<b>2004</b>	<b>39</b>
December . . . . .	39
Welcome (2004-12-20 00:37) . . . . .	39
Kyoto (2004-12-20 00:38) . . . . .	39
Literacy in the UK (2004-12-20 04:23) . . . . .	41
Polluter Pays Principle (2004-12-26 12:14) . . . . .	41
<b>2005</b>	<b>45</b>
January . . . . .	45
Who can issue Social Policy Bonds? (2005-01-03 14:01) . . . . .	45
If Social Policy Bonds are so marvellous... (2005-01-05 20:31) . . . . .	46
Outcomes for whom? (2005-01-10 21:28) . . . . .	47
There are arguments on both sides (2005-01-13 20:00) . . . . .	47
'Death of Environmentalism' (2005-01-16 13:10) . . . . .	49
Dark Age Ahead (2005-01-19 21:24) . . . . .	50
Anything but outcomes (2005-01-24 09:40) . . . . .	51
Third world hunger (2005-01-27 19:54) . . . . .	52
Corporate welfare (2005-01-30 12:15) . . . . .	53
February . . . . .	53
Ends and means (2005-02-02 19:56) . . . . .	53
Over-regulation favours big business (2005-02-03 09:05) . . . . .	54
No suggestion of illegality (2005-02-07 09:00) . . . . .	55
What Randians think (2005-02-07 22:07) . . . . .	55
Peace in the Middle East (2005-02-14 09:58) . . . . .	56
'The Revolution that Wasn't' (2005-02-16 02:14) . . . . .	57
Kyoto (2005-02-16 02:25) . . . . .	57
Peace in the Middle East - again (2005-02-19 05:02) . . . . .	57
Pap and politics (2005-02-21 09:19) . . . . .	58
Your tax dollars at work (2005-02-23 20:02) . . . . .	59
Prescribed ends (2005-02-27 09:13) . . . . .	59
Allocation of resources (2005-02-28 21:11) . . . . .	60
March . . . . .	61
Subsidies favour big business (2005-03-03 20:27) . . . . .	61
Social Policy Bonds: information as well as incentives (2005-03-09 09:26) . . . . .	62
How Social Policy Bonds minimise costs (2005-03-10 19:56) . . . . .	63
Why Kyoto will fail (2005-03-12 13:14) . . . . .	64
Mickey Mouse targets (2005-03-15 20:15) . . . . .	65
What are the New Zealand Government's goals? (2005-03-19 11:37) . . . . .	65
Corrupt Agricultural Policy (2005-03-21 09:44) . . . . .	66

What drives education policy? (2005-03-22 08:45)	67
Government cannot pick winners (2005-03-24 02:24)	67
'Solving the world's problems'... (2005-03-29 09:20)	68
Policy as if outcomes don't matter (2005-03-30 10:15)	68
Reframing environmental issues (2005-03-31 10:53)	69
April	70
Corporate goals and perverse subsidies (2005-04-05 10:36)	70
Numbers and happiness (2005-04-11 14:03)	71
What happens when government tries to help (2005-04-13 14:55)	71
Ideology = Intellectual Bankruptcy (2005-04-17 12:48)	73
Another day, another set of Mickey Mouse targets (2005-04-18 22:34)	74
Emissions are not climate change (2005-04-23 06:26)	75
Why bother to buy Social Policy Bonds? (2005-04-26 08:07)	76
May	77
Closing the gap (2005-05-01 06:12)	77
What about the subsidies to big oil? (2005-05-04 09:20)	78
Government for special interests (2005-05-06 14:48)	78
Killing our cities (2005-05-08 10:28)	79
Information markets and Social Policy Bonds (2005-05-13 08:39)	80
Subsidising the rich (2005-05-17 15:43)	81
Nappies and environmental policy (2005-05-19 16:43)	82
Entrenching dependence (2005-05-25 08:03)	82
Tax breaks for the rich (2005-05-28 14:18)	83
A European Union without France (2005-05-31 03:47)	84
June	85
"The EU: regulations R us" (2005-06-02 15:19)	85
Old Europe (2005-06-09 09:05)	85
UK (2005-06-14 08:12)	86
Prague (2005-06-20 18:37)	86
Back in the UK (2005-06-23 18:33)	87
'Better than Kyoto' (2005-06-28 13:04)	87
Amsterdam (2005-06-30 15:14)	88
July	88
Corporate goals are not social goals (2005-07-05 17:29)	88
Terrorism, war and market incentives (2005-07-09 08:01)	89
The private sector can issue Social Policy Bonds (2005-07-13 14:36)	90
War, terrorism and 'root causes' (2005-07-17 16:52)	91
Ideology or outcomes? (2005-07-23 15:57)	92
Investments as options (2005-07-26 17:07)	92
The need for over-arching objectives (2005-07-29 17:18)	93
August	94
Outcomes and metrics (2005-08-05 17:28)	94
Israel Peace Bonds: give greed a chance (2005-08-09 17:34)	95
Subsidising oil consumption (2005-08-17 13:52)	97
Sponsoring intermarriage (2005-08-19 19:10)	98
Pluralism versus central planning (2005-08-22 08:39)	98
Even imaginative governments are limited (2005-08-24 09:34)	100
Design versus liberalism (2005-08-27 15:43)	100
Issue your own (2005-08-30 08:39)	101
September	102

Maintaining the status quo (2005-09-05 15:10)	102
The EU: 'Regulations R Us', continued (2005-09-08 16:12)	102
Memo to Government: make sure my milk is fresh (2005-09-09 07:40)	103
Price stability is not a goal (2005-09-14 07:42)	103
New Public Management (2005-09-16 08:18)	103
Social Policy Bonds - an overview (2005-09-21 13:53)	105
Goals for a bond regime (2005-09-27 16:27)	108
On the commons (2005-09-28 13:39)	108
October	109
Environmentally harmful subsidies (2005-10-04 12:14)	109
Incentives for development (2005-10-07 16:47)	110
Numerical indicators (2005-10-11 07:38)	111
Causes: interesting but irrelevant (2005-10-14 16:35)	112
Perverse subsidies: a continuing story (2005-10-19 13:37)	113
Shock News: CAP rips off Europeans (2005-10-22 07:50)	114
Bangkok's new airport (2005-10-25 16:23)	114
Extension transference (2005-10-26 17:23)	115
Humility (2005-10-27 12:46)	117
Small government: not an end in itself (2005-10-30 06:01)	117
November	118
Riots in Paris (2005-11-02 09:18)	118
Kyoto is dead (2005-11-05 16:57)	119
Prince Albert of Monaco receives 300 000 euros from CAP (2005-11-12 05:13)	120
Kyoto is dead ...still (2005-11-16 10:32)	120
Subsidising our oil addiction (2005-11-21 09:25)	122
Eradicating small businesses: all join in (2005-11-21 10:32)	123
Fraud, dammed fraud, and the CAP (2005-11-24 09:51)	123
Achieving social goals requires imagination, not selection (2005-11-28 14:03)	124
December	125
Rewarding outcomes, not effort (2005-12-02 10:06)	125
More subsidies for the rich (2005-12-06 00:20)	126
Politics without outcomes (2005-12-08 09:32)	126
Stabilisation wedges (2005-12-13 09:28)	127
Markets and 'markets' (2005-12-14 09:42)	128
Social Policy Bonds and developing countries (2005-12-17 13:30)	129
Markets and 'markets', continued (2005-12-20 12:49)	130
Government favours industry concentration (2005-12-21 11:52)	130
The middle-class housing crisis (2005-12-26 05:26)	131
Climate change: subordinate policy to outcomes not process (2005-12-27 11:52)	132
2005 (2005-12-31 09:45)	133

## 2006

January	135
Ideology destroys neighbourhoods (2006-01-01 14:09)	135
More about Climate Stability Bonds (2006-01-04 11:00)	136
Eminent domain (2006-01-06 12:29)	137
Policymakers need numbers (2006-01-08 12:06)	137
Government should concentrate on eradicating poverty (2006-01-10 10:10)	138
Abandon your principles! (2006-01-14 10:13)	139
Governments don't learn (2006-01-18 10:23)	140

The smoking gun (2006-01-21 11:35)	140
Climate change (2006-01-23 09:36)	141
Looting the common wealth (2006-01-24 12:55)	144
Government to millionaires: here's more taxpayers' cash! (2006-01-26 00:12)	144
Ninety per cent of Americans agree with me (2006-01-28 11:13)	145
February	145
Subordinating policy to outcomes (2006-02-01 12:10)	145
Madness (2006-02-03 12:45)	146
Why I don't like Proportional Representation (2006-02-06 09:06)	147
Immigration and public policymaking (2006-02-09 11:47)	148
Letting go (2006-02-12 09:51)	149
Costs of doing business (2006-02-14 13:50)	151
What happens when you subsidise big business? (2006-02-16 09:12)	152
How many synonyms for 'insanity' are there? (2006-02-19 12:30)	152
Current policymaking is limited (2006-02-22 11:52)	153
The costs of subsidised parking (2006-02-26 05:33)	154
March	155
We care... about selling dog food (2006-03-01 11:27)	155
Kyoto will fail because it's central planning (2006-03-03 10:12)	156
No, I'm not bitter (2006-03-07 09:33)	158
Another Mickey Mouse micro-objective (2006-03-10 11:02)	159
Government by the rich, for the rich (2006-03-12 08:59)	160
Social Policy Bonds: the book (2006-03-14 10:03)	160
Incentives and the developing countries (2006-03-17 11:39)	161
Subordinate organisations to objectives, not vice versa (2006-03-19 08:21)	161
Don't despair (2006-03-20 09:32)	162
Flying blind (2006-03-24 09:46)	163
Ideology blights medicine, not just policymaking (2006-03-25 14:42)	163
Policy priorities (2006-03-28 09:30)	164
Gesture politics or meaningful outcomes? (2006-03-30 12:14)	165
April	166
Transport targets should favour pedestrians (2006-04-03 09:41)	166
Exactly! (2006-04-04 10:54)	167
The CAP is killing Europe as well as Africans (2006-04-06 10:32)	168
Nature therapy (2006-04-06 13:08)	169
Goals must correlate with welfare (2006-04-09 13:17)	169
'I don't know what to do' is not good enough (2006-04-12 09:07)	170
Social Policy Bonds aren't perfect (2006-04-17 10:19)	171
The law of social diversity (2006-04-19 11:43)	171
Farm subsidies: get rid of them all (2006-04-22 09:57)	172
Economy or well being? (2006-04-26 12:40)	173
Become an insider by ..er..screwing everyone else (2006-04-27 11:11)	173
Kyoto may not go far enough (2006-04-30 07:04)	174
May	175
Give to charity directly, rather than via government (2006-05-03 01:27)	175
Social Policy Bonds: the core text (2006-05-04 02:56)	176
Markets reduce adjustment costs (2006-05-07 03:50)	176
US and EU follow my suggestion! (2006-05-10 02:52)	177
War is a statist response (2006-05-11 09:08)	178
Summing it up (2006-05-14 05:03)	178

	Motivation (2006-05-15 10:16) . . . . .	180
	What do we really want? (2006-05-18 02:47) . . . . .	180
	The unimportance of outcomes in medicine (2006-05-21 11:19) . . . . .	181
	A new type of organisation (2006-05-22 06:51) . . . . .	182
	Social Policy Bonds and free-riding (2006-05-24 15:26) . . . . .	183
	Transport: a means not an end (2006-05-28 15:58) . . . . .	184
	Why do I always go on about perverse subsidies? (2006-05-30 16:02) . . . . .	184
June	. . . . .	185
	Judging our leaders (2006-06-01 13:01) . . . . .	185
	Social Policy Bonds and Catastrophe Bonds (2006-06-02 14:12) . . . . .	185
	Targeting conflict (2006-06-02 20:26) . . . . .	186
	Kyoto and common sense (2006-06-04 19:57) . . . . .	187
	Perhaps insurers? (2006-06-05 18:58) . . . . .	189
	So it's come to this (2006-06-07 13:57) . . . . .	190
	The need for broad, meaningful targets (2006-06-08 20:56) . . . . .	190
	Whose infrastructure? (2006-06-09 20:27) . . . . .	191
	Letter from America (2006-06-12 20:53) . . . . .	192
	Rejigging incentives (2006-06-13 15:38) . . . . .	192
	Financial incentives (2006-06-15 20:28) . . . . .	193
	Ideology and education in Britain (2006-06-16 19:23) . . . . .	194
	Leave it to the government (2006-06-23 15:23) . . . . .	195
	Targeting mental health (2006-06-25 18:37) . . . . .	197
	Airbus: the flying Common Agricultural Policy (2006-06-26 14:08) . . . . .	198
	Tragic consequences of management without objectives (2006-06-28 15:34) . . . . .	198
	Portentous prose about nothing (2006-06-30 08:26) . . . . .	199
July	. . . . .	200
	Why England lost the World Cup (2006-07-02 06:39) . . . . .	200
	Entrepreneurs and managers (2006-07-03 14:56) . . . . .	200
	Contracting out UK Government services (2006-07-05 21:55) . . . . .	201
	Sprawl is subsidised (2006-07-08 19:29) . . . . .	201
	What's good about the status quo? (2006-07-10 14:02) . . . . .	202
	France: world champion of hypocrisy (2006-07-11 12:17) . . . . .	203
	Government failure is catastrophic (2006-07-12 14:49) . . . . .	205
	Incentives for peace (2006-07-16 21:56) . . . . .	206
	Measuring quality of life (2006-07-18 22:17) . . . . .	206
	Solitudinem faciunt... (2006-07-23 08:35) . . . . .	206
	Nothing positive here (2006-07-26 08:32) . . . . .	208
	Making aid work (2006-07-27 16:15) . . . . .	208
	Farm subsidies are evil (2006-07-29 07:27) . . . . .	210
	Real people lose interest (2006-07-31 13:14) . . . . .	210
August	. . . . .	211
	Outcomes: anything else is self-indulgence (2006-08-02 08:18) . . . . .	211
	Social Policy Bonds are not utopian (2006-08-04 13:43) . . . . .	212
	Recasting political debate (2006-08-06 13:01) . . . . .	213
	Taking stock after 17 years (2006-08-09 07:37) . . . . .	214
	War and asymmetric incentives (2006-08-12 09:13) . . . . .	215
	Outcomes trump ideology (2006-08-14 07:50) . . . . .	217
	It's the outcomes, stupid (2006-08-16 08:51) . . . . .	217
	Obscuring and entrenching our irrationality (2006-08-19 08:24) . . . . .	218
	The sterility of British politics (2006-08-21 07:34) . . . . .	219

Why I don't like Kyoto (2006-08-25 08:50)	219
Coming next: a fake kidnap (2006-08-29 09:46)	221
Moral blindness (2006-08-31 04:26)	221
September	222
Oxfam: almost right (2006-09-02 06:55)	222
An Inconvenient Truth (2006-09-05 09:23)	223
The public interest (2006-09-07 16:42)	223
Why I go on and on about farm subsidies (2006-09-08 16:28)	226
Social Policy Bonds and complexity (2006-09-14 08:18)	226
What's a couple of rainforests? (2006-09-16 17:20)	227
'Fooled by Randomness' (2006-09-19 16:23)	227
Life in Bangkok... (2006-09-21 16:20)	229
Thailand, democracy and policy outcomes (2006-09-24 12:59)	229
Defining democracy (2006-09-27 09:37)	229
Incentives for peace (2006-09-28 12:34)	230
Brilliant (2006-09-29 12:51)	230
October	231
Social Policy Bonds to reduce crime (2006-10-03 09:49)	231
Politics and accountability (2006-10-05 09:30)	232
Policy and rationality (2006-10-07 09:10)	233
The limits of quantification (2006-10-09 11:35)	234
The limits of quantification, continued (2006-10-10 09:47)	235
Roads are for the rich (2006-10-12 09:35)	236
There is such a thing as society (2006-10-13 11:45)	236
Ignorance all round (2006-10-16 12:39)	237
Measuring government performance (2006-10-19 09:45)	238
What drives immigration policy? (2006-10-21 10:07)	239
Target outcomes, not alleged means of achieving them (2006-10-23 09:14)	240
Monetising public goods (2006-10-25 09:01)	240
Insuring against catastrophe (2006-10-28 10:17)	242
Government taxation is not government spending (2006-10-30 09:06)	242
November	243
Subsidising environmental destruction (2006-11-01 08:43)	243
Thank you Anatole Kaletsky (2006-11-02 11:36)	244
Tying it all together (2006-11-06 09:34)	244
Markets better than Kyoto at minimising costs (2006-11-07 11:24)	245
Archives available again (2006-11-08 10:05)	246
Unleash the private sector - a little! (2006-11-08 11:58)	246
David Lange (2006-11-09 10:20)	247
Things will change (2006-11-10 09:53)	248
Why bother to think? (2006-11-12 10:17)	248
I don't know (2006-11-14 10:00)	249
Dirty energy is subsidised too (2006-11-17 10:00)	251
Compliance costs discriminate against small business (2006-11-20 13:27)	252
Subsidising environmental destruction (continued) (2006-11-22 10:49)	252
It doesn't really matter... (2006-11-23 10:14)	253
Milton Friedman and the public sector (2006-11-24 01:25)	254
Killing with kindness, killing with complexity (2006-11-27 09:23)	254
What politicians think of us (2006-11-28 13:27)	255
Don't rely on government (2006-11-30 05:31)	256

