclear catastrophe. The taboo against threatening the use of nuclear weapons has been broken. It now appears inevitable that, unless we rebalance the incentives, the taboo against their use will also be broken. It's now time to encourage and reward diverse, adaptive and *successful* ways of dealing with the looming nuclear threat.

## 19.9 September

### 19.9.1 The Nobel Prize (2022-09-03 16:46)

No, Social Policy Bonds are unlikely to win a Nobel Prize nor any major prize, despite the anonymous comment in [1]this newspaper article (pdf), and their mention in Robert Shiller's 2013 [2]Nobel Prize lecture (pdf, page 489). Why not? There may be other reasons but the two that come to mind are:

- Social Policy Bonds do not originate in a member of an esteemed institution; and

- Only the non-tradeable variant has actually been issued.

The non-tradeable variant, also known as [3]Social Impact Bond, pay-for-success bond, or social benefit bond, with which I've had no direct involvement, is currently deployed in about 25 countries, with varying levels of success. As I explain [4]here and [5]here, I'm ambivalent about them, and I still hope that one day my [6]original conception will become manifest and help solve our long-term, seemingly intractable, large-scale social and environmental problems.

In the meantime, I've added a [7]Donate link in the right-hand column, in an effort to keep my SocialGoals.com site online, and to help pay my other expenses.

### **19.9.2 Are electric vehicles better for the environment? It's not clear (2022-09-22 16:55)**

Social and environmental problems are complex: they are bedevilled by many variables and pathways with feedback loops and time lags, all of which change constantly and vary with geography. They are simply not amenable to conventional policymaking, which tries to identify causes of our problems and then deal with them. Social Policy Bonds take a more humble approach. A bond regime wouldn't assume knowledge of all the causes of a problem, nor which private- or public-sector agency is best placed to solve it. Rather, it would reward the people who take steps that solve the problem. By doing so, the bonds greatly enlarge the range of problems we can target, to encompass even those thought to be intractable, such as war.

One example of the sort of complexity that our current policymakers think they grasp, but don't, concerns electric vehicles (EVs). The *Economist*, quoting Socrates Economou, discusses the nickel used in EV batteries:

Indonesian nickel is not the high-grade sort usable in batteries. It can be made into battery-compatible stuff, but that means smelting it twice, which emits three times more carbon than refining higher-grade ores from places like Canada, New Caledonia or Russia. Those additional emissions defeat the purpose of making EVs..... Carmakers, particularly European ones, may shun the stuff. [1] *Could the EV boom run out of juice before it really gets going?* The 'Economist', 14 August

No conventional organisation, with its fixed structure and a sclerotic inability to adapt to changing circumstances, can keep track of all the important variables and relationships necessary even to answer such a relatively simple question as 'are EVs better for the environment than vehicles powered by internal combustion engines?' We need organisations that don't presuppose answers with fossilised science; ones that can try many diverse, adaptive approaches, and take a long-term view.

[2]Social Policy Bonds could help. They would stipulate the required outcome; one that would be meaningful and comprehensible to everyone, such as an improved [3]environment, or [4]world peace. At every stage along the path toward achievement of the targeted goal, they would provide incentives in such a way as to subordinate all activities and approaches to that achievement. It's likely that a [5]new sort of organisation would evolve; one with a protean structure and composition, with all its activities dedicated to solving the targeted social or environmental problem.

I will admit that all this sounds far fetched, and that despite my floating of the Social Policy Bond concept into the public arena more than [6]30 years ago, they have been issued only in a non-tradeable form and so [7]stripped of much of their value - [8]in my view. The likelihood of their ever being issued in accordance with my wishes is slim. But the relevant question to ask a time when we may well be poised on the brink of environmental or nuclear catastrophe is: what is the alternative?

## 19.10 October

### 19.10.1 Where are the incentives to take the long-term view? (2022-10-02 17:38)

Where are the incentives to take a long-term view? I mean not only for policymakers, but for corporations, philanthropists, and the rest of us. Rewards are there for turning up to work, for attracting attention, for doing things; even sometimes for solving problems, though rarely for preventing them arising in the first place. But, increasingly, we are more concerned with short-term goals. There are several possible explanations. In the private sector, industry concentration means that managers, rather than family members, control corporations. But what about the public sector?

[Government bureaucracies non-self-evaluate. At a minimum, agencies with evaluative responsibilities are not invited to evaluate - they are kept out of the loop, their opinions unsought. At a maximum, government agencies actively suppress their own internal evaluative units and are discouraged from evaluating the beliefs and policies of other agencies . [1]*Why States Believe Foolish Ideas*, Steven van Evera, 2004

There are, then, few rewards for being successful, and fewer still penalties for failure. As well, government's role is changing. The current *Economist* writes about its growing role in bailing out corporations:

Politicians have long sought to provide safety nets or stimulus in bad times. But over the past 15 years, they have become far more willing to shore up vast swathes of the economy. When industries, companies or people get into trouble, fiscal help is never far away. Gains are privatised, but a growing share of losses or even potential losses are socialised. To appreciate this role for the state, discard much of the conventional wisdom, which says that in the "neoliberal" era governments have let free markets run riot. Instead, this is an era of "bail-outs for everyone". [2]*The world enters a new era: Bail-outs for everyone!*, *Economist*, 1 October

The long-term view is the inevitable loser.

[3]Social Policy Bonds aim to inject the market's incentives into the achievement of our social goals. But perhaps their greater benefit is that they enable the targetting of goals that can be achieved only after decades, such as reduced [4]crime rates, a cleaner [5]environment or [6]world peace. Nobody knows how to achieve these goals, and [7]existing organisations have little incentive to investigate the wide range of diverse, adaptive approaches necessary to do so. But a Social Policy Bond regime would put in place incentives for people to take the long-term view: to research, investigate, experiment, refine and implement the most promising potential solutions to our social and environmental problems, even if, as is likely, total success will take decades.

## 19.10.2 Give learned associations a chance! (2022-10-10 20:19)

Justin Gregg compares diagnostic inference, whereby animals learn to associate a cause with an effect, to causal understanding, whereby humans reason as to *why* something happens:

If causal understanding is such an obvious advantage over other ways of thinking, why did it take our species 200,000 years before we began using this ability to begin the spread of modern civilization? The answer is that sometimes, being a why specialist leads our species toward unexpected ludicrousness that is so bad for our species (evolutionarily speaking) that it makes you wonder if we'd actually be better off relying solely on learned associations. Justin Gregg, [1]*If Nietzsche Were a Narwhal*, September 2022

I will agree that, when policymakers attempt to understand why something is happening by looking for 'root causes', this can be a waste of time or an excuse for inaction. There are too many causes of social problems, and they are too various and too variable to be identified - at least by conventional public- or private-sector organisations, with their fixed structures and limited remits. Crime, poverty, war: these have many causes that vary markedly over time and space. It is politically acceptable for governments either address the symptoms of these problems, or to spuriously reduce the number of causes to one and target that: so crime is often attributed to poverty, and climate change to greenhouse gas emissions. But these problems may have no single, fixed cause, and we need to offer incentives that encourage people continuously to explore the many, varying causes of our social and environmental problems. Often, there are suggestive associations between cause and effect, but insufficient evidence for governments to use taxpayer funds to act on those associations. So, unless effect can unambiguously attributed to causes upon which we can act, our problems remain.

What I suggest we do instead is reward the outcomes we want to achieve, regardless of how they are achieved. Provide incentives for people to investigate some or all possible causes or simply to learn by association - as in the animal kingdom - and react accordingly, even without the evidence required to draft a policy. And to bear in mind that doing nothing, in some rare circumstances, might be the optimal approach.

[2]Social Policy Bonds would encourage this type of behaviour, rooted in a humility that recognises that we cannot always identify the causes of our problems, but that we might not need to in order to solve them. How would they do so? They would reward all approaches, however indirect or nebulous, that help solve a targeted problem. Evidence in favour of an approach could be anecdotal, associative or putatively causal: governments cannot act on all such evidence, but holders of Social Policy Bonds can; their sole criterion for backing an approach is whether it promises to be a cost effective way of achieving the goal they target.

What do I mean when I say that doing nothing might be the optimal approach? Take climate change: the evidence that it's actually happening convinces me (currently). The evidence that we can or need to do something about it is a little more contentious. We need a framework in which, if circumstances change, incentives are in place for an appropriate, nimble response. Such circumstances might include, say, a dramatic increase in adverse climatic events (more rapid response required), or in our scientific knowledge, or a supervolcano that threatens to freeze the planet, or an unforeseeable (and, admittedly unlikely) reduction in adverse climatic events. In these latter two events a bond regime would see climate mitigation activities

could be attenuated or suspended. The conventional approach would find it difficult to adapt appropriately.

My point, ultimately, is a simple one: if we target outcomes, we do not need to identify [3]root causes to solve our complex social and environmental problems.

### 19.10.3 Not so outlandish (2022-10-27 16:21)

I'm aware that Social Policy Bonds can seem outlandish - at least at first reading. They imply the outsourcing of the achievement of our social goals to anybody, public- or private-sector, with no directive as to how they shall achieve our goals, except that they comply with legislation. That said, many social and environmental problems have resisted all attempts at solution. You are immediately dismissed as an idealist for suggesting, for instance, that war can be abolished, or that poverty or crime can be drastically reduced. In response, I might say *Could a Social Policy Bond regime do worse than our current efforts?* It's true that a bond regime could be completely ineffectual: people could simply refuse to buy the bonds on flotation, or they could buy them, then do nothing to help solve the targeted problem. If nobody buys the bonds, then that tells the issuers that they have allocated insufficient funds for redemption. If bondholders do nothing, then the value of their bonds would fall until either they have a powerful incentive to do something, or to sell their bonds to people who would do something. In all such cases, however, there would be no cost to taxpayers, even if the bonds had been issued by government, unless the targeted social problem is solved.

As important is that Social Policy Bonds can be issued in parallel with existing efforts to solve social problems. Bondholders could undertake their own initiatives, but would also have incentives to look at current approaches and boost the finances of the more promising ones.

*Below is an excerpt from my book showing how this transition could work when addressing UK health problems. The excerpt is from Chapter 4. That chapter, and the complete book can be downloaded free of charge from [1]here. Simpler, shorter explanations of the Social Policy Bond concept can be found via my [2]homepage.*

" Take health, for example. In the UK, central government provides funding for regional health authorities (for spending on doctors, hospitals and prescriptions) according mainly to population level, age and need. Government also supplies funds directly to medical research organizations and academic institutions. A transition to a Social Policy Bond-based, rather than institution- or activity- based, funding programme would see the direct funding government gradually decline, while expenditure allocated by bondholders to the outcomes that all these institutions are collectively trying to achieve — longer life spans and a better quality of life, say — would gradually rise.

On introducing such a bond regime a government could decide to reduce its funding of health authorities and research institutes by 1 percent a year, in real terms. (The government could allocate the saved funding to the future redemption of the health bonds it has issued.) So after five years, each health authority would be receiving directly from central government only 95 percent of the funding that it formerly received. But bondholders could choose to supplement the income of some of these health bodies. They may judge a particular group of health authorities to be especially effective at converting the funds they receive into measurable health benefits, as defined by their bonds' redemption terms. Particularly effective health authorities might be working in deprived areas, where small outlays typically bring about larger improvements in health. Or bondholders might judge a particular research body to be worthy of additional funding, because it was conducting excellent research into a condition that would be likely to respond especially effectively, in terms of health outcomes, to additional expenditure. In such cases, bondholders would supplement their selected health authorities' or research institutes' funding. It may well be that these favoured bodies end up receiving a large boost in income throughout the lifetime of a bond regime.

It could also happen that investors in bonds targeting health look at completely new ways of achieving health objectives; ways that currently receive no, or very little, funding. To give a plausible example, they may be convinced that one of the best ways of achieving society's longevity objectives is to deter teenage drinkers from driving. Following this logic, they may find that one of the most efficient ways of doing so would be to lay on subsidised taxis for teenagers attending parties on Friday and Saturday nights – but only in certain parts of the country. It is difficult to imagine how our current centralised government fund allocation mechanisms could go about implementing such a programme. A Social Policy Bond regime would quickly eliminate some of the less rational distortions in other health care matters, amongst them the British National Health Service's terminal-care budget, 95 percent of which was allocated to the 25 percent of the UK's population who die from cancer, and just 5 percent to the 75 percent who die from all other causes.

It is also likely that holders of bonds targeting health outcomes would greatly expand funding in areas such as health education or preventive medicine that rely on expertise outside those bodies traditionally devoted to health care.

Could bonds targeting remote objectives, such as a large rise in longevity, or a halving of the crime rate, be compatible with a gradual transition of the type described above, where funding to existing health institutions reduces by 1 percent annually? At first sight there would seem to be an apparent mismatch between such incremental reductions in government spending and the time scale needed to reach long-range objectives. The critical point here is that bondholders would be investing not on the basis of the annual reductions in government expenditure on existing health institutions, but on the basis of the redemption value of all the bonds issued. To be more precise, it would be this total redemption value, minus the bonds' existing market value, that would inform bondholders' investment decisions. This sum could be many times each year's incremental reduction in government's institution-based spending. One of the virtues of a Social Policy Bond regime is that bondholders could expect capital gains in the short run from investments that will begin to impact on the targeted goal only in the long run. By doing the initial groundwork efficiently and speedily – not usually a very lucrative proposition in the current regime – they could see short term rises in the bond price and early capital appreciation. The accumulated reductions in spending to existing institutions would be one, but not the only, factor influencing how much government decides to spend on achieving a specified social goal. Also important would be the financial savings (if any) that achieving the objective would bring about, and the value society would place on any

nonfinancial benefits. Similarly gradual transitions would be warranted in other areas, such as education and crime, where schools and police forces, some of which are bound to be much more effective than others, are well entrenched. These institutions would receive slowly diminishing absolute levels of funding directly from government, while bondholders would again focus their spending on especially rewarding, in terms of specified education and crime outcomes, projects and institutions. As with health, it is likely that those areas that are initially most disadvantaged would again provide bondholders with the greatest return per unit outlay. In newer policy areas, particularly the environment, it may be possible to expand spending allocated via the bonds at a faster rate: expertise in the environment is still relatively mobile, and it would be easier to quickly establish new outcome-based institutions or to reorientate existing ones. "

Anonymous (2022-10-29 21:22:06)

The problem with Social Policy Bonds is that you have the whole bureaucratic class and edifice stacked against you. The bureaucratic class believes problems can only be solved by ever finer legislation and tighter regulation. Millions and millions of people are employed on this basis and are heavily invested in this idea. Ask anyone, how we can solve this or that problem, and the automatic answer will be that more regulation and funding is needed from the "guvmnt". Social Policy Bonds suggest there is a better way. But as the saying goes, "It is difficult to get a (bureaucrat) to understand (SPBs), when his salary depends on his not understanding it"

Ronnie Horesh (2022-10-30 09:29:58)

Thanks for your comment. I agree. I now think that if Social Policy Bonds are ever issued, it will be at the initiative of the private sector. I've tried to interest philanthropists (see <https://www.alliancemagazine.org/blog/make-social-impact-bonds-tradeable/>) in the concept, without success, but will persist.

## **19.11 November**

### **19.11.1 How broad? (2022-11-09 19:51)**

Though this discussion is unlikely to have practical application in the next few years (or decades), I will pose the question anyway: should a single Social Policy Bond issue target one social ill, or more than one? Say that we are aiming to reduce climate change and its impacts. Doing so, we could issue [1]Climate Stability Bonds that target a range a physical, biological, social and financial indicators. Because targeting climate change makes sense only at a global level, and because of the wide range of indicator variables necessarily targeted, I am inclined to think that, yes, it would be better to issue Climate Stability Bonds independently of measures to target other disasters. By this I mean that [2]Disaster Prevention Bonds,

which could encompass a range of natural or man-made disasters, could or should be issued separately from Climate Stability Bonds.

Then again, should political violence (wars and civil wars) be targeted by Disaster Prevention Bonds, or should they be the subject of a more narrowly targeted bond issue, such as [3]Conflict Reduction Bonds?

The answers depend partly, as I've suggested, on the range of indicators to be targeted. It would be simpler to keep track of a smaller number of variables, which makes monitoring and verification easier and would focus the minds of bondholders and their agents more effectively. Much would also depend on who would be paying for the bonds' redemption: a global problem like climate change is more likely attract funds from a wider range of governments than a more general bond issue that folds climate change in with other disasters to which some countries are less prone. Since taxpayers would supply the public-sector funding, popular support is relevant here too.

Against this argument, is that it could be more efficient to target the broadest possible goal, so that bondholders would have incentives, depending on events, say, to shift resources away from targeting climate change and towards conflict reduction, if they believe that doing so would minimise human suffering at least cost. They would be more likely to do this if there were no mismatch between the time horizon of the bond issues; for example, if Climate Stability Bonds required an array of indicators to fall within approved ranges for thirty years, and Conflict Reduction Bonds likewise stipulated a thirty-year period of sustained peace before they could be redeemed. My thinking, though, is that any such efficiency gains would be outweighed by the lack of focus that a very broad targeting implies, and the enhanced difficulty of monitoring a very wide range of targeted indicators.

For these reasons, and for the funding reason, even Conflict Reduction Bonds might be too broad to attract much interest, which is why I have also written about [4]Middle East Peace Bonds, though any region could of course be the subject of bonds aimed at conflict reduction.

To summarise, I would think that at a national level, broader is generally better when considering the targets of a Social Policy Bond issue. At the global level, I think that the broadest possible bond issue might be suboptimal. However, I'm open to discussion.

### **19.11.2 Why organisations fail to work for the public good (2022-11-15 17:29)**

The *Economist* reviews  
*For Profit* by William Magnuson:

[Mr Magnuson] draws sensible conclusions .... Corporations cannot hope to put public interest above all else for long; what the public wants is far too complicated for them to fathom. When businesses wade into politics, they play an outsize role in shaping it. Yet the belief that the pursuit of profit will always benefit society as a whole is also sadly erroneous, the author says. [1] *"For Profit" offers thrilling tales of commercial endeavour: Corporations often start out with the public good in mind. It doesn't last,* the 'Economist', 10 November

The same, in my view, applies to organisations whose mission statements explicitly say they will put aspects of the public interest first, including charities, universities, religious bodies, trade unions and government agencies. At some point their original purpose becomes subordinated to the goal of [2] self-perpetuation. As organisations grow in size, ownership or governance becomes more diffuse, and society becomes more complex, there are fewer incentives for managers to stick to their organisation's founding remit.

Which is why I believe that, when it comes to social and environmental policy, the way forward is to reward only the actual achievement of explicit, verifiable and meaningful social outcomes. Issuing [3] Social Policy Bonds would do that and would be likely to lead to the creation of a [4] new type of organisation: ones whose structure, composition and every activity would be subordinated to achieving society's targeted social goals as cost-effectively as possible.

### 19.11.3 A sane alternative to MAD (2022-11-24 17:25)

Paying people not to hate each other - or, at least, not to express their hatred militarily: that's a crude, but fairly accurate description of the workings of Peace Bonds, a term that encompasses [1] World Peace Bonds, or more geographically limited applications of the Social Policy Bond concept, such as [2] Middle East Peace Bonds.

Some commenters are reluctant to contemplate the financial transfers implicit in these bonds; shouldn't we be peaceful for more edifying motives? I agree, that would be ideal, but I think humanity is too far gone for that. (Readers unfamiliar with the [3] Social Policy Bond concept should look first at a short [4] overview.)

First, this disdain for paying people to bring about socially and environmentally beneficial outcomes needs some grounding. I am aware of, and agree with, the work of [5] Professor Bruno Frey

who found that monetary incentives can undermine our willingness to do the right things for ethical and moral reasons. People perform valuable social or environmental services not only for monetary gain, but also because they enjoy doing them for their own sake, because they believe

them to be the morally right things to do, or because they believe that their actions will advance some cause to which they are committed. These 'intrinsic' motives are qualitatively different from external, monetary incentives, and offering monetary rewards might 'crowd out' or undermine these less mercenary and more civic-minded motivations. Crowding out internal motivation can occur, writes Professor Frey, because, monetary incentives can undermine people's feelings of self-determination and self-esteem. Also, when external incentives are supplied, the 'person acting on the basis of his or her intrinsic motivation is deprived of the chance to exhibit this intrinsic motivation to other persons.'

Not mentioned by Professor Frey, but also plausible is that financial incentives can undermine the cognitive outlook that sees socially and environmentally beneficial services as worthwhile in their own right, rather than as a cost for which compensation and payments must be paid by taxpayers.

When it comes to war and peace, though, I think there are valid arguments on the other side. First, is that fact that there is no moral reason not to pay people for pursuing goals that have society's well-being as their goal. We pay teachers and nurses a salary; we pay many people who work for charities a salary; and we pay people who work for peace organisations, including the United Nations, a salary. There is nothing inherently immoral about paying people to do things that have an idealistic underpinning. Peace Bonds would certainly see more funds going to people involved in anti-war activities. They'd probably benefit from higher salaries, at least in the short term. But not only would their remuneration rise; so too would their numbers: anti-war bodies would have more resources, including more personnel, with which to pursue their activities.

Second is that much conflict is driven by monetary incentives. There would, for instance, be much less availability of destructive power if corporations didn't generate revenue by manufacturing it. Monetary incentives play a similar, though indirect, role in financing the spread of hatred and pro-war propaganda. Holders of Peace Bonds could, therefore, achieve results simply by paying corporations to cease production of weapons, or fomenters of conflict to change their rhetoric. It wouldn't, of course, be as simple as that, and bondholders would probably also have to follow more sophisticated approaches, but we should not underestimate what even unobtrusive monetary payments could achieve. Even if bondholders did little more than match the monetary incentives of the pro-war complex, that would be an improvement on the current situation. This need not conflict with Professor Frey's findings: achieving world (or regional) peace is already the goal of many hard-working low-paid workers and volunteers, and the enhanced likelihood of achieving peace that a bond regime would confer would increase their intrinsic motivation - and encourage more people to join them.

And third: what is the alternative? War between the big nuclear powers has been unthinkable in recent decades only because of Mutually Assured Destruction. Are Peace Bonds any more outlandish than MAD? And while the number of nuclear warheads appears to have [6]fallen, the number of nuclear powers has risen. In the future it's likely that more rogue powers, including non-state actors, will possess nuclear or biological weapons whose use, or threats of use, would have calamitous consequences. There are well-meaning hard-working

organisations trying to restrain our capacity to destroy ourselves and our environment, but they don't have large budgets and, crucially, their financial rewards are independent of their success or otherwise in achieving peace.

Actually, Peace Bonds need not be an alternative: they can be issued in parallel with current efforts. Holders of Peace Bonds would probably increase the funding those bodies they deem to be most efficient at achieving and sustaining peace.

In summary: Peace Bonds could complement and strengthen the most promising current approaches to securing and sustaining peace. As with all Social Policy Bonds, they'd encourage diverse, adaptive solutions to what now appears to be our species' most urgent, most dangerous problem.

## 19.12 December

### 19.12.1 The benefits of relinquishing power (2022-12-09 10:43)

The problem with philanthropy is that philanthropists and their employees are reluctant to relinquish control over how their goals shall be achieved and who shall be seen to be achieving them. (Politicians are similar in that respect, but we have higher expectations of wealthy individuals with noble intentions spending their own money.) Sadly, this wish not only to be a benefactor to humanity, but to be seen to be such a benefactor means that our biggest, most urgent challenges are being neglected. Philanthropists - and politicians - want to be identified with successful initiatives. It's a natural human tendency, but it's holding us back. Society is too complex for most of our serious social and environmental problems to be traced to a discrete set of causes. Insecticide-drenched bed nets might be the best way of dealing with malaria somewhere at some time - but not everywhere, and not always. We need a policy environment that encourages initiatives that are capable of adapting to differing and changing circumstances, and that have a long term focus on achieving outcomes.

Which is where the [1]Social Policy Bond idea can play a role. Under a bond regime the role of philanthropists - or government - would be limited to supplying and raising funds to be used to redeem the bonds, and defining the outcome that they wish to achieve. They would not stipulate how that outcome is to be achieved, nor who will achieve it. By relinquishing those powers, groups of philanthropists or governments could greatly expand the range of goals they could target to include such global goals as sustained periods of [2]world peace

or [3]climate stability - goals that have no single, identifiable cause, and that will necessarily take many years to achieve. It would be unfortunate if, solely because of people's wish to be publicly identified with successful initiatives, our most urgent problems depend for their solution on a small number of dedicated people with pitifully inadequate resources.

### **19.12.2 Peace on Earth; worth paying for (2022-12-25 15:41)**

Applying the Social Policy Bond concept to conflict reduction means, in effect, paying people not to kill each other. It doesn't sound very edifying, but I'll make the case for it anyway.

Of course, it is less than ideal that people don't freely choose to live in peace; and frequently invade and kill in pursuit of their goals or those of their leaders. Throughout the centuries, we haven't found ways of ending war. Conflict has so many causes and it's widely believed that war is an inevitable, intractable aspect of humanity. Given the human and resource cost of war and preparing for war, I think it reasonable to allocate funds to eliminating it for a sustained period. A [1]Conflict Reduction Bond regime would aim to do this and, importantly, if it were to fail, no government funds would be lost.

A misconception of those who disdain the [2]Social Policy Bond principle is that they think paying for results means huge cash prizes for the already wealthy. It's true that, under a bond regime investors in the bonds would benefit if the targeted social goal are achieved quickly but, in the long run, what's more likely is that more people would be attracted to working to achieve the targeted goal. The most efficient of these should see some higher financial rewards but, more importantly, they will have more resources with which to work. It's my impression that, if there were bodies with a proven record of bringing about peace in a wide range of circumstances, they'd enjoy very high levels of funding.

Underlying all this reasoning, though, are two points:

- Incentives matter. Weapons manufacturers, ideologues, military bodies all respond rationally to the incentives on offer. Not all these are financial incentives, but there are sufficient monetary rewards to those who manufacture and use weapons to make sustained periods of world peace unlikely. A Conflict Reduction Bond regime would offset such rewards, to a degree dependent on their backing.
- While it would be lovely if people's humanity alone were sufficient to ensure peace on earth and goodwill to all, the Conflict Reduction Bond option of making explicit, taxpayer-funded payments in exchange for world peace would be preferable to the situation we have today.

# 2023

## 20.1 January

### 20.1.1 Yet another post about nuclear war (2023-01-09 18:30)

The *Financial Times* discusses the ruler of North Korea:

In his New Year's address, he declared he would "exponentially increase" nuclear weapons production in 2023 and stressed his willingness to use his nuclear arsenal for offensive as well as defensive purposes. [1] *North Korea's nuclear threat* (subscription), *Financial Times*, 9 January

He is certainly acquiring the capability:

[A recent test brought the North Korean] regime a step closer to acquiring a solid-propellant intercontinental ballistic missile that, unlike liquid fuel missiles, can be fuelled in secret before they [sic] are deployed, giving adversaries far less time to conduct a preventive strike. one of many recent examples of Pyongyang approaching or crossing key technical thresholds that are making its nuclear arsenal increasingly versatile and difficult to destroy or defend against.

How should we address such a possibility? The experts have no idea:

[S]ome analysts worry that a strategy to meet strength with strength risks making conflict even more likely.

So whether the world does or does not suffer a nuclear exchange depends on the state of mind of the ruler of a hermit kingdom who is not renowned for a willingness to accept the status quo, nor a predisposition to negotiate in good faith. There are, of course, other potential nuclear flashpoints in our world. How are we going about dealing with these threats not only to millions of people, but to an already parlous physical environment? Well, we have international bodies such as the United Nations and numerous other organisations, staffed by hard-working, well-meaning employees with very limited resources doing their best to try to bring about peace, either regionally or globally.

Sadly, in comparison to those who benefit when tensions are high and rising, the people working for these organisations have little to work with. There are fewer incentives to achieve and sustain world peace than there are to foment war. People, especially on the left, don't like the idea that we should pay people for doing idealistic things and really dislike the idea of paying them more for doing an excellent job. But even if we share their disdain for paying people cash for success in performing a public service, we can see that giving such people and their organisations more resources with which to work can be helpful in bringing about their goals - which, in the case of nuclear conflict, are the goals of almost the entire world population.

Yes, incentives matter. But there is no known way of reducing the likelihood of nuclear conflict: we need an array of diverse, adaptive approaches, many of which we cannot foresee in advance. So my proposal is to issue Nuclear Peace Bonds, which would reward the people who bring about nuclear peace for a sustained period, whoever they are and however they do so. I've written copiously about this idea both on [2]this blog and on my [3]main site: see [4]here. Nobody's taken it up, probably because it's radical, possibly because it doesn't emanate from one of our esteemed institutions or highly acclaimed academics or celebrities. Yes, some wealthy people might become even wealthier if they succeed in bringing about thirty years of nuclear peace. Is that so bad, though, when compared to the alternative? The unfortunate fact is that our current policy choices are leading humanity and our physical environment to disaster.

### **20.1.2 Actuarially... (2023-01-20 19:25)**

It concerns me that our biggest, urgent social and environmental problems are never going to be solved under our current political arrangements. The problems include global environmental depredations, the risks arising from ever-greater access to weapons of mass destruction and extreme poverty.

Their features make them ideal for targeting with [1]Social Policy Bonds:

- they require many diverse approaches, depending on geography. So reducing the likelihood of war, say, in the Middle East requires a wholly different approach to reducing the chances of war originating in the Korea peninsula, or the horn of Africa.
- they are long term problems that require sustained attention - not necessarily from the same people; and
- they will take years or decades to solve, so they require adaptive approaches, which respond to changing circumstances.

It is the last two points that require that the bonds must be [2]tradeable, so that bondholders have incentives to do what they can to achieve our targeted goal in cooperation with other

bondholders, and then realize the consequent rise in value of their bond-holdings by selling to investors who can better continue progress towards the goal.

But *all* these features of our global problems show just how inadequate are our current attempts at solving them. Our politicians' purview is temporally or geographically extremely narrow. Our supra-national organisations do some good work, but cannot attract the people they need, nor the resources necessary to match the scale of our problems. As well, their structures and composition cannot respond to changing circumstances. We need a [3]new sort of organisation whose structure, composition, and every activity are subordinated to its goal of solving a targeted social problem.

Social Policy Bonds have been in the public arena since 1988 (pdf). Others have taken the idea, made the bonds non-tradeable, and issued [4]Social Impact Bonds, about which I am [5]ambivalent. Actuarially, I'm unlikely to see my original concept deployed, despite the initial flurries of interest it has provoked over the last 34 years. I'll carry on, however, because I see no sign of any better way of addressing the multiple calamities towards which we are heading.

## 20.2 February

### 20.2.1 Where's the vision? (2023-02-02 18:22)

I've long stressed the most obvious feature of [1]Social Policy Bonds: their *efficiency*, which would be measured as the increase in social (or environmental) well-being per pound spent. Under a bond regime, bondholders would have incentives to achieve our social goals as efficiently as they can. Also, I've talked about the *stability* of the goals that a Social Policy Bond regime could target: there's more consensus about such goals than there is about the means of achieving them, the most efficient of which would anyway change over time. And I've mentioned the *transparency* of a bond regime, which would target explicit, verifiable goals. All these attributes are beneficial. They allow us to take a long-term approach to dealing with complex social problems that require a wide array of diverse, adaptive approaches to their solution.

It's also important that the goals we can target with a bond regime are *comprehensible* and *meaningful* to ordinary citizens. Taking health, for example, most of us have little idea about the relative merits of certain interventions, and recent events have seen a growing distrust of corporations and governments who, we'd like to believe, are acting with good intentions. My (long) [2]essay on applying the bond principle to a country's health discusses the possible use of Quality Adjusted Life Years as one way of measuring the physical well-being of the population

that could be targeted. Such measures have their technical difficulties but they would be broadly understood by citizens with an interest in health outcomes. This is a benefit in its own right, but also a stimulus to greater public engagement with health policy and, therefore, greater buy-in.

Sadly, but not unexpectedly, the essay languishes on my website, and current policymaking in the UK at least, continues to be an incoherent and incomprehensible (to outsiders) mix of arguments about funding and structures, and short-term kludges. Where is the vision? The strategy? The buy-in?

## 20.2.2 Adysforemenon-cracy (2023-02-18 21:39)

The title of this post I intend to mean: rule by the insecure. ChatGPT says that the Greek term for 'rule by the insecure' is 'τυραννία των αδυσφορημένων' (tyrannia ton adysforemenon), which is probably more correct, but less snappy. (If you know the correct term, please let me know.)