## 2008

<b>2008</b>	<b>431</b>
January	431
We're all Aztecs now (2008-01-01 10:18)	431
The unimportance of being responsible (2008-01-04 11:59)	432
Avoiding catastrophic climate change (2008-01-05 23:52)	432
Corporate goals are not societal goals (2008-01-08 11:57)	433
Unnecessary surgery (2008-01-10 00:51)	434
Anecdote is not proof (2008-01-14 00:27)	435
Policy and rationality (2008-01-15 09:33)	436
Too many doctors? (2008-01-16 12:35)	436
Procedure is king (2008-01-17 07:35)	437
Irrationality as a policy driver (2008-01-20 11:23)	439
Education is not schooling (2008-01-22 05:18)	439
Exporting environmental damage (2008-01-24 12:58)	440
Hunger and aid (2008-01-27 09:45)	441
Catastrophe bonds versus Social Policy Bonds (2008-01-29 10:55)	442
The Victory Project (2008-01-30 11:51)	443
February	444
Society is not chess (2008-02-02 10:20)	444
Philanthropy and profitability can go hand-in-hand (2008-02-04 14:13)	444
I don't know what the policy is, but we need to change it (2008-02-07 10:58)	445
Subsidising planetary destruction: biofuels (2008-02-08 09:49)	446
Bureaucrats versus policymaking (2008-02-11 04:25)	446
Social Policy Bonds and prediction markets (2008-02-13 00:01)	447
No security without privacy (2008-02-15 13:04)	448
How to create a lobby group (2008-02-16 09:19)	449
Living on traffic islands (2008-02-18 09:36)	449

Farm subsidies, continuing (unfortunately) (2008-02-21 10:52)	450
Nuclear peace or exotic cat food? It's up to us. (2008-02-23 23:54)	450
Military blunders and policy (2008-02-25 22:41)	451
The Martindale approach to policy (2008-02-27 09:39)	453
March	454
Broad indicators are essential (2008-03-01 09:05)	454
Growth at all costs (2008-03-03 08:43)	455
Motoring ourselves to death (2008-03-04 23:14)	455
Post 500 (2008-03-06 11:56)	456
Subsidising environmental destruction in India (2008-03-07 04:33)	457
Follow the money (2008-03-09 10:38)	458
Torture and the unimportance of outcomes (2008-03-11 08:31)	459
Targeting broad outcomes (2008-03-13 09:32)	460
Free-riding (2008-03-15 12:33)	460
Sacrificing the environment (2008-03-17 11:56)	461
Social Policy Bonds as insurance (2008-03-19 07:59)	461
Loudtalks (2008-03-19 11:57)	462
Getting rich by doing the right thing (2008-03-22 04:15)	463
Crime and incentives (2008-03-23 12:19)	463
Housing monoculture (2008-03-25 08:48)	464
Ends, means and the financial sector (2008-03-26 09:23)	465
Nothing new here (2008-03-28 10:14)	466
April	466
Zimbabwe (2008-04-01 11:00)	466
Social Policy Bonds: I'm convinced anyway (2008-04-03 12:00)	467

The bias against unglamorous diseases (2015-11-21 18:57)	990
Climate change, again (2015-11-27 21:29)	991
December	992
But who allocates the funds? (2015-12-03 23:37)	992
Metrics for climate change (2015-12-08 19:44)	993
Paris will fail (2015-12-17 23:27)	994
Social Policy Bonds: the past and the future (2015-12-31 19:05)	995

## 2016

<b>2016</b>	<b>997</b>
January	997
No one is in charge (2016-01-10 19:46)	997
Insiders, outsiders, and world peace (2016-01-17 19:28)	999
Health screwups (2016-01-25 19:12)	1000
February	1001
The importance of buy-in (2016-02-02 20:23)	1001
The 'root causes' fallacy (2016-02-10 20:04)	1003
Society as a dynamic system (2016-02-19 18:43)	1004
Overcoming institutional sclerosis (2016-02-27 21:54)	1005
March	1006
Economic growth and inequality (2016-03-04 20:55)	1006
Blockchains and Social Policy Bonds (2016-03-08 19:58)	1007
Money isn't everything (2016-03-16 20:32)	1008
Bypassing democracy (2016-03-20 18:59)	1008
Society needs more creative destruction (2016-03-24 19:08)	1010
April	1012
Inequality (2016-04-04 21:50)	1012
Subsidising obesity (2016-04-09 18:41)	1013
Health is not an accountancy issue (2016-04-17 18:41)	1014
The business of America is lobbying (2016-04-24 19:09)	1016
GDP and distribution (2016-04-28 17:42)	1017
DAOs and Social Policy Bonds (2016-04-29 17:59)	1017
May	1018
Terrorism and strokes (2016-05-07 18:13)	1018
More regulation, more gaming (2016-05-15 17:53)	1019

What is government for? (2016-05-22 18:55) . . . . .	1020
Blockchain could guarantee integrity of redemption terms (2016-05-23 18:45) . . . . .	1021
Answering the phone quickly is not a health goal (2016-05-24 19:09) . . . . .	1023
Nuclear war? Yawn, yawn (2016-05-27 18:20) . . . . .	1024
June . . . . .	1026
PBR and SIBS: bring in tradability! (2016-06-08 19:05) . . . . .	1026
Metrics for World Peace Bonds (2016-06-09 18:39) . . . . .	1027
Britain and the European Union (2016-06-20 17:49) . . . . .	1028
The CAP is destroying Europe (2016-06-22 19:20) . . . . .	1029
Good policy is not about choosing a team (2016-06-27 18:51) . . . . .	1030
July . . . . .	1032
Compassionate woman, compassionate policy, cruel outcome (2016-07-02 19:11) . . . . .	1032
From operative to speculative politicians (2016-07-12 19:38) . . . . .	1033
Political parties are divisive and unnecessary (2016-07-23 17:43) . . . . .	1035
How we select our policymakers (2016-07-24 19:23) . . . . .	1036
Policy for the Middle East (2016-07-30 19:12) . . . . .	1037
August . . . . .	1038
Government of the people, by the rich, for the rich (2016-08-03 20:43) . . . . .	1038
Health funding needs to be more impartial (2016-08-07 18:59) . . . . .	1040
Social Policy Bonds: state of play (2016-08-14 20:22) . . . . .	1041
Poverty: the need for diverse, adaptive approaches (2016-08-20 19:29) . . . . .	1042
Alternative data and metrics for a bond regime (2016-08-22 20:20) . . . . .	1044
Make them tradeable (2016-08-27 19:30) . . . . .	1045
Social Policy Bonds as a meta-system (2016-08-30 18:39) . . . . .	1046
September . . . . .	1048
Impediments to a radical transformation (2016-09-03 18:25) . . . . .	1048
Health: better late than never (2016-09-08 22:18) . . . . .	1049
New world disorder (2016-09-15 19:58) . . . . .	1049
Industry concentration discredits market forces (2016-09-21 18:21) . . . . .	1051
Polluter Pays Principle: Social Policy Bonds as a meta-system (2016-09-24 19:33) . . . . .	1053
Policymaking is incomprehensible to outsiders (2016-09-27 21:39) . . . . .	1054
October . . . . .	1056
Limitations of the Payment by Results model (2016-10-04 18:50) . . . . .	1056
Why I voted for Brexit (2016-10-09 20:35) . . . . .	1058
Make democracy work: target outcomes directly (2016-10-14 18:26) . . . . .	1060
How not to address climate change (2016-10-17 21:50) . . . . .	1062
The EU: killing its citizens and destroying rainforests (2016-10-19 17:58) . . . . .	1062
World Peace: the quick and efficient way (2016-10-25 22:33) . . . . .	1063
November . . . . .	1065
Consensus and politics (2016-11-05 22:55) . . . . .	1065
Bootlickers, yes men, liars (2016-11-09 19:52) . . . . .	1067
Ideologues and vested interests impede good policymaking (2016-11-17 23:17) . . . . .	1068
Policy for the post-truth era (2016-11-27 18:57) . . . . .	1069
December . . . . .	1071
Fossilised science is no basis for policy (2016-12-07 19:19) . . . . .	1071
Target environmental ends, not means (2016-12-13 23:03) . . . . .	1072
Working for a living (2016-12-30 22:47) . . . . .	1073

<b>2017</b>	<b>1075</b>
January . . . . .	1075

How to become a nuclear optimist (2017-01-05 18:24)	1075
Target health, not surrogate indicators (2017-01-08 17:20)	1076

# 2004

## 1.1 December

### 1.1.1 Welcome (2004-12-20 00:37)

Kyoto, computers in schools, Concorde: the list of expensive, wasteful policies goes on. Social Policy Bonds are a new financial instrument. They can be issued by governments or private individuals, and are redeemable for a fixed sum only when a targeted social goal has been achieved. So:

- they inextricably tie rewards to outcomes, rather than activities or institutions; and
- they inject market incentives into the achievement of social and environmental goals.

This blog looks at the failures of existing policies and will suggest how Social Policy Bonds could radically improve the efficiency, stability and transparency of policymaking. For more information about the bonds, click on *What are Social Policy Bonds?* in the right-hand column, or go to the main Social Policy Bonds [1] website

. Your comments and suggestions are very welcome.

### 1.1.2 Kyoto (2004-12-20 00:38)

The entire focus of Kyoto is to reduce anthropogenic emissions of what are currently thought to be greenhouse gases. But we simply don't know whether reducing such emissions will mitigate climate change. We certainly don't know that reducing such emissions will be the most cost-effective way of stabilising the climate. A Climate Stability Bond regime would not

prejudge how the climate is to be stabilised. They instead would reward people for achieving climate stability however they do so. So a bond regime would reward efficiency, rather than adherence to a conclusion based on the fossilised science of the 1990s. Click to see a short article describing [1] Climate Stability Bonds

Anonymous (2005-01-27 08:48:00)

All this nonsense about climate presupposes there is something actually wrong with it. More preposterous is the idea that we actually might be causing whatever is supposed to be wrong with it. Even more arrogant is the notion that we might even control it. There's nothing wrong with the climate - Kyoto is a complete and utter waste of resources. Better to direct the Social Policy Bonds idea into something that actually has some chance of succeeding.

Ronnie Horesh (2005-01-27 10:01:00)

Interesting comment, though you make it on the same day as reports are published saying global warming is [1]'twice as bad as previously thought'. The point, surely, is that we don't know what is going on and there is a nonzero probability of major climatic disruption. Climate Stability Bonds would minimise costs of achieving a stable climate regardless of what (if anything) is happening to it and who (or what) is causing it to happen.

1. <http://www.blogger.com/r?http%3A%2F%2Fnews.independent.co.uk%2Fworld%2Fenvironment%2Fstory.jsp%3Fstory%3D604955>

Anonymous (2005-01-28 03:30:00)

I suppose if you have to throw money at a perceived problem you may as well use Social Policy Bonds as anything else. My point really is not to throw any money at it at all - better surely to apply Social Policy Bonds to a real problem. Incidentally the mentioned news item is nothing more than a prediction from a computer model. I guess I need to be on Climate Change blog ;-)

Ronnie Horesh (2005-01-29 11:28:00)

Thanks for your comment. There is legitimate debate as to whether climate change is a real problem. Some think not but most scientists think it is. It doesn't matter under a bond regime. One of the features of the bonds is that they minimise costs depending on the market's view of how serious the problem is. If everybody agrees with you that climate change is not a problem, then any Climate Stability Bonds issued would sell at a price very close to their redemption value. The cost to the bonds' backers then would be minimal. The market minimises costs, and reveals valuable information about the likelihood of how serious the problem is and the estimated cost of solving it.

nice blog...

this blog is very important for me ... thank you ...

### 1.1.3 Literacy in the UK (2004-12-20 04:23)

Twenty-six million people of working age have levels of literacy and numeracy below those expected of school leavers. People with the lowest levels of skills – those expected of a 9 to 11 year old or below – can experience practical difficulties in their every day lives.

This is the main conclusion of a [1] report

released on 15 December by the UK's National Audit Office. Another conclusion:

More providers need to engage in creative development of flexible learning that people want because it meets both their practical requirements and personal needs.

My take: would-be providers must have incentives to be creative. The UK Government is right to have identified 100 per cent basic literacy and numeracy as a valid social goal, and to devote funds to its achievement. The Government has set the goal, and is prepared to finance its achievement. Democratic governments are good at articulating their society's needs and raising the necessary funds. But they are terrible at actually achieving social goals. The UK Government should bypass the entrenched lobbies of the educational establishment and reward people for achieving its literacy goal *however they do so*.

The private sector can play a role too, and its intervention is perhaps more urgently needed in the developing countries. If you are interested in issuing your own bonds, click to see how [2] Female Literacy Bonds

could work for improving the literacy of girls and women in Pakistan. (This is a 250kB pdf file.)

### 1.1.4 Polluter Pays Principle (2004-12-26 12:14)

The Polluter Pays Principle (PPP) says simply that those who pollute the environment must pay for the damage they have caused. The idea originated in the 1970s when members of OECD countries sought a means by which pollution control costs would be financed by the polluters rather than the public in general. Its principal defect is that it does not guarantee efficiency of pollution control and environmental protection.

The PPP assigns environmental rights to those who benefit from environmental improvement, so polluters pay. The Beneficiary Pays Principle (BPP), on the other hand, says that whoever benefits from a cleaner environment should bear the costs of pollution control.

Social Policy Bonds are not concerned with who pays for solutions but with efficiency in achieving them. But some have asked me whether Social Policy Bonds targeted at environmental goals ([1]Environmental Policy Bonds) would be compatible with the PPP. The answer is yes.

Where polluters can be clearly identified, and where society believes that the PPP should apply, then the polluters could be taxed and their proceeds used to redeem the bonds.

Take, for example, a lake is polluted by activities of farms surrounding it. Assume that the local authority thinks a bond regime would be the most cost-effective way of improving the lake's health. It could issue 'Lake Health Bonds', which would be redeemable for a fixed sum only when the lake's water quality had reached a target level for a sustained period.

Who would contribute to the redemption funds used to redeem the Bonds? Where the lake is grossly polluted and the farmers are wealthy, the political process would probably demand that the farmers pay. But where the lake is already healthy, though not quite healthy enough to attract fee-paying fishers, then the beneficiaries of a clean-up - would-be tourist operators around the lake, perhaps - could reasonably be asked to contribute. They might, on their own initiative, decide to issue their own Lake Health Bonds.

The crucial points are that the Social Policy Bond principle:

1. maximises efficiency, expressed as maximum reduction in pollution per dollar spent; and
2. is versatile enough to encompass the PPP and the BPP, or any combination.

Anonymous (2007-02-08 06:37:00)

"the political process would probably demand that the farmers pay"? That's what we're trying to determine aren't we: the political process to reduce pollution. You're just saying let's use a political

process to have polluters pay.

Ronnie Horesh (2007-02-08 11:03:00)

Hi zylstra and thank you for your comment. Actually I was trying to say that once the political process has decided that there shall be a reduction in pollution, and (yes) that polluters or beneficiaries shall pay for that reduction THEN Environmental Policy Bonds would ensure that the targeted reduction per dollar spent would be maximised. Regards, RH

# 2005

## 2.1 January

### 2.1.1 Who can issue Social Policy Bonds? (2005-01-03 14:01)

Who can issue Social Policy Bonds and when would Social Policy Bonds be better than alternatives?