Isaac Chotiner writes about the President of Turkey:

[T]he Gezi protests, which were really about an environmental issue initially, were meant to overthrow him. He sees everything in that vein. [1]*How Erdoğan Set the Stage for Turkey's Disastrous Earthquake Response*, newyorker.com, 14 February

The *Economist* writes about the ruler of India:

After the prime minister's many victories against his domestic critics, going after foreign ones is the logical next step. [2]*After silencing critics at home, Narendra Modi goes after foreign media*, the *Economist*, 18 February

It's unfortunate that the politicians, having attained power, are so desperate to avoid losing it. It's also inevitable: one cannot now ascend the political ladder unless you really, really want to do so. The desire for power trumps all other qualifications, including competence and the wish to improve the well-being of one's citizens (see [3]*Anything except outcomes*). Maybe it was different when there was a born-to-rule class, but the relevant message now is that our political systems are increasingly dysfunctional, as shown by the widening gap between our rulers and the people they are supposed to represent.

[4]Social Policy Bonds would do something to cut out the middleperson: under a bond regime, politicians wouldn't have the power to allocate funds between competing bodies; their role

would be limited to that of articulating society's goals and raising the funds necessary for their achievement. Funding would be decided by bondholders, whose sole criterion would be the efficiency with which society's scarce resources could be deployed to fulfil its wishes. Cutting out the middleperson might not be so necessary if our leaders were honourable, competent and caring. Unfortunately, more and more, and whether or not we live in a democracy, our leaders are not selected for those qualities. They possess one quality above all others: a thirst for power - and they are pathologically insecure about losing it. This doesn't make for effective governance.

## 20.3 March

### 20.3.1 Arguing for and against Social Policy Bonds (2023-03-03 18:33)

Over the years Social Policy Bonds have discussed in many forums. I tried to address some concerns raised in these forums in my [1]book, but that is several years old, so I am now going into more detail. This post looks at some concerns that delegates raised at a meeting of the OECD during which I presented a [2]paper on the Social Policy Bond idea applied to the environment. I will eventually collate these arguments and responses and upload them onto the Social Policy Bond [3]website.

-

**If the polluters are few enough to overcome the free rider problem, then why are they not enough to collude in the bond market and thereby pay too cheap a price for the bonds issued?**

The question is not about numbers of polluters. It's about the number of bonds. Bidders for the bonds will compete to buy the bonds, then

collude to achieve the goal that the bonds target.

The free rider problem arises when people own the bonds and do nothing to help achieve the goal. The more bonds in the hands of would-be free riders (passive bondholders), the lower the incentive for active bondholders to do anything. The value of the bonds on the market would keep falling. At some stage most bonds will end up in the hands of active investors. There might be few or many such investors, but they have every incentive to collude when they own bonds. They will, though, not necessarily collude to buy the bonds: the bonds will be sold on an open market, and, because anyone can buy them, collusion won't be possible at that stage. So, there is always competition to buy the bonds, which maximises the returns to the issuing body. And there is always collusion between the shifting cast of bondholders, which maximises efficiency.

**A more careful analysis is required about how governments would regulate information signals stemming from bondholders' pollution abatement efforts and environmental measures on which bond payments are indexed.**

The 'environmental measures on which bond payments are indexed' would be chosen to be, or to be inextricably and strongly correlated with the targeted goal. They would also be chosen to minimise the need for governments to regulate the associated information signals.

**The idea needs a more careful analysis of the pros and cons of bond payment structures. Why do bonds simply pay a lump sum upon attainment of a fixed goal? Why not issue bonds that yield regular payments commensurate with pollution levels? If the bonds an all-or-nothing deal, the risk associated with the return could limit trading.**

I agree. But the Social Policy Bond concept remains untried. Refinements can come later. Of course, separate 'all-or-nothing' bonds could be issued with targets of varying magnitude along the same scale.

### 20.3.2 Futures, options and perverse incentives (2023-03-05 19:47)

*I continue to look at concerns raised by delegates at an OECD meeting that discussed a [1]paper I presented on the environmental application of Social Policy Bonds. My [2]previous post was the first; this is the second.*

**Perverse incentives could arise from trading of Environmental Policy Bond derivatives. For example, one could make financial killing by selling bonds short (or by purchasing put options) and then dumping a million tons of manure in the Chesapeake Bay, or simply by not following through with promised abatement activities.**

Futures

and options markets

in Social Policy Bonds would enable people to benefit from a falling bond price, so giving them an incentive to delay achievement of the targeted goal.

It is quite likely that there would be futures and options markets for large bond issues, and it is almost certain that the price of any

particular Social Policy Bond would not always be rising monotonically from its float price to its redemption value. It would be justifiable, as well as efficient, if bondholders could hedge against consequent falls in the value of their assets. People who do not hold bonds might want to participate in markets for derivatives of bonds, some of which would rise in value as the targeted goal became more remote. This in turn means that speculators and short sellers could certainly profit from short-term bond price falls, and the question is whether these people would then take steps to impede progress towards any targeted goal.

There are two main reasons why they would probably not. The first is that, in the long term, the weight of money would be against them. Provided sufficient funds were allocated to achieving the targeted objective, there would be a net positive sum of money payable if the targeted objective were to be achieved, and a net zero sum paid as long as the goal were not achieved. All the long-term incentive would be to achieve the targeted objective. Those who, for whatever reason, would suffer from achievement of the objective could be compensated by bondholders, or bribed to change their ideas. Note also that for every buyer of a 'put' option there would be a seller, and that for every futures contract bought on the expectation that the bond price would fall, there would be an equivalent futures contract sold on that basis, so that the net incentive generated by derivatives would be in line with the incentive created by the underlying financial instrument, the Social Policy Bond: in the long run, this would favour achievement of the targeted objective.

The other reason that short sellers, or holders of 'put' options, in Social Policy Bonds might not take actions aimed at interfering with achievement of the goal is that such actions might well already be illegal or, again given the incentives that the bonds would generate, be made illegal - or have their provenance more enthusiastically investigated - once the bonds had been issued. Some miscreants might be tempted to sell bonds targeting water pollution short (or buy 'put' options) then dump a million tons of manure into Chesapeake Bay. But they would know that such an act is illegal - and that there will be people at the other end of their transactions who will be highly motivated to see the law enforced to its fullest extent.

**Environmental Policy Bonds would not obviate the need for governmental regulators to monitor pollution levels and abatement activities of individual firms. Just like financial market need accountants, auditors and regulations to ensure Enron-like episodes remain an exception rather than the norm, Environmental Policy Bond markets will require similar oversight. The**

## **costs of this would reduce the efficiency of the bonds.**

Government would need to monitor aggregate pollution levels under a bond regime, as these would be the measures targeted by the bonds. They would not need to monitor the pollution or abatement activities of individual firms. Bondholders would have incentives to monitor the activities of the largest polluters and either bring them to the attention of the authorities if they are breaking the law, or to find ways in which they would reduce their polluting activities. Bondholders would act as efficient enforcers of the government's regulations by bringing the worst cases to the government's attention.

### **20.3.3 More on free riding (2023-03-14 17:49)**

*My [1]previous [2]posts have discussed points raised at an OECD meeting in Paris when the environmental [3]application of the Social Policy Bond concept was discussed. I am collating these criticisms and my responses, and uploading them onto a [4]Criticism page on my website. I will now go into more detail about free riding, often cited as a reason not to consider the concept further.*

Free riding

Much of the criticism of Social Policy Bonds has centred on the free rider problem. I should make clear at the outset is that Social Policy Bonds are intended to be the best possible way of achieving many of our complex, long-term social and environmental goals for which there are currently no successful, efficient policies, and many of which are thought to be intractable. This is the over-arching aim of the bonds: the aim of the bonds is not to eliminate the possibility of free riding.

The goals that Social Policy Bonds are best suited for are those that are:

- long term;
- broad;
- require diverse, adaptive approaches and, quite likely, a mix of these; and

- resistant to any current or envisaged efforts by policymakers to their achievement.

If Social Policy Bonds are to be of value, then, they need not be elegant in an economic sense. They just need to be better than alternative approaches, including the approach of not doing anything. Which is all to say that, even if free riding does occur under a bond regime, it need not be so significant as to detract from the bonds' ability to tackle some of our most challenging social and environmental problems.

The first thing is to note that free riders gain only if the value of their bonds rises; that is, if the goal is seen to be more likely to be reached, which usually means that something is being done to achieve the goal. The real problem arises if so many bonds are owned by passive investors (would-be free riders) that nobody does anything or, rather, that the goal remains unachieved as a result of their passivity.

The more bonds in the hands of would-be free riders, the less likely that the targeted goal will be achieved quickly. The market value of all the bonds will therefore fall. As it falls, so the potential rewards from holding the bonds rises, so that more people would become interested in buying the bonds. If the price keeps falling, the would-be free riders will be tempted to sell their bonds to these buyers. Some might be tempted to become active investors themselves, rather than sell to such investors. *The bonds are worth most to those prepared to do something to help advance the targeted goal.* Nevertheless, there will certainly be some who will hang on to their bonds, and it is likely that, yes, there will be an irreducible number of bonds in the hands of free riders, who will profit as the targeted goal comes closer to achievement. The question is whether these holdings would be sufficiently large to make Social Policy Bonds less efficient than alternative policies.

Because large quantities of the bonds held by a single passive investor would be big enough to devalue the bonds, it's unlikely that a passive holder will want large quantities of the bonds. More likely the bonds held by would-be free riders will be distributed amongst a large number of people with small holdings. It's possible that would-be active investors, if the bonds are falling in value, eyeing the total number of these bonds, would make offers greater than the current value to these small, passive, investors, and that the result would be aggregation of holdings into a holding sufficiently large, and bought at sufficiently low cost, to encourage the holder to be an active investor.

The goal is not to minimise free-riding, or to create policies that generate no free-riding. Indeed, most policies can be interpreted as rewarding free riders, in the sense of people taking advantage of the efforts others have made to supply some collective good without actually contributing themselves. Society accepts even spectacularly egregious cases of free riding, such as the rewards reaped by property owners when transport infrastructure is extended to their locale.

But to repeat, the over-arching goal of Social Policy Bonds is to set in place the most efficient practical way of solving humanity's social and environmental problems. Free riding is problematic only if it so blights the Social Policy Bond concept that it becomes less efficient or less effective than any other policy, including the policy of doing nothing.

Writing in this year, 2023, when global tensions are high and there is a non-negligible chance of nuclear conflict, I feel certain that most people would accept the price of a few passive investors benefiting from holding the bonds in exchange for a new approach to reducing the probability of say, nuclear conflict; especially given the obvious and frightening inadequacy of current efforts.

One other point

In chapter 5 of my [5]book I discuss issues of bonds that are failing to achieve their intended purpose. That could be because of insufficient funding. If progress is obviously too slow, the funders (government, usually) could simply increase the size of the redemption funds. But that would have the effect of immediately raising the value of all existing bonds, which would lead to 'moral hazard' in that free riding would be rewarded: people could hold a large number of bonds hoping that by doing nothing to achieve the issuers could increase the redemption value of each bond, or issue more bonds, which would have the effect of raising the value of these passive investors' holdings. My thinking now is that the issuers might be better invalidating existing bond issues, perhaps stating in advance that if no significant progress is made toward goal achievement within, say, ten years, then that bond issue will be invalidated. They could then issue new bonds targeting the same goal, with greater funding.

## 20.4 April

### 20.4.1 Why poverty persists in rich countries (2023-04-06 17:26)

Without even mentioning corporate welfare and subsidies to agriculture, Matthew Desmond writes about the tragedy of US poverty. Longish excerpts, because it's paywalled:

The evidence indicates that low-income Americans are not taking full advantage of government programs for a much more banal reason: we've made it hard and confusing. People very simply often don't know about aid designated for them or are burdened by the application process.

In 2020 the federal government spent more than \$193 billion on homeowner subsidies, a figure that far exceeded the \$53 billion allocated to housing assistance for low-income families.

I can't tell you how many times someone has informed me that we should reduce military spending and redirect the savings to the poor. I've met far fewer people who have suggested we boost aid to the poor by reducing tax breaks that mostly benefit the upper class, even though we spend over twice as much on them as on the military and national defense. According to recent data compiling spending on social insurance, means-tested programs, tax benefits, and financial aid for higher education, the average household in the bottom 20 percent of the income

distribution receives roughly \$25,733 in government benefits a year, while the average household in the top 20 percent receives about \$35,363. [1]*The High Cost of Being Poor*, Matthew Desmond, New York Review of Books dated 20 April

If we allow that programmes ostensibly designed to relieve poverty are actually intended to relieve poverty, then these facts point to a tragic failure of policy. Perhaps the system isn't wholly cynical, in that policymakers find the programmes just as confusing as do the intended beneficiaries. Assuming good intentions, then, my solution would be to:

1. recognise that poverty is a complex problem, requiring long-term, diverse, adaptive approaches;
2. decide exactly the goals we want to achieve, in quantitative, robust, verifiable terms;
3. reward people for achieving those goals.

Sadly, policymakers do not work like this. When it comes to poverty alleviation, as with climate change, water pollution, housing and the rest, if there are stated goals at all, they will be vague and incoherent sound bites. There will be changes in the funding of established bodies, or the creation of new bodies and, perhaps, some Mickey Mouse [2]micro-targets set in the sure knowledge that [3]nobody will actually check on whether their achievement or otherwise has done anything useful.

[4] ✖

Politicians can escape blame for absurd, destructive and corrupt programmes such as their supposed policy alleviation efforts because they are not expected to express society's goals in terms of outcomes. One of the advantages of a Social Policy Bond regime is that policymakers would have to express policy goals in explicit, transparent and verifiable terms. These would be expressed in ways that ordinary people can understand. Few would argue for programmes that favour wealthy corporations, farmers and individuals, but those are the policies in place now. Making poverty goals transparent would go a long way to solving the poverty problem. A bond regime would generate further gains by providing incentives for those working to relieve poverty to do so cost-effectively.

It's not uncommon to hear the wealthier beneficiaries of government largesse bemoaning the cost of supporting single mothers, the homeless and other unfortunate and genuinely struggling individuals. The politicians deceive the people, and the rich welfare beneficiaries deceive themselves.

Tax breaks are nice if you can get them. In 2020 the mortgage interest deduction allowed more than 13 million Americans to keep \$24.7 billion. Homeowners with annual family incomes below \$20,000 enjoyed \$4 billion in savings, and those with annual incomes above \$200,000 enjoyed \$15.5 billion. Also in 2020, more than 11 million taxpayers deducted interest on their student loans, saving low-income borrowers \$12 billion and those with incomes between \$100,000 and \$200,000 \$432 million. In all, the top 20 percent of income earners receives six times what

the bottom 20 percent receives in tax breaks. We have chosen to prioritize the subsidization of affluence over the alleviation of poverty. And then we have the gall—the shamelessness, really—to fabricate stories about poor people’s dependence on government aid and shoot down proposals to reduce poverty because they would cost too much.

## 20.4.2 Social Policy Bonds: a sonnet (2023-04-21 10:07)

I asked [1]ChatRPG to write a sonnet about Social Policy Bonds:

In policy circles, talk of Social Bonds  
Has grown in strength and scope in recent days  
A tool to tackle ills that have prolonged  
By focusing on outcomes, not just ways

And in this field, one name stands apart  
Ronnie Horesh, a pioneer so bright  
His insights help policymakers chart  
New paths to achieve the social right

The bond’s concept, to put it simply, shows  
That we can make a market for progress  
And fund the goals that society chose  
By issuing bonds that we can all invest

So here’s to Horesh and his vision bold  
A brighter future for us all he’ll hold.

-

Policy as if outcomes mattered  
SocialGoals.com

1. <https://chat.openai.com/>

### 20.4.3 Taking advantage of complexity (2023-04-23 15:09)

Powerful interests use complexity to hide their anti-social behaviour:

Since 2013, ProPublica has exposed how Intuit, the maker of TurboTax, and other companies have resisted efforts to make tax preparation easier and less costly, including lobbying to ban the IRS from offering free, simple tax filing and deceiving customers who should qualify for the Free File product. [1]Source

The evidence indicates that low-income Americans are not taking full advantage of government programs for a much more banal reason: we've made it hard and confusing. People very simply often don't know about aid designated for them or are burdened by the application process. When it comes to increasing enrollment in social programs, the most successful behavioral adjustments have been those that simply raised awareness and cut through red tape and hassle. [2]*The High Cost of Being Poor*, Matthew Desmond, New York Review of Books, 20 April

One of the advantages of the Social Policy Bond concept is its transparency. Policymakers would have to be explicit about their intentions. So, for example, if they want to shovel [3]billions of dollars from taxpayers and consumers to a small group of wealthy landowners who have [4]devastated the environment, and helped [5]impoverish developing countries, they would have to say so openly, instead of, as at present, waving their arms and mumbling about 'food security', 'saving the family farm', 'looking after the countryside', and relying on people's inevitably limited attention span. Likewise, as with poverty alleviation, it's not enough to put in place a few programmes with impressive-sounding titles that *might* be well meaning, but access to which is difficult for those without an abundance of time and energy; which is to say: those who need them most. Lack of transparency also allows politicians and bureaucrats to avoid accountability: if there are no explicit, verifiable goals, then success or failure are a matter of spin.

### 20.4.4 What happens if nobody does anything? (2023-04-23 17:22)

In my [1]book I speculated that, if a goal targeted by a Social Policy Bond issue remains remote, the bonds' backers could issue more bonds, or swell the redemption funds and, by doing so,

1456

increase the incentive for bondholders to work to achieve the goal. I now see that this was probably naive, and that there would be a perverse incentive for investors to acquire as many bonds as they could, do nothing, and watch the value of their holding rise if the backers did as I speculated.

So I have modified the original text of the relevant paragraph in [2]chapter 3 of the book to read:

Note that the issuing body could add to the number of bonds in circulation after floating at any time, if it wanted to boost the efforts going into achieving a particular social goal, but this could encourage people to buy the bonds, and do nothing to achieve the targeted goal so that, when more bonds were issued, the value of their holding would rise. A better approach might be to declare the initial bond issue invalid, which would act as a spur to encourage would-be passive investors to become active, or to sell to active investors. If the issuers wanted, for whatever reason, to reduce such efforts, the situation would be a little more complicated. It could buy bonds back from holders, but doing so would reduce the total funds to be spent on achieving the targeted objective, and so would lower the value of all bonds in circulation. People might therefore be unwilling to buy bonds in the first place if they thought there were a high probability of the issuing body's buying some of them back in this way. They would demand some sort of premium for taking that risk. Alternatively, the issuing body could undertake either that it would never buy Social Policy Bonds back or that, if it did, it would pay the market price ruling before it announced its purchase intentions.

The intention is to deal with the criticism presented on [3]this page; that is, the sixth criticism (beginning 'Expectations...'). Chapter 5 of the book is also slightly modified to reflect the same concern.

## 20.4.5 Methane and supervolcanoes (2023-04-30 18:01)

This recent headline from [1]ScienceNews says it all:

Methane may not warm the Earth quite as much as previously thought

There is much about the environment - and society - that we just do not know. Yet our policies are formulated as if we do know. We think climate change is mostly a result of our pumping greenhouse gases into the atmosphere. That may well be the true but, even now, we find that we don't know as much as we thought about the relative contribution of each greenhouse gas. In this instance, the original estimate was 30 percent off the latest estimate. But we are making policy as if the role of each greenhouse gas in climate change is certain and fixed.

Not only is the science about each gas's relative contribution uncertain; so too is our knowledge about other determinants of climate change. Yet we enact policy as if we know

everything. It's risky; especially as not only is our knowledge of the physics of climate change incomplete, so too is our ability to forecast the future. Eruption of a supervolcano is unlikely but:

[T]his gigantic eruption sent the world into a decade-long volcanic winter and caused the climate to be cold and dry for thousands of years after that. The resulting famine is theorised to have reduced the ancient human population down to just a few thousand individuals. [2]Source

Lesser events, as well as surprises in the physics, could invalidate some or all of our efforts to deal with climate change. Policy should account for such gaps in our knowledge, and not only in environmental matters. Society is also too complicated for a policy approach that assumes that relationships are known and fixed. So, for example, reducing crime rates or increasing literacy is not simply a question of more funding for already-existing bodies. In my view, it's more a matter of putting in place incentives that reward people for achieving our goals, whoever they are, and however they do so. The risks of unanticipated events and failed approaches should be borne by those taking on the task.

[3]Social Policy Bonds are one way of addressing the complexity of society and the environment. They reward the achievement of desirable outcomes, rather than the supposed means of achieving them. They set up incentives to reward promising approaches and - importantly - to terminate failing approaches. They transfer the risk of failure from the bonds' issuers (usually government) to investors in the bonds. They encourage investors to keep an eye on events as they unfold, and to respond to them appropriately. So, for example, investors in bonds [4]targeting climate change would react to the research referenced above (if they did not carry it out themselves) by refining their attempts to deal with methane emissions. Under the current regime, nobody has incentives to change the assumptions on which existing models are based.

## 20.5 May

### 20.5.1 Obscurity causes obesity (2023-05-03 17:27)

Recently I did a [1]post describing how complexity can be used to obscure the effects of a policy or the true intentions of policymakers influenced by corporate interests or other powerful groups - such as farmers.

Food processors appear to be doing something similar. Chris van Tulleken explains the UK's Nutrient Profile Model, NPM 2004/5, which was developed as a tool to regulate food advertisements directed at children:

If you struggle to make sense of the nutrient data table on the [package of food] to guide healthy eating for your child, then the NPM 2004/5 is going to blow your mind. You can't look up the NPM score of a food easily – you have to calculate it using the following three steps, which I write out only to illustrate their complexity. First, you award a score for the bad stuff: calories, saturated fat, sugars and sodium. These are called 'A' points. Second, you add up the points for the good stuff: fruit, vegetables, nuts, fibre and protein. These are called 'C' points. (By the way, you may need to pay for access to something like the NielsenIQ Brandbank nutritional database to gather all this information.) After you've calculated the A and C points, there are other rules to be factored in, like: 'If a food or drink scores 11 or more A points then it cannot score points for protein unless it also scores 5 points for fruit, vegetables and nuts.' Clear so far? Well, then you subtract the C points from the A points to calculate a score out of thirty. Any food that scores more than four is classified as HFSS [High in (saturated) fat, salt and sugar]. But, even if you do all that, it isn't clear whether children should eat these HFSS foods, or in what amounts. The designation determines only whether a food can be marketed to children at particular times and in particular ways. Chris van Tulleken, [2]Ultra-Processed People, April 2023

By such means is the relationship between ultra-processed food and health obscured; and by such means do we understand how ultra-processed foods make up 60 per cent of the calories consumed by the average UK citizen, and at least 80

percent of the calories consumed by one in five citizens. So policies intended to safeguard the health of our children get corrupted in the black box of our policymaking, regulatory or legislative bodies. The result? As Mr van Tulleken tells us, over the past thirty years, obesity has grown at a staggering rate: '[A]mong children leaving primary school rates of obesity have increased

by more than 700 per cent, and rates of severe obesity by 1600 per cent.' This is despite fourteen government strategies containing 689 wide-ranging policies addressing obesity having been published in England in that period. Oh, and children in the UK (and US) are shorter too: 'This stunting goes hand in hand with obesity around the world, suggesting that it is a form of malnutrition rather than a disorder of excess.' Policymakers and their paymasters couldn't get away with such deceptive behaviour under a Social Policy Bond regime, in which the first step is an explicit setting of verifiable goals. Such goals would be meaningful to ordinary people, which means we could all engage in the policymaking process. So, for example, government would set broad health goals, using an array of indicators, such as longevity, infant mortality, quality-adjusted life years and others, all of which would have to fall into an agreed range for a sustained period before the bonds could be redeemed. (See [3]here; or [4]here for a longer essay on Tradeable Health Outcome Bonds.) Regulations to control adverts targeting children would be enacted only if they could be shown to have favourable health impacts. As with all Social Policy Bonds, investors would have as their sole criterion for the activities they undertake their efficiency in achieving the targeted goal. Currently, big corporations influence policy in their favour, and obscurity and complexity allow them to get away with it.

By targeting broad, transparent, agreed outcomes, Social Policy Bonds could reclaim policy to the benefit of the people on whose behalf it nominally made.

## 20.5.2 Status $\approx$ wealth, unfortunately (2023-05-15 18:30)

One takeaway, after watching a [1]documentary on the life of Justice Clarence Thomas of the US Supreme Court is that money is becoming almost the sole criterion by which many of us measure success or fulfilment.

Robert Locke, [2]writing about Japanese society, argues persuasively that 'what people are pursuing in the workplace is not so much money as the respect of the people around them.... [The Japanese] have understood that a large part of what money-seeking individuals really want is just to spend that money on purchasing social respect, through status display or whatever, so it is far more efficient to allocate respect directly.'

Rather than offer financial rewards we could perhaps reward people who help achieve societal goals with higher social status. An honours system could go some way toward rewarding people who forgo financial fortune for the good of society. Indeed, many countries have honours systems that are - or were - intended to do this. People also gain status merely by being admitted to exclusive societies, by working for a reputable organisation, or are pleased simply to be recognised in their role by cognoscenti. And many social reformers are quite happy to toil away without needing their efforts validated by any external body. They might be happier knowing that they are helping to improve the society in which they live but, for a very large number, their reward lies simply in knowing that they are making a contribution.

But whether for good or ill, the context within which social status is barely correlated with financial status is fading from many rich countries: social status is becoming more and more a function of high levels of wealth and income. The British honours system, for example, which used to compensate dedicated people for the financial sacrifices they made for the public good, is more and more following the trend, making awards to entertainers and sportspeople who, whatever their other troubles, are not financially impoverished. There are still fields of activity, in the academic and religious worlds, for instance, wherein social status and monetary reward do not always go hand-in-hand, but they are shrinking or indeed reward activities that most of us would see as anti-social. Re-instatement of a popular culture that confers high status on those who achieve social and environmental goals would be a difficult task in our highly mobile world. But in the meantime, facing severe and urgent social and environmental challenges, what are we to do?

One of the benefits of a [3]Social Policy Bond regime is that it would create a means by which financial rewards are inextricably linked to social benefit. Under such a regime it would be

politically easier to tax the income and profits of activities that have little (or negative) social impact. Great wealth might then be less divisive than under the current regime, where too much of it is generated by questionable or corrupt activities.

## 20.6 June

### 20.6.1 Social Policy Bonds haven't gone very far (2023-06-01 17:52)

This is post number 1361; as good a time as any to look at why [1]Social Policy Bonds haven't gone very far in the few [2]decades since the idea has been in the public arena.

Similar sounding [3]Social Impact Bonds, with which I've had no involvement, have been issued in at least 25 countries. Unlike Social Policy bonds, they are not tradeable. I'm ambivalent about them for reasons I've explained more fully [4]here and [5]here, but in essence they are inherently short term in nature, and do not encourage new entrants nor much in the way of diverse, adaptive approaches; the range of social and environmental outcomes they can target is inherently narrow. However, they could be a stepping stone on the way to my original concept - or they could discredit the whole notion of injecting market incentives into the achievement of goals currently the remit of government.

The main reason why I think the original Social Policy Bond concept hasn't made much progress is that it threatens existing institutions, including those currently charged with allocating funds to service suppliers, and the service suppliers themselves. Under a bond regime, the government bodies that allocate funds to favoured service suppliers would relinquish that power, though government would still articulate society's wishes and raise the revenue used to redeem the bonds when targeted goals had been achieved. Existing service suppliers, would survive under a bond regime only if they were efficient, or deemed capable by bondholders of becoming so.

Sadly, our existing institutions, by which I mean government at all levels and the bodies they fund, are failing in their duties to respond effectively to our social and environmental problems. At the national level, our politicians and senior bureaucrats appear unresponsive to the needs and wishes of ordinary people. At the global level, a concern such as the increasing probability of large-scale war is a lower priority, as measured by where human ingenuity and creativity are most in evidence, than [6]generating profits for the wealthiest investors or [7]advertising dog-food. The gap between our leaders and the people they are supposed to represent grows ever larger.

Existing bodies, I realise now, aren't likely to do anything. Like every other institution, from trade unions to universities to religious organisations, their main priority is self-perpetuation.

I've tried to interest philanthropists, via their [8]journals, but I don't think that has achieved anything: perhaps philanthropists, like governments, relish their power to distribute funds to favoured organisations rather than to the achievement of social goals. My goal now is to carry on, and to keep my body of work on the bonds accessible over the internet for some years, via this site and the main Social Policy Bonds site and the papers and book chapters that are linked there.

For more about applying the Social Policy Bond concept to peace, click [9]here.

## 20.6.2 Give cash payments a chance (2023-06-03 11:09)

Below is an article I've written recently and sent to a couple of UK newspapers. They won't print it, so I'm making it freely available here. For those familiar with the Social Policy Bond concept, there will be little new in this piece.

# Give cash payments a chance: World Peace Bonds

Pay people to stop killing each other? Sounds crazy, and a long way short of ideal. But better, perhaps, than where we are headed.

As the rhetoric gets ever more heated; the piles of weapons ever greater and more lethal, it seems very much as if we're in a pre-calamity phase. Along with other social and environmental problems, the likelihood of nuclear conflict is probably contributing to falling birth rates in the most liberal and wealthy societies that have ever existed. There

are efforts being made by well-meaning, hard-working people and organisations doing what they can to facilitate dialogue, defuse tension, and limit deployment of, and trade in arms. But the sum of their efforts doesn't change the portentous reality: we are in grave danger of a world war. As the Institute for Economics and Peace tells us, the world has become successively less peaceful each year since 2014. (Source: Institute for Economics & Peace. *Global Peace Index 2022: Measuring Peace in a Complex World*, Sydney, June 2022. Available from: <http://visionofhumanity.org/resources> (accessed 21 May 2023)).

## World Peace Bonds

There's no single solution to the problem of violent conflict and I can't offer one. But I can offer a means by which we can find solutions: solutions that will be diverse, adaptive and efficient – as they need to be. My suggestion is that philanthropists put up initial funding for a new type of financial instrument: World Peace Bonds. Funds for the redemption of the bonds could be further swelled by non-governmental bodies, and the wider public. Even governments could contribute, if they could bear to focus on the long-term interests of the people they are supposed to represent. The bonds would be floated by auction and redeemed for a fixed sum only when the number of people killed by violent political conflict fell to, say, 50 000 a year, for a sustained period.

World Peace Bonds (unlike the similar Social Impact Bonds) would be tradeable on the open market. People would buy bonds only if they expect their market price to rise. Because bondholders could sell their bonds at any time, they wouldn't have to hold them to redemption to make a profit. The bond issuers could therefore target very long-term goals, such as our world peace goal sustained for, say, three decades.

Importantly, the bonds would make no assumptions as to how to bring about greater peace, nor who would do so: these decisions would be made by bondholders. Unlike normal bonds, World Peace Bonds would not bear interest and their redemption date would be uncertain. Bondholders would gain most by ensuring that peace is achieved quickly.

As the level and likelihood of large-scale violence fell, so the market price of the bond would rise. Bondholders would have incentives to cooperate with each other to do what they can to achieve peace, see the value of their bondholdings rise, then sell their bonds, and realise their profit. The bond's backers need decide only on the definition of peace to be targeted - not on how to achieve it. That would be left up to investors in the bonds, who would have every incentive to maximise their, and the backers', reduction in violence per unit outlay. So, in contrast to the current approaches to achieving peace, a World Peace Bond regime would stimulate research into, and implementation of, ever more cost-effective ways of defusing and eliminating political violence.

Bondholders would be in a better position than governments to undertake a range of peace-building initiatives. They could lobby or work with governments to, say, change and enforce laws that make wars at home or overseas a less likely prospect. They could finance sports matches between potential protagonists, promote anti-war programmes on TV, or set up exchange schemes for students and schoolchildren. They could try to cajole the financial supporters of conflict into redirecting their funds along more edifying lines. They could offer poor countries innovative forms of aid, including education and scientific aid, and measures aimed at enlightening populations. They might even subsidise intermarriage between members of different ethnic or religious groups. And they could simply pay people to stop killing each other, when they think that's the most cost-effective approach. The crucial point is that bondholders have *more freedom and incentive to explore and carry out such diverse initiatives than governments* or other international bodies.

By appealing to people's self-interest, World Peace Bonds are likely to be more effective than conventional efforts aimed at reducing violence. In channelling market forces into the achievement of this objective the bonds could bypass or even co-opt the corrupt or malicious people in government or elsewhere who stand in the way of peace.