Social Policy Bonds could be issued by anybody who genuinely wants to finance the achievement of social or environmental objectives.

- Government could issue Social Policy Bonds when it knows what it wants to achieve, but does not know how best to go about it;
- Philanthropic groups or individuals could issue Social Policy Bonds when they have a particular interest in a social problem that is being inadequately addressed.

When would Social Policy Bonds have the most marked advantages over conventional policy methods? There are four main criteria:

- The objective is fairly broad. So, for example, it is better to target broad health indicators like longevity, rather than the rate of heart disease. It is better to reduce water pollution in a river than the presence of one particular pollutant. This is because a bond regime should be free to channel resources where they will do the most good.
- There should be a reliable numerical measure (or combination of such measures) to target and it must be inextricably linked to what we want to achieve .
- Relationships between the problem we are trying to solve and its causes are complex, uncertain or changing constantly.
- Existing policies, if they have been tried at all, are ineffective or inefficient.

### **2.1.2 If Social Policy Bonds are so marvellous... (2005-01-05 20:31)**

...why doesn't anyone issue them? After all, it is 15 years since I first presented the bond concept in a public forum. I have since given talks about it to numerous audiences; I have published articles, papers and books on the subject. I have spoken to senior politicians, economists and officials. Yet to my knowledge, not a single body has yet issued Social Policy Bonds for any social or environmental objective.

Initially I thought governments would be most interested in the bonds. They spend vast sums of money - around 40 per cent of national incomes - on social and environmental activities, so you might imagine, as I did, that they would be keen to try out any idea that could make their spending more cost-effective. I was probably naive. Governments, I now believe, are quite happy to pursue failed policies as long as these policies have been done before. Supporting a failed but conventional policy less risky to the aspiring politician or bureaucrat than supporting a new policy, even one that is far more likely to succeed. This is what happens when the people in government, invariably (in my experience) well-meaning and hard-working, are rewarded for carrying out activities rather than for achieving outcomes. Provided their programmes have been tried before, their careers are unlikely to suffer.

What about the private sector? I have tried to interest various philanthropic organisations, but not a single one has had the courtesy even to respond to my initial approach. Think-tanks and non-governmental organisations have been more forthcoming, and I have spoken to some of them and they have published my work. None, though, has taken the idea further. I suspect this is because Social Policy Bonds are a 'right wing' (market) way of achieving 'left wing' (social) goals. The right wing doesn't like any sort of intervention, while left wingers see the word 'markets' and run a mile. This is pure speculation on my part, of course.

I am, though, heartened by individuals who have seriously considered issuing their own Social Policy Bond issues for goals as diverse as open source software completion, voter registration and literacy in India and Pakistan. So far none of these has come to fruition, but I am hopeful that they might. If you are interested in issuing Social Policy Bonds for any social or environmental goal please leave a comment or email me directly via the address in my profile.

Anonymous (2005-01-15 12:12:00)

Observation ... most senior gov bureaucrats are in their 50s (if not older) and are the least likely to rock the policy boat if they want to reach retirement age with their cushy golden handshake. I refer you to Peter Drucker's observation (see [http://www.context.org/ICLIB/IC32/Drucker\\_r.htm](http://www.context.org/ICLIB/IC32/Drucker_r.htm)) that \*NO\* US government social program has worked (with one exception). The political landscape means that it is easier starting a \*NEW\* initiative (with associated horn-blowing) than to audit past efforts (which would unduly embarrass the incumbent or even worse, cast the opposition in a good light).

### **2.1.3 Outcomes for whom? (2005-01-10 21:28)**

Social Policy Bonds are intended to subordinate all policy to the achievement of social and environmental outcomes *that are meaningful to real people*. The qualification is important: in the absence of any explicit targeted outcomes, policies and programmes will inevitably favour activities or existing institutions. Which institutions? Government bodies themselves or private corporations. In such a political environment it is hardly surprising that in Germany, as [1]recently revealed:

...top companies admitted that they have been topping up the salaries of hundreds of local and national politicians.

Would 'top' companies want to fund politicians whose goals were clear and meaningful to natural persons, as distinct from corporations? Probably not...but the important point is that *it wouldn't really matter*. Explicit, meaningful outcomes can be decided in full consultation with the public. But when there are no clear goals, only vague statements of intent, institutions with separate agendas and a proliferation of meaningless micro-targets, then it is no surprise that corporations try to influence policy and find it worthwhile to put policymakers on their payroll.

### **2.1.4 There are arguments on both sides (2005-01-13 20:00)**

It's always useful to have something credible to say at meetings when you've dozed off and wake up to find everyone staring at you expectantly, waiting for you to speak. Over the years I have found that 'it's not black or white, it's a continuum' can be helpful, while 'I think we should be looking at this holistically', has also become a reliable standby. Even more helpful is 'there are arguments on both sides'.

In an increasingly complex world, the links between a policy and its effect are ever more obscure. There are sufficient data to back up any hypothesis. Compelling evidence can usually be found in support of either side of a policy argument. Is the climate changing, and if so, why? Are genetically engineered foods good or bad for the environment? Does gun control mean fewer or more gun crimes? Will more military spending mean more security? On these and many more issues, thinking people are inundated with information, much of it contradictory. We rarely go through all the available argumentation and come to a reasoned conclusion. There simply isn't time. Very often, we select the information that suits our preconceived ideas. We might give more weight whatever side of an argument we hear first. Or we might believe proponents who are more charismatic.

A handy way of short-circuiting thorough analysis is to have an ideology. With a static set of preconceptions we don't need fully to engage with the issues, which would be time-consuming and probably inconclusive. Much easier to dismiss gun control because it interferes with our liberties. Or to believe that we ought to ban GM foods because of the precautionary principle. and if ideology doesn't supply a ready-made answer, very often the lobbying power of interested parties fills the gap.

Making policy like this is unscientific, inherently divisive and prone to corruption and manipulation. Yet there is a genuine problem, in that the world *is* complex, and in almost every case, there *are* valid arguments on both sides. Should we disbelieve evidence because it doesn't fit our prejudices, or because supporting research was funded by vested interests?

The temptation is to abdicate responsibility; to disengage from the political process, comforted by a vague feeling that crucial issues are up to the politicians to decide.

There is an alternative, and that is for policymakers to target outcomes, rather than activities. Rather than decide on how many police to employ, they should reward people for cutting crime *however they do so*. Rather than cut anthropogenic greenhouse gas emissions, they should reward the stabilising of the climate. Instead of subsidising arms manufacturers and selling lethal weaponry to whoever will pay for them, they should reward the achievement of peace.

Outcomes, in short, are a better driver for policy than ideology. [1]Social Policy Bonds not only subordinate all policy to outcomes, but inject market incentives into the achievement of our social and environmental goals. And because there is wider consensus over outcomes than over the means of achieving them, they will draw more people and more expertise into the policymaking process.

### **2.1.5 'Death of Environmentalism' (2005-01-16 13:10)**

...is the title of a long [1]essay by Michael Shellenberger and Ted Nordhaus. It describes how the environmental movement in the US has lost ground over the past 30 years. Discussing climate change, the authors say that '[t]he problem is that once you identify something as the root cause, you have little reason to look for even deeper causes or connections with other root causes.'

My take: the article outlines what happens when social and environmental issues become detached from the concerns of natural persons, then politicised and 'owned' by corporate bodies that have only institutional goals - the prime one being self-perpetuation. [2]Social Policy Bonds would correct this by subordinating all policy to explicit outcomes that are meaningful to real people.

The Death of Environmentalism" (DOE) should be called "The Death of Elite, White, American Environmentalism." A critique of the environmental movement that draws on neither the perspectives nor achievement of the environmental justice (EJ) movement is, at very best, incomplete. That the DOE interviews and recommendations only focused on white, American male-led environmentalism meant that the fatal flaws of that part of the environmental movement infected the critique itself. These omissions inspire me to paraphrase Sojourner Truth, and ask "Ain't I an environmentalist?"

I was struck by how the piece echoed the National People of Color Environmental Leadership Summits of 1991 and 2003, both of which I attended. A review of the attendees list indicates that neither Shellenberger nor Nordhaus were present at either Summit. Their critiques also repeated analyses from letters EJ leaders sent to leaders of white environmental groups since 1990. It's unfortunate that the authors have begun to attack the EJ movement, calling it fetishized NIMBY-ism, while making the contradictory claim that environmental health issues aren't real concerns in communities of color (February 23rd UC Berkeley campus newspaper The Berkeleyan; tape of the panel).

for more go here: [http://www.ludovicspeaks.com/2005/05/aint\\_i\\_an\\_envir.ht](http://www.ludovicspeaks.com/2005/05/aint_i_an_envir.ht)

Ronnie Horesh (2005-05-07 08:59:00)

Thanks for your interesting comment. I don't know much about the respective merits of the EJ movement and the mainstream environmental groups. But I'd like to see a focus on environmental outcomes. You mention the 'achievement' of the EJ movement. What is this? This is a genuine question. How does it differ from that of the 'white...male-led' groups?

Actually, to me what is more important than ascribing merit or blame to the different factions, is to get some agreement on minimum environmental outcomes - bottom-line achievements - and then push for these.

### **2.1.6 Dark Age Ahead (2005-01-19 21:24)**

"Not TV or illegal drugs, but the automobile has been the chief destroyer of American communities ... One can drive today for miles through American suburbs and never glimpse a human being on foot in a public space, a human being outside a car or a truck ... While people possess a community, they usually understand that they can't afford to lose it; but after it is lost, gradually even the memory of what was lost is lost. In miniature, this is the malady of Dark Ages." Jane Jacobs, *Dark Age Ahead*, Random House, New York, 2004.

Whenever I argue against car driving, motorists are quick to say that it represents market forces and freedom of choice. It doesn't. The enthronement of the car in our societies is a result of government making decisions for us. The very high social and environmental costs of motoring are not paid by drivers. Oil extraction, refining and transport also exact a heavy environmental toll. Roads are built with taxpayer funds. Some argue that the funds extracted from road users exceed the costs of building and maintaining highways. Even if this were true, it ignores indirect costs. But the bigger point is that government, influenced by powerful corporate interests, has chosen to build roads; in doing so it has determined the type of society we live in. If we then find it impossible to live without roads, and too expensive or dangerous to travel in any other way, that is a result of government's favouring a particular form of development. It is the essence of the anti-market approach. If people really want roads they should build them on their own initiative and negotiate compensation with those who suffer as a result of their preference.

What has all this to do with [1]Social Policy Bonds? A bond regime would be entirely outcome-focused. It would aim to achieve outcomes that are meaningful to real people, as against corporate bodies. For natural persons, more transport is not an end in itself but a means to an end. As Jane Jacobs points out, many of the things that do matter to people are destroyed by road transport. Genuine markets, arising from the wishes and concerns of real people, would assign them more significance than the current consortium of big business and government.

Policy as if outcomes mattered  
SocialGoals.com

1. <http://socialgoals.com/blog/spbs600words.htm>

---

Anonymous (2005-01-20 08:04:00)

Roads have always had state backing ( <http://www.gbcnet.com/ushighways/history.html>) but US had a special impetus in Truman (<http://www.fhwa.dot.gov/infrastructure/origin.htm>) and its open road culture.

From an economic perspective, roads enable labor mobility with resulting growth due to East/West Coast relocation.

However, the social fragmentation of family ties is an unknown factor in calculating negative externalities. So who judges the tradeoff between economic growth and social cohesion?

Perhaps a social bond could be constructed to accelerate the introduction of cleaner fuel cells? And structured that it is only efficient for compact wheelcheel or golfcart vehicles combined with high speed rail transit? I certainly worry about the elderly being left out in isolated communities due to housing costs of urban centres.

Ronnie Horesh (2005-01-20 20:18:00)

Thanks for your comment. Economic growth and labour mobility are, I believe, means rather than ends. People ought to be able to make their own trade-offs between them and social cohesion. Building roads with taxpayer funds was a top-down, irreversible, decision made by handful of politicians and corporate interests some decades ago. The physical infrastructure they have imposed on us has greatly strengthened big, global business at the expense of small, local business and natural persons. Its effect on our political infrastructure has paralleled its impact on our physical infrastructure. It has entrenched the power of corporates and government agencies. It is unlikely that people in pre-car communities would have opted for a transport system that destroys those communities, kills millions, seriously injures many more millions, depends absolutely on imported oil, and wreaks havoc on the environment. But it is possible. My point is that they were not given the choice.

### **2.1.7 Anything but outcomes (2005-01-24 09:40)**

"[T]he essence of leadership has changed into something that is less and less about significant undertakings and more and more about dramatic stunts." Christopher Caldwell, *The Triumph of Gesture Politics*, New York Times, 23 January 2005.

What drives policymaking? Extreme distance between consumption and production is a defining feature of a developed economy. Corporate bodies, whether government or private sector, subsidise the infrastructure that promotes this separation. They also benefit from it, not least because it means that the effects of a policy are difficult to trace back to their cause. Indeed, the relationships between cause and effect are so obscure that politicians can seldom be judged by the outcomes of their policies. Ideology, the reception given to spending announcements, celebrity endorsement, or the dramatic stunts of gesture politics - anything but outcomes - increasingly dictate which policies shall be undertaken.

This naturally generates cynicism about politics and a worrying disengagement from the political process. [1]Social Policy Bonds would make a policy's goals explicit from the outset. Doing so, they would draw natural persons, as distinct from corporate bodies, into the

policymaking process, helping to close the gap between policymakers and the public.

### **2.1.8 Third world hunger (2005-01-27 19:54)**

A report sponsored by the United Nations, and overseen by Jeffrey Sachs, urges rich countries to spend more on cutting hunger and poverty in the developing world. An [1]article about it appeared (online only) on *The Economist* website. The online edition of this week's *Economist* has published [2]my reaction:

#### **Eradicating poverty**

SIR - There is more intellectual grunt devoted to marketing a single new laundry product than there is to eradicating poverty in the third world ("Whatever it takes", *Economist.com*, January 17th). More money may be necessary, but it will not be sufficient unless it harnesses the ingenuity of diverse, responsive minds and is tied to achieving explicit, verifiable outcomes that are meaningful to real people.

My suggestion is that the rich world auctions freely tradeable bonds that would become redeemable only when a specified social objective has been achieved. These objectives could include conflict reduction, increases in basic literacy, and reductions in disease and hunger. By contracting out the achievement of poverty reduction to the private sector, such bonds would inextricably link rewards to outcomes rather than inputs, outputs, activities or institutions; and they would inject the market's incentives and efficiencies into the eradication of third-world poverty.

### **2.1.9 Corporate welfare (2005-01-30 12:15)**

Is it the role of government to subsidise aircraft manufacture? I think not, but why not let people decide? This [1]article gives the EU's views on subsidies to Boeing and Airbus. It says that planned subsidies for Boeing's 787 [formerly 7E7] from Washington State amount to \$3.2 billion, from Kansas \$0.5 billion, and Oklahoma \$0.35 billion. Of course the EU also gives comparable quantities of 'launch aid' to its Airbus builders. Direct subsidies are not the only way in which government supports big business: import barriers to protect favoured industries are another, as is over-regulation. What they have in common is that they are rarely voted for directly by the people that pay for them. In fact, they often conflict with objectives that real people would choose for themselves. Government and big business can get away with this mutual support arrangement because we have come to accept that policymaking be based on funding programmes or institutions, or on undertaking activities. A [2]Social Policy Bond regime would take as its starting point *outcomes*. People might choose to elect a government that declares wealthier corporations to be its policy objective, but I suspect that most would vote for better basic health and education outcomes, lower crime and unemployment, and a cleaner environment.

## **2.2 February**

### **2.2.1 Ends and means (2005-02-02 19:56)**

Treasury estimates that our GDP per capita would rise by 5.1 per cent if we lifted our participation rates overall to the average of the top five OECD nations. That's a worthwhile objective and at this time of labour shortage, it's a good time to be pursuing it. Extract from the New Zealand Prime Minister's [1] statement to Parliament  
, 1 February

There is understandable confusion, at the highest levels of government, between means and ends. The only accepted ways of measuring the welfare of large societies involve numerical

data, and the most widely used indicator has come to be GDP per capita. But as an indicator of welfare it is inadequate. It does not distinguish between helpful and harmful economic activity. It puts no value on any activity that bypasses the monetary economy. So it ignores leisure time, the environment, crime, health, and other things that are meaningful to natural persons.