In today's emotional climate decision-making is too often reactive. It is too easily swayed by those with a propensity for violence or those who benefit from it, financially or emotionally. There *are* enlightened, hard-working, supra-national organisations working for peace, but their funding is conditional on their carrying out the limited, short-term activities approved

by their sponsoring governments. Private peace-building bodies work in admirable and diverse ways, but their efforts are small-scale and uncoordinated. For neither type of organisation are the financial rewards from building peace correlated with their effectiveness in actually doing so. World Peace Bonds, in contrast, would explicitly reward movement toward a long period of world peace, however it is done, and whoever achieves it. They would focus on an identifiable, meaningful outcome and channel market efficiencies into exploring ways of achieving it. They could be the most effective means of achieving the peace that people all over the world yearn for and deserve.

### **20.6.3 Ending world poverty efficiently (2023-06-13 18:59)**

Reading Peter Singer's [1]*The Life You Can Save: acting now to end world poverty*, I'm pleased to see that someone else recognises the importance of solving social problems as efficiently as possible. It's not a given: institutions - even the best run, most dedicated - have their own priorities, of which [2]self-perpetuation is paramount. Efficiency, as measured by improvement in well-being per dollar spent, should be an end in itself, in that optimal efficiency maximises the benefits from our scarce resources. But it is, in my view, also a means to an end, in that efficient poverty relief programmes would encourage more people to contribute to them. To quote Dr Singer: '[A]s people become more confident of the cost-effectiveness of charities, they will become more willing to give.' I haven't finished reading his book but, in it, Dr Singer quotes William Easterly:

The West spent \$2.3 trillion on foreign aid over the last five decades and still had not managed to get twelve-cent medicines to children to prevent half of all malaria deaths. The West spent \$2.3 trillion and still had not managed to get four-dollar bed nets to poor families. ... It's a tragedy that so much well-meaning compassion did not bring these results for needy people. William Easterly, [3]*The White Man's Burden*, 2007

In a [4]Social Policy Bond regime, the most important feature would be the targeted outcome, not the institution. A bond regime could target long-term goals in ways that current organisations cannot. All activities would be subordinated to the efficient achievement of the targeted

goal. Existing institutional involvement would not be taken as a given: efficient organisations would thrive under a bond regime, but the less efficient would see a drop in their funding. The long-term feature of the bonds means there would be ample time to try diverse, adaptive approaches, and promote the most promising of those while, importantly, terminating those that show themselves to be inefficient. Consistent with Dr Singer's thesis, the best approach would be to issue bonds that target global poverty, with resources being channelled to wherever in the world they can do most good, regardless of the nationality, ethnicity etc of beneficiaries. A starting point could be to issue bonds [5]targeting improvement in some refinement of the Human Development Index. For reasons I've recently [6]given, existing bodies are unlikely to fund such bonds. Philanthropists could, in theory, but I suspect they too would not want to relinquish the control and kudos that come with dispensing large sums of money to needy people. It's certainly, and understandably, difficult for ordinary people to make suggestions along those lines to wealthy individuals, though I [7]try.

#### **20.6.4 The continuing destruction of tropical forests (2023-06-29 17:15)**

The *Financial Times* summarises a recent report by the University of Maryland and the World Resources Institute's Global Forest Watch:

The equivalent of 11 football fields worth of primary tropical forests disappeared per minute last year[.] [1]*Tropical forest loss rises 10 % despite pledge by 145 nations*, *Financial Times*, 28 June

The article concludes:

'Market forces driving deforestation were "much greater" than those behind protecting woodland' according to Mikaela Weisse director of the Global Forest Watch.

There's nothing inevitable about market forces when there are no markets for negative externalities and markets themselves are undermined or manipulated by large corporations, or subject to legislative and regulatory constraints. Rather this is a tragic case of market failure.

It could conceivably be addressed by doing some complicated and divisive calculations as to the likely impacts of lost woodland and attendant atmospheric pollution, and applying a contentious discount rate to some highly aggregated cash-equivalent figures. That's practically and politically impossible to do. However, I do not believe that a perfect market for, say 'woodland services', with all externalities accounted for, even if it were possible to create one, is an end in itself. It would be a means to an end, and we'd do better to focus on what, actually we want to achieve.

My suggestion is that we stipulate the environmental goals we want to achieve. One such goal could be a limit on the area of primary woodland destroyed over a period of, say, 30 years. Then Social Policy Bonds could be issued that would be redeemable only when that goal had been achieved. Redemption funds could be raised by a consortium comprising some or all of world governments, NGOs, corporations or philanthropists. The funds would be held in escrow until the targeted woodland preservation goal had been achieved. It would be up to bondholders to decide how to limit the destruction of woodland, and they would have a powerful incentive - the increase in value of their bonds - to do so effectively and quickly. They could take steps that current bodies cannot or will not take, such as bribing illegal loggers to undertake some other activity. A bond regime, rather than eschew market forces, would channel them into the preservation of the world's primary tropical forest.

## 20.7 July

### 20.7.1 How best to allocate healthcare funds (2023-07-15 16:27)

It's striking how unrelated is healthcare funding to need. Medical experts have little capacity or incentive to see beyond their own institution or speciality. Governments respond to pressure from interest groups and industry, and allocate funds accordingly. Slipping through the cracks are unglamorous diseases, such as some mental illnesses. Even within a class of diseases, such as cancer, funding [1]discrepancies are stark. I think government here is failing in its purpose. It should target for improvement the broad health of all its citizens rather than merely respond to lobbyists, however dedicated, sincere and hard working. It should, as far as possible, be impartial as to the causes of ill health, and direct resources to where they can return the biggest health benefit per dollar spent. Applying the Social Policy Bond principle to health could do this. At the national level, governments could gradually divert

an increasing proportion of its healthcare spending to create and expand a fund to redeem [2]Tradeable Health Outcome Bonds (For a shorter treatment see [3]here.)

At the global level - I'll be realistic - such an approach is even less likely to be followed so, having read Peter Singer's [4]*The Life You Can Save: acting now to end world poverty*, I can recommend the approach he takes when it comes to choosing which charities to support, which are those that, in his assessment, generate the highest increase in well-being per dollar spent. As he points out, 'The best charities can be hundreds or even thousands of times *more impactful* than others.' See [5]here for more.

## 20.7.2 World targets in megadeaths: the superforecasters give their opinion (2023-07-17 17:54)

The current issue of the *Economist* [1]reports on a survey of 89 'superforecasters', defined as 'general-purpose prognosticators with a record of making accurate predictions on all sorts of topics, from election results to the outbreak of wars.' They were asked to estimate the likelihood that an unspecified event, such as an AI-caused extinction or a nuclear war, would kill 10 % or more of the world's population (or around 800 million people) before the year 2100.

The superforecasters gave that event a probability of 9 %.

Nine percent is worryingly high, but quite plausible. We could speculate on the type of event most likely to bring about such a catastrophe, but it's more important to see if we can find a way of forestalling it.

I think the answer might be to use the Social Policy Bond concept to prevent any sort of catastrophe from happening for a sustained period.

The issuers of such [2]Disaster Prevention Bonds need have no knowledge of the relative likelihoods of known or unforeseeable catastrophic events. Neither would they have to pre-judge,

with our current limited scientific knowledge, the most efficient ways of ensuring our survival. Instead, the bond mechanism could target the sustained avoidance of any -

unspecified - catastrophe. It would do so in a way that encourages the exploration and investigation of all threats, known and new, impartially .

Policymakers would not (and, anyway, could not) try to calculate how dangerous each threat is. That would be left to bondholders, who would have powerful incentives to do so continuously , which is necessary because the most likely type of catastrophe will change over time.

Investors in the bonds would be rewarded only if they can successfully adapt to rapidly changing events and our ever-expanding knowledge.

This

is a stark contrast to the current approach; the one that has led to highly intelligent men and women giving our survival such a gloomy prognosis. The people who are currently working in favour of humanity do so in ways that, while worthy of great respect, are doing so within a system that is heavily weighted to favour the short-term goals of large organisations, including governments, that have little incentive or capacity to care about the long-term future of the whole of humanity. It's very regrettable, and Disaster Prevention Bonds, issued with sufficient backing, could change all that. With sufficient backing from governments, corporations, non-governmental organisations and philanthropists, they could encourage more people and more resources into activities that would help reduce the likelihood of catastrophe.

### 20.7.3 Focusing on nuclear peace (2023-07-22 10:44)

Back in April 2014 just after Russia had annexed Crimea, the London-based think-tank , Chatham House, published a [1]report on the dangers of unintended nuclear conflict: 'The probability of inadvertent nuclear use is not zero and is higher than had been widely considered,' it stated. 'The risk associated with nuclear weapons is high' and 'under-appreciated.'

You don't need to know much about, say, the origins of the First World War to be scared by the possibility that Russia and NATO might be sleepwalking towards a nuclear catastrophe. We could spend a lot of energy trying to allocate blame, but doing so is far less important than striving to reduce the likelihood of such a conflict. There *are* bodies that are working toward that end, either as their main activity or indirectly, with peace being a hoped-for result of such aims as poverty reduction, climate change mitigation or mass vaccination.

I think, though, that we need to be more focused: a nuclear conflict is one of the worst scenarios imaginable, dwarfing our other serious social and environmental problems. I cannot suggest a way out of any impending nuclear conflict, but what I do propose is that we offer incentives for people to find ways of avoiding such a disaster. Rather than leave everything to the politicians, ideologues, military men and the war-gamers, we could encourage people to back [2]Nuclear Peace Bonds that would be redeemed only when there has been a sustained period of nuclear peace. Backers would contribute to the funds for redemption of the bonds, which would occur only when nuclear peace, defined as, say, the absence of a nuclear detonation that kills more than 100 people, has been sustained for three decades. Backers could comprise any combination of governments, international

organisations, non-governmental organisations and philanthropists, and their funds could be swelled by contributions from the rest of us.

The maintenance of nuclear peace is an ideal for targeting via the [3]Social Policy Bond concept:

- it has an unambiguous, verifiable metric,
- existing policy doesn't seem to be working,
- nobody now knows the best ways of achieving the goal,
- the goal is long term, and
- the goal is likely to require a multiplicity of diverse, adaptive approaches.

Of course, the bond approach can run in parallel with existing efforts. It's likely to channel resources into those bodies whose activities are most promising. It would also encourage new approaches, the precise nature of which we cannot and need not know in advance.

## 20.8 August

### 20.8.1 Uncosted goals are platitudes (2023-08-03 18:26)

Janan Ganesh writes:

Let us dispose of the idea that net zero is popular. Yes, in Ipsos surveys, voters endorse various green policies by supermajorities. But when a financial cost is attached to them, most are rejected. ...Last month, a YouGov poll found that around 70 per cent of [UK] adults support net zero. If this entailed "some additional costs for ordinary people", however, that share falls to just over a quarter.

*The beginning of the end of Britain's net zero consensus,*

Janan Ganesh, Financial Times, 2 August (archived [1]here)

Government, unfortunately, rarely sets out transparent, explicit, verifiable goals. One such is the 2 percent annual inflation rate, targeted by the UK Government: currently the rate

[2]exceeds 8 percent. The same Government's [3]goal of 'net zero' by 2050 is even less credible. Perhaps, like most others, knows that nobody takes its goals seriously, and that nobody will be held accountable for its failure to achieve them.

A Social Policy Bond regime would be different. Under a bond regime a government would spend more time setting explicit, clear and meaningful goals than trying to achieve them, or hiding or explaining away its failure to do so. Democratic governments could be effective at articulating society's wishes and raising the revenue to fulfil them. They are not so effective at actually achieving them. Still less do they correctly estimate or explain the inevitable trade-offs that their policies entail. They can get away with such irresponsible behaviour because society is complex, and people too preoccupied with more day-to-day matters.

As I explain in more detail in my [4]book, under a government-backed Social Policy Bond regime, costs of achievement of goals need not be accurately estimated. Government would put funds for the ultimate redemption of the bonds into an escrow account; the bonds would be redeemed only when the specified social or environmental goal had been achieved. If the funds are deemed by the market to be insufficient, then investors will show no interest in the bonds. If the funds are roughly equal to, or even much, much greater than, the market's view of how much achievement will cost, then investors would buy the bonds, bidding for them against each other, so that the net cost to the government of achieving the goal will be minimised. The market for the bonds would ensure that this would happen continuously, with investors having powerful incentives to assess the effects of new knowledge and events quickly. Tradeability, which I discuss [5]here and [6]here, greatly expands the range of goals that the bonds can achieve: government could target very long-term outcomes, such as universal literacy or greater life expectancy and then disengage from any attempt to achieve them, which would become the responsibility of investors in the bonds.

Sadly, governments today, knowing that they are [7]rarely held accountable, are prone to preach such uncOSTed goals as 'net zero' that function as little more than self-satisfied advertising slogans.

## 20.8.2 Using reason to make policy (2023-08-05 17:16)

The *Economist* writes:

...Americans need to recognise just how many of their compatriots' lives are being squandered. Too often politicians have been slow to do so and, as a result, America

has come to tolerate an obscene level of early deaths. Only after the shock and shame of yet another mass shooting, at an elementary school in Uvalde, Texas, last year, did Congress muster the will to pass modest new gun controls. A proper sense of alarm at other kinds of needless loss may help bring about measures to keep more Americans alive for longer. That way the country could start to curb the carnage. [1]*How to reduce American carnage*, the Economist, 31 July

It's unfortunate that it takes dramatic events that have immediate visual impact before our current policymakers think about addressing many of our social problems. Ideally, we should aim for policies that minimise adverse impacts on *all* people's well-being, regardless of who they are, where they happen to live, or whether their plight is dramatic enough to make people watch news bulletins.

One way of doing this would be for government to consult with citizens to discover their priorities for policymakers, specified in terms of broad goals, at times of relative calmness and over a sustained period. Examples of such goals could be: cut violent crime by 50 percent; raise literacy to 99.5 %; improve life expectancy by three years. The exact formulation of these goals would be decided by experts and confirmed by government.

The next step would be to reward people for achieving these goals, whoever they are and however they do so, provided the act within the law - though as part of their goal-achieving activities they can lobby for changes in the law.

I would go further: my [2]Social Policy Bond concept would aim to inject the market's incentives and efficiencies into the achievement of our specified social and environmental goals. It's a simple idea but one that represents a complete change in the ways government currently runs things. Essentially, it would allow government to concentrate on articulating society's wishes and raising the revenue to achieve them: things that democratic governments are actually quite good at. But the bonds would, in effect, contract out the achievement of these goals to whoever thinks they are best placed to do so. These investors in the bonds would be prepared to pay more for them than they are worth to current holders, so that the bonds would always flow into the hands of those who can best advance progress towards the targeted goal. Because they would be [3]tradeable, investors wouldn't have to hold them for long: they could buy them, advance progress toward the targeted goal, so seeing the value of the bonds rise, then sell them to those best placed to take the next steps towards the goal's achievement, at which point the bonds would be redeemed.

In such a way, government would be doing what it's best at, while the market for the bonds would do what - in economic theory and on all the evidence - markets do best: allocate society's scarce resources optimally.

### **20.8.3 Targeting environmental outcomes: thirty wasted years (2023-08-22 18:47)**

What sort of environmental policy are we seeking? What are our goals? What should be our goals? Such questions arise when we read that, for instance, operating carbon capture and storage would increase direct emissions of NO<sub>x</sub> [nitrous oxides] and particulate matter by nearly a half and a

third, respectively, because of additional fuel burned, and increase direct NH<sub>3</sub> emissions significantly because of the assumed degradation of the amine-based solvent. From [1]*Air pollution impacts from carbon capture and storage (CCS)* [pdf], EEA Technical report No 14/2011

...or when we reading about road vehicles, we realize that:

their tyres brakes and wear and tear on the road also produce dangerous pollutants, which get worse the heavier vehicles are. [2]*How green is your electric vehicle, really?*, the Economist, 10 August

...and that electric vehicles are heavier than their internal combustion equivalents. Clearly, there are significant environmental trade-offs here: we can reduce emissions of greenhouse gases, but at the cost of increased emissions of other air pollutants. Currently, policy is made without much consideration of these trade-offs: an apparent emergency, such as climate change, dominates policymakers' thinking so much that the impacts of addressing it are neglected. So, for another example, the environmental costs of generating electricity using wind turbines (with non-biodegradable blades) or solar energy (with losses to biodiversity) are ignored.

It's quite possible that, in the long run, the policymakers have chosen correctly and that climate change is a real emergency that merits increased pollution of the atmosphere with nitrous oxides,, particulates from tyres, etc and the loss of biodiversity. There are very few instances where one human activity, whether it produces energy or anything else, does not have a negative environmental impact. So, mining and using the filthiest coal to generate electricity has, and still does, bring heat and light to poor people at low cost, while polluting the air and costing the lives of miners. Once the negative impacts become impossible to ignore, and society becomes wealthier, we make efforts to regulate or price the negative impacts.

How is this policymaking approach working? I think the consensus would be: not very well. As well as climate change with all its attendant dangers, we are facing biodiversity loss, overfishing, water and air pollution, and other depredations at all scales. But we can't expect policymakers to weigh up all the impacts of our activities and price or regulate them accordingly, and to do so on a continuous basis to ensure that policy keeps up with scientific advances (just one current possibility [3]here) and the growth of our knowledge about scientific relationships.

So I propose a different method. The current system reacts to problems when they become politically unavoidable, and then tries to identify and address their causes. My method would be instead to specify acceptable ranges of indicators of environmental health, including human, animal and plant health, and supply incentives for people to ensure that the targeted

indicators remain within those ranges for a sustained period. In short, to target environmental goals and reward those who achieve them.

My suggested way of doing this at the national level would be for the government to issue [4]Environmental Policy Bonds. These bonds would not bear interest, but would be redeemable once the specified environmental targets had been achieved and sustained. The bonds would be tradeable and, could have a very long-term focus, encouraging people to research, refine and undertake activities directed toward one or all of the targeted goals. In this, and in other ways, they would have several advantages over current policymaking:

- We'd be targeting outcomes, for which there is more consensus than for the means to achieve them.
- People can identify more readily with explicit environmental goals than with the means to achieve them, which means that there would be more engagement with the public when developing environmental policy, which in turns means more buy-in, which I consider to be essential.
- The target outcomes would be stable and have a very long-term focus: essential if we are to encourage new ways of achieving our environmental goals.

If national governments successfully implemented Environmental Policy Bonds, they could conceivably collectively issue bonds targeting global environmental objectives, encompassing, for example, the health of the seas and atmospheric pollution as well as climate change and biodiversity loss. I have to admit that that looks extremely unlikely, especially as the concept has been in the public arena now for more than [5]thirty years, and only a non-tradeable variant ([6]Social Impact Bonds) has so far been tried. As I explain [7]here and [8]here tradeability is absolutely necessary if we want to achieve broad, long-term goals. Perhaps, rather than wait for government to change the way it does things, we should try to engage with philanthropists. I've [9]tried and had no luck, but perhaps my readers will be more successful.

## 20.8.4 Resources for health (2023-08-29 17:26)

Today's *Financial Times* has a feature on antimicrobial resistance, pointing out that resistant pathogens are thought to have killed 1.26 million people in 2019, and that the problem is getting worse.

Few venture capitalists or large drugmakers want to fund the costly clinical trials required by regulators.... As with climate change and future pandemics, no one is taking enough responsibility for the ever-present global threat of antimicrobial resistance.... [1]*Why it's so hard to stop the 'silent pandemic'*, Hannah Kuchler, 'Financial Times', 29 August

The article does talk about philanthropic investment aimed at launching two to four new antimicrobials in the next decade, but this is thought to be insufficient, and:

attention is turning to changing how health systems buy antibiotics. This year, the UK has proposed expanding its novel subscription model, so drugmakers would receive up to £20 million a year for selling innovative antibiotics, no matter how many - or how few - are prescribed.

...nor indeed how effective or ineffective they are - which is the problem: we shouldn't be targeting how many new antibiotics are marketed; that's, at best, a [2]surrogate endpoint. It's not a meaningful outcome to people who want to optimise their health nor, therefore, for policy-makers who represent those people. What we need to be doing is targeting broad, meaningful indicators of national health and reward improvements in these indicators *however they are achieved*. Funding should be dictated by its expected benefits to people, rather than to drugmakers; and it should be directed to where it will achieve the maximum improvement in health per pound spent. Such improvement could be measured using such indicators as Quality Adjusted Life Years, longevity and an array of other measures. It may be that these investments in producing new antimicrobials are appropriate on that basis - or there may be other priorities that would generate a higher return. My concern is that there is little to suggest an analysis of expected benefits per pound spent has been carried out.

My suggestion, therefore, is that national governments issue [3]Tradeable Health Outcome Bonds, which would provide incentives to research, develop and refine all approaches to improving our health, including measures that are currently thought to be beyond the remit of health authorities, but that could have large positive health improvements. Such measure could include providing better public transport for low-income households, or subsidised apprenticeships. There are many other possibilities, but there are few incentives to consider their health impacts. The linked essay is long, at 9500 words. A shorter version is [4]here.

## 20.9 September

### 20.9.1 Climate policy has failed (2023-09-07 16:13)

John Michael Greer writes:

If the point of the last three decades of climate change activism was to slow the rate at which greenhouse gases enter the atmosphere, the results are in and the activists have failed. Nor is there any reason to think that doing more of the same will yield anything else... [1]*Riding the Climate Toboggan*, John Michael Greer, 6 September [2]

'Climate activism became a big public cause about halfway along this graph. Notice any effect?'

Some might argue that, without climate activism, the trend line would have become steeper in recent years, but it doesn't really matter. What does matter is that a great deal of policymakers' thinking and public resources have gone into trying to reduce greenhouse gas emissions, none of it has had the slightest discernible effect. This was foreseeable.

I suggest that we clarify what it is we actually want to achieve. Do we want to change the climate, or should we instead aim to reduce the impact of adverse climatic events on human, animal and plant life? Most likely, we should target a wide array of approaches that would fit into either category. The next step is to issue Climate Stability Bonds, which would reward the achievement of our impact-reduction goals regardless of whether bondholders do so by trying to influence the climate or by more direct means, such as, for example, reinforcing levees, building new homes for people currently living in flood-prone areas etc.

Climate Stability Bonds would have the long-term focus that current policymaking eschews; the issuers could stipulate that the bonds shall not be redeemed until all targeted indicators fall into an approved range for a sustained period, which could be three decades; bondholders would still profit by doing whatever they can to achieve the targeted goals, seeing the value of their holding rise, then selling their bonds to whoever is best placed to continue with achieving the goals. I have written many treatments of the Climate Stability Bond concept; all of which are freely available [3]here, and there are also numerous posts on this blog (see [4]here, [5]here and [6]here, for instance).

## 20.9.2 Social Policy Bonds: current state of play (2023-09-22 16:48)

I don't think any Social Policy Bonds have yet been issued, despite their having been in the public arena for about [1]35 years. That said, more national and local entities continue to issue Social Impact Bonds, the non-tradable variant of Social Policy Bonds. This wikipedia [2]page summarises the history and current deployment of SIBs, currently issued in about 25 countries. These include the UK, Australia, the US, and they are also being considered in Brazil, Israel and New Zealand. Dan Corry of NPC (formerly [3]New Philanthropy Capital) in London summarises the state of play in 2022 with SIBs in the UK [4]here:

There was a time when social impact bonds (SIBs) were all the rage, the shiny new policy wonk instrument. This instrument is a contract where payment is hard-wired into specified outcomes being achieved. Independent investors put up the working and risk capital and only get paid back if it all works, it was said these instruments would help us all deliver better services, would encourage innovation, guide government and philanthropists to a better way of commissioning, and would mean we only paid for the things we wanted. But then they sort of faded away from the front-line of interesting ideas: I've not seen a think tank or politician talk about

them in a long time, even though some keep going in the background. ...

So far, [SIBs] have yet to really taken off despite the pleas of their fans. Are they the future or the last dregs of the New Public Management and the marketisation of everything? ... Only time will tell. [5]*What is the future for Social Impact Bonds?*, Dan Corry, NPC, 5 October 2022

I do have reservations about SIBs, which I have expressed [6]here, [7]here, and in several blog posts (search this blog site for *Social Impact Bonds*). They are necessarily narrow in scope and, in my view, will be prone to manipulation and gaming, especially if they become so commonplace that they escape public scrutiny. Because of their limitations they are also, as I expected and as mentioned by Mr Corry, costly to administer. I haven't been consulted about, and have no involvement in, anything to do with SIBs. As regards Social Policy Bonds, there are occasional mentions in esoteric discussion of innovative finance (see [8]here, for example, or [9]this X thread), but I have to be realistic and I don't think it's likely that any will be issued in the near future. This saddens me, as I do think they could do much to narrow the gap between policymakers and the people they are supposed to represent, and stimulate the diverse, adaptive approaches that humanity needs to solve its big, urgent social and environmental problems. It is, though possible that SIBs, because of their focus on meaningful outcomes will advance, rather than discredit, the Social Policy Bond concept: either scenario is possible.

### 20.9.3 Perverse incentives and health (2023-09-24 16:37)

The *Economist* writes about organ transplants in the US:

[I]f the recipient dies soon after the transplant, hospitals suffer—a key measure used to evaluate them is the survival rate of recipients a year after transplant. According to

Robert Cannon, a liver-transplant surgeon ..., hospitals succeed by being excessively cautious and keeping patients with worse prospects off waiting lists. [1]*In America, lots of usable organs go unrecovered or get binned*, the Economist, 16 September

It's just one example of a narrow, poorly thought-through goal that's in conflict with social well-being. In this instance, improving the financial status of hospitals worsens the health of patients. A more usual comment, though in a bizarre setting is:

An anonymous nurse involved in the case suggested that the deceased patient might not have needed the [heart] procedure in the first place. [2]*Woman propped up to look alive for family after already being declared dead at Adena Hospital*, Derek Myers, Scioto Valley Guardian, 20 September

There are other examples, some of which I write about in my [3]long piece on using the Social Policy Bond concept to improve broad, societal health outcomes. (For a shorter treatment, see [4]here.)

In our complex societies, we rely on numerical data to give us an idea of where we, where we are going and where we want to be going. For private sector entities, narrow, short-term financial goals are good enough, but for a country, or the world, we need broad, long-term goals whose achievement is inextricably linked to the well-being of people and the environment. [5]Social Policy Bonds were conceived as a way of injecting the market's incentives and efficiencies into the solution of social problems, but perhaps their greater contribution would be to encourage policymakers to think more carefully about society's over-arching, long-term goals. I believe there would be more consensus over such goals than there is over the alleged means of achieving them and, further, that targeting broad goals that are meaningful to ordinary people would close the gap between policymakers and the people they are supposed to represent. There would be other advantages to the bond concept, but those are the crucial ones. Meantime, it looks very much as though the sort of [6]Mickey Mouse micro-objectives that bedevil healthcare - and [7]not only in the US - are worse for society than the old-fashioned way of relying on people's integrity and willingness to do the right thing.

## 20.10 October

### 20.10.1 Paying people not to kill each other: why not? (2023-10-08 16:31)

Some of the people I speak to disdain applications of the Social Policy Bond idea because it's transactional. 'They shouldn't be doing it for the money: people should not have to be paid to reduce their pollution, or to look after their own bodies, or not to commit burglaries.' Or, indeed, to refrain from killing each other. So neither [1]Middle East Peace Bonds nor [2]World Peace Bonds, nor any variant has ever been issued; nor, let's be frank, is likely to be issued in the foreseeable future. I will admit that paying people to achieve peace sounds, at first, a long way short of ideal. We should be at peace because we respect and even love each other, even people of a different tribe, race, religion and all the rest. That would be lovely, but it's plainly not working.

So, for those who are squeamish about aiming for a noble ideal (peace) using sordid means (money), here are my reasons:

- Paying people who achieve peace is similar to paying nurses and teachers who also work, at least partly, for idealistic reasons. Money pays their bills and allows them to raise families. It is not all about enriching already wealthy plutocrats or corporations but even if, under a bond regime, that were to occur, it would have been a result of channeling people's self-interest into socially beneficial outcomes.
- There are plenty of people who benefit financially from fomenting conflict. A World Peace Bond regime would help to offset the incentives on offer to those people.
- A bond regime aiming for a decades-long sustained period of peace would set in place incentives for people to explore, research, investigate and refine many different ways of achieving peace. Many bodies already work to this end but...
- ...a bond regime would give them more resources to work with. This includes people: rewarding peace would allow these bodies to attract more, and better-qualified, people to work for them. We need to divert talented, hard-working people away from less socially beneficial activities (trading currencies, say) or socially destructive (creating ever more sophisticated weapons of mass destruction), and towards such worthwhile goals as the ending of war which, I believe, in spite of all the evidence, *is* achievable - provided we have it as a long-term goal, and reward it in accordance with its value.

As I say, the current methods of trying to end war aren't working. Perhaps it's because the rewards and incentives are dwarfed by those reaped by those who depend on conflict for their living. A bond regime may be our best hope of bringing about the sustained period of world peace that all of humanity craves and deserves. Or maybe somebody out there has a better idea?

## 20.10.2 Greenhouse gas emissions: we're not actually doing anything to reduce them (2023-10-13 21:39)

Here, as [1]reported in the current *Economist*, are some grounds for optimism about curbing global emissions:

- 'China understands the need to decarbonise and is investing massively in solar and wind.'
- 'The second-biggest emitter, America, has taken a green turn under Mr Biden.'
- 'Brazil has sacked a rainforest-slashing president;'
- 'Australia has ditched a coal-coddling prime minister.'
- 'Nearly a quarter of emissions are now subject to carbon pricing.'
- 'In polls of 12 rich countries...the share of respondents who said [climate change] was a "major threat" rose in every country except South Korea, where it was already high.'

I'm in the [2]happy intellectual position of not having to advocate for or against greenhouse gas emissions, because I think the priority is to decide on those climate-related outcomes we want to see, then rewarding people for achieving them, however they do so. But since emissions are the bandwagon onto which everyone has climbed, what's happening to them is an indicator of how serious we are about the climate. It sounds good so far doesn't it? All those positive trends. But we shall get a better picture if I just repost (I first [3]posted these on 7 September) this graph and caption from John Michael Greer's [4]blog:

'Climate activism became a big public cause about halfway along this graph. Notice any effect?'

It's the outcomes that are important and it's clear that, despite the singular focus on greenhouse gases, we're not actually achieving any reductions in the rate at which they're emitted. It's a familiar story: we target surrogate indicators; things that current science tells us will influence a target variable, rather than the variable itself. In this instance, greenhouse gas emissions, rather than climate change (or the [6]negative impacts of climate change), and we're not even succeeding at that.

Here's a better idea: let's not assume the questions about the causes of climate change have been definitively answered. Let's also decide on what combination of goals we wish to achieve. And then reward the sustained achievement of these goals. I have written innumerable papers and blog posts about applying the Social Policy Bond principle to climate change. Links to papers can be found [7]here, and this blog can be searched for relevant posts.

### **20.10.3 Bureaucracy triumphs over health outcomes (2023-10-20 17:40)**

Dr Malcolm Kendrick [1]describes the Quality and Outcomes Framework (QOF) of the UK's National Health Service. It's the usual array of poorly-thought out, meaningless micro-targets that doctors are paid to achieve, but that have nothing to do with health. As Dr Kendrick points out, such (perhaps) well-intentioned, but futile bureaucratic processes impose a formidable opportunity cost on the NHS, to the detriment of doctors and patients. My suggested solution is to apply the [2]Social Policy Bond principle to health; a short description of this application of the bonds is given [3]here; a much longer version [4]here.

We see the same proliferation of Mickey Mouse micro-targets in other policy realms, notably education, and in diversity guidelines or regulations. They spring from the same presumably benign impulse, but they suffer from a similar lack of vision and strategy. They assume that processes that might have served society well in the past will continue to do so into the indefinite future. They do not allow for diverse, adaptive approaches. Yet it takes courage to criticise them, as Dr Kendrick is doing. My experience is that many people grumble about such top-down initiatives but are understandably reluctant to say anything openly. Though Social Policy Bonds aim to inject the market's incentives and efficiencies into the solution of our social problems, perhaps their more important contribution - if they ever take off - will be to focus policymakers' attention on outcomes that are meaningful to the people they are supposed to represent.

## **20.11 November**

### **20.11.1 Peace in the Middle East (2023-11-03 11:03)**

Decades of negotiations and initiatives have failed. We might well be on the brink of a nuclear calamity, and the entire region is a seething

cauldron of every sort of hatred: ethnic, confessional, sectarian and gender. I have no solution to the anxieties and potential catastrophes facing Israel, nor to the wider problems facing the citizens of all the Middle Eastern countries. What I offer instead is a way of encouraging people to find effective and efficient solutions. At this time, my vision of peace must sound like an impossible dream, but we can look at, for instance, the current relationship between Scotland and England; the long-running [1]vicious battles between the two countries have ended and the border is one of the more peaceful in the world. There are other examples.