Big business is very much the same in that its objectives are not those of real people: its goals are expressed in terms of profits, sales, growth and market share. Government and big business together are the major determinants of the sort of society in which we live. Their interests drive the current policymaking system. Yet their goals are quite different from, and often in conflict with, those of real people. Natural persons feel disenfranchised so it is hardly surprising that there is widespread cynicism about politics, a growing distance between government and people, and a growing [2]disengagement from the political process.

A [3]Social Policy Bond regime would be driven entirely by outcomes for real people. Under a bond regime, all government activity would serve broad outcomes, such as basic health and educational standards, low crime and a cleaner environment. Unlike the meaningless, abstract drivers of current policy, these outcomes would be explicit and transparent, as would the trade-offs between them. Policymaking would become comprehensible to real people and there would be informed debate about policy and where, as a society, we want to go.

## 2.2.2 Over-regulation favours big business (2005-02-03 09:05)

On 31 January the European Union Commission unveiled exactly what EU law about food traceability means. [1]EU guidelines spelled out the meaning of that new requirement, technically known as Article 18 of the General Food Law. Every business in the food and drink trade must now keep detailed records of every delivery from a supplier and every delivery out to a customer.

All records must be kept for five years, unless the products are perishable, in which case records must be kept for six months. The intention is to have standardised "traceability systems" across the EU, so authorities can track food almost instantly in the event of a crisis, such as an outbreak of food poisoning or contamination. Transport companies that merely ship food from place to place are also obliged to keep batch by batch records of every delivery they make to a restaurant, grocers or canteen.

There is something pathological about all this. Government and big business create an economic environment that, through (for example) agricultural, transport and energy subsidies, favours the large and global at the expense of the small and local. When this leads to

large-scale outbreaks of food poisoning the government reacts by imposing regulations that make it even more difficult for small businesses to operate, because it is the small businesses that suffer most from the costs of complying with the regulations. It's a self-perpetuating process; most of us don't want it to happen, and if policymaking were about specifying and rewarding the achievement of agreed, explicit outcomes it *wouldn't* happen.

### **2.2.3 No suggestion of illegality (2005-02-07 09:00)**

Australian Ministers' time is auctioned according to an illuminating [1]article from the Age, Melbourne:

Before the October election... a 45-minute walk with Attorney-General Philip Ruddock and "a quicker-paced jog" with Health Minister Tony Abbott each fetched bids of thousands of dollars.

This practice is quite legal. But we need not worry that politicians benefit directly from this practice: the proceeds go straight into the election war chests of the major parties. Big government and corporate interests - what's the difference?

### **2.2.4 What Randians think (2005-02-07 22:07)**

Why exactly are we supposed to pay taxes to help the poor? We aren't legally obliged to help our siblings or friends, so why are we legally obliged to help perfect strangers? And in the process of forcing people to pretend they love poor people they never met, don't we breach our far more obvious duty to leave people alone? These are not irrefutable proofs, but they are far more convincing than anything in Descartes' Meditations.

To this series of questions raised by [1]Econolog I replied:

One of the reasons for helping perfect strangers is that we take actions that hurt them. Our government subsidises a physical infrastructure that favours corporate interests but does much to destroy communities; it promotes immigration and free trade - for sound economic reasons, no doubt. But there are losers from this, and they rarely have the power of veto. They are due their compensation.

Government and big business get away with reshaping our physical and social environment against the best interests of real people because, I believe, they do not express their policy objectives as outcomes. Instead, they target alleged means rather than ends. They direct taxpayer revenue to this or that agency. But agencies, public or private sector, have their own objectives, primarily self-perpetuation and growth. Policymakers escape or deflect censure because the relationships between their policies and outcomes are obscure. Government ends up subsidising corporate interests and funding the expansion of its own agencies regardless of how effective or efficient they are. It should, instead, target objectives that are meaningful to the people it is supposed to represent. [2]Social Policy Bonds are about finding out what these objectives are and giving government and people the means of achieving them efficiently.

### **2.2.5 Peace in the Middle East (2005-02-14 09:58)**

People make all sorts of compromises for money. We work not solely out of love, or dedication to duty but also because we receive payment. Financial incentives can liberate and focus our ingenuity. So when people talk about allegedly intractable conflicts, or ancient hatreds that can be ended only by the total crushing victory of one side or the other, I disagree. (See [1]this discussion, on the Middle East for example.) In any conflict there are certain to be faults on both sides. But if we really want peace, we have to go beyond history, beyond notions of justice and revenge. All our activities and institutions must be subordinated to the goal of peace. Middle East Peace Bonds would reward people for reducing the numbers of people killed in that conflict to a sustained low level. We don't need to prejudge *how* peace is to be achieved, but we do need to reward its achievement. Bondholders could try all sorts of possibilities that the current protagonists cannot: they could set up school exchange visits; subsidise intermarriage between the opposing factions; or give everybody with beards first class, one-way tickets to the overseas golfing resort of their choice. The governments in the region have failed, so have the ideologues, idealists, generals and the men of religion. It's time to contract out the solution to the private sector. In short, to [2]give greed a chance.

### **2.2.7 Kyoto (2005-02-16 02:25)**

The Kyoto protocol, which requires developed countries to cut their emissions of greenhouse gases, comes into force today. Unlike most opponents, I do not question the underlying science - but nor do I accept it. We need a policy that will adapt to our rapidly expanding scientific knowledge. We need to mitigate climate change (or its negative effects), whatever is causing it and even if there's no proof that it's happening. See a published article about Climate Stability Bonds [1]here. Or click [2]here for more details about my short book on Climate Stability Bonds.

### **2.2.8 Peace in the Middle East - again (2005-02-19 05:02)**

In the final chapter of [1]*How Israel Lost*, Richard Ben Cramer explains how the men in authority, in both Israel and the occupied territories, benefit financially from the conflict. Talking about why he had mistakenly predicted peace, he goes on:

What I didn't see, or failed to think about, was the breakup of Israel's national consensus. ... What Israel lost—apparently while I looked elsewhere—was precisely the capacity to act in the national interest. The interest of the nation was replaced by tribal interests-and, in a lot of cases I see now, by purely individual interest. Making money for instance....

Cramer ends his book on a pessimistic note. My take is that evidence he presents of collusion between the principals at the highest levels (for instance, over the casino near Jericho), is actually a cause for optimism. The underlying principle of Social Policy Bonds, is that financial incentives can be channelled into social goals. If the Middle East conflict is at least in part caused by financial self-interest, then it can be ended by financial self-interest. [2]Middle East Peace Bonds would be non-interest bearing bonds redeemable for a fixed sum only when the conflict has subsided. If the governments involved, or the United Nations, won't issue them, then maybe it's time for philanthropists or non-governmental organisations to do so.

### 2.2.9 Pap and politics (2005-02-21 09:19)

What are our politicians talking about?... Listen to Alan Milburn, New Labour's election campaign coordinator, trying to inspire us by declaring that 'the priority must be to fashion an active citizenship'. Or David Miliband, the cabinet office minister now writing New Labour's manifesto, attempting to kickstart the election campaign this week by promising a new era of 'individual empowerment' in New Labour's third term. It is like listening to the members of some exclusive club, using a code that is intended to keep their plans a secret. Mick Hume, [1]*From immigration to Iraq, they are a political class apart*, 11 February

Mick Hume is writing about the UK, but he might just as well be writing about New Zealand or the US. Politicians aren't present us with clear choices anymore. Choices create winners and losers, and the debased language of politics, like that of make-believe, cannot admit that policies will make some people worse off. The notion of trade-offs is rigorously excluded from political debate. Instead we get vapid, vacuous platitudes that widen the distance between politicians and the people they are supposed to represent. Every policy statement is scripted, having first been tested on a focus group and fine-tuned by the public relations industry. Politics becomes a battle between PR professionals. As Hume puts it: the gap between the public and politics is yawning - in every sense.

A [2]Social Policy Bond regime would start out by asking the basic question: what outcomes do we want to achieve? Targeted outcomes, not activities or the current institutional setup would dictate where government funds would go. And these outcomes would be transparent: everybody would know what they are. Political debate would revolve around what these outcomes should be and how they should be ranked. There would be more, and better informed, public participation in policymaking because outcomes, unlike the bland pap that is the current political fodder, actually mean something.

### **2.2.11 Prescribed ends (2005-02-27 09:13)**

Economics is the allocation of resources so as better to achieve prescribed ends. Who prescribes these ends? In most countries it appears that nobody bothers, and the ends are decided, by default, by bodies such as large corporations and government agencies. Apart from the inflation rate, which is explicitly targeted in countries like the UK and New Zealand, most other policy objectives are obscure or unstated. The UK does deserve a pat on the back for its targeting of child poverty, and it and other governments are beginning to realise that what really matters are outcomes, not amount spent, nor activities or outputs. That said, governments unfortunately subordinate their social and environmental policy not to outcomes but, most often, to existing institutional structures. It is these that in large part receive tax revenues and dictate how they shall be spent. They are most often government agencies, which are not known for being responsive, adaptive or efficient.

Social Policy Bonds would in contrast subordinate all policymaking to desired outcomes. So instead of assuming relationships between cause and effect that might be only temporary and tenuous, they would reward only the achievement of outcomes - whoever achieves them and however they are achieved.

This means that if society sees climate change as a problem, it would reward people for

stabilising the climate - not (as with the Kyoto Protocol) for reducing greenhouse gas emissions. If war, anywhere in the world, is a problem, people could issue bonds that reward the achievement of peace - rather than fund the activities of institutions (including governments) that very often inflame conflict.

Social Policy Bonds would formulate policy in terms of ends. They could be issued by individuals or groups, by local or central governments, or by non-governmental organisations. They are explained briefly [1]here. For more details, see the Social Policy Bond [2]website. I will discuss how a Social Policy Bond regime leads to the efficient allocation of resources in my next post.

### **2.2.12 Allocation of resources (2005-02-28 21:11)**

Economics is the allocation of scarce resources to better achieve prescribed ends. My previous post discussed the prescribed ends. What about the allocation of resources? The evidence tends to support economic theory in saying that markets are the most efficient way of making the most of our limited resource endowment. Perfect competition is the basis of the ideal market. Under perfect competition any single buyer or seller has a negligible impact on the market price and information is perfect. If firms make excess profits the absence of barriers to entry means that other firms will enter the market and drive the price level down until there are only normal profits to be made. Under perfect competition output will be maximised and price minimised.

Markets can fail when a single buyer or seller can significantly influence prices, when information is imperfect, or when they do not take into account the impact of an economic activity on outsiders. They also fail when they do not generate sufficient incentive to supply public goods.

The market's incentives and efficiencies can often work to improve the distribution of resources, even when resources are initially distributed randomly and inequitably. Markets can work to reallocate resources so that they maximise efficiency and reward the provision of those goods and services that people most value.

So far, so uncontroversial. Also widely accepted is that there is a strong case for government intervention when market failure creates demonstrable, significant negative externalities.

Unfortunately though, much government intervention actually makes things worse, and it does so in ways that entrench and reinforce social and environmental problems. Take agricultural subsidies: research has shown that they are economic nonsense *and* socially inequitable *and* environmentally destructive. Yet they have persisted for decades. The big agribusiness corporates like them, because they are the major beneficiaries. Grown fat and powerful on subsidy, they then exert huge leverage over political parties and governments

and the result is the persistence of expensive, wasteful and corrupt policies. *The subsidies are self-reinforcing*. This is not unique to agriculture of course. Perhaps even more socially and environmentally destructive are subsidies to road transport and the energy sectors.

A Social Policy Bond regime would screen out this nonsense at an early stage. Instead of devising policies that allegedly 'help the family farm' or 'ensure a safe supply of food' - when they do no such thing - a bond regime would target meaningful and verifiable outcomes. If the real problem is rural poverty, then our target should be the reduction of rural poverty. If the problem is that some people can't afford food, then our target should be to ensure that nobody goes hungry. The same applies in other policy areas: if climate change is the problem, then reward people for stabilising the climate. If poor health and literacy outcomes are the problem, then reward people for improving them. It is not for government to dictate *how* these problems should be solved nor to reward its favoured institutions.

Markets are the most efficient means yet discovered of allocating society's scarce resources, but many believe that market forces inevitably conflict with social goals: accentuating extremes of wealth and poverty, for example, or accelerating the degradation of the environment. So it is important to remind ourselves that market forces can allocate resources in ways that serve public, as well as private, goals. Social Policy Bonds are a new way of channelling the market's incentives and efficiencies into the solution of our social and environmental problems.

## 2.3 March

### 2.3.1 Subsidies favour big business (2005-03-03 20:27)

Take agriculture subsidies: in the OECD area these amount to US \$250 billion per year. Most of it does not end up in additional income for farm households. Some goes to those who administer farm programmes, but most goes to those who supply inputs to farmers and those who process output from farmers.

The OECD estimates that only 25 per cent or less of most of the subsidy from consumers and taxpayers ends up as additional income for farm households.

What happens to the remainder? For every one dollar of taxpayer funded deficiency payments, 40 cents goes as extra profits to suppliers of farm inputs. Another 14 cents goes out as extra rents for non-farming landlords. Resource costs, that is the money needed to offset the combined opportunity costs of diverting resources from other productive uses to the production of the supported commodity, account for 20 cents.

Inputs and processing are mostly supplied by large agribusiness companies. Agricultural support policies tend to raise the prices of fertilisers, pesticides, animal feedstuffs and farm buildings, as well as land. Subsidies mean that farmers buy more purchased inputs and that

suppliers, knowing that farmers can afford to pay more, charge higher prices for them. One study showed that identically packaged products and services in unsubsidised New Zealand are typically priced at half the levels charged to their subsidised counterparts in the UK and the Netherlands.

So large agribusiness corporates are major beneficiaries of high food prices. Who else benefits? A British charity, Oxfam, found that wealthy landowners like the Dukes of Westminster, Marlborough and Bedford, Lords Illife and de Ramsey and the Earl of Leicester can each receive subsidies of up to £370 000 a year for growing their cereal crops.

It is a self-perpetuating system of mutual back-scratching. The subsidies discriminate in favour of the largest corporates and biggest landowners, who can use taxpayer funds to buy up small businesses and small farms and to bankroll opposition to reform. Large businesses are also in a much stronger position to manipulate the regulatory environment that makes life so difficult for their smaller competitors.

The pattern is similar in other sectors, and the result is industry concentration. A subsidised transport infrastructure favours large, global businesses, as do compliance costs, which impose a disproportionately heavier burden on small businesses. Small, independent firms go bankrupt or sell out. McDonalds, Burger King and Starbucks take over.

A Social Policy Bond regime would not see a proliferation of small businesses as an objective, but that would be the most likely outcome. Why? Because the current subsidy system is based in large part on deception and it is unlikely that most people would willingly choose to subsidise large trans-nationals at the expense of small, local businesses. A bond regime would be transparent about what taxpayer funds would be used for: its goals would be explicit and meaningful to real people. Most of us, I believe, would rather see our taxes spent on raising basic health and education standards (for example) than on further enriching some of the wealthiest companies and individuals in the world.

### **2.3.2 Social Policy Bonds: information as well as incentives (2005-03-09 09:26)**

In my work in trade policy I often have to point out that zero risk of threats to our animal, plant or human life through introduced species means no imports. We accept the uncertainties and small risks for most products because we think the benefits of trade outweigh the risk-adjusted costs. Policymakers have decided that the optimal level of biosecurity risk is not zero.

Is there also an optimal level of crime? Or road deaths, or illiteracy? There are certainly levels that we tolerate or accept. These levels have evolved through the political process. They have not been calculated nor made explicit. They might be wildly inconsistent and apparently irrational. Limited resources can be allocated according to criteria that have little to do with where they will most cost-effectively improve outcomes. So we spend large sums on, for example, removing small amounts of [1]arsenic from drinking water, when it is at least possible that we could save far more statistical lives by diverting those resources elsewhere.

What is missing is the notion of trade-offs. Our current decision-making processes neither require nor generate the costs of achieving outcomes. So we are flying blind and contentious decisions are made on the basis of speculation, media profile and the relative power of lobbyists.

A Social Policy Bond regime would be different. A government that wanted to raise longevity would auction non-interest bearing bonds that would be redeemable once the longevity target had been met. These bonds would inject market incentives into finding the most cost-effective ways of increasing the average lifespan. The bonds would not prejudge how best to achieve that objective. Bondholders would have incentives to find and initiate the most effective projects: these could include preventive medicine, or basic health education - both of which receive derisory funding these days because they lack the public profile and media appeal of larger, more visible efforts.

As important, the market for Social Policy Bonds would continuously generate valuable information about how much the achievement of targeted objective will cost. As soon as the bonds are issued, their market value will give an estimate of the cost to the issuers of achieving the targeted objective. The prices of the bonds would be constantly changing in response to events and the anticipated effects of bondholders' actions. From these price changes it would be possible to infer the marginal cost of tweaking the objective so as to bring about further improvements. If, for instance, bonds were issued to increase the current average lifespan to (say) 80 from (say) 76, then at every moment the bonds are on the market they would generate estimates of the costs of raising the average lifespan still further.

---

### **2.3.3 How Social Policy Bonds minimise costs (2005-03-10 19:56)**

Issuers of Social Policy Bonds would have to know the maximum they are prepared to pay to achieve an objective, but they would not have to calculate how much the actual cost would be with any accuracy. That would be done by bidders for the bonds in the open market. For example: say a city government targets a 50 per cent reduction in its crime rate, and it issues one million 'Crime Reduction Bonds' each of redemption value \$10.00. If the market decided that the issue value of these bonds were \$1.00, the net cost to the issuers of achieving the targeted objective (ignoring administration costs) would be \$9 million. In other words, the market at the time of issue believes that the cost, including its profit margin, of achieving the objective would be \$9 million.

Now suppose the bond issuers are completely in the dark about how much it will cost to achieve a targeted objective and instead of issuing one million bonds they issue ten million with the same redemption value, \$10.00. They would then be liable for a maximum cost of \$100 million. However, the market would still reckon that it could achieve the objective for around \$9 million. So instead of valuing the bonds at \$1.00 competition between potential investors would bid up the issue price of the bonds to around \$9.10. (Social Policy Bonds

would be an unusual financial instrument, in that the more that were issued, the higher would be their value!) The issuers therefore would not have to estimate with any accuracy how much a targeted objective might cost to achieve, and they would put a cap on their total liability by limiting the number of bonds issued.

So the Social Policy Bond mechanism ensures that the market, which means *people other than a handful of government employees*, would decide roughly how much it will cost to reach a specified social outcome. They would do this when they bid for the bonds at issue and at all times afterwards. This fact, and the would-be bondholders' incentive to minimise their costs, contrast with the current system in which the costs of achieving particular outcomes, if they are calculated at all, are not widely known, nor subject to competitive bidding. Indeed, under the current system, many of the people charged with achieving social goals (or, more likely, with supplying certain outputs) have every incentive to inflate the projected cost of their doing so. Under a bond regime, however, the awesome information-processing power of the market would be channelled into minimising the costs of achieving social and environmental goals.

#### **2.3.4 Why Kyoto will fail (2005-03-12 13:14)**

Despite a decade of research documenting the carbon emissions from man-made reservoirs, hydroelectric power still has an undeserved reputation for mitigating global warming. [1] *Hydroelectric power's dirty secret revealed*  
, Duncan Graham-Rowe, 'New Scientist', 25 February 2005.

It's been known for some time that hydroelectric dams can increase greenhouse gas emissions: they produce significant amounts of carbon dioxide and methane - in some cases more of than power plants running on fossil fuels. But only now is this fact making it onto the political agenda. In the next round of IPCC discussions in 2006, the proposed National Greenhouse Gas Inventory Programme, which calculates each country's carbon budget, will include emissions from artificially flooded regions. But even then "[m]ethane production will go unchecked because climate scientists cannot agree on how significant this is".

Our knowledge of the causes of climate change is limited, but expanding rapidly. We urgently need a way responsive way of dealing with climate change that adapts rapidly to our changing knowledge. [2]Climate Stability Bonds would differ from Kyoto, in that they would not assume that we know the best way of solving the problem. They would reward the achievement of climate stability, however it is achieved. Bondholders would have incentives to respond quickly and appropriately to new knowledge about what is causing climate change and to new ways of dealing with it.

### 2.3.5 Mickey Mouse targets (2005-03-15 20:15)

Staff in some hospital accident and emergency departments are threatening the safety of seriously ill or injured patients because of pressure to meet government targets limiting casualty waiting times. [1] BMA targets put very ill at risk , 'The Guardian', 14 March 2005

When government does get round to targeting outcomes (rather than giving taxpayer funds to favoured agencies or activities), it most often chooses Mickey Mouse goals. So in the UK, rather than target broad indicators of health, the Government has promulgated a panoply of micro-targets, such as the percentage of patients seen through hospital Accident and Emergency departments within four hours. Somebody in the Government has decided that this figure should be 98 per cent by the end of this month. One result is that people with serious, urgent conditions have to wait for treatment so that those with relatively minor conditions can be seen and discharged. This is especially so as the end of the 'four-hour envelope' approaches.

[2] ✖

What effect does this have on patients? A quarter of hospital consultants surveyed said the care of the most ill patients was being compromised; 40 per cent said patients were being discharged before their condition was adequately assessed and stabilised, and half believed people were being rushed into inappropriate wards so that they would be wiped off the casualty unit lists. To comply with the government targets some departments simply redesignated beds within their units as separate wards.

This sort of nonsense is typical of governments when they try to outguess the market. Under a Social Policy Bond regime, a government would set meaningful, broad goals, rather than a range of easily measurable but irrelevant micro-targets dreamed up by a handful of middle-level bureaucrats with little capacity or incentive to see the whole. Instead of costly, intrusive and ultimately counter-productive monitoring of useless pseudo-objectives, a bond regime would target broad outcomes, such as infant mortality, or quality-adjusted longevity. The market would then decide how best these can be achieved. Markets are better than bureaucrats at allocating resources; they are far more responsive to particular circumstances and events than government agencies. Government should stick to what it is good at: representing and articulating the wishes of its constituents, rather than trying to micro-manage its way to re-election.

### 2.3.6 What are the New Zealand Government's goals? (2005-03-19 11:37)

A Unicef study has found that 16.3 % of New Zealand children are being raised in poverty — a rate higher than all but three OECD nations (Mexico, the United States and Italy). *Child Poverty in Rich Countries 2005*, published by the United Nations Children's Fund (Unicef) found that

one in six New Zealand children were living in homes that earned less than half of the local national median income. (These figures are based on data collected in 2001.)

*Figure 1 The Child Poverty League*

*The bars show the percentage of children living in 'relative' poverty, defined as households with income below 50 per cent of the national median income.*

[1] 

Child poverty, according to this measure, increased during the 1990s:

*Figure 2*

*Changes in child poverty rates during the 1990s. The bars show the rise or fall in child poverty rates in each country during the 1990s.*

### **2.3.7 Corrupt Agricultural Policy (2005-03-21 09:44)**

What is missing in NAFTA is precisely the element that makes the EU work as a free-trade bloc. The EU's regional policy pays money directly from wealthy industrialized nations such as Germany to less wealthy agricultural nations such as Italy, Greece, Portugal and Spain. The result is that EU farmers stay on their farms. Like the US Farm Bill, EU subsidies violate the principles of free trade and comparative advantage, but do so for a higher cause: social stability. [1] Militarism and the war on drugs

, *Asia Times*, 18 March 2005

There are several things wrong with this. First, is that EU farmers don't stay on their farms. They have been leaving in droves, and for decades. Second is that most of the subsidies don't go to farmers: they are capitalised into land values or go to food processors or input suppliers. Of those subsidies that do find their way to farmers, most go to the very largest, who can then snap up any land parcels that become available. Subsidies have fuelled the replacement of farm labour by expensive machinery. Nevertheless, if we accept that subsidies have caused at least some farm labour to stay on the land, how would that be a force for social stability? The jobs that ex-farmers would have done are being undertaken by unwilling migrants. Unwilling, because any chance they had of becoming prosperous in their home countries has been crippled by the EU's protectionist barriers against imports of, amongst other things, farm products. The EU's Common Agricultural Policy has undermined social stability in Europe and in would-be exporting countries. It is a corrupt, deceitful policy that wastes

billions of dollars, denudes the environment and subsidises the rich at the expense of poorer consumers and taxpayers.

### **2.3.8 What drives education policy? (2005-03-22 08:45)**

According to [1]this report the more school pupils use computers at home and school, the less well they do on tests of literacy and maths.

These findings raise questions over the UK Government's decision, announced by Gordon Brown in the Budget last week, to spend another £1.5 billion on school computers, in addition to the £2.5 billion it has already spent.

It's clear that whatever is the basis for the government's obsession with putting computers in schools, it's got nothing to do with educational outcomes.

### **2.3.9 Government cannot pick winners (2005-03-24 02:24)**

The [1]death of John DeLorean is a good time to remind ourselves that government picking winning products doesn't work. In this case it was a futuristic-looking sportscar, into which the British Labour government poured £55 million taxpayers' money. The Thatcher Government later topped that off with a further £30 million. Within 21 months, receivers were appointed, the car went out of production and the workers at the DeLorean factory in Northern Ireland lost their jobs. Fewer than 9000 cars were produced.

Governments aren't much better when it comes to picking winning industries, and for exactly the same reasons: it's cannot respond quickly enough to changing circumstances, it doesn't adapt to local conditions, it doesn't understand markets and it has no financial incentives to be efficient.

So why should we assume that a government is any better at picking policy mechanisms? If the government wants to achieve, say, better health outcomes, that's fine. Democratic governments are good at articulating their citizens' wishes. But that's quite different from picking the best ways of actually achieving better health outcomes. (See *Mickey Mouse targets*, below.) Government is no better at choosing activities and policy programmes than it is at picking winners in other areas. Let the government do what it's best at: representing our

wishes and raising revenue to achieve them. But then let the market take over, and work out how best to allocate taxpayer resources. A [2]Social Policy Bond regime would bring about such a division of labour.

### **2.3.11 Policy as if outcomes don't matter (2005-03-30 10:15)**

When outcomes don't determine policy, this is how politicians spend your tax money:

[T]he [UK] government finally published details of the £1.7bn in support payments that farmers and agricultural companies in England receive from the taxpayer. The most glaring subsidy was more than £120m received by Tate and Lyle in a single year.

and

Aristocrats who received CAP subsidies included the Dukes of Westminster (£448,000 in 2003-04), Marlborough (£511,000) and Bedford (£366,000), plus the Earl of Plymouth (£459,000) and the Marquess of Cholmondeley (£306,000).

Meanwhile:

Ali Abbas, the Iraqi orphan who lost both arms in the war, has been told he will not receive backdated disability payments in Britain because he cannot prove his injuries existed before last week.

Sources: [1]1, [2]2, [3]3.

### **2.3.12 Reframing environmental issues (2005-03-31 10:53)**

Grist has an interesting [1]discussion about reframing environmental issues. I made this contribution:

#### **Reframing in terms of agreed outcomes**

One problem is that we are all the beneficiaries of a degraded environment. I don't just mean those of us who fly or drive or buy supermarket food. I mean everyone on the planet. By destroying the environment we have allowed a massive increase in the quantity of life, and we, ourselves, our lives, are the result. Without environmental destruction the earth would be supporting far fewer people. So any campaign, or reframing, must start with some humility. It's not us versus them. We are all 'us'.

To be more pragmatic, I suggest reframing the discussion in terms of explicit, agreed, meaningful, environmental goals. Not, as at present, about rights, processes, activities, or funding of institutions. Goals - so that instead of talking about cutting greenhouse gas emissions, we target climate stability. Instead of trying to monitor and pin down polluters of water, we agree on and target the quality of the water. My [2]website goes into more detail, and discusses how we can use the market's incentives and efficiencies to achieve environmental goals. Efficiency is part of it, but it's also about having clear, agreed, targeted outcomes. There is more consensus over what we need than about how to get there. Talking about outcomes makes trade-offs clearer, and brings more participation and buy-in into environmental policy.

## 2.4 April

### 2.4.1 Corporate goals and perverse subsidies (2005-04-05 10:36)

The corporate sector has very clear objectives, comprising mainly sales, profits, market share and growth. In achieving its objectives the corporate sector generates positive and negative externalities. If corporations were human beings, informal pressures would probably ensure that the positives outweighed the negatives, or at least we could appeal to their humanity when the negatives become outrageous. They aren't, so we try formal regulation instead. But what happens when the regulators - governments - don't have equally clear objectives?

One answer is that they can be easily corrupted by the corporations. So we get perverse subsidies, such as those to the energy or agriculture sectors, that are financially and environmentally disastrous, and subsidise the rich at the expense of the poor.

Perverse subsidies are essentially expensive ways of protecting sectoral investments and employment. They constitute sufficient evidence that governments mis-allocate significant resources. But they are only the most spectacular wastes of government funds, representing entire policies almost all of whose effects on society and the environment are negative. Other government failings are not always so obvious or quantifiable. Sometimes only certain elements of a programme are questionable, or only fractions of public funds may be misdirected or abused. Or government may be carrying out worthwhile activities inefficiently, so that their costs to the taxpayer are higher than necessary.

The result is that in many of the wealthiest societies that have ever existed in human history, there are significant pockets of deprivation, crime rates are high and rising, health services are plagued by too much demand and occasional scares, and public education seems always to be in crisis. Environmental problems are a growing cause for concern at all levels: local, national and global. Indeed the entire human population is now threatened by global environmental catastrophe and by the proliferation of weapons of mass destruction. These problems persist despite high levels of government spending and the less well-funded but laudable efforts of many non-governmental organisations.

Under a Social Policy Bond regime, governments would target social and environmental outcomes as single-mindedly as corporations target their own objectives. A Social Policy Bond regime would combine explicit, meaningful goals with the other essential element that defines corporations: financial incentives. Click [1]here to go to the Social Policy Bonds website and find out more about how the bonds would work.

ZenTiger (2005-04-18 07:50:00)

Interesting thoughts. I will need time to absorb these. I may chat later.

Ronnie Horesh (2005-04-18 09:00:00)

Thanks; all comments welcome

## **2.4.2 Numbers and happiness (2005-04-11 14:03)**

One of the points Richard Layard makes in his new [1]book on happiness is that beyond certain levels of income and wealth, more money does not make us much happier. There are very significant policy implications. One is that most governments' de facto goal, faster economic growth as (badly) measured by GDP per capita, is even less useful than you might think. (For work on alternatives see, for instance, [2]Redefining Progress.)

A Social Policy Bond regime would target explicit, quantifiable goals. Already this would improve on the current system, where goals are often unstated or sufficiently vague so that governments cannot be held accountable when they fail to achieve them. But Social Policy Bonds would target outcomes, and whoever issues them could make sure that their targets would be *inextricably linked to increased social welfare*. As Layard points out, at low levels of income and wealth, gains do translate into increased welfare, and it would therefore be worthwhile for governments (or other bodies) to target such gains. Far better to do that, than to target obsessively GDP per capita.

The problems with targeting economic growth to the exclusion of most other goals are becoming ever more obvious: a deteriorating environment; a fraying social fabric; the entrenchment of poverty; and health and education systems that seem perpetually to be in crisis. There is also the frightening prospect of violent political conflict; another area where significant financial incentives (to arms merchants and others) are available only to the creators of social problems, not to the would-be solvers.

## **2.4.3 What happens when government tries to help (2005-04-13 14:55)**

"Ask yourself," wrote John Fund of the Wall Street Journal a decade ago, "If you had a financial windfall and wanted to help the poor, would you even think about giving time or a check to

the government?" My explanation for why the answer should be a resounding, unanimous "no" is that government is inefficient in helping the poor, even if that is its actual goal. And it is inefficient because it has no incentives to be efficient. Charities are far more efficient, but have to run on a shoestring because most of what we would spend on the poor is compulsorily taken away from us to be spent by government.