Most ordinary people in the region, given time to reflect and the freedom to express their opinions would like nothing more than to see an end to the violence in the region. But there are enough powerful people inside and outside the region with a vested interest in keeping conflict going. They include men of religion, ideologues, politicians and bureaucrats. There are also, of course, the weapons merchants and their corrupt beneficiaries in government. Well-meaning idealists on all sides do what they can, but their efforts are overwhelmed and relentlessly undermined by the powerful people and institutions that want them to fail.

### **Peace above all**

We also need to focus exclusively on our goal of peace, which will mean putting aside feelings of fairness and justice, except insofar as they help our cause.

And we need ways of promoting peace that can modify or circumvent people's uncooperative or obstructive behaviour; ways that can co-opt or subsidise those people in positions of authority and power who want to help, and at the same time bypass, distract, or otherwise undermine those opposed to our goal.

Ideally too, we would deploy market forces. Markets are the most efficient means yet discovered of allocating society's scarce resources, but many believe that market forces inevitably conflict with social goals: accentuating extremes of wealth and poverty, for example, or accelerating the degradation of the environment. So it is important to remind ourselves that market forces can serve public, as well as private, goals.

We need to give people and organisations of all kinds the incentives to create and sustain peace, rather than conflict. We also need a verifiable definition of peace, which will consist of a combination of conditions that have to be satisfied and sustained. These could include:

- a much-reduced number of people killed in conflict
- a much-reduced level of terrorist events, or military incursions
- minimal forcible expulsions of people
- no use of nuclear weapons

As well, given the strong causal [2]relationship between mass media incitements to violence and actual violence we could add to our definition of peace:

- a drastic reduction in mass media incitements to violence; and

- school texts to be approved by all sides of the conflict.

I would aim to issue Middle East Peace Bonds, which would reward investors only when all the conditions for peace have been satisfied and sustained for two or three decades.

### Middle East Peace Bonds

My suggestion is that philanthropists ideally with governments and other interested organisations and individuals, collectively raise a large amount of money, put it into an escrow account, and use these funds to redeem at some future time a new financial instrument: Middle East Peace Bonds. These would be sold by auction for whatever they would fetch. They would be redeemed for, say, £100 000 each only when all the conditions for peace, as defined by the issuers, had been satisfied and sustained.

Importantly, the issuers of the bonds would make no assumptions as to how to bring about greater peace. No one solution, nor even an array of solutions will work all the time. We need diverse approaches that are adaptive, and therefore unlike anything our current institutions can envisage. The bonds instead will stimulate diverse, adaptive solutions.

Nor do we need to know who would hold the bonds or carry out peace-creating projects. Those decisions would be made by would-be investors in the market for the bonds. Unlike normal bonds, Middle East Peace Bonds would not bear interest and their redemption date would be uncertain. Bondholders would gain most by ensuring that peace is achieved quickly. As the prospects for peace brighten, the value of the bonds will rise.

#### **Trading the bonds**

Middle East Peace Bonds, once floated, must be readily tradable at any time until redemption. Many bond purchasers would want or need to sell their bonds before redemption, which might be a long time in the future. With tradability, these holders would be able to realise any capital appreciation experienced by their holdings of Middle East Peace Bonds whenever they choose to do so.

The bonds will be worth more to those who believe they can do most to help reduce the violence, who will then own most of the bonds. Large bondholders might decide to sub-contract out peace-building projects to many different agents, while they themselves held the bonds from issue to redemption. The important point is that the bond mechanism will ensure that the people who allocate funds have incentives to do so efficiently and to reward successful outcomes, rather than merely pay people for undertaking activities.

Too large a number of small bondholders could probably do little to help achieve peace by themselves. If there were many small holders, it is likely that the value of their bonds would fall until there were aggregation of holdings by people or institutions large enough to initiate effective peace-building projects. As with shares in newly privatised companies the world over, Middle East Peace Bonds would mainly end up in the hands of large holders, be they individuals or institutions. Between them, these large holders would probably account for the majority of the bonds. Even these bodies might not be big enough, on their own, to achieve much without the co-operation of other bondholders. They might also resist initiating projects until they were assured that other holders would not be free riders. So there would be a powerful incentive for all bondholders to co-operate with each other to help bring about peace in the Middle East. They would share information, trade bonds with each other and collaborate on conflict-quelling projects. They would also set up payment systems to ensure

that people, bondholders or not, were mobilised to help build peace. Large bondholders, in co-operation with each other, would be able to set up such systems cost-effectively.

Regardless of who actually owns the bonds, aggregation of holdings, and the co-operation of large bondholders, would ensure that those who invest in the bonds are rewarded in ways that maximise their effectiveness in bringing about peace.

So, in contrast to today's short-term, tried, tested and failed approaches, a Middle East Peace Bond regime would stimulate research into finding the most cost-effective ways of achieving peace. Indeed, bondholders would be in a better position than governments to undertake a range of peace-building initiatives, having more freedom to try innovative approaches. They might, for example, finance sports matches between opposing sides, promote anti-war programmes on TV, set up exchange schemes for students of the opposing sides. They might try to influence the financial supporters of conflict outside the region to redirect their funding into more positive ways. They could offer the Palestinians and the citizens of neighbouring Arab countries different forms of aid, including education and scientific aid, and measures aimed at providing a secular education for all Arab citizens.

By appealing to people's self-interest, Middle East Peace Bonds would be more effective than conventional efforts aimed at reducing violence. In channelling market forces into the achievement of this objective the bonds could bypass or even co-opt the corrupt or malicious people in government and elsewhere who currently benefit from conflict.

Middle East Peace Bonds would focus on an identifiable peace outcomes and channel market efficiencies into diverse, adaptive ways of achieving it. They might sound implausible and radical but - let's be frank - the way things are currently going, with no end of well-meaning inter-faith dialogue and not-always-well-meaning interventions by UN bodies, governments outside the region and NGOs, is leading all of us into the abyss.

For another version of this essay, see [3]here. For applying the [4]Social Policy Bond principle to conflict reduction more generally, see here.

### **20.11.2 Peace: the long view (2023-11-11 16:31)**

Financial incentives aren't going to prevent terror groups from killing civilians of a different persuasion. They're too far gone for that. But that fact doesn't undermine the workings of [1]Middle East Peace Bonds or [2]World Peace Bonds.

It's true that we are unlikely to be able to deflect a terrorist who's been brought up from birth to hate members of a different religion, sect or ideology, from murderous intent with some

cash payment. It is, however, possible, though still unlikely, to prevent him or her acting on that intent. But it's far more likely that if bonds had been issued targeting sustained peace in the Middle East (say), that such a person would not exist. A long-term peace strategy, of the sort currently pursued by well-intentioned but under-resourced groups could not only try to staunch the conditioning of schoolchildren and set up alternatives to the hate-filled media that is often a [3]precursor to war, but *would have the incentives and resources to do so effectively.*

Most likely, such an approach would need to be taken in parallel with others, including strong defences, controls on weaponry, more inter-faith dialogue and other trust-building exercises. The reasons for applying the Social Policy Bond concept which, at its heart, is about using financial incentives are that:

- Once bonds have been issued there would be no uncertainty about policy changes, so investors in the bonds would be sure that, if successful, they would be rewarded;
- Given the long-term vision, a wide range of possible approaches could be researched and tried and, if promising, implemented and refined. The bonds would reward only the most successful approaches and, in contrast to current policy, ensure that failing approaches are terminated.

So, yes, people are right to be sceptical that fanatical ideologues can be dissuaded from killing people by a some pecuniary reward. But once a system of incentives is in place, all types of people could work towards countering hateful ideologies, promoting the benefits of tolerance, and creating the conditions for peace. The relevant question here is less 'could it work?', that 'is it more likely to work than the current array of (in my view) failing approaches?'

### **20.11.3 Investing in world peace (2023-11-24 17:44)**

As a species, we know the solutions to a very limited number of social and environmental problems. If the motivation and resources are there, we can be quite effective at solving visible and localised problems, such as a polluted lake, or high levels of crime or unemployment in a small area. But with any degree of complexity and complexity we're out of luck. We simply don't know the best ways of reducing crime, eliminating poverty, dealing with climate change or ending large-scale conflict. These are problems that are:

- long term,
- broad,

- likely to need a mix of diverse, adaptive approaches to their achievement, and
- resistant to any current or envisaged efforts by policymakers to their achievement.

Such problems are exactly those that Social Policy Bonds are poised to solve. Take a goal such as sustained world peace, which many of us see as impossibly idealistic. Our efforts, for the most part made by hard-working and well-meaning people, are distinctly unsuccessful. It's a problem suited to the Social Policy Bond idea. The bonds would, by rewarding the sustained achievement of world peace, motivate existing bodies to do more. This is where criticism of the bonds usually begins and ends, as if I am suggesting that employees of such organisations as the United Nations are motivated purely by money, and need more of it to do their jobs effectively. There's a hint of disdain for such mercenary motives here, familiar to those of us brought up in a society pervaded by class conflict and snobbery. To which I have two answers:

- The bonds would not just see that existing organisations pay their people more; they would also give these bodies more resources to work with, provided that investors in the bonds regard them as efficient; and
- The bonds would represent a commitment to a stable, long-term goal. With incentives to achieve that goal, not only would efficient, existing bodies benefit, but new organisations could be created whose every action would be devoted to achieving peace quickly and efficiently.

So a sufficiently funded [1]World Peace Bond regime would generate more resources for all bodies, existing or new, so long as they are efficient. The effect would be to encourage research into diverse approaches; to finance trials of the most promising ones (and, importantly, to terminate those that are failing), and to enable the refinement and implementation of only those approaches that are most effective.

#### **20.11.4 Health and efficiency (2023-11-29 17:38)**

(No, not [1]H &E!)

Dr Malcolm Kendrick, in the third part of his inquiry into the UK's National Health Service (NHS) [2]*What is wrong with the NHS?*, summarises the problem:

[I]n the last four to five years, productivity has fallen by around twenty per cent. ...[W]hat we have is twenty per cent more staff, working just as hard, probably harder. Yet, they are creating no additional clinical outcomes. Where does this leave us? ...There is only one possible conclusion. Which is the following.  
At least twenty per-cent of the work that clinical staff are doing is non-productive.

A large part of the problem appears to be the lamentable proliferation of regulatory oversight and overseers in the NHS. He quotes from a [3]report (pdf) by the Institute of Government:

We found that hospitals that had more managers or spent more on management **were not rated as having higher quality management** in the staff survey, **nor did they have better performance.**

The implication being the overall hospital performance is dictated by clinical actions and behaviour, while hospital management is focused on administrative tasks ensuring regulatory constraints are met. **The number of managers in each hospital was largely determined by the administrative tasks that needed to be fulfilled**, with the scope of management circumscribed to these well-defined tasks. (Dr Kendrick's emphasis)

Dr Kendrick illustrates this point by showing a picture of Dr Gordon Caldwell lying beside the paperwork necessary to admit one patient to the Accident & Emergency department of an NHS hospital.

'These are the forms that now have to be completed to admit *one* patient in Accident and Emergency.'

[5]

It's not uncommon, in my view, for large institutions, be they public or private, to lose sight of their original goals. After enough time these organisations' existence is taken as a given, and they cease to be judged solely on how good they are at achieving their stated objectives. In the case of NHS hospitals, the original goals would have been expressed in terms of clinical outcomes but, because of regulatory pressures from outside, those outcomes have ceased to be the over-arching measure of success.

This is where a Social Policy Bond regime could help. It would set down our long-term social and environmental goals and inject market incentives into their achievement. At every stage of progress toward achievement of our goals, investors in the bonds would have efficiency as their over-riding criterion. The bonds would always be owned by those who can maximise the speed and cost-effectiveness of the targeted goals.

A bond regime targeting the health of a country's population would express its goals in terms that are stable, and long term. A health bond would target a range of indicators that could include such goals as improvements in longevity, reductions in infant mortality, and improvements in Quality Adjusted Life Years. (It should exclude such indicators as five-year cancer survival rates, which can [6]mislead.) Broad measures such as those a bond regime target would be readily comprehensible to the public, and so would attract more [7]buy-in. Links to my work on applying the [8]Social Policy Bond concept to health can be found [9]here.

## 20.12 December

### 20.12.1 Make saving the planet profitable (2023-12-17 11:19)

"Making oil is more profitable than saving the planet ..."

...says the [1]headline

,

accurately. There are many other activities that are more profitable than saving the planet: fomenting conflict, manufacturing, office work, mining...etc. We try to curb some of their most obvious environmentally destructive by-products with taxes and regulation, but we also support activities that destroy the environment - to the tune of [2] \$1.8 trillion, annually.

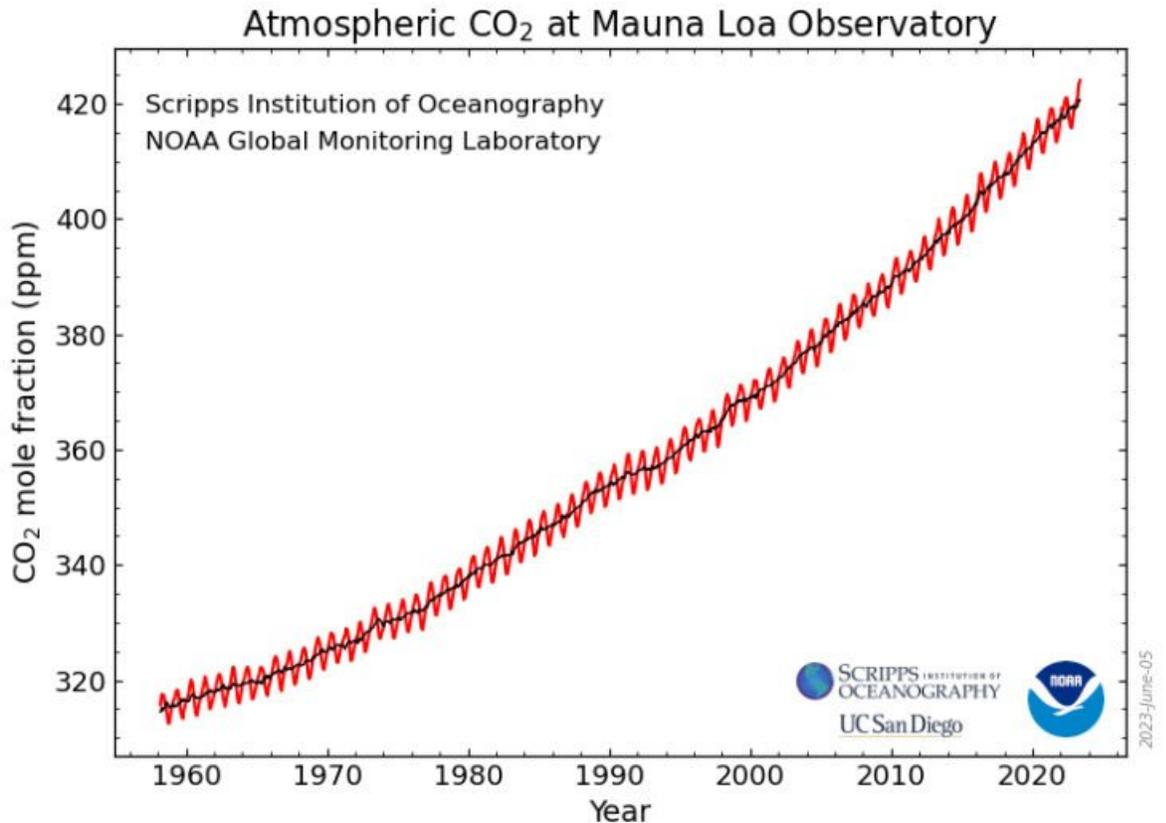

I don't know whether making oil will destroy the planet: there are many negative externalities that accompany oil production and consumption, but there are also many positive externalities. Thus, Alex Epstein writes:

There are many other positive externalities of fossil fuels that are almost never discussed—including ... clear benefits [arising from] warmer temperatures in many places where cold-related deaths far, far exceed heat-related deaths. To not consider these is pure benefit denial, regardless of whether you use a word like “externalities.” [3]*Fossil Future*, Alex Epstein, 2022

Whether the benefits of oil production and consumption outweigh all its costs to society, to the environment and to the long-term future of the planet can never be calculated in a meaningful way. With such urgent, hugely important and complex issues, I suggest that we set in place a range of acceptable outcomes and reward people for achieving them. These outcomes could be expressed, to take those relevant to oil, in terms of atmospheric composition and human, animal and plant well-being. That means that we should target reductions in polluting gases (not only greenhouse gases) while maintaining acceptable levels of human welfare and indicators of environmental well-being.

Doing that would recognise that there are trade-offs; that rapidly reducing oil production and consumption could drastically reduce the quality of life for millions of people. That is one reason why there's been no discernible progress in actually cutting greenhouse gas emissions:

[4]

'Climate activism became a big public cause about halfway along this graph. Notice any effect?' From [5]*Riding the Climate Toboggan*, John Michael Greer, 6 September

Targeting atmospheric composition and, simultaneously, indicators of planetary well-being would, I think, be less unpopular and more attainable than the current efforts supposedly aimed at reducing climate change. My suggestion is that we achieve our aims by issuing bonds that would be redeemed only when all our targets have been achieved and sustained for some decades. This we could do by applying the Social Policy Bond concept to our targets. We do need, though, some [6]clarity about what we are trying to achieve: do we want to target the Earth's climate, or the impacts of adverse climatic events or - to take the current focus - the concentration of greenhouse gases in the atmosphere? At this late stage it's probably best to aim for more immediately verifiable goals, so I suggest that it might be preferable to target atmospheric composition rather than the [7]stability of the climate, which has been the focus of my previous work. If such an application of the Social Policy Bond concept were ever implemented then we'd go some way to making saving the planet more profitable than activities that have, as a by-product, accelerating its destruction.

To be frank, I don't think anything like this will happen. Our political systems are incapable of solving global problems, even if our leaders had the will to do so. The Social Policy Bond concept has, to my knowledge, never been tried, and there are few incentives and commensurately few resources that are channelled into saving the planet. It's sad.

### **20.12.2 Nobody wants nuclear war. So why is it increasingly likely? (2023-12-18 19:53)**

Some recent reporting:lurk

South Korea is again considering developing and manufacturing its own nuclear weapons. The cause is the growing instability of North Korea and South Korean fears that the United States won't fulfill its pledge to attack North Korea with nuclear weapons if the North attacks South Korea with nukes. [1]source

Of the total global inventory of an estimated 12 512 warheads in January 2023, about 9576 were in military stockpiles for potential use—86 more than in January 2022. [2]source

China, India, North Korea, Pakistan and the United Kingdom, as well as possibly Russia, are all thought to be increasing their stockpiles. [3]source

There are two things that we can be almost certain about:

1. Very few people want to see a nuclear conflict, and
2. the chances of a nuclear conflict are rising.

Why the disconnect between what most people want, and what we are very likely to get? In the nuclear policy arena, there is the self-entrenching idea of deterrence. 'If they were ever used they'd be failing in their purpose,' went the caption to a picture of UK nuclear-armed submarines lurking deep in the sea, in an advertisement for naval recruitment. Other countries have them, so we need them too. The logic is persuasive; the cost of not following it incalculably great - possibly. The problem is that very few of us have sufficient incentive to question this logic

and to think of alternatives. There are organisations of all sorts, staffed by well-intentioned, hard-working people who do what they can, with their scanty resources, to minimise conflict. But they are institutionally bound to think and act along conventional lines.

What I propose is that we offer incentives for people to think of alternative approaches, all of which would have as their aim to reduce the likelihood of nuclear conflict as efficiently as possible. I have no idea how to halt the drift towards nuclear conflict, but I can suggest that we put in place a system that encourages and rewards people for researching, refining and implementing the most promising of such alternative approaches.

Nuclear Peace Bonds would be an ideal application of the [4]Social Policy Bond concept, which is a way of rewarding verifiable outcomes that we are currently failing to achieve. In this instance, the targeted outcome could be nuclear peace sustained for thirty years. 'Nuclear peace' could be defined as something like 'the number of people killed within 24 hours by the detonation of a nuclear device is less than 500'. The bonds would reward those who achieve such a sustained period of nuclear peace, whoever they are and however they do so: only the outcome would be stipulated. For a short piece on how Nuclear Peace Bonds would work, please click [5]here. For essays about applying the bonds to conflict in general, click [6]here.

As well as pursuing activities the exact nature of which we cannot anticipate, investors in Nuclear Peace Bonds could do things that cannot be done by existing organisations, constrained as they are by precedent, and their perceived need to maintain their existence and so satisfy the bodies that fund them. So, for example, in today's world, nobody would have any incentive to bribe people close to decision makers in politics or the military to advocate nuclear disarmament. Likewise, an existing body is unlikely to try to get religious extremists to tone down their rhetoric, even if it believed that were the most efficient way of reducing the probability of nuclear conflict. The risk and consequences of exposure and backlash are too great for current institutions to bear. Holders of Nuclear Peace Bonds, however, would not be deterred from whatever actions they think most effective: funds to redeem their bonds could be held in escrow. Once nuclear peace had been achieved and sustained, their reward would be guaranteed.

# 2024

## 21.1 January

### 21.1.1 Tantrums, bribes and world peace (2024-01-06 21:38)

Nobody seems to have high expectations for this year, beyond any personal hopes and dreams. War, fear of new pandemics, environmental tipping points, nuclear proliferation: the possibilities are frightening. Yet the ingenuity of our species knows no bounds. Each day brings news of discoveries in every field of the sciences, medicine, technology including IT... All driven by our curiosity, intellect, skills and hours of dedication and hard work.

And - oh yes - by ample funding. Perhaps it's funding and the way it's allocated that explain the contrast between our boundless successes and the very real possibility that we are heading for at least one of a baleful array of potential calamities. We are collectively very happy to support research into activities that have identifiable winners, such as pharmaceutical companies, weapons manufacturers and also, to be fair, universities and research institutes. We are less happy to adopt the [1]Social Policy Bond approach by targeting outcomes, such as world peace, however desirable they are, where humanity - the biggest beneficiary - cannot monetise its wishes. Such goals as world peace, if we believe them attainable at all are, we think, best worked towards by bodies that might have founded with idealistic goals and hard-working, well-meaning employees, but have (often) been ossified by routine and cynicism, such that their over-arching goal is now self perpetuation. Those bodies that have escaped that fate are pitifully under-resourced and make only localised impacts.

We pay teachers, don't we? They receive salaries, as do doctors, nurses, and people who care for others. But we are squeamish about paying people for things that we think should be pursued solely for idealistic reasons. Example: paying people not to kill each other is a long way short of ideal, but I believe that, if it's the only or the best way of avoiding deadly conflict, then we should encourage it. It is one possible approach that investors in World Peace Bonds could follow; an approach that we eschew, not because it's been tried and failed, but because (I surmise) it's too crude, or too defeatist (as in 'are we really so degenerate that we have to bribe adults not to have murderous tantrums?'), or perhaps because it's never been tried before. Tried, tested and failed will always beat new, might-not-work and disruptive. In large institutions of any sort, things must never be done for the first time.

[2]World Peace Bonds would allow for the possibility that such unsubtle measures as bribing or otherwise undermining those who foment conflict are the most efficient way of bringing

about peace. They would encourage research and experimentation of all potentially viable measures, and refinement and implementation of only the most promising ones. The goal is always to achieve peace as efficiently and speedily as possible and the way the bonds work would ensure that all activities, always, would be aimed at that goal. To this end, approaches would be necessarily diverse (what works in one part of the world won't work in another) and adaptive (what works in some conditions won't work in others). Such flexibility is beyond the imagination of any current organisation, be it private- or public-sector.

There are other advantages to this application of the Social Policy Bond principle: the bonds would take a long-term view, paying out only when the goal (world peace, in our example) had been achieved and sustained for a period of, say, three decades. They would divert funds away from socially neutral or negative activities as investors, with an eye only on their financial returns, would see the light. This does not mean that only self-interested investors would be rewarded: the gains from holding the bonds while working to achieve society's goals would cascade downwards, so that the number of, and rewards to all those working for bondholders would benefit, just as civil servants, teachers or workers generally, benefit from the success of their employers.

### **21.1.2 Nothing to report (2024-01-22 17:34)**

There's very little happening with the Social Policy Bonds idea. At least, I'm not aware of any progress. In many ways we seem to be going backwards. With climate change, for instance, there appears to be less focus on defining the outcomes we want to achieve, and more on such surrogate indicators as numbers of electric vehicles on the road or generating capacity of wind and solar installations. Other environmental problems receive even less attention. Nuclear and non-nuclear weapons continue to proliferate. Our politicians are judged less by their achievements or competence and more according to soundbites, personality and tribal identity. Outcomes - verifiable meaningful outcomes - are rarely cited now as goals of policy. Politicians hang on to power for its own sake, or because they can't find better jobs, or because it gives them immunity from prosecution for corruption or war crimes. A capable, aspiring, idealistic man or woman would hardly choose to go into politics, where the entirety of your private life and those of your family are scrutinised by those looking to sell a story. There are more suitable positions in the private sector, NGOs or religious bodies.

So there's little to be optimistic about. The Social Policy Bond concept seems to be out of sync with today's realities. For the last thirty years I've been told that the idea is ahead of its time, but now I think it's behind its time, in that long-term goals are a yet lower priority than immediate concerns. The idea receives little attention now, and though such attention is welcome, it is invariably fleeting and unlikely to gain traction.

I still think the bonds they could play a role where we are confronting big, urgent crises, such as war and nuclear war and the many global and regional environmental depredations.

When it comes to war, right now almost all the financial incentives favour those who wish to foment conflict or who would benefit (at least in the short run) from it. We need countervailing incentives; incentives that would divert talented people from activities with little or negative social benefit, into improving the prospects for peace. It is disappointing that much of our undoubted human ingenuity is devoted to trading esoteric financial instruments, computer coding, advertising dog food etc, all of which would have their place if the probability of social and environmental catastrophes could be significantly lowered. I will carry on with publishing this blog, in the hope that, even if the ideas here and on my [1]SocialGoals.com site are not taken up immediately, they will be around for others to develop, refine and implement when I cease publishing.

## 21.2 February

### 21.2.1 The question nobody asks: are the cows actually better off? (2024-02-03 15:15)

The effort highlights a glaring cow-related contradiction in the BJP's [Bharatiya Janata Party's] Hindu nationalist ideology. The party says it wants to protect cows, which are associated with divine beneficence and venerated by Hindus. Yet its pro-cow policies, including bans on cow slaughter, appear to be detrimental to cattle welfare. They are thought to be causing an increase in stray cows, typically male calves and aged milkers which, having little commercial value, are let loose by their owners. Abandoned, they feed on plastic bags and other rubbish, cause car crashes and raid farmers' crops. [1]*The Hindu right's pro-cow policies are terrible for India's cows*, the 'Economist', 3 February

It shouldn't surprise us. The stated aim of a policy in today's policymaking environment need have no relationship to its result. The two may, as here, even be conflict. Collectively, we rarely hold the people who make a policy responsible for its outcome. In the private sector it's different: there are the disciplines of the market and competition, and reliable, visible, constantly readable indicators of the success or failure of an enterprise. But in the public sector:

[G]overnment bureaucracies non-self-evaluate. At a minimum, agencies with evaluative responsibilities are not invited to evaluate - they are kept out of the loop, their opinions unsought. At a maximum, government agencies actively suppress their own internal evaluative units and are discouraged from evaluating the beliefs and policies of other agencies. [2]*Why States Believe Foolish Ideas: Non-Self-Evaluation By States And Societies* (pdf),

So politicians can get away with selling their policies according to what they say they will achieve. In the absence of data we choose politicians who have lofty-sounding goals, or who look good on camera. We vote for people, or personalities, or out of tribal loyalty to political parties.

A Social Policy Bond regime would be different. We'd vote for social and environmental outcomes, rather than the people or policies who say they'll achieve them. Politicians would retain their roles of articulators of society's wishes and revenue raisers, but their role of allocating finance and determining the structure of bodies charged with achieving society's goals would be diminished. Those decisions would be taken by bondholders, who would make them according to the sole criterion of efficiency in achieving the targeted goal at minimum cost. Bondholders would face the discipline of the market: if they are inefficient, their bonds would be bought up by more efficient operators. A transition to such a regime should be made gradually, partly for pragmatic reasons, but partly also to give existing bodies a chance to evaluate and improve their performance. (I discuss such a transition in my [3]book.) There would be a gradual focus away from politicians and their antics, and more on the elements that make up society's well-being. So rather than be swayed by such rhetoric as how a particular policy would be good for cows in India, say, we'd look instead at whether things are actually improving for cows. Such a way judging is perfectly acceptable in the private sector; extending it to goals currently the remit of the public sector, could greatly benefit society.

### **21.2.2 In no-strings philanthropy I trust (2024-02-16 11:14)**

The *Economist* writes:

[T]he great expansion of higher education has coincided with a productivity slowdown. Whereas in the 1950s and 1960s workers' output per hour across the rich world rose by 4 % a year, in the decade before the covid-19 pandemic 1 % a year was the norm. Even with the wave of innovation in artificial intelligence, productivity growth remains weak—less than 1 % a year, on a rough estimate—which is bad news for economic growth. A new [1]paper by Ashish Arora, Sharon Belenzon, Larisa C. Cioaca, Lia Sheer and Hansen Zhang, five economists, suggests that universities' blistering growth and the rich world's stagnant productivity could be two sides of the same coin. ...

Businesses had more responsibility for achieving scientific breakthroughs: in America during the 1950s they spent four times as much on research as universities. ...[W]hen it came to delivering productivity gains the old, big-business model of science worked better than the new, university-led one. ... Free from the demands of corporate overlords, [university] research focuses more on satisfying geeks' curiosity or boosting citation counts than it does on finding breakthrough that will change the world or make money. [2]Universities are failing to boost economic growth, the 'Economist', 5 February

To me, this speaks to the value of incentives. Research of the type done by universities is similar to the way that our social and environmental goals are pursued: they are done by large organisations whose employees are not rewarded in ways that correlate with their success. Those who work for government or government-dependent bodies are, consciously or not, disinclined to rock the boat. The funding of these bodies is hardly, if at all, linked to their success in coming up with problem-solving initiatives. Sadly, most of our important social and environmental goals fall under the remit of such government-dependent bodies. These include the elimination of poverty and crime, the reduction of environmental depredations and, on a global level, the solution to such trans-national problems such as over-fishing and war. Research is just one of the activities that government has brought into its purview, with the disappointing results that Arora *et al* relate.

How is it that government constantly expands its remit? There is the sense that some things are too important to be left to the private sector, and that only government can be impartial as to the allocation of funding. This sense pervades such critical debates as to whether the UK's National Health Service should be partly or completely privatised. That debate rarely considers health outcomes or, indeed, any outcomes at all: instead, ideology and vested interests set the debate's terms. Some concerns are genuine: markets have been abused and undermined such that they, in many cases, are rightly discredited in the eyes of the public.

[3]Social Policy Bonds could combine the best elements of both the public and private sectors. Under a bond regime, government could articulate society's wishes and raise the revenue for their fulfilment; these are things that democratic governments can do well. But where they perform badly is in actually achieving society's goals, largely because of the incentive structures they put in place: the structures that reward activity regardless of outcome. The effect of a Social Policy Bond regime, however, would be to contract out society's goals to those best placed to the achieve them. In economic theory and on all the evidence, that is what competitive markets do best. An obstacle in the way of implementing the Social Policy Bond concept is the unwillingness of government and its funded bodies to relinquish their control over activities ostensibly directed at the public good. Rather than wait for government to do that, perhaps the best hope for a [4]no-strings philanthropist to get the ball rolling....

### 21.2.3 Pournelle's Law (2024-02-24 16:03)

The *Economist* quotes Sir Keir Starmer:

Policy churn is the 'single most important reason' for the [UK's] economic malaise.  
[1]Sir Keir Starmer: bureaucrat first, politician second, the 'Economist', 24 February

There is some truth there, but what explains policy churn? [2]Pournelle's Iron Law of Bureaucracy tells us that:

[1]In any bureaucratic organization there will be two kinds of people:

First, there will be those who are devoted to the goals of the organization. Examples are dedicated classroom teachers in an educational bureaucracy, many of the engineers and launch technicians and scientists at NASA, even some agricultural scientists and advisors in the former Soviet Union collective farming administration.

Secondly, there will be those dedicated to the organization itself. Examples are many of the administrators in the education system, many professors of education, many teachers union officials, much of the NASA headquarters staff, etc.

The Iron Law states that in every case the second group will gain and keep control of the organization. It will write the rules, and control promotions within the organization.

I've written ([3]here, for example) about the swerving of organisations away from their ideals and ultimately becoming self-perpetuation. I think it applies to every type of organisation, public- and private-sector. In my understanding, policy churn follows from this: it's a result of politicians wishing to retain control over their bureaucracies. Whereas, under a [4]Social Policy Bond regime, the incentives to achieve society's targeted goals would cascade downwards, under our current political systems the incentives of our publicly-funded bodies are to maintain their income in an environment that, thanks to policy churn, is constantly changing. The result is the short-term thinking and learned helplessness of our bureaucracies. A bond regime would encourage the creation of [5]a new type of organisation: one whose structure and every activity would be entirely subordinate to society's targeted goals.

## 21.3 March

### 21.3.1 Black Out nights, climate and war: the need for verifiable goals (2024-03-11 17:30)

Stephen Bush writes about 'Black Out' nights in the US and UK, which are intended to encourage more black people to attend theatre performances by inviting an 'all-Black-identifying audience'. Mr Bush's opinion about this form of segregation is similar to mine (negative), but he is also ...

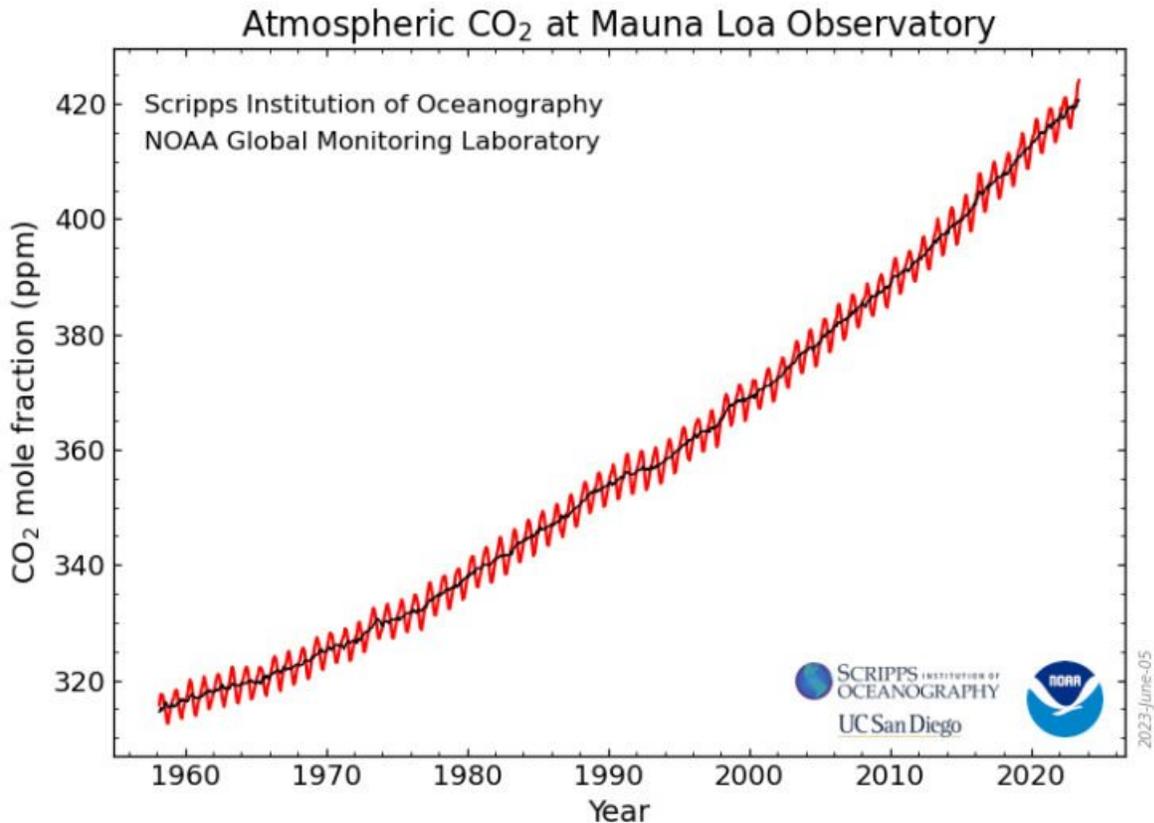

...struck by an equally important and more widespread problem: that no one involved either has any idea if the scheme works or any plan for measuring it. [1]Even worthwhile causes need a metric for success (paywall), Stephen Bush, 'Financial Times', 11 March

He concludes:

All of us who criticise Black Out nights because we don't like the principle at stake are also guilty of failing to ask the first question we should pose to anyone doing anything, no matter how worthwhile. And that is: how, exactly, will we be able to tell if you've succeeded or failed?

It's a common failing, and one that is most grievous when it's made by policymakers. My [2]previous post refers to an [3]article written 22 years ago by Stephen van Evera, and I don't think things have improved since then. It's one of the reasons that I have posed [4]Climate Stability Bonds as an alternative to the current focus on reducing greenhouse gas emissions as the sole solution the climate change problem. We can target emissions fairly accurately, but we cannot reliably link any changes in emissions to changes in the things that matter to us. We need to specify exactly what are those concerns, and set up reliable measures of progress towards addressing them, before imposing heavy regulatory and financial costs on society. That's one reason, I believe, that despite heroic efforts (alongside those costs), nothing in the way of greenhouse gas emission has been achieved.

[5]

'Climate activism became a big public cause about halfway along this graph. Notice any effect?' From [6]*Riding the Climate Toboggan*, John Michael Greer, 6 September 2023

It seems that charities and activists are following the government's lead: declaring grandiose, lofty-sounding goals that just happen to be so vague as to resist effective monitoring. Speaking out against initiatives that may well be futile and certainly cannot be shown to be successful, such as Black Out nights or, indeed, agreements to cut greenhouse gas emissions is, in today's politically polarised scene, risky. Potentially even more disastrous for humanity than the climate change circus is the failure to set and reward verifiable goals for eliminating deadly conflicts: wars and civil wars and their consequences. There are well-meaning, hard-working people working for bodies ostensibly aimed at reducing conflict levels, but nobody is in a position to judge how effective are any of their myriad approaches.

A [7]Social Policy Bond regime would not allow policymakers to get away with specifying goals that can't be measured. So, for example, we need to identify what exactly we want climate change policy to achieve. Our goals in that area could be defined in terms of a range of physical, ecological, social and financial indicators, all of which would have to fall within an approved range for a sustained period before the policy would be deemed successful, and holders of Climate Stability Bonds rewarded. That period could be decades long. All of

this would be a sharp contrast to today's approach, which has as its sole goal a reduction in greenhouse gas emissions, which even if it were to be achieved, does not speak to the concerns of ordinary people, which is one reason why it has gained no real traction. Similarly, with conflict. Targeting broad, *verifiable*, meaningful, long-term outcomes, such as sustained period of a more benign climate or [8]world peace would not only be more effective than any current efforts to solve global problems; it would enjoy more public support and hence more buy-in; essential if we are to successfully meet the huge challenges humanity faces, of which climate change and war are two of the most urgent.

### 21.3.2 Defining and rewarding peace (2024-03-24 12:06)

How do we define 'peace' in such a way it could be meaningfully targeted by such applications of the Social Policy Bond concept as [1]World Peace Bonds or [2]Middle East Peace Bonds?

It seems difficult at first. Peace, in the sense of absence of open conflict reigns, by definition, in the years before wars break out. But the opening sentence of [3]*Liddell Hart's History of the First World War* gives a clue:

Fifty years were spent in the process of making Europe explosive. Five days were enough to detonate it.

A World Peace Bond regime would be targeting long-term peace. Bondholders therefore would be rewarded when they reduce the probability of conflict *before it becomes lethal*. As with most Social Policy Bond applications, our overall goal will be a set of subordinate goals, each of which has to be satisfied before the bonds will be redeemed. So, one such sub-goal could be to ensure that the 'number of people killed within 24 hours of an act of violence' falls below 5000 for a period of several decades. But this condition would have to be satisfied at the same time as others, such as the lethality of weaponry held by actors.

With a goal for peace that must be sustained over fifty or more years, metrics that target for elimination the use of deadly violence become more closely aligned with what we actually want to achieve. With such a decades-long outlook, bondholders would have incentives not merely to prevent the outbreak of violence, but also to prevent the precursors to violence. For example: the Cold War ended peacefully, but if World Peace Bonds issued in the year

1950 had targeted a period of sustained peace of just ten years then bondholders would have profited, despite the accumulation of ever more horrific atomic and nuclear weapons, during the period that preceded the Cuban Missile Crisis of October 1962. If the same bonds had been issued with a target of fifty years of sustained peace, then bondholders would have been motivated to reduce tensions, including by such means as reducing the weapons pile-up, or fostering better relations between the US and USSR. A ten-year goal would see the original bondholders making profits while the prospects for peace looked ever darker. A fifty-year goal would have seen the value of their holdings collapse before and during the Crisis.

The point is that rewarding peace sustained for a decades-long period encourages longer-term thinking. By choosing to target a decades-long period of sustained peace, we should do much to eliminate the much less quantifiable - but hugely important - precursors of violence.

Even more appealing as a target would be [4]nuclear peace. A goal such as 'fewer than 500 people killed by a nuclear device within one month of its detonation over a period of fifty years' would be even simpler to define robustly, and could be a top priority for organisations, or philanthropists perhaps, who wish to ensure nuclear peace, but have no means or wish to get involved in achieving it.

### **21.3.3 Transcending identity geopolitics: Conflict Reduction Bonds (2024-03-28 11:38)**

Gideon Rachman asks:

What is it that causes some tragedies and conflicts to command the world's attention and others to pass almost unnoticed?

The tragedies of Ukraine, Gaza and Israel all get far more attention than wars and humanitarian calamities in the rest of the world. ... [L]ast week the UN warned that "Sudan will soon be the world's worst hunger crisis" with 18mn people facing acute food insecurity. It highlighted an ongoing conflict that involves "mass graves, gang rapes, shockingly indiscriminate attacks in densely populated areas" and more than 6.5mn displaced people. [1]*War and the rise of identity geopolitics*, Gideon Rachman, 'Financial Times', 27 March

The answer appears to be something Mr Rachman calls identity geopolitics. But for my purposes, the 'why' doesn't really matter. A higher priority is, I believe, to target for reduction *all* deaths and depredations caused by human conflict, *impartially*; that is, without regard to people's identity, beliefs, or where they live. We have limited conflict reduction resources, and

they should be deployed where they can relieve the most human suffering. When thinking rationally and compassionately, I believe most of us would agree.

One way of doing this would be to issue [2]Social Policy Bonds to target [3]conflict and the results of conflict. The bonds could target conflict in a particular region (the [4]Middle East, for instance), or the entire [5]globe, or (simpler to monitor), [6]nuclear conflict specifically, depending on the source, magnitude and interests of those funding the bonds. I will admit that the idea of issuing bonds targeting something the ancient Greeks and others have deemed an [7]inescapable aspect of human nature seems overly idealistic at first sight. But incentives can direct our goals and behaviour in unimaginably varied directions. Financial incentives, as offered by the bonds, aren't the only way of influencing our behaviour but, if they are sufficiently large and embedded in a very long-term vision, they could attenuate some of the more negative human traits that lead to deadly conflict. If that sounds far-fetched, consider the power of financial incentives to foment conflict: without weapons at every level of sophistication, tragedies of the scale at which we are seeing today would simply not occur. Manufacturers supply weapons in such copious quantities precisely because of the financial incentives on offer.

The links in the previous paragraph lead to pieces explaining how the bonds would work. In my view, issuing bonds with the goal of peace sustained for several decades would have two huge benefits:

- They would bring about more more efficient allocation of conflict-reduction resources, so minimising the human suffering that conflict brings about, including that measured in terms of deaths, injury, or homelessness.
- For that reason, people would be more inclined to invest in conflict reduction, in all its aspects, many of which will be innovate and that we cannot anticipate.

Greater effectiveness of peace making, and more resources devoted to peace making: I think it's worth a try.

## 21.4 April

### 21.4.1 Betting markets and benign manipulation (2024-04-11 16:59)

Zachary Basu writes about the 'explosion of legalized gambling' in the US, which 'has set the stage for a provocative new frontier in the world of risk-taking — betting markets for everyday

events, ranging from Taylor Swift streams to hurricanes hitting major U.S. cities.’  
Punters...

...can bet on hundreds of real-world events — whether the Fed will cut rates, the high temperature today in Miami, Oscar nominations, the outcome of Supreme Court cases — on [1]Kalshi, the only federally regulated exchange dedicated to event markets.... Some ethics experts have raised concerns about the integrity of betting on natural disasters and other markets tied to human suffering, as well as those that could be subject to manipulation. [2]*America the slot machine*, Zachary Basu, 10 April

If there were a market that promised huge rewards for successfully predicting, say, a halving of the number of people killed by natural disasters in the US, then you can see how it would be in punters’ (otherwise known as ‘investors’’) interests to do whatever they can to improve US citizens’ resilience to such disasters. And that explains how I came up with the idea of Social Policy Bonds: the aim is to reward not so much the successful prediction of future events, but successful efforts to *influence* future events to the benefit of society. Hence, in this example, [3]Disaster Prevention Bonds.

The [4]Social Policy Bond principle is a beneficial form of the manipulation to which Mr Basu refers, which can manifest itself in the sports world as match fixing. With governments (unsurprisingly) and philanthropists (disappointingly) taking only [5]tiny steps in the direction of rewarding successful achievement of beneficial outcomes, perhaps another approach would be to set up a market with Kalshi for a relatively unambitious goal. Those who stand to lose money from, say, high crime rates in a particular city, such as insurance companies, could bet that crime in that city will *not* halve in the next five years. Punters on the other side of that gamble, and would be motivated to do all they can to make sure that such a halving *does* occur. Everybody would gain from this benign form of manipulation. Such is the Social Policy Bonds differ only in that those setting up the bet would aim to reduce all forms of losses, not only those that can be valued monetarily.

## 21.4.2 Another way of subsidising the rich (2024-04-18 16:53)

Environmental policy now seems focused almost exclusively on greenhouse gas emissions. Almost anything that *might* reduce the net emissions of those gases that are currently thought to be the instigators of global warming is lauded and, indeed, subsidised, regardless of its impact on land use, water quality, child labour, and the viability of public transport.

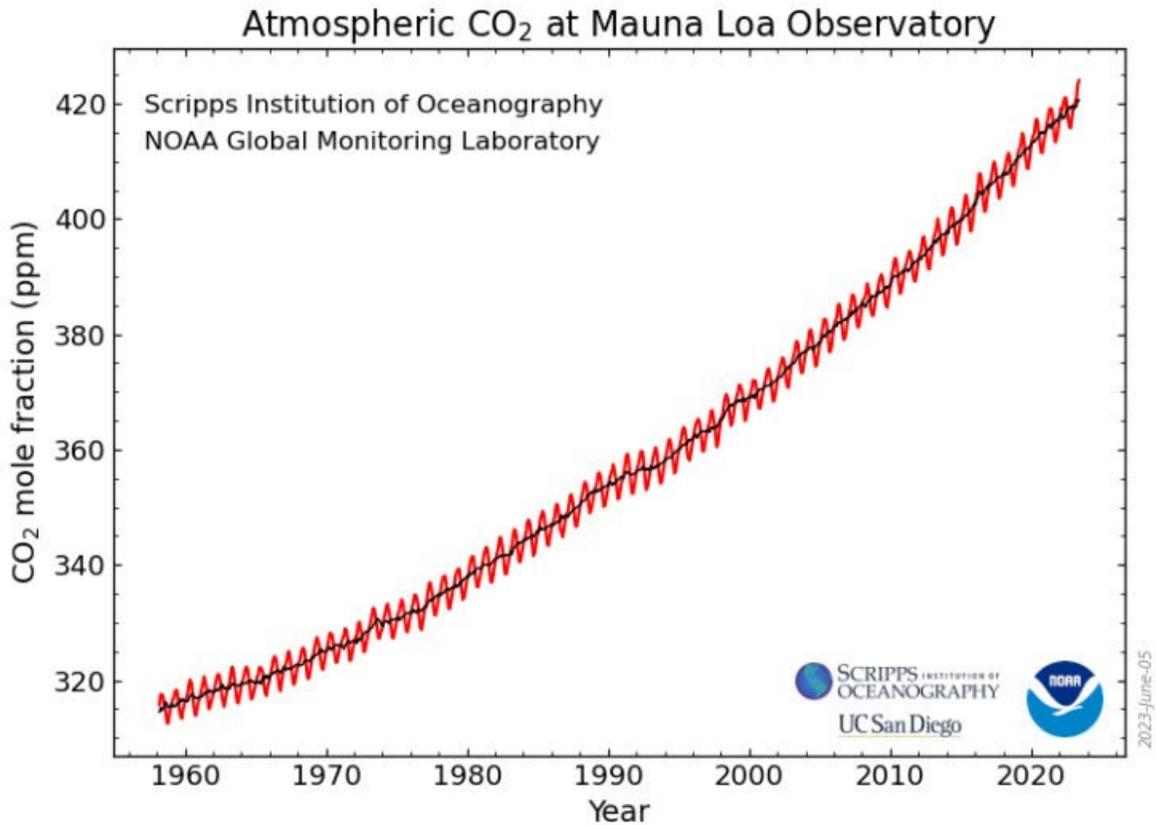

And inequality. Take Norway, which is...

...constantly being hailed as a frontrunner in the promotion of electric cars. It is true that there has been a real boom of BEV [battery electric vehicle] sales in the country – due to generous government subsidies. However, the overall picture is not so rosy – one might even consider it tragic. Namely, in 2010, there were 2,308,000 cars, while by 2022 this number jumped to 3,105,000 – in a country with a population of 5.4 million. During this period, the number of internal combustion engine (ICE) cars did not decrease at all. ... Many [Norwegians] think that it would have been more useful to invest more in public transport and encourage cycling and walking. Subsidies for electric cars have also increased social inequalities by primarily benefiting the wealthier individuals who usually bought one or more additional cars to the already existing one(s).

[1]*Electric cars are a dead end*,  
András Lukács  
Aydan Gurbanova, 'The Ecologist', 16 April

There's something really cynical about this. If we are serious about wanting to reduce our impact on the climate, then we need to enact policies that reduce our impact on the climate. We need also to take into account the negative externalities of our policies, not only on distribution (of income or wealth), but also on the environment more generally.

My suggestion is that we focus on the outcomes that we want to achieve, rather than the supposed means of achieving them. [2]The fundamental question is whether we want to change the climate, or to reduce the adverse impacts of climate change. We could, for example, aim for a range of social, physical, biological and financial indicators (insurance claims for instance); all of which must fall within an approved range for a sustained period in order for our climate goal to be deemed achieved. The tunnel vision focus on greenhouse gas emissions won't do anything to bring about such a broad range of goals. In fact, despite vast expenditure of bureaucratic energy, technical advances, coercion and subsidies it's even failing to reduce greenhouse gas emissions:

'Climate activism became a big public cause about halfway along this graph. Notice any effect?' From [4]*Riding the Climate Toboggan*, John Michael Greer, 6 September

Our scientific knowledge about the impacts of, and optimal solutions to, climate change is constantly expanding, and we need policies that allow for that. My suggestion is that we reward those who achieve an array of meaningful climate-related targets by backing and issuing [5]Climate Stability Bonds. These would stimulate research into, and implementation of the diverse, adaptive approaches that will be necessary to bring about an efficient solution to the climate change problem.

### 21.4.3 Sitting on the razor's edge (2024-04-29 10:16)

Concluding her recent book on nuclear war, Annie Jacobsen writes:

Nuclear war is insane. Every person I interviewed for this book knows this. Every person. The whole premise of using nuclear weapons is madness. It is irrational. And yet here we are. Russian president Vladimir Putin recently said that he is “not bluffing” about the possibility of using weapons of mass destruction. North Korea recently accused the U.S. of having “a sinister intention to provoke a nuclear war.” We all sit on the razor's edge. [1]Nuclear War: A Scenario, Annie Jacobsen, March 2024

Each step along this razor's edge was taken rationally given the incentives on offer, and historical precedent, which tells us that if someone else, enemy or not, has a decisive weapon in their artillery, then we had better acquire one too. These individually justifiable steps have taken us, collectively, to the brink of nuclear exchange. (The term 'nuclear war' isn't really apt, as it's likely the exchange would take place over hours rather than years.) It speaks to the madness of humanity's current condition that we are at a point where our best hopes for nuclear deterrence lie in having leaders who are, or who appear to be, [2]irrational (pdf).

Where do we go from here? The technology to develop and deliver nuclear weapons (which also doesn't sound right - they're not for fighting, they're for killing whole populations) can't be wiped from our collective memory - except by their use, which would wipe out our collective memory and all of humanity and most other life besides.

Under the current system, while the total number of weapons has shrunk, the number of countries that own them has risen. The knowledge and materials needed to build them are widely, and increasingly, available worldwide. There's little to deter state and non-state actors, from doing their best to acquire them.

[3]Numerous actors *are* making efforts to prevent nuclear proliferation. They aren't, though, rewarded in ways that are linked to their success or otherwise in their mission. This does not mean that they aren't working as hard as they can, nor that they are not sufficiently motivated. It means that they have fewer resources at their command with which to continue with their current efforts and to explore other, perhaps more effective, approaches.

My suggestion is that, with the need for diverse, adaptive approaches, interested governments, NGOs, and others collectively back and issue [4]Nuclear Peace Bonds. These bonds would reward the sustained achievement of nuclear peace, however it's brought about, and whoever helps achieves it. Effectively, the bonds would be paying people to stop other people initiating mass annihilation. It's some way short of ideal, but it is better than where we appear to be heading. Ms Jacobsen continues:

What if deterrence fails? “Humanity is just one misunderstanding, one miscalculation away from nuclear annihilation,” United Nations Secretary-General António Guterres warned the world in the fall of 2022. “This is madness,” he says. “We must reverse course.” How true. The fundamental idea behind this book is to demonstrate, in appalling detail, just how horrifying nuclear war would be.

## 21.5 May

### 21.5.1 'Flow-trimming': another deception (2024-05-11 15:51)

George Monbiot writes about UK rivers:

I'd been wondering how, when [1]more sewage has been entering our rivers than ever before, some of the water companies have managed to improve the ratio of the sewage they treat v the sewage that pours untreated from their storm overflows into our rivers and the sea. Now we know. It's called "[2]flow trimming". Sounds innocuous, doesn't it? What it means is that sewage is diverted into rivers and ditches upstream of the water treatment works. By reducing the amount of sewage entering the works, the companies can claim to be dealing responsibly with a higher proportion of it. [3]*The one reliable pipeline*, George Monbiot, 10 May 2024

When goals are narrowly defined, it's easy to get away with stipulating outcomes that do nothing to achieve what society wants to achieve or, worse, that conflict with society's wishes. That's because narrowly defined goals are of little interest to most of us, so are not subject to widespread monitoring. As with much of the regulatory environment, they can be easily manipulated to mislead the public or to stifle competition. 'Flow trimming' is just another example.

My suggestion is that we become more familiar with defining society's environmental and social goals as broadly as possible. So that, instead of meaningless goals such as 'increasing the proportion of sewage entering the plant that's treated', we target indicators that actually *are*, or are *inextricably correlated*, with what we want to achieve. So, we should be targeting 'the health all of our rivers', as exhibited by an array of indicators of ecological well being. The benefits of doing so are not limited to making manipulation more difficult: goals that are too narrowly defined can be achieved by shifting problems from one realm to another. So, for example, the goal of reducing the level of several particular polyfluoroalkyl substances (PFAs - better known as 'forever chemicals') in our rivers could be readily achieved by replacing them with an untargeted set of such chemicals. The goal of improving the health of one river could be achieved simply by relocating a source of pollution to a different river a few miles away.

Expressing our goals in broad, meaningful, terms has advantages other than making our goals less susceptible to manipulation. It makes them more amenable to public participation in their

construction and, for many goals, more public engagement in monitoring progress toward their achievement. It means we can more readily formulate long-term goals, so making it easier to optimise resource allocation over time, and providing policy certainty which, again, encourages long-term thinking.

The [4]Social Policy Bond concept would have these, and additional advantages: it would inject market incentives into the achievement of our social or environmental goals, maximising efficiency as measured, in our example, by improvements in the health of the UK's rivers per pound spent. My work on applying the concept to environmental goals is linked to [5]here.

## **21.5.2 Poor countries have no incentive to deal with climate change (2024-05-23 16:32)**

Bjorn Lomborg writes:

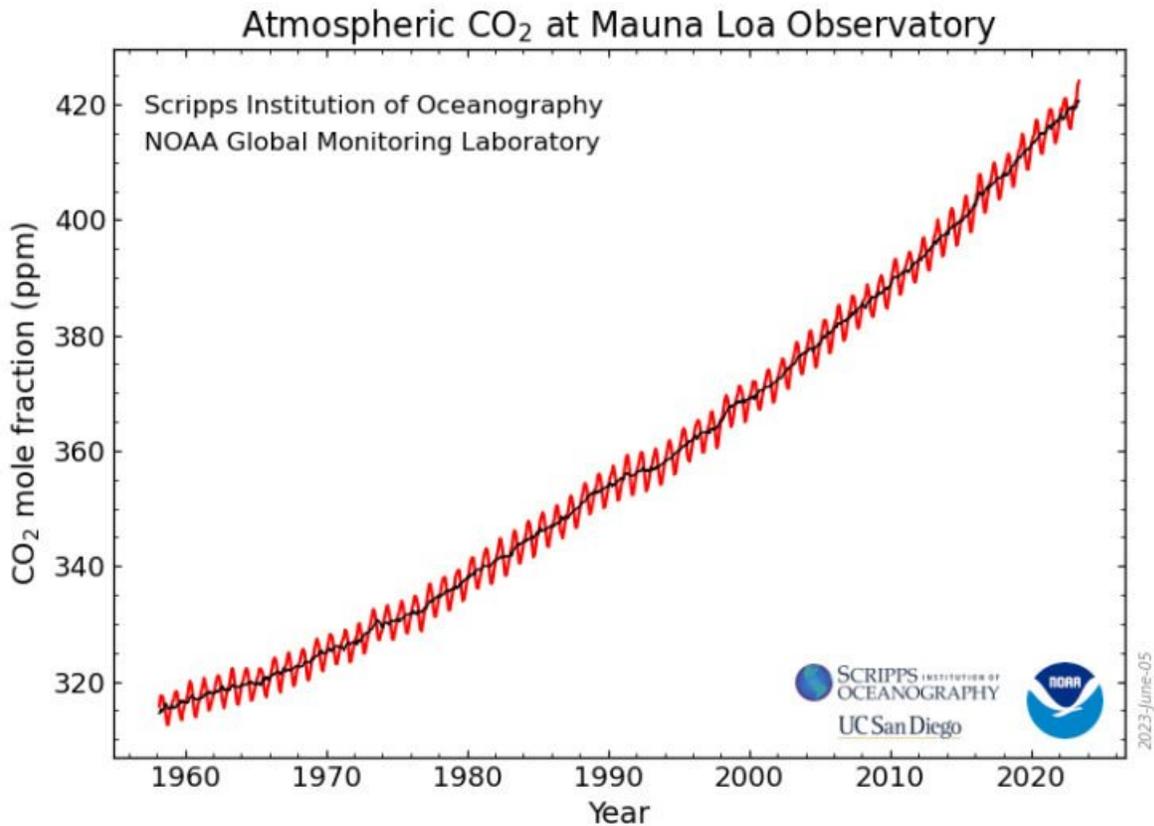

Life for most people on earth is still a battle against poverty, hunger and disease.... Tackling global temperatures a century out has never ranked high among the priorities of developing countries' voters - and without their cooperation, the project is doomed. [1]*When the only problem was climate change*, Bjorn Lomborg, 'Wall Street Journal', 8 May 2024

Sad, but true. The intense focus on climate change and, in particular, greenhouse gas emissions is, I think, unfortunate, in that it's a global problem that requires global cooperation - which is not happening and is not going to happen. National governments should focus on improving the well-being of the people they are supposed to represent; there are plenty of country-level environmental problems that could be solved without the cooperation of other countries: I'd nominate clean water and air, and loss of habitat as a priority for most developed countries, but others will disagree.

But climate change, or climate breakdown, and the problems it gives rise to, is serious. I think it should be addressed by Climate Stability Bonds, which would be issued by a supra-national body, and backed by contributions for national governments, NGOs, and philanthropists. A crucial first step would be to define precisely, exactly what we want to achieve. The fundamental question is whether we want to try to change climate, or to mitigate climate-related adverse impacts on human, animal and plant life. I envisage a range of biological, ecological, financial and social measures would be targeted, all of which would have to fall within an

approved range for a sustained period before the global climate stability goal would be deemed achieved, and after which bondholders would be paid. Such a scheme would have big advantages over the current approach, which is extremely expensive and achieving nothing at all: I refer (again) to this graph:

[2]

'Climate activism became a big public cause about halfway along this graph. Notice any effect?' From [3]*Riding the Climate Toboggan*, John Michael Greer, 6 September 2023

I have written about the bonds and their advantages in papers linked to [4]here. For the purposes of this discussion, the one relevant advantage is that, once they have deposited their funds into the bonds' escrow account, governments need not try to persuade, cajole or threaten other governments to help achieve our climate change goals: all necessary actions would be undertaken by a shifting cast of highly motivated bondholders, working with each other in ways that we cannot foresee, over the requisite, long, time period. The bonds would set up a system of cascading incentives: bondholders would do what they can to ensure that, when global cooperation is absolutely required, reluctant national governments would have incentives to comply.

## 21.6 June

### 21.6.1 Outlook: scary (2024-06-07 18:23)

Post number 1397, and as good a time as any to discuss policymaking and Social Policy Bonds. On both counts, I think the outlook is gloomy. I'd be less concerned about the fate of the bonds if there were any sign that policymaking were becoming more responsive to ordinary people's wishes and well-being. I don't see such signs, either in the country in which I'm currently based (the UK) or in the wider world. Government agencies and large organisations of every sort - corporations trade unions, universities, religious bodies, charities, etc - work hand-in-hand to further their own goals, which are very often irrelevant to the interests of the people they are supposed to represent, or actually in conflict with them. This divergence is replicated at the supra-governmental level.

[1]

20 May 2024

*Members of the Security Council  
observe a moment of silence in the memory of Seyyed Ebrahim Raisi,  
President of the Islamic Republic of Iran, aka as the 'Butcher of Teheran'.*

*[2]Source*

The results of this divergence are apparent and disconcerting:

- increasing inequality of income and (especially) wealth within countries, leading to a loss of faith in government in democracies and autocracies alike,
- extreme polarisation of political factions,

- environmental disasters, in the seas, rivers, climate etc, and
- increasing [3]fears of a nuclear exchange.

Decades of all politicians' ignoring the wishes of ordinary people have led to a pervasive [4]nihilism and [5]learned helplessness as nobody thinks they can do anything to improve things at any level above the local.

The aim of Social Policy Bonds is to inject market incentives into the solution of our social problems. But the first essential element was to articulate and prioritise society's goals. Free, competitive, markets have been manipulated and undermined by big organisations, including government regulatory agencies, but even more crucially, there's little discussion of, or priority given, to society's wishes. Vague suggestions that more economic growth will solve all our problems are made, though even given the narrow definition of growth, as measured (usually) by GDP, the poorest in most western countries have benefited little from decades of it. Politicians, prisoners of their paymasters or their [6]ideology, just don't identify with ordinary citizens.

Realistically, there's almost no chance that anything like Social Policy Bonds will be issued in the near future. There has been some interest in the non-tradeable version (with which I have no involvement) known as Social Impact Bonds or Pay-for-success Bonds, but nobody's made the leap to making them [7]tradeable, which I regard as essential to the achievement of society's goals. My main worry now is about a nuclear exchange. The taboo against threatening use of nuclear weapons has recently been [8]broken; the taboo against their use looks fragile. The other huge challenges - environmental and social - remain, but a sustained absence of a nuclear exchange is a necessary condition for addressing them. My forlorn hope is that some combination of government, NGOs, philanthropists and ordinary people, raise funds that would provide meaningful incentives for people to actually bring about (not simply to 'work towards') world peace. Applying the Social Policy Bond concept to [9]that goal is my suggestion, though I'd welcome any gesture in that direction.

## **21.6.2 Social Impact Bonds: tradeability would change everything** **(2024-06-13 17:29)**

I'm not a great supporter of [1]Social Impact Bonds (SIBs), with which I've had no involvement. They came on the scene after my first presentations of Social Policy Bonds and differ in that they are not tradeable. This seemingly minor difference is actually critical, and I've explained why [2]here.