Government, by default is now taking charge of our physical environment. Given the mess it's made of our social environment, we know what to expect: good intentions, massive funding of government agencies, supplanting of environmental goals by insitutional goals, some corruption, more waste, and the crowding out of our own intrinsic motivation to do the right thing. If only government would issue Social Policy Bonds. Then it would concentrate on articulating society's wishes and raising the funds necessary to achieve them - things it does quite well. It would leave to markets the actual allocation of resources to achieve our goals - which government does very badly indeed.

-  
Policy as if outcomes mattered  
SocialGoals.com

---

Ronnie Horesh (2005-04-15 07:53:00)

Thanks for your considered comment Adam, which is much appreciated. Let's say that, apart from government, there are two types of 'people who want to solve problems'. There are wealthy individuals or philanthropists who might have lots of capital, and who can indeed issue their own Social Policy Bonds. I have done a [1]handbook which tries to give some guidance on this. I have also tried to interest philanthropists, but understandably perhaps, they invariably ignore my emails. I do not share your concern that bond issuers would initially raise funds from the bond sales: they can always specify a remote objective so that this amount would be negligible and the problem-solvers would have to shell out very little in relation to their potential gain.

Then there are, as you put it, 'cash strapped entit[ies] with the problem solving idea'. These might be individuals or non-governmental organisations. They would not have to buy Social Policy Bonds themselves to put their ideas into action: they could do that by getting bondholders interested in their ideas. A Social Policy Bond regime would give bondholders strong incentives to seek out these entities or, more accurately, their ideas. The potential for profit from higher bond prices would catalyse the getting together of those with the cash but no ideas, and those with the ideas but no cash.

The idea in your last para is interesting. I will think about it more, but here are my first reactions. I am not sure I like the idea of many people holding bonds that would become worthless if a targeted social objective were achieved. They would have perverse incentives to sabotage any objective-achieving projects. The idea would make the problem-solving the exclusive responsibility of the business. It could work though if government bought the bonds, and for small-scale problems, where the relationship between a problem and its causes are readily identifiable and solvable by a single business. But it lacks the fluidity of ownership (of the problem-solving, not necessarily the bonds) that Social Policy Bonds would bring about, which I think is more suited to complex social and environmental goals. For these, there is a need for a larger (than one business) and more changeable cast of characters who will carry out the problem-solving. with your proposal I also see the need for careful and continuing monitoring of what happens to the proceeds from the bond sale. The market would of course discount the risk that these proceeds would (how shall I put it?) not find their way to solving the specified problem, but in doing so it may not actually reward the business with much starting capital. Lastly, I am a wary of businesses identifying problems and offering to solve them for a price. I'd rather the existence and role of problem-solving businesses were a consequence of social policy, not a cause of it. Under the Social Policy Bond regime as I envisage it, I think this is what would happen.

1. <http://socialgoals.com/handbook.pdf>

Anonymous (2005-04-24 22:22:00)

Still, your system relies on the existence of organizations or individuals with enough cash and time to both buy social policy bonds, and seek out organizations with ideas to do something about a problem, and then work with them and probably fund them with more cash to actually help solve the problem.

I'm just not really convinced that the incentive provided to these cash and time rich organizations or individuals to see the price of their bonds go up would really be enough to make a measureable difference in their behavior.

The organizations and individuals who would be most likely to buy social policy bonds under this scheme are probably already working to solve social problems, and don't need an extra incentive to do so by buying social policy bonds.

The key would be to get organizations and individuals who normally are not interested or focused on a given social problem because it is not already part of their mission, to buy these social policy bonds. But why would they if they are not going to see any return on their investment unless they invest more money and time, beyond what they give to buy the bond itself, in what for them are non-mission related activities?

Ronnie Horesh (2005-04-25 02:57:00)

Thanks for your comment. For remote objectives, an organisation would pay relatively little to buy Social Policy Bonds in the first place. They might stand to see capital gains of 900 per cent, or much more, if they held the bonds to redemption. With that sort of opportunity, I see new organisations coming into being, *dedicated solely to achieving targeted objectives*. They need not directly carry out objective-achieving activities, but could concentrate on subsidising existing bodies that are trying to solve social problems. The bondholders would have incentives to fund only the most efficient of existing projects, or only the most promising new solutions to social problems. What you rightly call 'non-mission related activities' would become 'mission related' to an organisation holding a large number of bonds. The existence, mission and role of a large bondholding organisation would in fact be defined by objective that is targeted by the bonds it owns.

#### **2.4.4 Ideology = Intellectual Bankruptcy (2005-04-17 12:48)**

The New Zealand opposition National Party [1]decries the increasing size of the state sector, saying it would conduct a thorough review of all state spending and "identify waste" if it returned to power. Fine, and it is true that after five years of Labour (to September 2004) total state sector staff numbers had grown by 33 630 to 278 831. In core government departments, staffing has risen from 30 702 to 38 270.

But the selection of 'cutting back the state sector' as a policy goal is, I believe, a symptom of intellectual bankruptcy. In this respect the New Zealand National Party is no worse than the New Zealand Labour Party or virtually any other political party in the world. Driven by ideology, they fail to target outcomes that are meaningful to the people they want to represent.

Cutting back on the numbers employed by the state is not valid as an end in itself. It might be a means to certain ends, but these ends should be explicit and transparent, and people should be given a chance to vote on them. The size of the state sector should be a

result of decisions made about what social and environmental outcomes people want, not a matter of blind ideology. If political parties treated the electorate as adults, and gave us choices about meaningful outcomes, we might take politics more seriously and even participate in it. Perhaps that's what they're afraid of.

ZenTiger (2005-04-18 07:54:00)

Good point. However, I sometimes wonder if people can see things are wrong on an instinctual level, and react on the basis that doing something is often better than doing nothing (even if that turns out not to be the case)

It may not reflect intellectual bankruptcy, but a kind of intellectual deficiency that just needs some guidance?

Ronnie Horesh (2005-04-18 09:08:00)

Thanks ZenTiger. I agree: my aspersions are directed at policy specialists and politicians, rather than ordinary folk who can be excused an instinctive reaction. The politicians know, or should know, that targeting agency funding levels, activities, inputs and outputs is inefficient, prone to corruption, and no substitute for targeting meaningful outcomes. The world is too complex for simple ideological 'solutions'. Policymakers should know that by now.

#### **2.4.5 Another day, another set of Mickey Mouse targets (2005-04-18 22:34)**

✕

More Mickey Mouse targets, this time from a typical day in the [1]UK election campaign. The Tories are saying they want to open more children's hospitals, Labour promises shorter waiting lists for women seeing breast cancer specialists, and the Liberal Democrats say they'll spend more on police and community support officers.

This is more run-of-the-mill policymaking as if outcomes don't matter. The parties' Public Relations consultants identify an 'issue' of the day and the politicians think of some policy response. What is missing is the link between the policies they come up with and achievement of a meaningful outcome. What do political parties know about improving children's health outcomes, women's health outcomes, or reducing crime rates? Not much, but our policymakers are not known for their humility. Rather than relinquish their role in dictating how social goals shall be achieved, our politicians impose their own Mickey Mouse targets for peripheral pseudo-goals that may or may not be tenuously linked with what society actually wants to achieve.

But the world is too complex and fast-changing for that. We cannot assume that any single group of people knows the answers. Under a Social Policy Bond regime, the achievement of broad social and environmental goals would be contracted out to the most efficient

operators. Bondholders would have powerful incentives to be efficient themselves, or to sell their bonds to more efficient investors. So if, for instance, a government were serious about reducing crime it wouldn't assume that more police or community support officers are the best solution. It would hand over responsibility to bondholders, who might decide that more could be achieved by subsidising employment in some areas, or installing effective alarms and cameras in others, or building youth clubs in still others. We need diverse, responsive, solutions run by people with incentives to perform. We do not need politicians' micro-management, Mickey Mouse pseudo-targets, chosen because of their high profile, or because they can be staffed by government agencies, or subject to central control.

SocialGoals.com

1. [http://www.itv.com/news/index\\_1771303.html](http://www.itv.com/news/index_1771303.html)

---

Jimmy Jangles (2005-04-20 22:54:00)

Are these policies just simply electioneering? You know, more hospitals sounds like a good thing so it is said regardless of the effect... but then you already knew that.

Ronnie Horesh (2005-04-21 13:31:00)

Jimmy Jangles! Yes, I guess we are complicit in that we think they sound good, so we carry on voting for them. Or we don't, but the non-voters have no representation. Now if policy were expressed as outcomes, then we'd have something meaningful to vote about....

#### **2.4.6 Emissions are not climate change (2005-04-23 06:26)**

From [1]the Economist:

Emissions trading is also taking off. America led the way with its sulphur-dioxide trading scheme, and today the EU is pioneering carbon-dioxide trading with the (albeit still controversial) goal of slowing down climate change. ... Here, politics merely sets the goal. How that goal is achieved is up to the traders.

Not quite. The goal is to mitigate climate change, not cut back on anthropogenic carbon dioxide emissions.

For sulphur dioxide, there is probably a strong correlation between amounts emitted by those (relatively few) polluters whose emissions can be accurately monitored and its adverse effects on social welfare. But this is not the case with carbon dioxide. What will emissions trading in CO<sub>2</sub> achieve? It might put a cap on anthropogenic emissions of carbon dioxide - those at least that can be reliably monitored. It may or may not bring about a significant reduction in total anthropogenic greenhouse gas emissions. It might even limit total greenhouse gas emissions. But it does not target beneficial changes in the composition of the atmosphere. And it does nothing to encourage those who find ways of mitigating climate change other than reduce CO<sub>2</sub> emissions.

It is in short an indirect and tenuous way of cutting back one possible driver of climate change. If imposed in a way that will have any effect on emissions at all, it will be expensive, divisive and almost certainly ineffectual if its real goal is actually to mitigate climate change.

Here's another idea: instead of targeting anthropogenic CO2 emissions, reward people who mitigate climate change *however they do so*. Better still, offer market incentives, so that people not only do the right thing, but do it efficiently. In other words: issue [2]Climate Stability Bonds.

#### **2.4.7 Why bother to buy Social Policy Bonds? (2005-04-26 08:07)**

I am often asked why corporations or other agencies would bother to buy Social Policy Bonds. Those that are already trying to achieve social or environmental goals probably won't have much cash to spend on bonds and, unless they bought a great many, would hardly gain much by seeing the market value of their bonds rise.

I have two answers: first is that existing bodies could benefit substantially from holding Social Policy Bonds that target a remote objective (where the initial market price of the bonds would be very low). They could see the value of any bonds they buy multiply many times. But my main answer, which applies especially to larger projects, is that in the long run Social Policy Bonds would bring about new sorts of organisation: those dedicated financing the most efficient solutions to social and environmental problems. These organisations would, I think, end up owning large proportions of the bonds in circulation. They could subsidise the most cost-effective existing projects that are aimed at solving social problems; they could bribe socially destructive operations to reduce their activities; or they could help maximise returns from law enforcement. They could also finance research into the most promising new ways of achieving our social goals.

The profits of these bondholding organisations would be highly correlated with their success in solving social problems. Their profit-seeking would fit in exactly with the goals of wider society. Many bondholders, whether individuals or corporations, would be rich and, if their bonds were redeemed early, they would become richer. But this would be a socially beneficial way of acquiring wealth. What would be the implications of this? Two long-run possibilities:

It would enlarge the pool of talented people working to achieve social and environmental goals; and

As a way of accumulating wealth that is strictly correlated with wider public benefit, it could allow other, less socially beneficial ways, to be taxed more heavily.

ZenTiger (2005-04-27 10:51:00)

Hi Ronnie. Can you fix the links to Social Policy Bonds in Brief?

Ronnie Horesh (2005-04-28 02:13:00)

Thanks for the feedback. Will try to fix: meanwhile here is an alternative link to [1]Social Policy Bonds in Brief.

1. <http://geocities.com/socialpbonds/spbs600words.html>

## 2.5 May

### 2.5.1 Closing the gap (2005-05-01 06:12)

Unlike many economists I have no view on the desirable size of government. I do not believe that 'taxation is theft', or that economic freedom is necessarily the most important consideration. To me it is the distance between government and people that is the matter of concern, especially as this distance seems to be widening in most democracies.

The gap would narrow if more people participated in policymaking. One reason, I believe, why we're not very interested is that policy is formulated in terms that are difficult to relate to outcomes that are meaningful to natural persons, as distinct from corporate bodies. Policymakers appear to concern themselves with decisions about funding for different government agencies, dispensing patronage to big business and other lobbies, presenting themselves in the best light ... almost anything, in fact, except outcomes that mean something to real people.

A government that issued Social Policy Bonds would, from the outset, have to concern itself with social and environmental outcomes. Its main role would be to articulate society's wishes regarding social and environmental outcomes, and to raise the revenue that would fund these outcomes. Unlike most of the current determinants of policy, the language of outcomes and the necessary trade-offs between them is comprehensible to people other than politicians, bureaucrats, lawyers and public relations experts. For that reason, more people would be drawn into policymaking - an end in itself, as well as a means toward getting greater public buy-in to the resulting policies.

Expressing policy in terms of outcomes, and the consequent closing of the gap between public and policymakers would be one valuable benefit arising from a Social Policy Bond regime. The other would be the much greater efficiency in achieving social and environmental goals once the market, rather than a handful of government employees, decides who shall achieve these goals, and how they shall be achieved.

### **2.5.2 What about the subsidies to big oil? (2005-05-04 09:20)**

If we're going to get through this crisis period without an awful lot of pain, we're going to have to have the equivalent of a Manhattan-like Project. We're going to have to challenge, not just the American people, but the people of the world because the first thing we have to do is to have an enormous conservation effort so that we buy time. US Congressman [1] Roscoe Bartlett

(R-Maryland)

Politicians are still subsidising oil extraction and oil consumption, as they have for decades. It is politicians who have subsidised the infrastructure that makes us dependent on oil. And here is one of them advocating another top-down, think-big, government-knows-best 'solution'. Yes, that's sure to work. Memo to Mr Bartlett: why not just stop the subsidies?

### **2.5.3 Government for special interests (2005-05-06 14:48)**

The problem with special-interest conservatives is not that such agenda items violate their greater principles on any given point, any more than the policies promoted by Democratic interests violate liberal principles. Rather, it's that the entire enterprise of running Washington as a special-interest spoils system breeds a bloated, ineffective government - which does very much go against conservative principle. Ten years ago, conservatives defined themselves in large measure by their belief in less government. Many still view themselves that way, but the self-conception no longer has anything to do with reality. ...[F]or the 101 biggest programs that the Contract With America Republicans proposed to eliminate as unnecessary in 1995, spending has now risen 27 percent under a continuously Republican Congress. [1] *Interest-Group Conservatism* , Jacob Weisberg, 'Slate'.

What goes for the United States goes for the other western democracies. The identity of the special interests changes, but the consequences don't: government that keeps growing, but fails to achieve society's social and environmental goals. And the consequence of that? A widening gap between government and the people, and a self-perpetuating lack of public participation in the political process. Even with postal voting, the turnout in yesterday's UK general election amounted to [2]about 60 per cent. Only when politicians stop catering to special interests, and start focusing on what real people want, will this change. And that won't happen until they start expressing their policy goals in terms of broad, transparent, explicit, verifiable outcomes.

#### **2.5.4 Killing our cities (2005-05-08 10:28)**

[1]*The Nation (Bangkok), today published my letter:*

The Bangkok Metropolitan Administration wants to ban street vendors from operating on Sundays. I am sure the BMA genuinely believes its plan would be good for the city. Like government the world over, it probably identifies economic success with the profits of its friends in big business, in this case the owners of shopping malls, luxury goods stores, and car manufacturers, all of whom would benefit from clearing vendors off the streets. In this the BMA is mistaken. It is small businesses on which the economic and social health of Thailand depends, and the BMA should be encouraging them, not chasing them away.

If the BMA wants to see the results of policies that favour big business at the expense of small businesses it need only visit typical western cities, where well-meaning over-regulation and zoning laws have created sterile, bleak, city centres. Cities that used to be vibrant and thriving, as Bangkok is today, are dying. In fact, at weekends and every evening they are already dead. People are afraid to walk in the streets and drunks and yobboes take over. Bangkok should learn from the mistakes we have made in the west, where government and big business seem determined to stifle diversity and enterprise.