So I agree with most of the aspersions cast on Social Impact Bonds by the authors of the paper excerpted below, which echo my own sentiments expressed [3]here and [4]here. However:

The introduction of a profit incentive fundamentally alters the relationship between the service provider and user. The principal client and dominant stakeholder of any given SIB is its financier, not those who receive the services it finances and whose voice rarely figures into any discussion. The motivation propelling private investment in SIBs is profit or return on investment, rather than assisting or changing the circumstances of citizens in need. ... This does not seem to trouble SIBs' many proponents, who blandly assume that the interests of private financiers can be aligned with the needs of service users, and who are content to see the changing fortunes of citizens instrumentalized as payment triggers. SIBs thereby transform [5]citizens into commodities.... SIBs exemplify the financialization and privatization of social and public policy; they reduce the rights of citizens both as service users and as a polity. [6]*A Critical Reflection on Social Impact Bonds*, Michael J. Roy, Neil McHugh, and Stephen Sinclair, 'Stanford Social Innovation Review', 1 May 2018

Social Policy Bonds, being tradeable, can take a very long-term view: they can target goals that will depend on a shifting cast of investors for their achievement. Their goals can be meaningful not only to a clique of financiers, but to the public, who can participate in decisions about which goals shall be targeted and their relative importance. With such transparency about broad social and environmental goals, it is society as a whole who will be the principal stakeholders of a bond regime, and many will also be the direct beneficiaries of such goals as cleaner air, reduced crime rates, or similar large-scale goals that a Social Policy Bond regime can target.

I also think Social Policy Bonds would not lead to undue profits, as implied by the paper and as could readily be made in a SIB regime. It's true that organisations would make profits if they are successful in achieving the targeted goals - that is, those goals that society wishes to see achieved. But, again, tradeability and the ability to target long-term goals, mean that the identity of service providers, whether those invested in the bonds or their agents, can change over time. (See [7]here, for how Social Policy Bonds could lead to a new type of organisation, whose every activity would be aimed at achieving our social goals.)

And, because there would be no barriers of entry into investment in Social Policy Bonds, any profits would tend to be competed away over time between the bonds' flotation and their redemption after long-term goals have been achieved. There would be profits, but they would

not be excessive . I don't agree with the authors of the paper that such profits would transform citizens into commodities, any more than paying teachers or nurses transforms schoolchildren or patients into commodities.

All that said, I think SIBs could play a positive role if they serve as a stepping stone toward Social Policy Bonds. The danger is that their practical disadvantages might discredit the whole idea of contracting out the achievement of broad, long-term social and environmental goals to a protean cast of motivated investors.

### 21.6.3 AI enters politics (2024-06-18 17:50)

Some early applications of Artificial Intelligence (AI) are being reported. In the UK, Steve Endacott, or "AI Steve" is asking the constituents of Brighton and Hove to submit policy proposals:

Endacott created the AI candidate's initial platform, for example, and the campaign wants to recruit 5,000 people to be "creators"—these are the folks who will have discussions with the chatbot—to surface potential policies. ...These people, everyday Brighton commuters, will review and rate AI Steve's policies on a scale of 1 to 10. [1] *Source*

I think asking people for their preferred policies is a missed opportunity: we should be asked what are our preferred goals. Policies are a means to an end. Very often they don't achieve their stated goals, or do so inefficiently and in conflict with other goals. For most of us, it's not policies that are important; it's how closely society's goals are met. (I've written to AI Steve along these lines.)

A political application of AI in the US looks more promising. Victor Miller, running for mayor of Cheyenne, Wyoming, has created a chatbot ("VIC") that would call the shots:

Miller fed VIC the supporting documents - emails, public records, notices - from past Cheyenne Fity Council meetings... By analyzing these documents, Miller says VIC will learn to make policy recommendations, figure what's important and decide how to vote in council meetings. "It's unlikely that a human can read, say, 400-plus supporting documents between meetings," he says, "But VIC can do that[.] [2]An

*AI Bot Is (Sort of) Running for Mayor in Wyoming*, Vittoria Elliott, wired.com, 12 June 2024

A possible danger of injecting AI into politics is that it could be used to entrench existing inefficient and opaque policymaking systems by making them easier to work with. My hope is that it can help in the articulation, prioritising and costing of society's goals - a necessary condition for implementing the [3]Social Policy Bond concept.

#### **21.6.4 Why don't we trust politicians any more? It's (largely) our fault (2024-06-29 16:38)**

In her article [1]*Why no one trusts politicians any more*, Camilla Cavendish writes about ways of closing the gap between politicians and the people they are supposed to represent:

The usual proposals - tightening the ministerial code, properly regulating the revolving door between public office and business and stopping abuses of the honours system - would all help. But they will not address the deeper issue of eroding faith in government: the lack of accountability for failure. Financial Times, 29 June 2024

I agree.

[G]overnment bureaucracies non-self-evaluate. At a minimum, agencies with evaluative responsibilities are not invited to evaluate - they are kept out of the loop, their opinions unsought. At a maximum, government agencies actively suppress their own internal evaluative units and are discouraged from evaluating the beliefs and policies of other agencies. [2]*Why States Believe Foolish Ideas: Non-Self-Evaluation By States And Societies* (pdf), Stephen Van Evera, Massachusetts Institute of Technology Political Science Department and Security Studies Program, 2002

Our politicians and bureaucrats can get away with this, because their stated goals are rarely expressed as meaningful, verifiable outcomes. They talk about vague, lofty ideals; or about policies, which are means to ends, rather than outcomes, which are ends in themselves, and which are more difficult to achieve. So low and entrenched are our expectations of our governments that even radical attempts to change things - see my previous [3]post about injecting AI into politics - ask for no more than policy proposals when, in my view, we should be discussing, costing and prioritising policy goals.

That's not the whole answer

Another explanation for why our politicians disappoint is one that perhaps nobody in the media really wants to cite: the very high costs of becoming and being a member of a democratic government. These costs, borne by aspiring politicians *and their families*, include the intense, unceasing and merciless scrutiny of their current and past behaviour, the constant threats to their physical security and consequent the loss of privacy - which will continue when they leave office. The opportunity cost of entering politics has also risen in line with the relatively great financial rewards from alternative professions, such finance, the law, computing. As a result, the pool of potentially highly capable politicians who care about their country has shrunk. We are left with the mediocre, the thick-skinned, the power-seekers, the ideologues and the ones who cannot find employment elsewhere. There remain few who have any appealing long-term vision for their country.

A [4]Social Policy Bond regime could help by taking away some of the powers of these democratic governments. Under a bond regime, governments would continue to do what they can do well: articulating society's wishes and raising the revenue for their achievement; but they would contract out the actual achievement of our goals to investors who would have incentives to achieve them efficiently and quickly. Politicians and officials would lose the power to allocate funding to their favoured bodies. That is a matter of resource allocation which in theory and practice has been shown to be best done by competitive markets.

## 21.7 July

### 21.7.1 Incentives matter - more than we want them to (2024-07-17 15:52)

Theodore Dalrymple writes about the UK's public sector:

Everywhere one looks, one sees evidence of things not done properly, but nevertheless expensively. It is as if the real purpose of public expenditure were first to assure the pensions of those working, or ever to have worked, in the public sector, and to assure the employment of hordes of consultants, special advisors and the like. With expenditure about 25 per cent lower than Britain's own defence, France has more than 33 per cent more soldiers, more than twice as many tanks, six times as many military satellites, and more ships in its navy. The cost of HS2 to Manchester [from London, a distance of 184 miles] is projected to be more than twice the whole of Spain's entire high-speed railway network (the largest in Europe). While there are good reasons why it is cheaper to build such

railways in Spain, they surely cannot explain why in Spain it takes less than 5 per cent of what it costs in Britain to build a mile of such railway. [1]*Corruption legalised*, Theodore Dalrymple, the Salisbury Review, 21 March 2024

The *Consciousness of Sheep* explains why:

[1]In the immortal words of Upton Sinclair, “It is difficult to get a man to understand something, when his income depends on his not understanding it.” That is, if MPs [in the UK] had a financial interest in getting infrastructure projects done, they would do so. The fact that they do not is at best evidence of their turning a blind eye, and at worst of direct collusion.

[2]*What would Xi do?*, *Consciousness of Sheep*, 17 July 2024

Financial incentives matter. Sadly, in my view, more than they should, more than we might want them to. But in our highly aggregated, increasingly diverse and mobile societies, they are almost the only thing that matters. It’s a shame, I think, but it’s a fact. The [3]Social Policy Bond concept is an attempt to inject financial incentives into the achievement of our social goals, channelling our self-interest into more socially beneficial ends than the mere accumulation of wealth gained by undertaking activities of no or negative social benefit.

In so many areas, the financial incentives to create social problems are immediate, highly visible and (still) socially acceptable. Two examples

- Selling weaponry without which large-scale war would be less likely, is highly profitable, while the rewards and resources on offer to peace makers are nugatory, and unrelated to their success or failure in preventing war.
- The social costs (negative externalities, in economics parlance) of mining, production and consumption are largely imposed on our air, water and land. In former times, such costs of exploitation might have been low, relative both to the planet’s capacity to absorb them and to the benefits derived from doing so. But that doesn’t apply today, and while we do try to regulate some of the environmental burdens, the incentives to forestall, undermine or ignore such attempts are huge, while the incentives for legislators and those trying to preserve the environment are both low and uncorrelated to their success or otherwise in doing so.

In both [4]war and the [5]environment, and in other policy areas, Social Policy Bonds could be issued that would go some way to rejigging the incentives. The bonds would enhance the rewards to those engaged in achieving our social and environmental goals and, importantly, divert resources away from those creating problems and towards those dedicated to solving them.

## 21.8 August

### 21.8.1 Funding drug trials (2024-08-02 10:04)

Monika Odermatt writes about the possibility of issuing Social Impact Bonds to fund certain drug trials:

I had the pleasure of speaking with Dr. Rick Thompson, CEO [of [1]Reboot Rx]... [I asked] him about the drug repurposing social impact bond (SIB), the challenges he has encountered, and his perspective on the future of SIBs. According to Rick, the following ingredients are key to a successful SIB: flexibility, imagination, and funding. There is a need for flexibility in order to have an open mind and learn from the experiences of other organizations who have worked with SIBs before; imagination in order to overcome hurdles one encounters when trying to implement a SIB, and to find ways to collaborate with other countries and partners; and impact investors to fund the SIB and trials.

[2]*Social impact bonds could fund drug repurposing clinical trials*, Monika Odermatt

I agree, and intend to contact Reboot Rx, along these lines: The flexibility I'd like to see is the sort that would make the bonds tradeable. Finding cures for the rare diseases mentioned is inevitably going to be a long-term endeavour. The incentives on offer should encourage efficient new approaches, and terminate failing approaches. Funds should be channelled into organisations that are most efficient at achieving goals along the way to success; likely to be a multi-step process, in which each step is best taken by organisations with specific strengths. The cast of actors should be flexible enough to encourage efficiency at every stage of the path to success, which means that those who succeed at one step should be able to benefit from the incentives without having to proceed to the next step, in which they may have little expertise.

I've written elsewhere about the need to make the bonds [3]tradeable for long-term goals such as those of Reboot Rx, and other goals that will inevitably take decades to realise. These include [4]nuclear peace and other forms of [5]conflict reduction, [6]climate stability and other [7]environmental goals.

## 21.8.2 Why bother with the root causes of anaesthesia - or war? (2024-08-10 19:04)

Saying that we need to find the 'root causes' of our social and environmental problems, in the belief that doing so is necessary to solve them, can be a sincere and necessary position. It can also be a distraction, unnecessary, or a cynical excuse for inaction.

Despite the widespread presence of clinical anesthesiology in medical practice, the mechanism by which diverse inhalational agents result in the state of general anesthesia remains unknown. [1]*Mechanisms of general anesthesia: from molecules to mind,*

George A Mashour, Stuart A Forman, Jason A Campagna, *Best Pract Res Clin Anaesthesiol* 2005 Sep;19(3):349-64.

And even when identifying root causes turns out to be a necessary condition for solving our problems, it needn't be carried out by government. [2]Social Policy Bonds work by rewarding the achievement of a targeted goal; how this is done, and by whom, are not specified - they don't need to be. Even the people who help achieve the goal need not necessarily know why exactly their methods work.

Take violent political conflict. It's still going on, killing, maiming and making homeless millions of people every year. We could spend years analysing past outbreaks of war, but still never get close to identifying root causes in ways that could be usefully be deployed to forestall future outbreaks. Society is just too complex, diverse and fast-changing. Policymakers should begin by specifying society's desired outcomes, and then put in place ways of rewarding those who achieve them, rather try to identify any root causes. Society and the environment are not like simple chemistry or physics. The entities and their relationships are not static.

A bond regime wouldn't try to identify the root causes of war, which are a moving target anyway. Instead it would start by specifying exactly the outcomes we want to achieve, and then injecting market incentives into achieving those outcomes. The Social Policy Bond principle, applied to [3]conflict, are the means by which I propose we begin to end all war for all time. There are many organisations, staffed by hard-working, dedicated people, already aimed at ending conflict. But their resources and influence are pitiful compared to the scale of the problem. We should acknowledge that our current ways of trying to bring about world peace are insufficient at the global level, and that we need to encourage new approaches. In economic theory, and on all the evidence, competitive markets, of the sort in which Social Policy Bonds would be bought and sold, are the most efficient way of allocating society's scarce resources. Conflict Reduction Bonds would channel the market's incentives and efficiencies into finding cost-effective solutions. They would increase people's motivation and attract more resources into solving the problem of conflict, and the principle could be deployed to solve our other social and [4]environmental problems. This is not idealism, of the sort that can be put into a box and hence ignored: it's giving incentives to motivated people to find solutions and rewarding only those who succeed in doing so.

### **21.8.3 Avoiding Armageddon - an alternative approach (2024-08-17 16:45)**

The *Economist* asks *What if South Korea got a nuclear bomb?* 'Public support is high....' and, after all,

North Korea is believed to have dozens of nuclear weapons; its arsenal is already projected to grow into the hundreds by the end of this decade. ...Detractors counter that the [Korean] peninsula will inevitably become a much more dangerous place if South Korea goes nuclear. ....Untested leaders on both sides of the border will have their fingers on the nuclear trigger. The finale of this drama could see them stumbling into Armageddon. [1]*What if South Korea got a nuclear bomb?*, 'Economist', 17 August

'[T]hem or 'us'? Because a nuclear exchange would be a global catastrophe, even if it did not spark a wider conflict. How are we, that is, the non-existent 'international community', going about reducing the probability of a nuclear conflict? It's a subjective view, but I'd say we're failing. Along with everyone else in the world, I can't see how we could convince those in control of nuclear weapons not to use them. What I can suggest is that we put in place incentives that would reward people who can achieve a sustained period of nuclear peace. If there are such incentives in place today, they're too meagre, because they're not working. We can't yet identify the best approaches to nuclear peace, but we can encourage people to research, experiment and follow such approaches.

Ideally, we'd also channel the market's efficiencies into efforts to bring about nuclear peace. We can do this, I suggest, by issuing [2]Nuclear Peace Bonds. These bonds would be redeemable for a fixed sum only when nobody detonates a nuclear device that immediately kills, say, 100 people; such a period of nuclear peace to be sustained for, say 30 years, before the bonds would be redeemed. Backed by a combination of governments, non-governmental organisations, philanthropists and ordinary people, they would encourage a number of peace-generating approaches. Some would be less promising than others: the way the market for the bonds would work means that these efforts would be terminated and resources diverted into the more promising initiatives.

#### A Nuclear

Peace Bond regime would reward those who achieve peace, whoever they are and however they do so. It's an admittedly unconventional approach. In its favour is that the funds used to back the bonds could be payable only if the bonds succeed, and nuclear peace reigns. And, the relevant question is: what is the alternative? The current approach has brought us to the brink of nuclear catastrophe. The taboo against threatening the use of nuclear weapons has already been [3]broken. It now appears inevitable that, unless we actively support and *pay for* nuclear peace, the taboo against their

use will also be broken. It's now time to encourage and reward diverse, adaptive and *successful* ways of dealing with the looming nuclear threat.

#### **21.8.4 Most environmental and social policies are ineffective (2024-08-31 18:08)**

[1] *New Scientist* says it bluntly, but truthfully:

#### **Most climate policies aren't effective**

I have been suggesting for [2] many years now that, instead of enacting policies that are entirely focussed on cutting emissions of those gasses thought to contribute to climate change, we should be clear exactly what outcomes we wish to see, and then reward the people who do actually achieve those outcomes. Instead we have an array of divisive, expensive policies, such as subsidising the substitution of one type of car for another, that have done nothing to affect the climate. Even in their own terms - cutting greenhouse gas emissions - they have failed in their ostensible purpose:

[3]  
1526

'Climate activism became a big public cause about halfway along this graph. Notice any effect?' From [4]*Riding the Climate Toboggan*, John Michael Greer, 6 September

If we were serious about tackling climate change we'd first answer the [5]fundamental question: do we want to stop the climate changing, or do we want to mitigate adverse events caused by the climate? Then we'd admit that, while we don't really know how best to achieve either of these outcomes, we do know that a multitude of diverse, adaptive approaches will be required. Then we'd put in place incentives for people to research, experiment, refine and then implement these approaches, terminate those that are ineffective, and invest in those that are most promising.

The problem is a wider one in the public sector: we do not express policy goals in terms of broad outcomes that are meaningful to ordinary people. Instead we put resources into existing institutions, which have their own agendas, top of which is usually self-perpetuation. These agendas may have little to do with the institutions' stated purpose, still less to do with bringing about meaningful improvements in environmental and societal well-being.

So we end up with the climate change bandwagon, on which hordes of well-meaning, hard-working (for the most part), people are working in bodies whose finance depends on their carrying out specified activities, rather than actually improving the environment or society's well-being. Companies in the private sector - those that operate in a competitive market - don't have that luxury. When they fail, they go out of business. A [6]Social Policy Bond approach,

applied to the climate or to other goals, would impose such discipline on organisations that work in the public sector. Achieve what society wants you to achieve, and be rewarded. Fail and you disappear. It's not as harsh as it sounds, as everyone ultimately depends on our environmental and social policies being effective.

## 21.9 September

### 21.9.1 Bypass the generals and politicians: target nuclear peace (2024-09-12 11:44)

How do we get to the point at which the US has 14 US Ohio-class submarines, each one of which has the destructive power of 1250 Hiroshima bombs? It's a complicated, expensive, extremely dangerous way of achieving ...what exactly? I'm not singling out the US here: all countries are doing it. What I'm getting at is the disconnect between the stated goals of policies - in this case, presumably, national security - and the likely results of the way we go about achieving them.

As with other social and environmental problems, we really don't know the most efficient and effective ways of ensuring national security. But our decisions as to who gets to choose these ways embody the assumptions that the military, especially those generals who fought previous wars, are those who know best. I believe that there could well be other, less potentially disastrous, ways of achieving the security that we all yearn for, and that we should explore those ways. Actually, we can go further back and ask: who chooses the choosers? Those who delegate national security to the military are invariably politicians whose expertise lies in the acquisition and retention of power.

I suggest we explore alternatives; or rather, that we put in place incentives that would encourage people to explore alternatives. A goal that we should target immediately is, in my view, sustained nuclear peace. It's one that probably everyone on the planet would like to see, and one whose achievement or otherwise is easy to monitor. If it's a priority at all, it's one that only a few dedicated people have as their vocation and for which they receive derisory funding.

By backing [1]nuclear peace bonds, a combination of governments, non-governmental organisations, philanthropists and ordinary people could increase the rewards to existing bodies working to achieve nuclear peace, but also increase the resources available for them - and, crucially, others - to work with in support of the nuclear peace goal. It would be up to

highly motivated investors in the bonds to research, experiment and eventually implement the ways in which they best think nuclear peace could be achieved and sustained. To be sure, they might decide that the best way of doing so is for big countries to pile up masses of nuclear destructive potential and hope that nothing goes wrong. But they might also look into alternative approaches that pose less danger and that are being neglected by those who currently make all the relevant decisions.

We might then look at other social problems, and decide to target those directly, rather than via politicians and so-called experts working in organisations whose interests invariably [2]differ from those of society.

So, if we want to raise literacy, why not target [3]literacy directly? If we want to reduce [4]crime, why not reward people for reducing crime, however they do so? If we want to improve the [5]environment, why not target the well-being of human, plant and animal life? In short, why not target outcomes, rather than activities, institutions, inputs or outputs, and let the most efficient operators, be they public- or private sector, rather than the taxpayer, be penalised for failure? Such would be the effect of a [6]Social Policy Bond regime.

## 21.9.2 Finance, like dog food advertising, is a low priority (2024-09-14 09:30)

Social Policy Bonds are intended to channel our ingenuity and ever more impressive technology into achieving our social and environmental goals. I often suggest that many of the activities into which we currently devote boundless energy and resources are socially useless or in conflict with society's wishes. It is not only the relatively minor indulgences that somehow win society's approval against which I inveigh: [1]advertising dog food for example, but such far more consequential resource sinks, such as nuclear weaponry (see my [2]previous post), or finance:

That's finance. The total value of all the economic activity in the world is estimated at \$105 trillion. ...The value of the financial derivatives which arise from this activity - that's the subsequent trading - is \$667 trillion. That makes it the biggest business in the world. And in terms of the things it produces, that business is useless. It does nothing and adds no value. It is just one speculator betting against another and for every winner, on every single transaction, there is an exactly equivalent loser. [3]*For Every Winner a Loser: What is finance for?*, John Lanchester, London Review of Books, 12 September 2024

We ought not to condemn those who choose financial trading as a career, whatever the net results of their collective actions. These people are reacting rationally to the incentives on offer. As Mr Lanchester says:

[I]n our society the classic three ways of making a fortune still apply: inherit it, marry it, or steal it. But for an ordinary citizen who wants to become rich through working at a salaried job, finance is by an enormous margin the most likely path. And yet, the thing they're doing in finance is useless.

It's the incentives that are perverse, directing our efforts into socially useless, or worse, activities. One way of re-jigging the incentives would be to issue [4]Social Policy Bonds, which would inextricably link the rewards gained by efficient resource allocation to the achievement of our social goals. These non-interest bearing bonds would be redeemable for a fixed sum only when a specified social goal. These goals would be broad and, importantly, meaningful to ordinary people, who could thereby participate in which goals would be chosen, and which would have higher priority. Such goals could include: reduced [5]crime, an improved [6]environment or, at the global level, [7]nuclear peace, or a reduction in adverse [8]climatic events.

A Social Policy Bond regime would allow us to target broad global and national goals explicitly, while channeling the market's efficiencies into the best use of our limited resources. Given that the survival of the planet itself is [9]under threat, I think the case for such targeting is a strong one, even if financial markets lose a fraction of their liquidity in order for us to get there.

### 21.9.3 Uncertainty is not an excuse for inaction (2024-09-19 15:17)

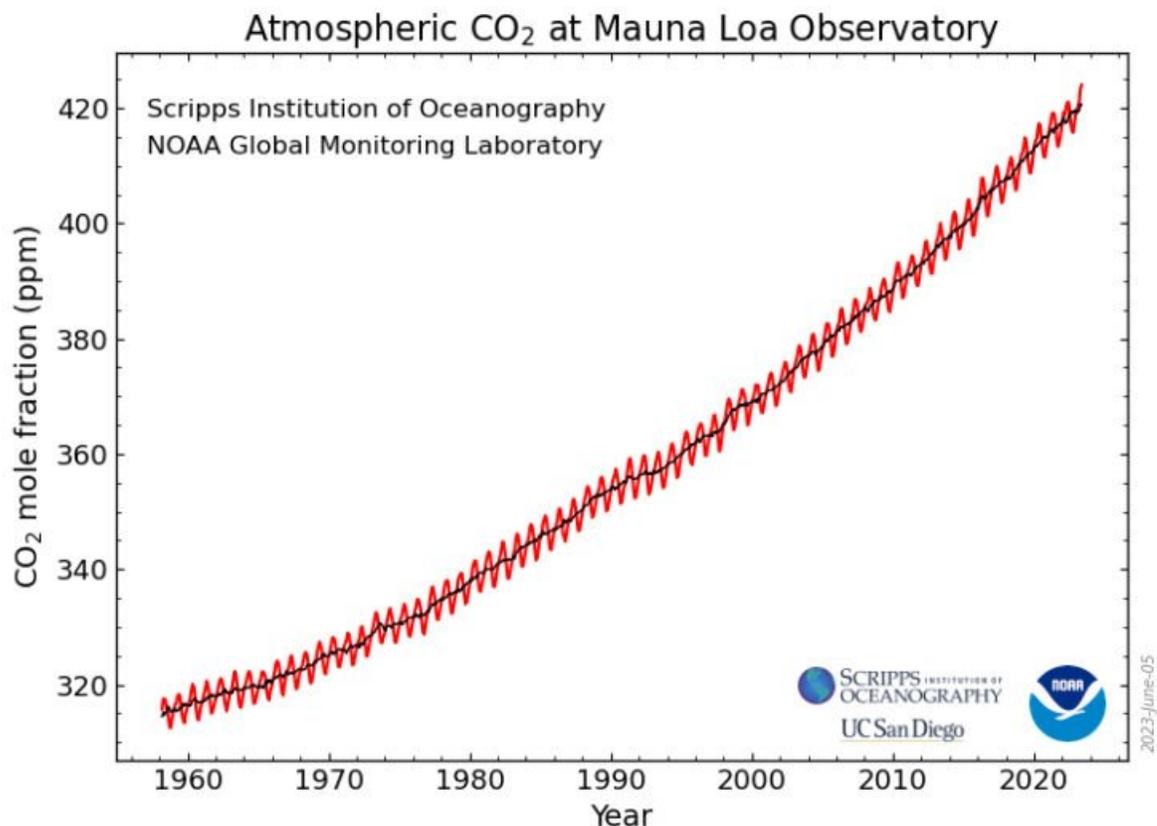

We need to recognize our limited knowledge. We don't know how best to solve many of our social and environmental problems. With some problems, we do acknowledge our limited capacity; war, for instance, has been thought to be an intractable aspect of our species, so that efforts to reduce it are sporadic, regional, incoherent and mostly ineffectual.

Similarly with climate change. We feel the need to 'do something' and so we use the tools at our disposal. With climate change, the main tool is ossified science. We know that our knowledge of the scientific relationships between our activities and the climate is not complete, yet we make policy as if it were. Most our efforts to reduce the pace of climate change are directed at reducing our emissions of greenhouse gases. It was only the Kyoto Protocol of 1997 that targeted for reduction gasses other than carbon dioxide, some of which, fluorinated gases for instance, are extremely potent.

There's a case for saying that the multitude of policies supposedly aimed at combating climate change are made cynically, and that they really have no such intention. Hence:

A [1]paper published in Science last month reviewed 1,500 climate policies around the world, and found that only 63 have delivered significant benefits. [2]Perception-ware, George Monbiot, 19 September 2024

With the predictable outcome:

'Climate activism became a big public cause about halfway along this graph. Notice any effect?' From [3]Riding the Climate Toboggan, John Michael Greer, 6 September 2023

But just because our knowledge of the causes of climate change is incomplete, that is not a reason for inaction or - the chosen course - for making ineffective policy. We don't have to wait for certainty. My suggestion is that, instead of basing policy on fossilised and incomplete science, we target our desired climate goal. This could be expressed as an array of quantifiable outcomes, each one of which would have to fall within a targeted range for a sustained period, before the goal would be deemed achieved. And once it has been achieved, and only then, the people who helped achieve it would be rewarded. The outcomes targeted could be physical (eg, temperatures), social (eg people made homeless by adverse climatic events), ecological (eg fates of keystone species), or financial (eg insurance rates for homes in developed countries). I suggest that governments, in conjunction with non-governmental organisations, philanthropists and others back Climate Stability Bonds, which would provide funds for the redemption of the bonds once the targeted outcomes had been achieved. The main advantages of such the bonds would be:

- the bonds would supply incentives for investors to explore, investigate and implement diverse, *adaptive* solutions to the climate change problem; and
- the bonds would use market incentives to motivate people to be efficient in their pursuit of successful solutions.

For links to much more about Climate Stability Bonds, see [4]here.

## 21.10 October

### 21.10.1 Useless organisations (2024-10-07 11:17)

Adam Kogeman writes to the *Economist*:

[T]he UN does some good through the provision of humanitarian aid, but it is a net negative contributor to global peace and prosperity. [It] prevents no conflicts and brings about no peace. Millions of Rwandans, Ukrainians, Sudanese, Lebanese, Syrians, Iraqis and Israelis, among others, can attest to that. It doesn't follow through on its grandiose but unserious pledges to heal the environment and improve the lot of the world's poorest. It provides diplomatic cover to the world's worst human-rights abusers and physical cover to terrorist groups. It is consumed by a rabid obsession with denigrating the world's only Jewish state. ...America's occasional inability to hold sway at such a compromised, ineffectual institution is a reflection of the UN's dysfunction and illegitimacy, not an indictment of its unmatched geopolitical influence. [1]Letter to the editor, Adam Kogeman, the *Economist*, 26 September 2024

Whatever their founding intentions, I believe that every institution, be it public- or private-sector, including government (at any level), trade union, church, university, charity or large corporation, eventually, inevitably, becomes consumed by one over-arching goal: self perpetuation. Vested interests get bedded in, acquiring the power to oppose meaningful reform. (See one of my previous posts [2]here about how, despite the many efforts of many organisations to reduce greenhouse gas emissions, nothing has been achieved.)

[T]he National Institute on Drug Abuse in Washington has sometimes claimed greatly to have advanced human understanding of addiction, largely thanks to itself, at the same time as the country in which it is located has suffered from an unprecedented epidemic of deaths from overdose—of drugs of addiction. The total of these deaths far exceeds that of all American military deaths since the end of the Second World War, two major wars included. ...The vast increase in the study of crime has not resulted in the diminution of crime, on the contrary, though it has certainly increased the number of criminologists. ... Another field of study whose academics and practitioners have made claims to great strides in understanding is psychology. This study too has undergone a vast expansion, indeed out of all recognition. Psychology is now the third most popular subject in American colleges and universities, and no doubt elsewhere as well. ...Despite unprecedentedly large numbers of psychologists, the psychological condition of the population does not seem to have improved. [3]Finding a cure for psychology, Theodore Dalrymple, Quadrant, 30 September 2024

Whereas large private-sector corporations at least, in theory, are subject to the discipline of the market (which they do their best to undermine), those organisations whose supposed goals are to solve our social and environmental problems face no such restraint. All of which means, to me, that we need a new type of organisation: ones whose every activity is dedicated to achieving their stated goals. A [4]Social Policy Bond regime, targeting broad, long-term goals, would lead to the creation of such organisations. They'd be driven entirely by financial incentives, which need not be as mercenary as it sounds. We pay people to teach, for example, or to care for people, but that doesn't mean those professions should be regarded with the disdain that many feel when the concept of paying people to achieve social goals - a la Social Policy Bonds - is mentioned.

A bond regime would work by raising funds to pay investors in the bonds only when a targeted social goal had been achieved. Incentives would cascade down from investors to all those contracted to work to achieve the goal. In the long run, a new type of organisation would evolve with the sole function of funding the most promising approaches to achieving the goal and, importantly, terminating those that are failing. Payment is thus inextricably linked to achievement of the goal. For more about such an organisation see [5]here.

## **21.10.2 Climate and the environment: it could have been so different (2024-10-11 16:10)**

Several years ago Michelle Nijhuis reviewed [1]*Losing earth: the decade we almost stopped climate change*, by Nathaniel Rich. She wrote about missed opportunities to address climate change in the 1980s. In 1980 the US National Commission on Air Quality convened a meeting of climate and energy:

[W]hen it came time to commit to specific solutions, the experts began to hesitate. China, the Soviet Union, and the United States were all accelerating coal production; [President] Carter was planning to invest \$80 billion in synthetic fuels. Proposed laws or regulations would focus attention on the costs of emissions reduction, instantly politicizing the issue. “We are talking about some major fights in this country,” said the economist Thomas Waltz. “We had better be thinking this thing through.” By the third day, Rich recounts, the experts had abandoned solutions and were even reconsidering their statement of the problem, loading it with caveats. (Were climatic changes “highly likely” or “almost surely” to occur? Were said changes of an “undetermined” or “little-understood” nature?) In the end, the meeting’s final statement was weaker than the language the commission had used to announce the workshop .... [2]*Early warnings*, Michelle Nijhuis, New York Review of Books, 27 June 2019

Then, as now, politicians’ priority is to avoid difficult ‘fights’. Much easier to move on to other, less contentious, issues.

One of the advantages of [3]Social Policy Bonds is that they put in place positive incentives. They channel self-interest into the public good. Sure, bondholders could lobby in favour of public funds being diverted to their target goal, but there is nevertheless a presentational advantage. With [4]Climate Stability Bonds, people would be rewarded for avoiding climate change and its negative impacts. The climate goal could be expressed as a range of physical, ecological,

financial and social indicators, all of which would have to fall into an approved range for a sustained period before the bonds would be redeemed. Importantly, the bonds could work well regardless of whether people believe or disbelieve (or say they disbelieve) that the climate is in fact changing. As with other goals that Social Policy Bonds could target, what matters is that the goal is achieved, not the effort required to achieve it, which means that, if the climate were somehow to revert to that deemed to be acceptable, bondholders would be paid out, even if they merely held the bonds and hoped for that outcome. Of course, if a bond regime were to target a goal seen as likely to be achieved, the float price of the bonds would be close to their redemption value.

I say all this knowing that it’s unlikely Climate Stability Bonds are ever going to be issued. They would require a huge redemption fund, backed by governments the world over, and there’s no

will now for such an initiative. The missed opportunities abound also for other environmental issues. Thus, the current *Economist* tells us that:

One study found the average size of wildlife populations had shrunk by 95 % since 1970 in Latin America and the Caribbean - more than in any other region of the world. [5]*The drug lords' side-hustle: smuggling macaws, jaguars and frogs*, the *Economist*, 10 October 2024

It's to be expected that vested interests will oppose policies that threaten their short-term financial goals. It's more of a tragedy that those who should be showing leadership back down in the face of such opposition. The Social Policy Bond principle, with their focus on rewarding meaningful social and environmental outcomes, could help, but inspired leadership would still be required. I'm not holding my breath.

### **21.10.3 Now let's try to solve terrestrial problems (2024-10-22 14:40)**

The *Economist* explains how NASA is reducing costs and enhancing efficiency in space exploration:

Over the past ten years NASA has started to move away from the time-honoured model which sees it tell private industry exactly what it wants built and then pay the price, with a handsome guaranteed profit added on. Instead NASA tells companies what it wants done; lets them say how they would do it, how much new stuff they will have to develop and what that will all cost; and then offers fixed-price contracts to the best bids. The enlightened goal is to build up a thriving competitive market in such services. [1]*SpaceX is NASA's biggest lunar rival*, the '*Economist*', 17 October 2024

This is exactly the model I've been advocating for many years: stipulate the outcome and let market incentives decide who shall achieve it and how they do so. As it's working successfully for space exploration maybe we could think about applying it to terrestrial problems. I'm not sure why we don't. It could be that the politicians and bureaucrats who control spending on social and environmental problems are reluctant to relinquish the power to determine which bodies receive government funding and how they go about achieving our goals. But they would still have the remit to help articulate society's goals and raise the revenue for their achievement. Democratic governments are quite effective in doing those things, but they will persist in

dictating both which bodies receive their funding, and how they are to go about achieving our social and environmental goals. That model can work well when the causes of our social problems are easy to identify, but it's less successful when our problems are inescapably complex and long term in nature. Such problems include crime, poor health, climate change and - most deadly of all - war. They probably all require a wide range of diverse, adaptive approaches to their solution, and these are exactly the approaches that government cannot follow. Nor can any single conventional organisation, whose stated goals inevitably get forgotten over time in favour of self perpetuation.

[2]Social Policy Bonds would do what NASA's doing: contract out the achievement of our long-term social and environmental goals to investors in the bonds, who would have incentives to co-operate with each other with the sole aim of achieving these goals. When the bonds are issued, I envisage that a [3]new sort of organisation will form, whose every activity will be devoted to maximising the efficiency with which investors solve, or pay others to solve, society's problems. Society's goals and those of investors would exactly coincide.

#### **21.10.4 Climate change policy: another way of subsidising the rich (2024-10-30 18:22)**

I will persist in believing that, if governments were serious about doing anything to combat climate change, they'd target for reduction some of the adverse impacts of climate, and either legislate appropriately, or put in place some incentives that would help mitigate those impacts. That they are not serious, can be clearly seen by the UK Government's Zero Emission Vehicle (ZEV) mandate, which...:

...sets out the percentage of new zero emission cars and vans manufacturers will be required to produce each year up to 2030. [Eighty] % of new cars and 70 % of new vans sold in Great Britain will now be zero emission by 2030, increasing to 100 % by 2035. [1]Source

There are some loopholes, of course:

If a manufacturer fails to meet this target, it could be fined £15,000 per car it sells that's outside the allowance. This is unlikely to happen, though, as there are several ways to avoid this. Non-compliant manufacturers can buy 'credits' from manufacturers that do comply, for example. Manufacturers that do comply can also 'bank' sales that can be traded in years where they may not comply. This system was introduced in 2023 as a part of the ban on fossil-fuel powered cars being pushed back from 2023 to 2035. [2]EV bargains: why some nearly new electric cars are being heavily discounted, 'Which? News', 25 October 2024

and subsidies to that fortunate part of the population that can afford to own cars and vans:

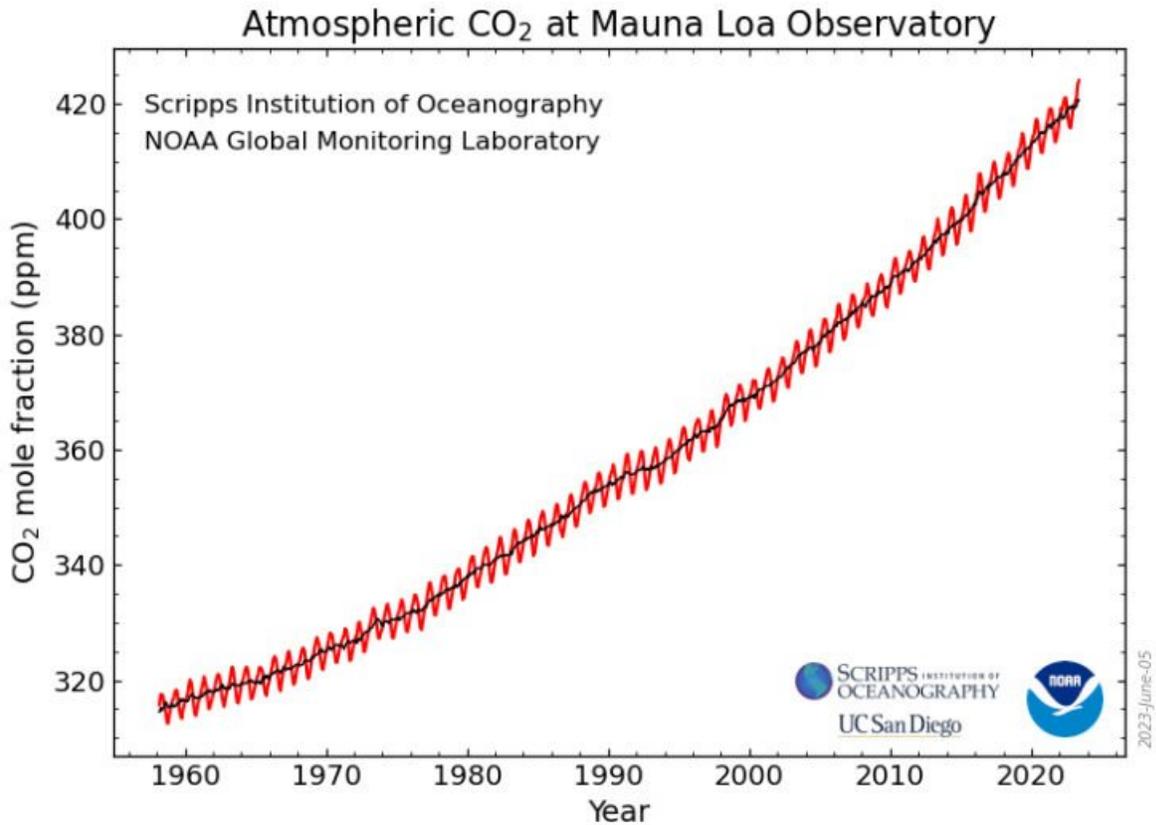

The government's schemes to lower the upfront and running costs of owning an EV [Electric Vehicle] includes the plug-in van grant of up to £2,500 for small vans and £5,000 for large vans until at least 2025 and £350 off the cost of homeplace chargepoints for people living in flats. [3]EV bargains: why some nearly new electric cars are being heavily discounted, 'Which? News', 25 October 2024

This is the usual complex, faintly corrupt, totally ineffectual policy that, sadly, is the norm. It might do something to change the ratio of EVs to other vehicles, but it is guaranteed to do nothing positive for the climate. Our politicians are more concerned with placating large corporations (those that make, sell and service vehicles), and motorists; and, as in agriculture (just one example), continuing to transfer funds from the poor to the wealthy. At least there's some consistency: amidst the tax hikes announced in the UK's budget today, we read that:

#### Fuel duty stays frozen

Rates on fuel duty - a tax included in the price you pay for petrol, diesel and other fuels - will be kept the same in the next financial year. The temporary 5p per litre cut introduced in 2022 will remain for one more year. [4]Autumn Budget 2024, 'Which? News' 30 October 2024

What would a meaningful attempt to combat climate change look like? First, we'd have some idea of what we want our policies to achieve. My thinking is that our goals would be expressed as an array of scientific, social and financial indicators of the climate and its impacts, each of which would have to fall within an approved range for a sustained period before they could be deemed achieved. What we have today is an exclusive focus on atmospheric composition. The plethora of policies supposedly aimed at influencing that over the years have had precisely zero effect:

'Climate activism became a big public cause about halfway along this graph. Notice any effect?' From

[5] *Riding the Climate Toboggan*, John Michael Greer, 6 September 2023

*For my suggestion as to how we can combat climate change or its adverse impacts on plant, animal and human life, please see the papers linked to*

## 21.11 November

### 21.11.1 The tragedy of the Common Agricultural Policy (2024-11-11 17:03)

All countries have bad policies. What matters is whether we have systems in place that will reform or abolish them. Few policies are as unambiguously bad as the rich countries' agricultural policies.

1. They are capitalised into land values, thereby intensifying agriculture, and so worsening the environment and animal welfare, as well as making the entry of young people into farming impossible.
2. They benefit wealthy landowners at the expense of consumers, taxpayers and food-rich developing countries.
3. They generate overproduction of [1]unhealthy products, which are then disposed of to the detriment of people's health.

These policies have been widely challenged for [2]decades; there's been some tinkering but, we still see, focusing on point (2):

### [3]Revealed: billionaires are 'ultimate beneficiaries' linked to €3bn of EU farming subsidies

Thousands of small farms have closed according to analysis of official but opaque data from EU member states. ...The European Union gave generous farming subsidies to the companies of more than a dozen billionaires between 2018 and 2021... including companies owned by the former Czech prime minister Andrej Babiš and the British businessman Sir James Dyson. Billionaires were "ultimate beneficiaries" linked to €3.3bn (£2.76bn) of EU farming handouts over the four-year period even as thousands of small farms were closed down, according to the analysis of official but opaque data from EU member states. ..."It's madness," said Benoît Biteau, a French organic farmer and MEP for the Greens in the last European parliament. "The vast majority of farmers are struggling to make a living." Ajit Niranjana, the *Guardian*, 3 November 2024

The stated objectives behind these corrupt policies sound grand: to secure the food supply (with huge quantities of imported oil) and, laughably, to protect the family farm.

Perhaps the most important advantage of a [4]Social Policy Bond regime would be that politicians would have to bind the financing of their policies inextricably to their stated goals. Under the current systems, they can get away with burying the actual goals (transferring money from the poor to rich individuals and, increasingly, corporations), under grandiose rhetoric and reams of legislation and regulation. Under a Social Policy Bond regime, policy outcomes and financing for their achievement would be exactly congruent. Unfortunately, the lobbies that resist reform can afford to do so precisely because of the subsidies they receive. So much so that, as Mr Niranjana points out:

The EU gives one-third of its entire budget to farmers through its common agricultural policy (Cap), which hands out money based on the area of land a farmer owns rather than whether they need the support.

Agriculture is one sector with which the governments have enmeshed themselves for decades. Government involvement, though, need not be corrupt nor corrupting. A bond regime could ensure that governments would intervene to bring about only the outcomes that are supported by a consensus of the people they are supposed to represent.

### 21.11.2 The corruption of every body (2024-11-19 17:41)

The current *Economist* writes about the militias and gangs in Brazil:

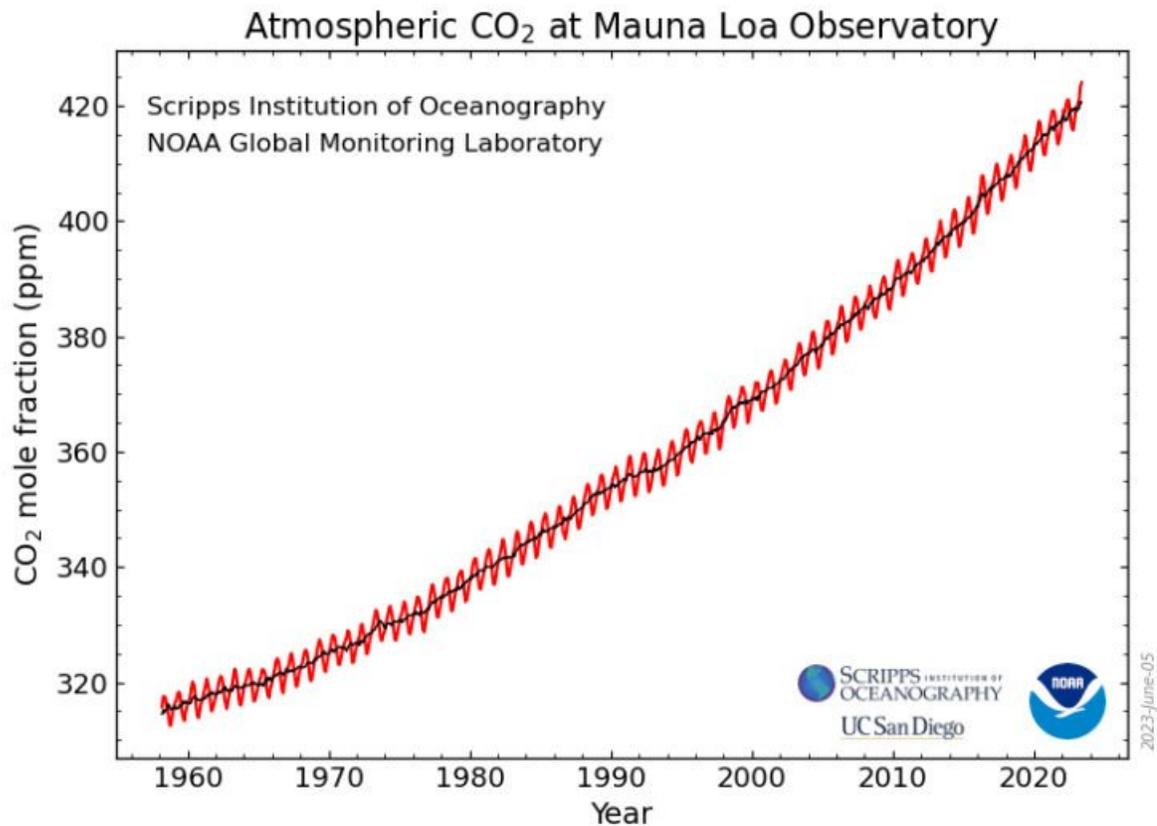

Founded by former policemen, Rio's militias gained prominence in the 1990s by hunting down drug traffickers, winning the support of terrified residents and forging links with local politicians. Yet today they extract a security tax in areas they control and charge residents for access to gas, internet, transport services and electricity. More recently, they have started trafficking the drugs themselves. Brazil's criminal groups are walking the militias' path in reverse. Gangs are increasingly funding politicians, paying off local prosecutors and bureaucrats, and laundering their assets through the legal economy. [1] *Brazil's gangsters have been getting into politics*, the 'Economist', 14 November 2024

At any scale above the smallest, we rely on organisations, be they public- or private-sector, to solve our social and environmental problems. However, organisations, once they've been going for a while, tend to develop priorities other than, and often in conflict with, their stated goals. Their over-arching goal becomes [2] self perpetuation. It happens to all types: not only government bodies and Rio's militias, but also to religious organisations, trade unions, political parties etc.

Which is why I advocate a [3] new type of organisation: ones whose structure and composition are entirely subordinated to their stated objective. Under a [4] Social Policy Bond regime, investors in the bonds would form a protean coalition, whose every activity would be devoted to achieving verifiable outcomes. Those outcomes, at the national level, could include, reduced [5] crime, and better physical and mental [6] health. At the global level, we aim to improve the [7] environment, reduce [8] climate change (or its adverse impacts) or, more ambitiously, we could aim to bring about [9] world peace.

There are plenty of organisations ostensibly devoted to these goals, but my contention is that they too frequently lose sight of their original intentions, despite their being staffed by, in many cases, hard-working and well-meaning employees. A case in point could be the United Nations Climate Change conferences. The current one, with 67 000 attendees, is the 29th. Much of their attention over the years has been focused on greenhouse gas emissions, chiefly carbon dioxide. This graph showing the level of atmospheric carbon dioxide over time, tells us how successful they have been:

### **21.11.3 Resistance is futile. Incentives are fruitful. (2024-11-24 17:09)**

Writing in 2019, Roy Scranton reviews books by Bill McKibben and David Wallace-Wells:

And at this point — after the 2003 protests against the Iraq War, the “largest anti-war rally in history,” which saw millions of people in hundreds of cities across the world protesting the American invasion of Iraq and which utterly failed to stop the war — after the “People’s Climate March” in 2014, the “largest climate change march in history,” which utterly failed to have any noticeable effect on global climate policy — after decades of failed protests against institutional racism, gun violence, sexism, nuclear weapons, abortion, war, environmental degradation, and a raft of other issues — only the deluded and naïve could maintain that nonviolent protest politics is much more than ritualized wishful thinking. In the end, McKibben’s argument falls into the same vague preaching as does Wallace-Wells’s. Human beings are special, McKibben insists, because we have free will: “We’re the only creature who can decide not to do something we’re capable of doing.” Asking hard questions about who that “we” is, how “we” make decisions, how power works, and the limits of human freedom are beyond the reach of both writers, because such questions lie outside the narrative they’re both trapped in. [1]*No Happy Ending: On Bill McKibben’s “Falter” and David Wallace-Wells’s “The Uninhabitable Earth”*, ‘Los Angeles Review of Books’, 3 June 2019

One thing we can take away from this is that sufficiently large financial incentives can outweigh the informed wishes and protests of millions of ordinary people. Dr Scranton is writing about climate change, but the same applies to any of a multitude of other threats to our well-being and even our existence. The incentives take the form not only of profits to large corporations but of salaries to hard-working employees of conventional organisations ostensibly devoted to improving the environment and society’s welfare. My thoughts about such organisations are [2]here, but we have only to look at the state of the planet’s human, animal and plant life to realise how little they are actually achieving. I do not see any of this changing, which is why I advocate Social Policy Bonds, which will encourage the formation of a [3]new type of organisation, whose every activity will be aimed at achieving society’s goals most efficiently.

The predicament that we’re in results from incentives that are mis-aligned, in that they favour existing wealthy corporations and existing bodies, be they public- or private sector, all of whose interests differ from and, indeed, are often in conflict with the long-term interests of everyone including, I believe, the individual members of these bodies themselves. The ‘we’ to which Dr

Scranton refers to, I believe, refer to all rational beings, despite their working in a system that is at odds with their real needs and wishes. Given that large-scale protests are ineffectual, the most effective way of re-orienting society such that we give a higher priority to solving our social and environmental problems would be to re-jig the incentives. [4] Social Policy Bonds would do that. They would start out by defining exactly those goals we want to achieve in terms of verifiable outcomes that are meaningful to ordinary people, who could therefore participate in their selection and relative priority. These goals would not presuppose who will achieve them and how they will be achieved. So, we could target so-called 'intractable' goals, such as the [5] ending of war. Or, once we have defined exactly which climate goals we want to see, we could target a combination of indicators of the climate and its impact on plant, animal and human life, and issue bonds that would supply incentives for people to solve the climate change problem. (See [6] here or search this blog for my work on climate change.)

There are various possible problems arising from the implementation of a Social Policy Bond regime, which I've tried to address [7] here. No question: the bonds are not a panacea and will need trials, experimentation and refinement. I advocate them because (1) Our current trajectory means we are collectively facing urgent, huge crises: social, environmental, nuclear..., and (2) I think Social Policy Bonds, with their combination of clear, meaningful outcomes and market efficiencies are the best option.

## 21.12 December

### 21.12.1 Elites should manage ends, not means (2024-12-29 07:18)

John Michael Greer writes about the costs of economic growth:

the cascading failures of the managerial elite that claims just now in the teeth of the evidence to be able to lead the world to a better future. Those failures have happened, and are continuing to happen, because the world is too complex to understand rationally. It is so full of unpredictable variables and intricate feedback loops that no degree of human expertise, no set of abstract principles, no concept of world order can provide accurate predictions and allow the creation of a viable and productive order on a global scale. [1] *The laughter of wolves*, John Michael Greer, 20 March 2024

I agree wholeheartedly - except that I don't believe 'accurate predictions' are necessary. The Social Policy Bond approach does not require accurate predictions: it requires and encourages constant adaptation to changing circumstances in order to achieve targeted outcomes. An evolutionary path towards society's ends. As Mr Greer says, the managerial elite (government, big corporations) can't do this: their interests are not the same as society's and they are too wedded to existing structures and ways of doing things. But what our managerial elite can do is articulate society's wishes and raise the funds for their achievement. No - I agree with Mr Greer - it can't actually achieve them: the complexities make that impossible. But it can reward their achievement, and this is what Social Policy Bonds would do.

Mr Greer has another suggestion:

That doesn't mean that human beings can't co-create a relatively stable, successful, thriving order in the world. It just means that this project is best pursued on a local level, relying on personal experience, folk wisdom, and close attention to local conditions. Those are exactly what the effete managerial aristocracy that thinks it runs the world can't provide.

It's an appealing idea and, actually, not necessarily different from Social Policy Bonds which, if issued with care could encourage exactly such local level initiatives, though with more co-ordination and coherence. Sadly, both ideas require our elites to target society's goals (rather than their own), and to relinquish the power to dictate how things shall be done and whom shall be rewarded for getting them done. And that would require our elites to change their thinking, or to be replaced. Both are unlikely, unfortunately.

# 2025

## 22.1 January

### 22.1.1 Mediocrity and the lust for power: why politicians aren't going to issue Social Policy Bonds (2025-01-02 19:07)

*The Economist* writes about the career choices of some of the brightest US students:

Look at where graduates of Harvard, for example, end up. In the 1970s, one in 20 who went straight into the workforce after graduation found jobs in the likes of finance or consulting. By the 1980s, that was up to one in five; in the 1990s, one in four. ...[I]n the past quarter-century there has been an even more pronounced shift: in 2024 fully half of Harvard graduates who entered the workforce took jobs in finance, consulting or technology... More than before—more even than when your correspondent entered Harvard less than a decade ago—life on campus feels like a fast track to the corporate world. [1]*Finance, consulting and tech are gobbling up top students*, the Economist, 19 December 2024

Why become a politician? Your past and present private lives will be scrutinised and anything unfavourable that you have done or said will be made public. You and your relatives will need more security. You will lose your anonymity and you won't (legally) make a lot of money. So it's understandable, though regrettable, that most of our top intellects forgo a career in politics for careers that are less exposed, less personally dangerous, and more lucrative. There will always be some who, at least initially, go into politics for noble, idealistic reasons. But it does seem likely that the majority of politicians are only moderately talented people whose main goal is to be close to, and acquire power. That's one reason, in my view, why the remit of governments tends to expand over time.

It's also one reason why governments are unlikely to be the first to issue [2]Social Policy Bonds. While a bond regime would allow or, indeed, require governments to articulate society's wishes and to raise the revenue for the achievement, the bonds would see private-sector bodies competing with government agencies to be rewarded for actually achieving them. Only the most efficient investors in the bonds would benefit from holding them. Idealistic politicians would perhaps be interested in Social Policy Bonds, and investigate whether the efficiency gains that I foresee would in fact occur, to the benefit of a society's citizens. But today's crop of politicians would be reluctant, I imagine, to consider issuing the bonds unless they had been tried, tested and shown to be successful by private-sector bodies. Since the bonds would work best for goals considered very long term, it's going to be a long time

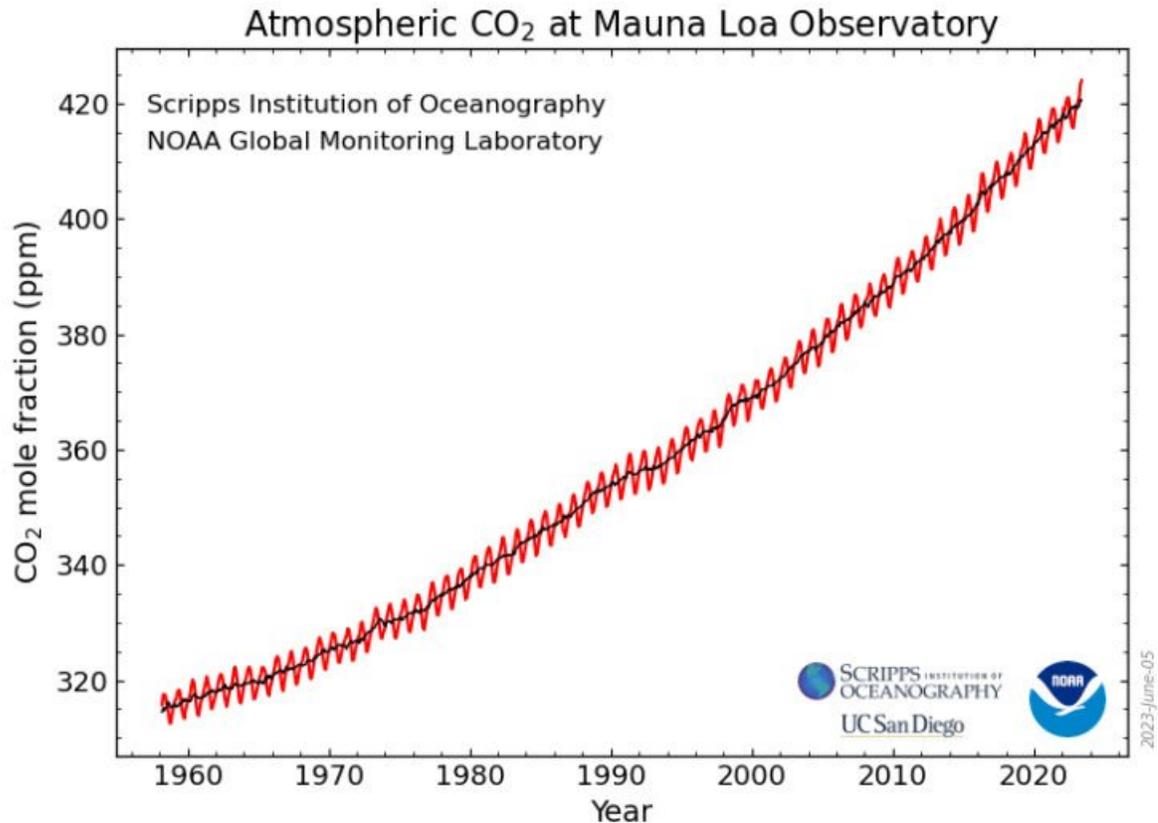

before our politicians would consider issuing them. Even then, they'd struggle to relinquish the power they currently possess, and greatly value, to fund favoured bodies and to let the market make those decisions on the basis of efficiency. Realistically then, I'm hoping some private-sector body, be it a non-governmental organisation, a group of philanthropists, or a charitable foundation, will show some interest in the concept.

### **22.1.2 Dealing with real or purported doubt about climate change (2025-01-08 18:32)**

What should policymakers do when they face a challenge where the evidence appears to indicate a huge, urgent problem - but some purport to be convinced that it's not a real problem and doesn't require any action? I'm thinking here of climate change, but the same conundrum can apply to other challenges. Politics always implies trade-offs, and any attempt to solve a slow-moving, long-term problem will mean that other demands for government funds must go unsatisfied. So it's perhaps inevitable - at least in countries whose citizens' views count - that governments will do what they can to postpone taking effective action. Greenhouse gas emissions have been the focus of policies aimed at dealing with climate change and it's fair to say that the aggregate effect has been nil:

*'Climate activism became a big public cause about halfway along this graph. Notice any effect?'* From [1]*Riding the Climate Toboggan*, John Michael Greer, 6 September 2023

The policymaking conundrum is a genuine one. Even for politicians who believe that climate change is happening and that we need to address it, the temptation instead to fund health, education and housing and other short-term social needs must be almost irresistible. We could, of course, fund yet more research with the aim of proving beyond all doubt that anthropogenic climate change is happening and that we must do something about it, but some would say that's already being done and that the interest groups opposed to, for example, cutting back on greenhouse gas emissions will always be able generate enough doubt in the minds of the public to ensure that their business can carry on as usual.

So what can those policymakers who are convinced that climate change is real and urgent do? One approach would be to issue Climate Stability Bonds. The market price of the bonds would embody investors' continuous assessments as to the likelihood and magnitude of climate change, and the costs of efforts to deal with it effectively. As such, governments would need take no action beyond articulating society's desired climate outcomes and providing the funding necessary to reward investors for achieving these outcomes. There's a lot more, of course, and there are links to my work on the bonds [2]here, but the important point here is that regardless of whether climate change is happening; *regardless of whether enough people **believe** it's happening, Climate Stability Bonds would stimulate the most efficient ways of achieving our climate goals.*

### **22.1.3 'The outcomes were terrible but the process was immaculate' (2025-01-10 11:54)**

'The outcomes were terrible but the process was immaculate'

Social Policy Bonds aim to achieve social and environmental goals as efficiently as possible. For many years, I've written about how politicians and the public are distracted, cynically or otherwise, from these goals to the supposed ways of achieving them (see [1]here, [2]here, [3]here and [4]here for some random examples). So we fuss over funding arrangements or the composition and structure of the bodies whose ostensible remit is to help achieve these goals, but whose over-arching objective is almost invariably [5]self perpetuation. When it comes to politics, we focus on the politicians: their personalities, their looks, soundbites, what they may have said when they were decades younger. In short: anything except the outcomes we want to see. The current *Economist* looks at how Britain uses process, often in the form of committees of enquiry, as a delaying mechanism: 'When the choice is between doing and discussing, British politicians instinctively opt for the latter.'

[6]Social Policy Bonds would be completely different. Their starting point would be the social and environmental outcomes that society wants to see. Politicians would retain the power to articulate and prioritise society's wishes, and to raise the revenue that would reward their achievement. But they'd relinquish the power to decide how our goals would be achieved, and which organisations would achieve them. That would be left to investors in the bonds, who would be rewarded for choosing only the most efficient approaches to solving our social problems. Most of our goals are long term in nature: slashing [7]crime rates, reducing [8]unemployment, improving [9]health, for instance at the national level; ending [10]conflict, mitigating the effects of [11]climate change, and improving the [12]environment at the global level. Today's politics, with its focus on politicians, personalities and process, is ill equipped to address our long-term needs. I suggest that Social Policy Bonds could be the way forward. They would lead to the creation of a [13]new sort of organisation, whose sole focus would be on the achievement of our desired outcomes. I hope the article in the *Economist* ([14]*How means conquered ends*, 9 January 2025, from which the quotes above are taken) is a portent of a necessary shift of policymakers' focus from means to ends.

#### **22.1.4 What do we really want? (2025-01-15 12:06)**

Guy Standing, in a letter to the *Financial Times*, argues that, contrary to what statistics appear to be saying, inequality in the UK has, in fact, risen. As well as pointing out that official income statistics, by ignoring the very highest and lowest earners, tend to underestimate inequality, he writes:

For most of the 20th century, state benefits represented a rising share of workers' social income. ...But, since the 1980s [they] have withered to a fraction of the average wage.... The same applies to community benefits, which come from the commons. The commons includes ...parks, libraries, childcare, allotments, a subsidised justice system, schooling. Most are worth a lot, and are withering. Guy Standing, [1]etter published in the 'Financial Times', 13 January 2025

As well '[w]ealth relative to GDP has soared' and 'stronger property rights means [sic] a rising share of GDP goes to owners of physical, financial and intellectual property.'