## 2.5.5 Information markets and Social Policy Bonds (2005-05-13 08:39)

[1]Robert W Hahn is co-founder and executive director of the American Enterprise Institute-Brookings Joint Center for Regulatory Studies. His paper, [2]Using Information Markets to Improve Policy, briefly refers to my work on Social Policy Bonds. I respond to his comments.

*Horesh's proposal differs from ours in two other ways. First, it does not pay for incremental progress toward a specific goal. That is, the bond would only pay the fixed amount if a specific objective were achieved.*

I have three main answers:

First, let's say our targeted objective is to reduce unemployment from 10 per cent to 3 per cent. We issue Social Policy Bonds that become redeemable for a fixed sum when unemployment is sustained at 3 per cent or below for, say, two years. This is a remote objective, but would that put people off buying the bonds even if they did not particularly want to make a long-term investment that might take many years until redemption? Not necessarily, because if they undertake unemployment-reduction projects now, the market value of their bonds will rise, even if the effect of their activities is only to reduce unemployment to, say, 8 per cent. The market will most likely interpret such a reduction as a reduction in the cost of getting the percentage down to the required 3 per cent target. The market value of the bonds will therefore rise, and the original purchasers can sell and realise a profit, once they have carried out their unemployment reduction projects.

Governments routinely issue bonds redeemable 10, 20 or more years into the future, but very few people who buy them at issue intend to hold them all the time until redemption. They can profit from shorter-term variations in bond prices.

Second, the redemption terms of the bonds could be formulated to explicitly reward incremental progress. In the interests of simplicity I have not gone into detail about this, but time-based provisos could easily be added to the redemption terms of any Social Policy Bond issue. For example, bonds could be issued that targeted a reduction of unemployment of 10 to 3 per cent. They might be redeemable for \$1000 each, but if, say, the 3 per cent target were achieved within five years (and sustained for a further two years) the issuers could make them redeemable for \$1500. If the target is not achieved for 30 years, the redemption value could collapse to zero. Of course, bond issuers could post more sophisticated time-based redemption conditions.

Third, and more trivially, bond issues could target intermediate targets themselves. So bonds could be issued that targeted a sustained drop in unemployment to 6 per cent rather than 3 per cent. Or two or more unemployment rates could be targeted by two or more bond issues.

*Second, in the absence of costless bargaining and coordination among firms holding Social Policy Bonds, individual firms will not have adequate incentives to help meet the performance objective under his proposal because of problems with free riding.*

I think this would be more accurate if instead of 'will not have adequate incentives' it read 'would have reduced incentives'. Even if bargaining and coordination were costly firms would, under certain conditions, help meet targeted objectives. Certainly, the direct benefits of bondholding would not always be apportioned strictly corresponding to bond holdings. But: Firms would be looking at how worthwhile it is to themselves to undertake activities that would raise the value of their bonds. They might not be deterred from carrying out these activities just because other firms might benefit disproportionately more. Company executives and workers respond to all sorts of incentives, and are not deterred from maximum performance just because large shareholders will receive much greater financial rewards.

Firms could leverage their actual bondholding by buying call options or futures for the bonds, thereby maximising the returns from their target-achieving activities.

However, perhaps more important is that bargaining and coordination in the age of the internet are, in fact, very close to costless.

*[Horesh] does not address how to obtain information on the costs and benefits of a policy prior to implementation.*

This is true for new policies. But issuers of Social Policy Bonds will easily limit the *maximum* cost of their policy because they determine the redemption value of each bond, and the total number of bonds in circulation. And once a bond has been issued that, say, targets the reduction of unemployment from 10 to 8 per cent, then the market value of the bonds will generate and reveal masses of information about the costs of this policy, costs and benefits of particular unemployment-reduction projects and, importantly, costs of reducing unemployment still further. (I go into this in detail in my books.)

### **2.5.6 Subsidising the rich (2005-05-17 15:43)**

The [New Zealand] Government is increasing its commitment to developing a knowledge society with an extra [NZ] \$60 million for its Digital Strategy, including [NZ] \$44.7 million of contestable funding. The strategy, released yesterday in advance of the Budget, says creating a knowledge society will require connections to the internet to be instantaneous, affordable and available everywhere. ... [T]he Government [will] spend up to [NZ] \$400 million on digital strategy initiatives in the next five years. [1] Government digs deep to create a wired society

, 'New Zealand Herald', 17 May

If the Government wants to create a 'knowledge society' it should first decide what a knowledge society is. A functional literacy level of 100 per cent would be a good start. A sensible government would set up some such meaningful targets, raise the funds to deliver them, then let the market decide how to achieve them. See [2]here (pdf), for how Social Policy Bonds could be issued to raise literacy of girls and women in Pakistan. I suspect this well-intentioned government initiative will end up subsidising the stay-at-home movie watching habits of well-off New Zealanders.

### **2.5.7 Nappies and environmental policy (2005-05-19 16:43)**

The UK Environment Agency's [1]life cycle analysis of nappies concludes that neither type - disposable or cloth - is better or worse for the environment. The Women's Environmental Network [2]disagrees, saying the report is analysis is seriously flawed.

As always there are bound to be valid arguments on both sides, as well as value judgements, boundary issues etc. The lesson for policymakers though is this: instead of trying to legislate for or against activities whose effect on the environment are not obvious, they should target environmental outcomes. Under a Social Policy Bond regime, people would have incentives to work out the best ways of achieving these outcomes. If you live close to a landfill site, for example, it might be better for the environment if you used disposable nappies rather than cloth. Only an outcome-based regime would reward people for taking a such a diverse, responsive approach.

With nappies, we are not talking about disaster scenarios. But the same mistake has been made with climate change. The politicians have decided that the way to prevent it is to cut back on anthropogenic greenhouse gas emissions. They have staked everything on this. Instead of targeting alleged causes, they should be rewarding people for achieving climate stability as cost-effectively as possible, however they do so. To see how, please read this published article about [3]Climate Stability Bonds.

### **2.5.8 Entrenching dependence (2005-05-25 08:03)**

The European Union has decided to [1]double the amount of taxpayers' money it will give in aid by 2015. The EU mandarins are obviously more comfortable giving other people's money

as charity than allowing poor countries to prosper through trade. According to [2]Oxfam:

The financial losses associated with import restrictions in rich countries outweigh the benefits of aid. Import tariffs, the least significant weapon in the protectionist arsenals of rich countries, cost developing countries around \$43bn a year. The total costs of all forms of trade barriers – including tariffs, non-tariff barriers, antidumping measures, and product standards – are more than double this amount, rising to over \$100bn, or more than double the total sum of development assistance.

The extra aid will amount to \$40 billion. If the EU chiefs were genuinely concerned about third world poverty, they would dismantle their corrupt, insane, barriers to agriculture, textiles and clothing. Especially since, as Oxfam continues:

Such figures understate the real impact on the poor. They do not capture the costs of protectionism in terms of reduced opportunities for employment, reduced income for essential goods such as food and health care, or the long-term economic losses associated with restricted opportunities for investment. Nor do they capture the disproportionate impact on very poor households. Because Northern governments impose the most punitive import restrictions on goods produced by the poor, they systematically diminish the potential for trade to act as a catalyst for poverty reduction.

It looks very much as though EU governments are trying to replicate on an international scale the disastrous, enfeebling welfare dependency they have created at home. Perhaps they are more interested in control than prosperity.

### **2.5.9 Tax breaks for the rich (2005-05-28 14:18)**

*Death by a thousand cuts* by Michael Graetz and Ian Shapiro tells the story of the successful campaign to repeal inheritance (estate) tax in the US. It is a fascinating story, reviewed [1]here by David Runciman.

The mystery is this: how did the repeal of a tax that applies only to the richest 2 per cent of American families become a cause so popular and so powerful that it steamrolled all the opposition placed in its way?

Part of the answer was the rechristening of the tax as the 'death tax', which implies that the tax was on the hard-working deceased, rather than those wanting to inherit wealth. The tax was also depicted as a form of discrimination,

By the time a few opponents of repeal started to make the case on more principled grounds, arguing that the estate tax was a crucial part of the American conception of giving everyone a fair chance in life, it was already too late. Graetz and Shapiro draw a blunt lesson from all this, designed to send a chill through the hearts of progressive politicians everywhere: 'In politics, when you're explaining, you're losing.'

Social Policy Bonds are more about spending tax revenue than raising it, but this book does illustrate how the complexities of social policy can be readily abused by interest groups acting out of pure self-interest. Exactly the same goes on when lobbyists argue in favour of 'protection' for farmers (for example) that end up as subsidies to wealthy landowners and large agribusiness corporates while everybody else, and the environment, suffer. The true beneficiaries and victims are obscured by the formulation of policy in terms of funding of various projects or vague, mutually conflicting pseudo-objectives. A Social Policy Bond regime, in contrast, makes absolutely clear from the outset who shall benefit from particular policies.

### **2.5.10 A European Union without France (2005-05-31 03:47)**

A European Union without the French and their emotional insecurities and hangups could be a powerful force for good. For a start, there would be one official language, English, instead of twenty. Then the new EU could set about dismantling the Common Agricultural Policy and other corrupt protectionist scams. Then they could start thrashing out genuine common policies, instead of relexively opposing the US and UK. As it is, the French in the EU are behaving exactly as they do in Canada: blackmailing everyone else until they get what they think is in their interest. Perhaps it's time to call their bluff; encourage them to leave, and get on with the job of creating a genuine European Union, responsive to its people, rather than to the French elite's manipulative skills.

### 2.6.2 Old Europe (2005-06-09 09:05)

In the UK briefly, where the political hot topic of the day is road pricing. The same confusion about the difference between ends and means of policy that bedevils other policy areas is rife in transport too. First, traffic congestion is seen as an urgent problem that needs to be solved, rather than a symptom of deeper problems. Second, there is no agreement on what would constitute a successful solution. Presumably, uncongested roads. But that could be achieved by halving the road network, and raising costs of motoring so that road travel were cut by 95 per cent. We'd then have fewer roads, sure, but they'd be traffic free.

Uncongested roads are not valid as a policy goal for government, because they do not necessarily generate increased social welfare. They may or may not be a means to other ends. The right response from a government is to work out what these other ends are, then to target them. It should let people in a properly regulated market decide on whether and how to travel.

Government, by subsidising road building in previous decades, has made too many people and interest groups too dependent on low cost road transport. It has subsidised the big and global at the expense of the small and local. So any sensible initiative, such as road pricing, is going to be aggressively opposed and the result will be too little, too late. A Social Policy Bond regime would make clear exactly where government funds are going: it would

express policy goals in terms of outcomes that mean something to real people rather than paid lobbyists or entrenched interests.

Policy as if outcomes mattered  
SocialGoals.com

---

### **2.6.3 UK (2005-06-14 08:12)**

In the UK, where policy seems to be determined by anything other than outcomes and the state is enlarging its role by default. There is a serious effort to extend school opening hours to 0800-1800 so that both parents can more easily go out to work. Part of the motivation for this is doubtless the resulting increase in income tax revenues. In Spain, a controversial new law, will force men to do their share of housework. The legislation will oblige men to "share domestic responsibilities". Recalcitrant husbands will face the wrath of the courts in divorce proceedings.

Here in old Europe the first impulse of anybody facing any sort of problem is to blame the government and then to look to the government for a solution. Government doesn't mind intervening too much, because that is its *raison d'être*, but the result is an enfeebled population, yet more dependence on government, and government enthusiastically going way beyond its competence.

A Social Policy Bond regime would clarify what government is about. Poverty and planet-threatening environmental problems would probably be given higher priority than the shortfall in baby-sitting services for double-income families. The state would probably not intervene when it comes to who does the vacuum-cleaning. I say 'probably' because the government's priorities would be determined by people, and they would choose outcomes that are meaningful to them. There may be many who think the government should run mass childcare establishments as an end in itself, but I suspect the state drifts into these activities through inertia rather than as a rational attempt to address the concerns of its citizens.

### **2.6.4 Prague (2005-06-20 18:37)**

In Prague, where memories of what happens when Government gets very far out of line are still prominent and sobering. A front page story in today's International Herald Tribune quotes a Jiang Yhaohua, a Communist Party secretary for the township of Zegou, in Zhejiang in China

No matter how smart we are, we officials have limited information. The easiest way to avoid mistakes is by having more democratic decisions.

Impressive humility, and let's hope it portends a way forward for acting on complex problems such as crime, climate change, and violent political conflict, where officials, politicians and experts, however dedicated and well-meaning, are failing. A Social Policy Bond regime would democratise the finding of solutions to these problems by letting people decide both on the priorities they would give to problems, and the best ways of solving them.

### **2.6.5 Back in the UK (2005-06-23 18:33)**

...after a few very pleasant days in Prague. I stayed at a modest hotel in Zizkov, a working class district two tram stops to the east of the city centre. At first I was apprehensive about the area, but it did not take much walking around to realise, or be reminded that, 'working class' does not necessarily mean menacing, nihilistic and drug-ridden as it seems to in the UK and increasingly in New Zealand, but can be synonymous with pride and dignity. Passing through customs at the airport back in the UK there are signs headed 'Assaults on Staff' warning us that anyone who beats up a customs official will be prosecuted. The authorities see no need to translate these into languages other than English.

### **2.6.6 'Better than Kyoto' (2005-06-28 13:04)**

'The Economist' pinched the title of my book on Climate Stability Bonds for its lead article on Kyoto. Its article is subtitled 'America should use the G8 summit to embrace carbon trading'. But I question that. Carbon trading may well be the most efficient way to reduce anthropogenic carbon dioxide emissions. But there is no evidence to say it's the most efficient way of stabilising the climate. What about removing carbon dioxide from the atmosphere? Shooting up mirrors into the atmosphere? Cyanobacteria that [1]convert a carbon dioxide atmosphere into one dominated by oxygen? All unlikely to be the sole solution, but not necessarily more unlikely than Kyoto, which puts all our eggs into the one basket. 'Better than Kyoto' means looking at all potential solutions not just the one favoured by 1990s science. Climate Stability Bonds would give incentives to people to investigate all possible solutions and to look for the most efficient. Carbon trading, and Kyoto itself, are dangerous distractions from this goal.

## **2.6.7 Amsterdam (2005-06-30 15:14)**

Conversation with Amsterdammers reveals much discontent with the way the Dutch Government allocates resources, particularly welfare. The attitude, by no means unique to the Netherlands, seems to be "because it's not perfect, I'm justified in going on the dole/ripping off the system/ripping off the rich/being permanently miserable".

My take on all this is that the problem is the wide and growing gap between people and their government. The gap is not going to close, I believe, until politicians express their goals in terms of outcomes that mean something to real people. Currently government goals are usually derived from an ideology, expressed as funding programmes for public agencies, or surreptitiously determined by the narrow interests of private corporations. Politicians are overwhelmingly ideologues or lawyers, skilled (or able to employ those who are skilled) with words and argument, but removed from the concerns of natural persons. Government should be about delivering outcomes for people, not about representing corporate interests, whether private or public. Social Policy Bonds, by inextricably linking policy goals to meaningful outcomes, would help to close the gap between government and people.

-  
Policy as if outcomes mattered  
SocialGoals.com

---

## **2.7 July**

### **2.7.1 Corporate goals are not social goals (2005-07-05 17:29)**

The more than minimal fraud is in measuring social progress all but exclusively by the volume of producer-influenced production, the increase in GDP. J K Galbraith, 'The Economics of Innocent Fraud', Penguin Books, 2004.

By default, GDP, or GDP per capita, has become the measure of social progress. What Galbraith calls fraud, I would call a trap or an irrational tendency, which parallels, or arises from, our individual psychology. For most of us education has been almost entirely verbal. So we see happiness as a set of circumstances rather than a state of mind. But the correlation is neither strict nor necessarily positive. Our societal obsession with GDP is, in my view, an exact projection of our individual obsession with preconceived, generally numerical and monetary, goals. What gets lost are crucially important, but neglected public goods, such as a healthy environment, low rates of crime, or a low probability of war. Social Policy Bonds would explicitly target these goods and reward those who help achieve them. Our current incentive structure rewards those who increase GDP, even if they do so by, for example, destabilising the climate or selling weapons to corrupt despots.

---

Jimmy Jangles (2005-07-06 20:54:00)

If we could presume that when we get richer, we will look after ourselves better - better environment, better health - then do we really need to specifically target these areas? Will they just not improve as our means do?