To me, this points to the need to develop and target indicators that are inextricably correlated with societal well-being. Statistical measures of financial inequality, as Mr Standing writes, fails this test. It matters because, in the absence of coherent policymaking, badly thought out indicators become a *de facto* targets. Probably the most important such measure is GDP; its [2]flaws as an indicator of well-being are well known but governments worldwide target it implicitly and explicitly ('economic growth'), though it has no necessary link to well-being and, indeed, can show an increase even as there is more activity that conflicts with well-being.

It is, perhaps, regrettable that, on the national and global levels, we require numerical indicators to get an idea of what's really happening. But, accepting that, we need to develop broad measures that are inextricably linked to whatever we actually want to measure; these we can then explicitly target. Targeting outcomes, rather than the alleged means of achieving them, would add some much-needed transparency to the policymaking process. Stability too: broad social and environmental goals are more stable over time than the many different policy approaches ostensibly aimed at achieving them. This matters because most of our broad social and environmental goals will necessarily take many years to achieve. We might also clarify whether supposed goals such as 'reduced inequality' are ends in themselves or rather a less precise way of targeting a perhaps more noble aim: the elimination of poverty.

[3]Social Policy Bonds are one way in which we can focus on outcomes rather than, as now, personalities, funding arrangements, sound bites and ideologies, when making policy. They

would oblige us to clarify what we really want to achieve. And, as well as their being explicit and transparent, they would inject market incentives into the achievement of our goals. Opinions will differ, but a big plus of targeting outcomes is that they can be understood by ordinary citizens, and so can generate public engagement and, hence, public [4]buy-in: an important but currently neglected aspect of policymaking.

### **22.1.5 Climate change theatre (2025-01-18 11:14)**

Jonathan Hinkles writes in the UK magazine, *Airliner World*:

Talking to a major bus operator earlier this year, I was astonished to learn that the hydrogen powering the buses that Virgin HQ's building every few minutes comes from Saudi Arabia. It's converted to ammonia pellets, which are shipped to the UK, then converted back into hydrogen for use in buses. A mind-boggling amount of energy is expended in that process to achieve 'emissions-free travel', as the bus slogan proudly complains. [1]Sky View, Jonathan Hinkles, 'Airliner World', dated February 2025

This is what happens when we target micro-objectives devoid of any link to our environmental goals. The micro-objective here is 'a reduction in greenhouse gas emissions per bus journey', which has nothing to do with 'a reduction in total greenhouse gas emissions'. I'd go further and say that instead of targeting greenhouse gas emissions, we should clarify exactly what we want to achieve: a halt to climate change? Or a reduction of the frequency and severity of adverse climatic events? Either way, national targets, let alone bus journey targets, are useless. Without a broad, global, specification of our goals, we'd have...well, what we have now: targets for reductions in local emissions of greenhouse gases that are politically divisive, expensive, have no buy-in, and are failing even in their stated aim:

[2]

*Global average abundances of the major, well-mixed, long-lived greenhouse gases - carbon dioxide, methane, nitrous oxide, CFC-12 and CFC-11 - from the NOAA [US National Oceanic and Atmospheric Administration] global air sampling network since the beginning of 1979. These five gases account for about 96 % of the effective radiative forcing by long-lived greenhouse gases since 1750. The remaining 4 % is contributed by 17 other halogenated gases including HCFC-22 and HFC-134a, for which NOAA observations are also shown here. [3] Source*

My suggestions are that we first clarify [4]whether we want to target the climate itself, or the effects of adverse climatic events on plant, animal and human life. Next, I suggest we issue Climate Stability Bonds that would specify exactly the goals that what we want to achieve, *at a global level and over the very long term*, and then reward the people who achieve them. I envisage that our goals would take the form targets for many variables, including those measuring features of the climate, and biological, physical, financial and social variables, all of which would have to fall into an acceptable range before the bonds could be redeemed. There are many posts relating to these suggestions on this blog, as well as links to my writings on the subject [5]here.

### **22.1.6 Market signals to inform those who achieve social goals (2025-01-29 17:05)**

The market for [1]Social Policy Bonds would generate extremely useful information that would enhance the efficiency of a bond regime. Price signals would be of immense value to investors in the bonds. At flotation, the bonds would be auctioned, and difference between the sums raised at flotation and the total redemption value of the bonds would supply the market's best estimate of the cost of achieving the targeted goal at that time. This estimate would vary over time, depending on many factors including bondholders' performance in undertaking or financing goal-achieving projects as well as changing economic, scientific and social circumstances. The market for Social Policy Bonds, then, as with all markets, plays a vital role not only in allocating resources but also in signalling to investors and policymakers the market's best estimates of the costs of achieving social goals.

A competitive market for Social Policy Bonds as well as signalling the total cost of achieving a specified objective, would minimise it. More subtly, and more technically, it would also indicate the marginal cost of achieving further improvements. Say one million crime reduction bonds issued by a local authority were to sell for \$5 each. This would tell the issuing body that the present value of the expected maximum cost, including bondholders' profits, of reducing the crime level from, say 50 to 40 units, would be \$5 million. The local authority might then suppose that it could afford to be more ambitious, and aim for a further fall to 30 units. It could issue a million additional bonds redeemable when this new lower rate were reached. These would (probably) have an initial market value of less than \$5, reflecting the (probably) diminishing returns involved in preventing crime. The point is that, by letting the market do the pricing of the bonds, the local authority would be getting an informed view of the marginal cost of its objectives. So if the bonds targeting the new level of 30 units were to sell for \$4 each, then the maximum cost of achieving that objective would be \$11 million, being equal to: \$5 million (paid out when the level fell from 50 to 40 units) plus \$6 million (paid out when the level fell from 40 to 30 units). The marginal cost of a 10-unit drop in crime would thus have been revealed to have risen from \$5 million to \$6 million. Should the local authority aim for a further fall to 20 units? Following such crime rate-targeting bond issues it would have robust information about the cost of doing so.

This is, of course, a simplified example and in fact the bond market would continuously update its pricing information. Say that new research, of the sort that might be stimulated by an initial bond issue targeting crime, suggested new ways of reforming or deterring criminals. Bondholders may, for example, have financed successful research into more effective reform programmes, or set up more appealing alternative lifestyles for especially hardened criminals. How would the market react to such developments? Once their effectiveness had been revealed, the value of all the bonds would rise. Instead of being priced at \$5 and \$4, the two crime reduction issues of the example might sell for \$8 and \$7. The total cost to the government of redeeming these bonds would not change: it would remain at \$11 million (though redemption would most probably occur earlier). But the market would be generating new information as to the likely cost of future reductions in the crime rate. The market would

now be expecting reductions of 10 units of crime to cost \$2 million (from 50 to 40 units), and \$3 million (from 40 to 30 units). The new research would have reduced the costs from \$5 million and \$6 million (respectively). So the cost of any further crime reductions would also fall, and by following market price movements policymakers could gauge approximately by how much.

These figures are hypothetical, but they do indicate the role that markets for Social Policy Bonds could play in helping the government, and taxpayers, decide on their spending priorities. This sort of information is just not available to today's policymakers, which is one reason why the costs of major projects are almost invariably much higher than initial estimates. (There are, of course other reasons rooted in cynicism and political expediency.) The point is that the market for the bonds is elegantly efficient in conveying information about the cost of achieving objectives and, crucially for investors and policymakers, how this cost varies with time and circumstances. I discuss this in chapter 5 of [2]my book.

### **22.1.7 The apotheosis of process (2025-01-31 10:16)**

In a [1]long post, the entirety of which is well worth reading, Dr Malcolm Kendrick contrasts the ongoing UK public enquiry into Covid with that done by the Swedes:

In the UK we have massive Covid enquiry going on. It consists of ten 'modules', one of which has been finally completed, the other nine grind on. The chair hopes to conclude public hearings by the summer of 2026. Yes, 2026... Four years after it the enquiry started. (I would place a small wager that this deadline will be missed.) After this, a majestic report shalt be written. Which will take several more years, no doubt? By which time we will all have lost interest or died of old age. Last time I looked, the enquiry had cost well over one hundred million pounds ( \$125m). I guess it will end up costing close to quarter of a billion by the time it is finished. All taking longer to complete than WWII. Sweden wrapped up their enquiry by February 2022, in well under two years. Done and dusted, before ours even got started. ...

In meeting its aims, the Inquiry will:

a) consider any disparities evident in the impact of the pandemic on different categories of people, including, but not limited

to, those relating to protected characteristics under the Equality Act 2010 and equality categories under the Northern Ireland Act 1998.

b) listen to and consider carefully the experiences of bereaved families and others who have suffered hardship or loss as a result of the pandemic. Although the Inquiry will not consider in detail individual cases of harm or death, listening to these accounts will inform its understanding of the impact of the pandemic and the response, and of the lessons to be learned;

c) highlight where lessons identified from preparedness and the response to the pandemic may be applicable to other civil emergencies;

d) have reasonable regard to relevant international comparisons; and

e) produce its reports (including interim reports) and any recommendations in a timely manner. (A *timely* manner...ho, ho.)

Dr Kendrick asks what's missing from these aims?

Just about every question you would wish answered. Plucking a few from the air:

- What is the evidence that lockdowns did any good
- What is the evidence that lockdowns were harmful

- What is the evidence that wearing masks provided any protection
- Were the models created by epidemiologists inaccurate, if so why, and why did we listen to them – and should we do so in the future
- Should we have had a behavioural unit within SAGE (Scientific Advisory Group for Emergencies) which used messages of fear to control the public response
- Were the vaccines rushed through without sufficient consideration to safety
- Were experts who disagreed with the official narrative attacked and silenced when it would have been more effective to listen to them

Yes, these sort of questions. The sort that you probably would like to have answered. Questions that the UK enquiry will go out of its way to avoid. Instead, it will be almost entirely concerned about process. Which departments should have spoken to each other. Should there have been a different oversight committee. Not, God forbid, any analysis of outcomes. [2] *What went on during Covid?*, Dr Malcolm Kendrick, 29 January 2025

Exactly. By setting up these endless reviews of process, politicians can distract us from their failings and anyway wait till we've all lost interest before they're exposed. It's a systemic problem. Our political debates centre round peripheral issues: personalities, sound bites, funding arrangements, institutional structures and, yes, process. Everything except outcomes. What do I suggest? At the national level, I propose [3] Tradeable Health Outcome Bonds, which would take a panoptic view of a country's physical and mental health, and reward people for improving it. (A shorter version is [4] here.) The focus needs to be on outcomes, about which there is room for legitimate debate and discussion - the sort of discussion that ordinary people can understand and in which we could participate. Such discussion would be an [5] end in itself, as well as generating a level of [6] buy-in - essential when it comes to complex matters such as health and the environment, but which is largely absent from our current policymaking environment. Focusing on outcomes has other benefits as well as efficiency and transparency: especially in complex policy areas like health or the environment, where our knowledge is expanding rapidly, our goals are far more stable over time than the best means of achieving them. The Social Policy Bond concept is entirely aimed at achieving society's goals. The essential first step is to clarify exactly what are these goals, in consultation with experts *and the public*. You would think this would be a priority for every democratic government, but, sadly, it rarely happens. The result? Politics has become a circus, and policymaking a farce.

## 22.2 February

### 22.2.1 World Peace (2025-02-08 17:37)

Targeting long-term goals means that we can greatly extend the realm of achievable outcomes compared to those available to today's policymakers.

For example: world peace. Today that simply means an absence of war or civil war - violent political conflict. So the current definition of peace can (and does) allow for: piling up of all sorts of weaponry; including weapons of mass destruction; and hateful and provocative propaganda in the media, schools, and religious institutions. These increase the probability of deadly conflict in the long run, but would still technically be defined as 'peace' today. Rewards under this short-term vision accrue to arms merchants and others intent on fomenting conflict to take place some time beyond the horizons of today's politicians. Today's incentives then do little to prevent conflict.

[1]World Peace Bonds would be different. They would be issued with a very long time horizon: perhaps five decades. Any outbreak of large-scale violence would see investors in the bonds the prospect of losing money. But if they are effective in ensuring world peace, then they stand to benefit - as does everyone else on Earth. World Peace Bonds, with sufficient backing, would outweigh today's incentives. With such a long-term view, it would be in the interests of bondholders to eliminate the hateful indoctrination of schoolchildren and everyone else, and to control the sales and lethality of armaments. Bondholders would have incentives also to research, experiment and implement new approaches to conflict reduction, concentrating on those that are most promising and efficient.

The goal of 'world peace' is readily categorised as unrealistic, utopian, idealistic and, of course, impossible. That's partly because we have only to look at human history in confirmation. But incentives have unleashed such human ingenuity that the quantity (population and longevity) and quality (standard of living) of billions of our species have risen spectacularly in recent decades. Long-term challenges threaten our achievements. We urgently need to supply incentives commensurate with the magnitude *and long-term nature* of those threats.

### 22.2.2 The widening gap between politics and people (2025-02-14 18:37)

Unlike many economists I have no view on the size of government. Government is a means to various societal ends and those should be decided by people. I don't believe that taxation

is theft, nor that economic freedom is the most important consideration. It is the large and widening gap between government and people that I believe needs to be addressed.

The gap would narrow if more people participated in policymaking. One reason, I believe, why we're not very interested is that policy is formulated in terms that are difficult to relate to outcomes that are meaningful to us as natural persons, as distinct from corporate bodies. Policymakers seem to concern themselves with decisions about funding for different government agencies, dispensing patronage to big business and other lobbies, presenting themselves in the best light ... almost anything, in fact, except outcomes that mean something to real people.

A government that issued [1]Social Policy Bonds would, from the outset, have to think clearly about social and environmental outcomes, rather than the supposed means of achieving them. Its main roles would be to articulate society's wishes regarding social and environmental outcomes, and to raise the revenue that would fund these outcomes. Unlike most of the current determinants of policy, the language of outcomes and the necessary trade-offs between them is comprehensible to people other than politicians, bureaucrats, lawyers and public relations experts. For that reason, more people would be drawn into policymaking - an end in itself, as well as a means toward getting greater public [2]buy-in to the resulting policies.

Expressing policy in terms of outcomes, and the consequent closing of the gap between public and policymakers would be one valuable benefit arising from a Social Policy Bond regime. The other would be the much greater efficiency in achieving social and environmental goals once the market, rather than a handful of government employees, decides who shall achieve these goals, and how they shall be achieved.

### **22.2.3 'Complexity is fraud' (2025-02-22 11:23)**

The late P.J. O'Rourke once [1]wrote, in *The Atlantic* in April 2002, that: 'Beyond a certain point complexity is fraud.... when someone creates a system in which you can't tell whether or not you're being fooled, you're being fooled.'

When people's wishes clash with vested interests it's the vested interests (the political class and those groups that can afford expensive lobbyists) that win every time. Our political systems are too complex, arcane or corrupt for ordinary people to stand a chance. The result is clear: an ever-rising gap between politicians and the people they are supposed to represent.

Voting makes little difference. And, while we don't really know the intentions of the people in power, I suspect that whoever they are doesn't make much difference either. The vested interests are too powerful. They have perpetuated a policymaking process that effectively excludes influence from people outside their exalted circle. They have weaponised the complexity and obscurity of our systems of government for selfish ends.

They can get away with this because our political discourse centres on sound-bites, personality, and image. Actual policymaking is an entirely distinct process: much of it focuses on the structures and funding of government bodies, law and regulation; all of which are opaque to non-professionals - which is to say, ordinary people. The only people who now really understand policymaking are those who are paid to do so, and the only people who influence it are those who have the millions of dollars necessary to pay them. You might even think the system has been specifically designed to keep ordinary citizens out of it.

Bernardo Mueller's 2019, *Why public policies fail*, is perhaps less cynical:

The failure of public policies is ubiquitous. This paper ascribes this failure to the complex system nature of public policies. A key characteristic of complex systems is that they cannot be closely controlled or predicted. Yet the traditional approach to public policy is fundamentally based on both control and prediction, as it proceeds by comparing the expected costs and benefits of a postulated set of alternatives. In this paper I provide five pathologies of complex systems and show how they cause the failure of the traditional approach. If a public policy is recognized as taking place within a complex system, it is necessary to use instruments that can work within those informational and epistemological constraints. I provide several examples of the types of policies that meet these demands. But when dealing with complex systems, even with appropriate instruments it is nevertheless necessary to adjust the expectations of what can realistically be achieved. [2] *Why public policies fail: Policymaking under complexity*, Bernardo Mueller, September 2019

I believe that we can set up a system that solves our long-term problems by bypassing government decision-making and rewarding solutions however they are achieved and whoever achieves them. Social Policy Bonds would work by giving incentives to people to try many different approaches to problems, such as crime, conflict, climate change, and pursue only those that are most promising. Such a system would resemble biological evolution, in that there would be constant pressure, in the form of incentives, to select only the most successful approaches to achieving our social and environmental goals.

A bond regime would require that policymaking focus on outcomes, rather than the alleged means of achieving them. Outcomes are more meaningful to ordinary people than the current policymaking emphasis on legal pathways, funding arrangements, institutional structures and composition, and other arcana.

Meaningful outcomes are one essential element of the [3] Social Policy Bond idea. The other is the injection of market incentives into their achievement: rewarding those who achieve our goals according to their efficiency in actually achieving them. The idea might sound outlandish at first hearing: handing over the solution of our social and environmental problems to investors. But government would still articulate our goals and raise the revenue for their achievement - things that democratic governments can actually do quite well. Only their achievement would be subject to the market, which economic theory and all the evidence suggest is the most efficient way of allocating society's scarce resources. No doubt the Social Policy Bond idea could do with some discussion and refinement. But the real question is: what is the alternative? To continue as we are doing, where the gap between vested interests and ordinary people grows ever wider, risks, in my view, social collapse.

#### **22.2.4 Betting on socially desirable goals (2025-02-27 17:54)**

The Social Policy Bond idea materialised when I thought about how, when betting big money on an uncertain outcome you could use some proportion of your expected winnings to make that outcome more likely. Fixing horse or greyhound races that way would be illegal, but could the same principle be used legitimately for society's good? Perhaps new betting markets are a way in which we could effectively issue Social Policy Bonds.

Let's take a look at [1]Polymarket, 'the World's Largest Prediction Market'.

Today (27 February 2025) we see that you can bet on whether [2]Timothée Chalamet will take his mother to the Oscars ceremony. This is a simple one-off event that's easy to verify. It's not difficult to imagine that, having placed a sufficiently large bet, a group of punters could persuade Mr Chalamet to bring about the outcome they desire, if necessary with the promise of a significant proportion of their expected winnings. One of the difficulties of the Social Policy Bond principle is that of setting up an experiment. The bonds have their biggest advantage over conventional policymaking when the desired social or environmental outcome is likely to be complex, long-term in nature and require the investigation of a range of diverse, adaptive approaches for its solution. Such socially desirable outcomes could include the slashing of crime rates, significant improvements in the physical and mental health of a country's citizens or, at the global level, a reduction in the adverse impacts of natural disasters. We can't test the efficacy of Social Policy Bonds against current policymaking aimed at achieving such outcomes.

But what some high-minded philanthropists could conceivably do is to take out a large bet against a readily verifiable one-off outcome like, say, the detonation of a nuclear device that kills more than, say, 500 people within 30 years? They could then use their influence and funds, predicated on their winning the bet, to make such a detonation less likely. At first sight, this sounds tempting: indirectly channelling resources into the achievement of an unambiguously positive social goal. In net terms: yes; nuclear peace is hugely and unambiguously positive. But Polymarket is merely a platform that facilitates peer-to-peer trading, so that people are betting against each other. So for every \$1 million bet on achieving nuclear peace, there would be people on the opposing side of that bet who would lose that much. If governments collectively decided to supply the funds that would be paid out on redemption of Nuclear Peace Bonds, then millions of taxpayers would, in effect, be paying for that outcome: a diffuse set of people, none of whom would benefit in any discernible way from a nuclear detonation. The Polymarket is different: it's likely there would be few people on the opposing sides of the bet of our philanthropists, and they could lose substantial amounts if sustained nuclear peace were achieved. They would be well placed and highly motivated, then, to co-ordinate efforts to foil any attempts to achieve that goal.

Social Policy Bonds would be best issued to encourage goals that are not only almost universally desired, but that also do not create a small group of highly-motivated people who would oppose those goals. The goals I [3]discuss are all like that, but it's also important that they be issued in

such a way that any losses from successful achievement of the targeted goals would be spread so thinly that nobody would be motivated to take action to frustrate the targeted goal. So, for instance, halving crime rates could reduce the prospects for lawyers, jailors and nurses, but I don't think that would motivate them actively to oppose that goal.

The quest for a way of experimenting with Social Policy Bond continues...

## 22.3 March

### 22.3.1 Government of the people, by the bureaucrats, for the bureaucrats... (2025-03-07 17:46)

One of the advantages of a [1]Social Policy Bond regime is that it would oblige democratic governments to do what they do well: articulate society's wishes and raise the revenue to fund their achievement. Sadly, much of the choosing and prioritising of society's goals has shifted from our elected representatives to bureaucracy:

Bureaucrats no longer saw their role as "looking for methods to fulfill responsibilities defined by the public through politics," wrote University of Chicago historian Barry Karl in a 1976 essay, but rather as "fulfilling the demands of interests defined by their own growing expertise." ...The "public good" is now explicitly defined by the bureaucracy, not elected leaders. Defending democracy means defending the right of bureaucrats to ignore elected leaders. [2]*Denizens of the Deep State*, Bruce Gilley, 'The American Mind', 26 February 2025

Reasons why this shift occurred are not hard to find: politicians have to react, and be seen to react, to daily events. With frequent opinion polls, their time horizons are even shorter than the period between elections. Bureaucracy is more permanent. So we have the 'deep state', whose over-riding interest, as with all institutions, is [3]self-perpetuation. Its goals are formulated, explicitly or not, without reference to - and perhaps in conflict with - public opinion.

A Social Policy Bond regime would be different. It would take as its starting point those social and environmental goals that are of interest to a country's citizens. These goals would be long term in nature and meaningful to ordinary people, who could therefore participate in their selection and prioritising. As a result, we'd have greater public [4]buy-in. That's in stark contrast to today's policymaking systems, in which debate centres around the supposed

means of achieving unarticulated or vague goals rather than the goals themselves. By default, then, decisions as to what society wants and where it's going are made by bureaucrats. It's not healthy.

### 22.3.2 Nobody takes a panoptic view (2025-03-10 11:08)

Peter

Gøtzsche writes:

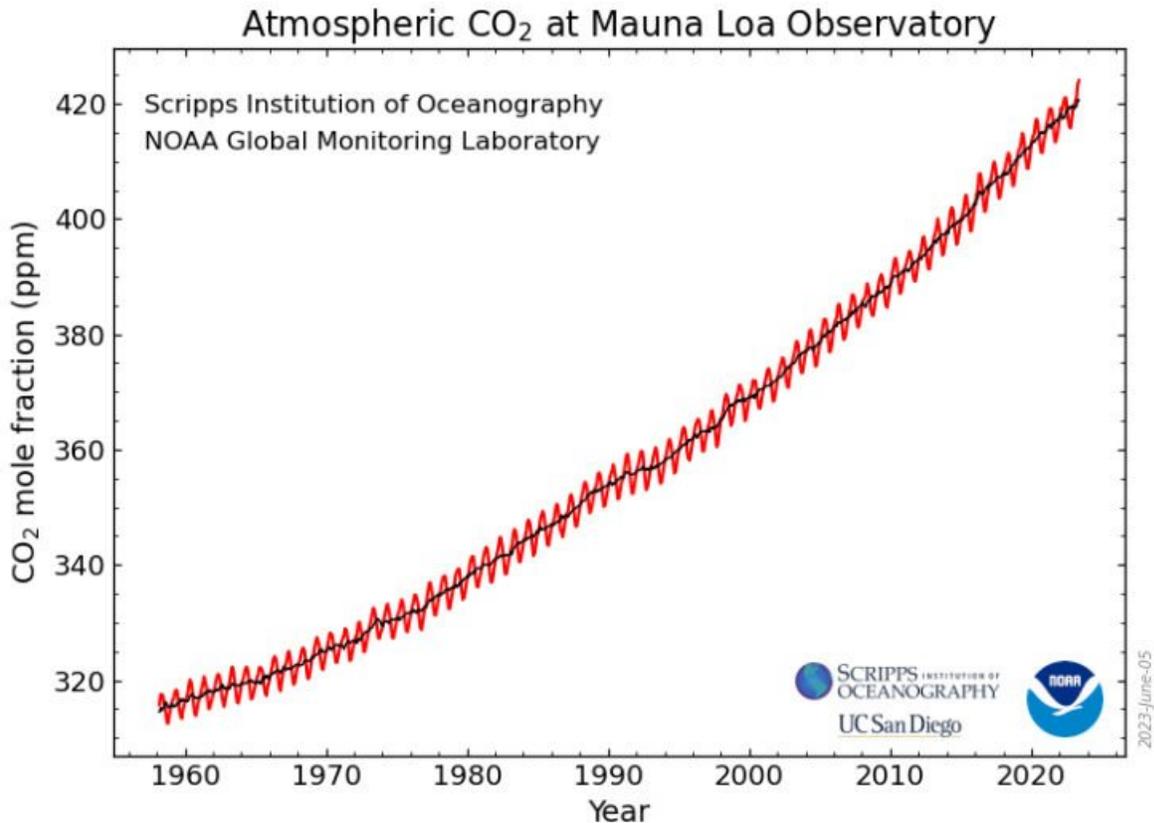

In 2024, PubMed indexed 1,728,666 articles. Compare this with the little progress there is in healthcare from year to year and consider also that most research results are unreliable or outright false.

[1]*Ridiculous names for predatory journals* (clicking the link will download a docx file), Peter C Gøtzsche, Institute for Scientific Freedom, 7 March 2025

This is exactly the sort of overview we need to take in health and other policy areas: a comparison of the resources devoted to a goal and the actual outcomes achieved. Unfortunately, few people have the incentive or capacity to make such comparisons. Professor Gøtzsche himself has [2]been [3]vilified for questioning the role that the pharmaceutical industry plays in psychiatry. Yet taking a panoptic view makes it clear that there's something very wrong with the world's healthcare. It's not just healthcare:

From 2004 to 2014, aid spending increased by 75 %. "There was a real feeling," says Stefan Dercon of the University of Oxford, "that if there was a time things were going to get going, this was it." Things did not get going. From 2014 to 2024, the world's 78 poorest economies grew more slowly than in the decade to 1970, when aid was first emerging. This is perhaps unsurprising, given earlier studies. In 2004 William Easterly of New York University and co-authors found that, from 1970 to 1997, aid was just as likely to shrink the world's poorest economies as to help them grow. [4]*Aid cannot make poor countries rich*, the 'Economist', 6 March 2025

Again, how many people take this sort of overview, and what influence do they have over policy? Very few, and negligible, I'd say. Arguably, the same failings occur in education in some of the rich countries. Certainly they apply to [5]climate change if we take greenhouse gas emissions as an indicator of policy success:

Why are we so hopeless at making effective and efficient policies? One answer is that we rarely evaluate their effectiveness:

[G]overnment bureaucracies non-self-evaluate. At a minimum, agencies with evaluative responsibilities are not invited to evaluate - they are kept out of the loop, their opinions unsought. At a maximum, government agencies actively suppress their own internal evaluative units and are discouraged from evaluating the beliefs and policies of other agencies. [6]*Why States Believe Foolish Ideas: Non-Self-Evaluation By States And Societies* (pdf), Stephen Van Evera, Massachusetts Institute of Technology Political Science Department and Security Studies Program, 2002

Another answer is that our policies do not adapt to changing circumstances, nor are national policies sufficiently adapted to different regions. From the same article in the *Economist*:

[D]isillusioned economists have turned to the work of Esther Duflo, a Nobel laureate at the Massachusetts Institute of Technology, who uses randomised controlled trials to study interventions. Yet she has come to a dispiriting conclusion: there is no reason why what works in one neighbourhood will do so in the rest of a district, let alone on another continent. In one Indian village, for instance, giving women pensions made their granddaughters (if not their grandsons) healthier; in another, handouts failed to improve health or even raise household consumption. Ms Duflo's findings chime with other research....

Especially for long-term goals, we need policies that are diverse and adaptive. [7]Social Policy Bonds, as well as injecting market incentives into the solution of our social and environmental problems, would encourage investors to explore different approaches, to refine those that are most promising and, importantly, to terminate failing approaches.

For more about how the Social Policy Bond principle could be applied to health, see [8]here. For how it could be applied to development see [9]here.

RE: "taking a panoptic view makes it clear that there's something very wrong with the world's healthcare. It's not just healthcare"

There is a panoptic view" that explains the reasons for this — carefully study the scholarly essay The 2 Married Pink Elephants In The Historical Room -The Holocaustal Covid-19 Coronavirus Madness: A Sociological Perspective & Historical Assessment Of The Covid "Phenomenon" at <https://www.rolf-hefti.com/covid-19-coronavirus.html>

Yet...

"The masses have never thirsted after truth. They turn aside from evidence that is not to their taste, preferring to deify error, if error seduces them. Whoever can supply them with illusions is easily their master; whoever attempts to destroy their illusions is always their victim." — Gustave Le Bon, in 1895

It's WHY you "very few" panoptic overview are around: they show the ugliest truth about advanced humans, and extremely few individuals WANT the real truth (see cited essay above).

If you have been injected with Covid jabs/bioweapons and are concerned, then verify what batch number you were injected with at <https://howbadismybatch.com>

### 22.3.3 Whipping up a tempest (2025-03-21 16:48)

From the current *Economist*:

Mr Trump is expanding his threats, promising to hold Iran to account for the Houthis' attacks and warning them of 'dire' consequences. Yet his approach is only hardening the mullahs' hearts. They may seize the chance to rally their embittered people against a common enemy and go for confrontation and a nuclear bomb. Israel might then join the fray. The Houthis would come to their patron's [Iran's] aid and fire again at Gulf cities and oil terminals. It is all too easy to imagine the worst. [1] *America's strikes on the Houthis could whip up a regional tempest*, the 'Economist', 20 March 2025

Indeed. I keep returning to the possibility of a nuclear exchange, because it would be a catastrophe in its own right, as well as a terrible portent. We could rely on some combination of world governments to make nuclear conflict less likely but, in today's political environment, I think we should look for a complementary solution.

My suggestion is that we [2] issue our own (pdf) Nuclear Peace Bonds. All it would take would be for some interested philanthropist to put up the funds, and let the market for the bonds do the rest. Of course, once the ball got rolling, contribution from other bodies and members of the public could be solicited, which would swell the total redemption rewards. Even governments, if they could put aside their short-term interests for a moment, could add to the pot.

The goal of sustained nuclear peace would actually make an ideal target for the Social Policy Bond idea. One, because it's a complex, long-term goal that will require diverse, adaptive solutions. Two, it's an easy goal to verify. And lastly, it's a goal that, on all the evidence, including that of the above excerpt from the *Economist*, is unlikely to be reached under current policy. The idea would be to issue bonds that reward a sustained period of nuclear peace. This could be defined, as, say the non-detonation of a nuclear device that kills more than 100 people for 40 years - the long time period is necessary so that systems are put in place that work in the long term. With sufficient backing the bonds would help offset and (one hopes) outweigh the incentives currently on offer to the military-industrial complex and to ideological and religious fanatics.

Those billions of us who would benefit from nuclear peace are presumably a massive numerical majority, but we currently have few means of channel our wishes effectively. The tendency is to assume that governments will do what's necessary, with the support of hard-working, well-intentioned people in the private sector. But the rewards to all these people are not linked to their success. This is unhelpful in itself but, more importantly, it discourages investors who, seeing little opportunity to benefit from working to reduce nuclear conflict, will focus instead of less edifying enterprises. Most important of all is that our current strategy is just not working.

We need to reward those who achieve nuclear peace at least as much as those working to undermine it. We don't know exactly how to reduce the chances of a nuclear exchange, nor who will be best placed to do so, over the long period during which our goal is to be achieved, but we have no excuse for not encouraging people to find out. Nuclear Peace Bonds would apply the [3]Social Policy Bond principle to this goal. Investors in the bonds would form a [4]protean coalition of people dedicated to achieving it as efficiently as possible. Their goal would be exactly the same as society's. Human ingenuity knows no limits. Currently, too much of it is devoted to relatively unimportant or socially questionable goals. Nuclear Peace Bonds would channel our ingenuity, and stimulate more of it, into minimising the risk of a global catastrophe.

My short piece on Nuclear Peace Bonds is [5]here. The links in the right-hand column of that page point to papers on similar themes: [6]Conflict Reduction, [7]Disaster Prevention, and [8]Middle East Peace