Ronnie Horesh (2005-07-07 08:42:00)

For individuals in most cases yes, but I am really talking about public goods, or near public goods, which are much more efficiently tackled at societal level. Goals like improved climate stability, lower crime rates, reduced probability of nuclear war, or better basic health and education standards. These can, and in some cases have, actually become more remote while society as a whole has become richer.

### **2.7.2 Terrorism, war and market incentives (2005-07-09 08:01)**

The Greeks saw war as an inescapable fact of human life. In the aftermath of terrorist outrages many commentators take the same view; and preventing every such outrage is indeed a formidable task. Which is why, in my view, it should not be the sole responsibility of the state. Government, I believe, could contract out much of the work needed to eliminate terrorism. It could issue Social Policy Bonds redeemable for a fixed sum only when there had been no people killed or injured by terrorist attack for a sustained period.

Bondholders would then have incentives to prevent terrorism efficiently. They would explore and invent new, more diverse options than are currently open to government. They could, for example, subsidise intermarriage between members of different religious communities. They could sponsor school exchange visits, sports matches or the broadcasting of peaceful propaganda. They could arrange for the most virulent preachers of hate to take long, luxurious holidays in remote resorts without access to communication facilities. They could pay people to seduce arms dealers into other areas of activity. Whatever holders of bonds targeting war and terrorism do, they will have successes and failures. But they will also have incentives to terminate projects that are failing and to refine and replicate their successes - to be efficient, in other words.

Government has no such direct incentive. It cannot offer direct financial rewards for success, and its talent pool is limited, partly for that reason. It would get into trouble if it advocated things like intermarriage, or sponsored sybaritic vacations for rabble rousers. As in other areas of social policy, its options are limited. They tend to be one-size-fits-all, slow to adapt and justified mainly because they have been done before, rather than by their efficiency.

The private sector can and should be given the chance to operate more freely. After all, it is largely private incentives that have aggravated the problem of war and terrorism. We need to redress the balance and reward those who strive for peace.

Under a bond regime targetting war and terrorism, Government would still have the responsibility of defining our peace goal, and it would be the ultimate source of finance for

achievement of that goal. But the actual achievement would be contracted out to the private sector, who would have powerful incentives to achieve it as cost-effectively as possible. Government and the private sector would each do what it does best: respectively, articulating its citizens' wishes, and finding the most efficient ways of achieving its goals.

-  
Policy as if outcomes mattered

SocialGoals.com

---

Ronnie Horesh (2005-07-12 17:08:00)

Thanks Mike for your comment. Your first para seems to be saying that terrorism is always a legitimate response to the projection overseas of illegitimate state aggression. This seems at least questionable if you look for example at present-day Thailand, Spain or the Philippines, but I don't want to get involved in that argument. Let me, for the moment, retreat into what is the purpose of economics: to allocate scarce resources to better achieve prescribed ends. Social Policy Bonds, I think, can do the efficient allocation of resources. I have views on what policy goals should be, but they are only my views, and others will have different ones. That said, I believe people can more readily come to consensus on these goals (outcomes) than they can on the means to achieve them, and one of the virtues of Social Policy Bonds is that policy goals would be explicit, transparent and agreed outcomes, rather than the incoherent hotch-potch of policies that serve established state and corporate interests that we increasingly see today.

Now, on your particular point. First, I think the private sector is quite an important influence on the military, so private entities, especially those within the military industrial complex can, I believe, do much to influence military practices by, for example, withdrawing their support for them. Second, private sector bodies outside the military industrial complex can have an effect through means other than what you rightly call the the 'same old political processes'. The private sector can, for instance, issue its own Social Policy Bonds targeting war or terrorism. The effect would be to offer countervailing incentives to those on offer through the existing system to those that create mayhem.

Taking up that thread, rather than go for subgoals, I would prefer a much broader goal. I propose that an alliance of enlightened governments, NGOs, charities and individuals back 'Conflict Reduction Bonds' that target all deaths caused by conflict, anywhere in the world, impartially (numbers would be unweighted by country/citizenship etc). Philanthropists could get the ball rolling by setting up a fund to which the public could contribute. I have discussed this idea and some of the issues it would raise in one of my books: Market incentives to end war (click on 'Books and ebooks' in the right hand column for more details). But feel free to comment further in this forum if you wish.

### **2.7.3 The private sector can issue Social Policy Bonds (2005-07-13 14:36)**

Governments are unlikely to be the first issuers of Social Policy Bonds. Doing so would mean they relinquish some of their power. They would be surrendering their power to dictate how specified social objectives shall be achieved. They would still be specifying what these objectives are, and they would still be raising, through the tax system, the funds that would be used to achieve them, but the decisions about how to achieve them would, in effect, be contracted out to the private sector. These contracts would be tradable, via the bond mechanism. But governments are not known either for their willingness to surrender power, nor for their deployment of innovative financial instruments.

So I now see the private sector as being the more likely first issuers of Social Policy Bonds. I have prepared a [1]handbook using the example of female literacy in Pakistan, suggesting how this might be run. (This is a pdf file of about 15 pages.)

#### **2.7.4 War, terrorism and 'root causes' (2005-07-17 16:52)**

Once conflict is happening, it's not difficult to reel off plausible reasons for its occurrence, or even its inevitability. Poverty, ignorance, despair, and differences of wealth, ethnicity, religion, class, culture or ideology: all these are thought to be some of the 'root causes' of war and violence. So are inequalities in access to resources, scarcity and economic decline, insecurity, the violation of human rights, exclusion or persecution of sectoral groups, and state failures including declining institutional and political legitimacy and capacity. Other key foundations for conflict could be historical legacies, regional threats, the availability of weapons, economic shocks, and the extension or withdrawal of external support. Demography is also significant: large numbers of unemployed males can catalyse conflict.

Sometimes inward factors are cited; such as individual pathologies; perhaps a history of being abused that predisposes someone to take up violence in later life. Often blamed too are the media, and the frequency with which our children are exposed to images of violence - especially when violence is presented as an acceptable and effective way of solving problems.

No doubt all these factors can and do play a part in fomenting and fanning the flames of conflict. But even aside from the impossibility of eliminating every potential cause of conflict, there is no inevitability that these causes will lead to war. Selective memory has strengthened these linkages in the collective mind, but for each of these 'root causes' there are examples that disprove any simple cause-and-effect relationship. There are, for example, dozens of countries in which people of different ethnicity and religion live happily side-by-side.

Perhaps Tolstoy summed it up best:

The deeper we delve in search of these causes the more of them we discover, and

each single cause or series of causes appears to us equally valid in itself, and equally false by its insignificance compared to the magnitude of the event.

An alternative to policymakers' trying to look for and deal with 'root causes' of violence, then, is for them to issue Conflict Reduction Bonds'. (See [1]my post of 9 July (below)). Then it would be up to bondholders to identify the most cost-effective ways of reducing conflict, which may or may not involve looking for root causes, but will certainly be more responsive and diverse than top-down, cumbersome, state-directed efforts.

### **2.7.5 Ideology or outcomes? (2005-07-23 15:57)**

Obviously food, clothing, shelter should and must be available for everyone; there should be a world pool of man's essential needs and right organisation for distribution. There is sufficient scientific knowledge to produce the essential needs of man but greed, nationalistic spirit, craving for prestige and power prevent the production of the essentials for all human beings. We are not concerned with feeding, clothing, and sheltering man but engrossed in a particular system which will guarantee food, clothing and shelter for all. The extreme left or the right are wrangling over a formula that will assure man security; so they are not concerned with man's happiness, but with which formula will guarantee him happiness.

[1] J Krishnamurti

Exactly. Formulas, ideologies and systems do not work. They cannot work, because they cannot cope with changing circumstances, nor with the multiplicity of variables, mostly non-quantifiable, that actually determine outcomes. A Social Policy Bond regime implies no formulas: it would stipulate only the desired social and environmental outcomes. Diverse, responsive approaches would be encouraged, and would thrive - provided they were effective and efficient. And, in a spectacular difference from the current system, failed approaches would be terminated. The self-interest of bondholders would see to that.

### **2.7.6 Investments as options (2005-07-26 17:07)**

Allocating resources between competing projects can, and perhaps should, be quite a sophisticated exercise. New techniques, such as [1]treating investments like stock options, can be

more useful than the fairly crude cost-benefit analysis often used by government bodies. One feature of the stock option approach is that it can deal more readily with changing circumstances: for example, it keeps open the possibility of making large investments if a project shows early promise. Holders of Social Policy Bonds, because they would subordinate their investment decisions to targeted outcomes, could possibly deploy such investment criteria more readily than government, which is more heavily constrained by existing institutional structures.

The effect of this sort of tool is to expand the range of projects that are amenable to objective assessment. Within an existing institutional body - a police force, for example - a limited budget may well be spent rationally; that is, in such a way as to maximise the reduction in crime that the police force can achieve. But the decisions about allocating the entire country's crime reduction budget are almost certainly not made on purely rational grounds. Most likely, they will be largely dictated by past patterns of expenditure and the wishes of existing institutions, including police forces, to perpetuate their existence.

We need, instead, investment decisions that are entirely subordinated to targeted outcomes. Holders of Social Policy Bonds would maximise the returns to society's limited capital partly because maximising the returns to society would maximise their own returns, and partly because they would be freer than existing bodies to consider the full range of likely projects, even ones that threaten existing bodies. Sophisticated financial techniques would give bondholders the tools to consider a wider range of projects than bodies who use outdated investment criteria, or who are handicapped by the vested interests of existing institutions.

### **2.7.7 The need for over-arching objectives (2005-07-29 17:18)**

If we aggregate individuals' and corporations' actions, we don't necessarily move closer to achieving society's goals. Government, at least in democracies, is supposed to do that, by creating a legislative and regulatory environment that restrains anti-social behaviour, by taxation and transfer payments and by the provision of public goods.

Corporations (and individuals) we assume, always act in their own best interests, and these can conflict with social goals. But corporations, like governments, can become so big and cumbersome that they lose sight of their own objectives. Short-term interests predominate:

Randy Hayes ... once told me of a talk he had with the uber-CEO of the Mitsubishi Company. Hayes said he was able to convince this CEO that Mitsubishi's program of global devastation for short-term profit was not in the long-term interest of either the planet or the company. Hayes achieved this moment of clarity only to have it followed by a far larger and more monstrous clarity for both himself and the Mitsubishi Head: Mr Mitsubishi had no idea how to change the practices of the company, because

the logic that drove the company was both systemic and autonomous. Curtis White, [1]The middle mind: why consumer culture is turning us into the living dead, Penguin Books, 2005 (page 98)

Even the short-term interests of parts of a single corporation, then, can be in conflict with the long-term survival of the corporation itself, let alone wider society. When corporations - and governments - are small in relation to the damage they can cause, then perhaps there's no urgent need to change the system. But when, as now, corporations and governments are huge, society needs to agree on explicit social and environmental targets. If we don't we shall find that our basic social and environmental needs go unmet.

A Social Policy Bond regime would begin by defining broad social and environmental goals. At a global level, these could include conflict reduction targets, or the avoidance of global environmental catastrophe. We have no intrinsic, inherent mechanism for avoiding social or environmental disasters. Unless we explicitly target the survival of our species and the health of our planet, and reward people for achieving them, we are very likely to lose them.

## 2.8 August

### 2.8.1 Outcomes and metrics (2005-08-05 17:28)

A Social Policy Bond regime would mean focusing entirely on outcomes. Apart from other advantages, this means that the range of indicators of success or failure can be expanded. Currently, a government that wants to reduce cocaine consumption has to rely on pretty dodgy figures to monitor how well its policy is doing. Its indicators will tend to be derived from current institutional structures. Its metrics for cocaine consumption, for instance, currently include seizures by customs, or the numbers of people requiring hospitalisation or dying from their addiction. These have obvious flaws.

A story in today's [London] *Times* shows how much more versatile in its choice of indicators a Social Policy Bond regime could be. Scientists in Italy can measure the extent of cocaine abuse by measuring the concentration of a metabolic by-product, benzoylecgonine in the Po river basin. "[T]he Po carries the equivalent of about 4kg of the drug a day, with a street value of about £20,000. ... [F]or every 1000 young adults in the catchment area, about 30 must be taking a daily dose of 100 milligrams of cocaine, which greatly exceeds official national figures for cocaine use." ('Where rivers run high on cocaine'.)

Focusing on outcomes makes it easier to target such indicators, which are more strictly correlated with policy targets. Unfortunately, in today's policy environment, policymakers target indicators for reasons unconnected with their usefulness. So Kyoto targets not the stability of the climate, nor even the composition of the atmosphere, nor even emissions

of greenhouse gases, but *anthropogenic emissions of those gases that were thought to be greenhouse gases in the 1990s*. A [1]Climate Stability Bond regime would be different, because it would reward people for achieving what we actually want to achieve: a more stable climate. It could include such indicators as insurance payouts for adverse climatic events, variations in temperature, the sea level at various locations etc. All of these would be more closely related to society's goal than the alleged causes of climate change.

## **2.8.2 Israel Peace Bonds: give greed a chance (2005-08-09 17:34)**

*This is an unpublished article outlining the application of the Social Policy Bond principle to the Arab-Israeli conflict*

Israel Peace Bonds: give greed a chance

Or to put it more politely: 'give financial self-interest a chance'. Why? Because the idealists and ideologues, the politicians, the generals, and the men of religion have failed tragically to end the violence in the Middle East. Perhaps it's time now to bypass the usual suspects and contract out the achievement of peace to the private sector.

It's largely a matter of focus: we don't have to be as ruthless as the terrorists, but we do have to be as focussed on what is presumably our ultimate goal: peace in the Middle East. We need to go beyond the slogans, beyond history and even beyond the different sides' views on truth and justice. We need to reward the successful achievement of peace, rather than activities that are supposedly aimed at achieving it—activities that are often counterproductive, unethical or disturbingly violent themselves.

There are too many people with a vested interest in continuing the conflict between Israelis and Palestinians. Many people, all over the world, and certainly most Israelis and Palestinians, would like nothing more than to see an end to the violence in the region. But there are many in positions of power or influence who are half-hearted about peace; others who feel threatened by it, and others who, for whatever reason, actively promote violence.

Ideally, then, we need a way of promoting peace that can modify or circumvent these people's uncooperative or obstructive behaviour. We need to mobilise the interests of the far greater number of people who want peace. We need to find a way that can co-opt or subsidise those people in positions of authority and power who want to help, and at the same time bypass, distract, or otherwise undermine, those opposed to our goal.

Ideally too, we would use market forces. Markets are the most efficient means yet discovered of allocating society's scarce resources, but many believe that market forces inevitably conflict with social goals: accentuating extremes of wealth and poverty, for example, or accelerating

the degradation of the environment. So it is important to remind ourselves that market forces can serve public, as well as private, goals. Israel Peace Bonds are a new way of channelling the market's incentives and efficiencies into what must be one of the most sought after objectives by most Israelis, Jews and Palestinians wherever they are: ending the violence between Palestinians and Israelis.

Unlike current funding programmes, which reward activities, organisations or individuals, Israel Peace Bonds would reward only the targeted outcome: peace in Israel. And unlike policies run by governments or inter-governmental organisations, they would encourage diverse, responsive and cost-effective projects.

My suggestion is that interested individuals and organisations collectively back Israel Peace Bonds. They would launch the bonds by making deposits into an escrow account. Then they would issue the bonds, which would be sold by auction, and redeemed for a fixed sum only when the number of Israeli citizens or Jewish visitors killed by terrorism in Israel reached a very low level.

Unlike normal bonds, Israel Peace Bonds would not bear interest and their redemption date would be uncertain. Bondholders would gain most by ensuring that peace is achieved quickly. Importantly, the bonds would make no assumptions as to how to bring about greater peace—that would be left to bondholders.

Once issued, the bonds will be freely tradeable on the free market. As the level of violence fell, so the bond price would rise. Bondholders would have incentives to cooperate with each other to do what they can to achieve peace, then to sell their bonds at a higher price.

The issuers of the bonds would decide only on the definition of peace to be targeted—not on how to achieve it. That would be left up to investors in the bonds, who have every incentive to maximise the reduction in violence per unit outlay. So, in contrast to the current fossilised, counterproductive approach, an Israel Peace Bond regime would stimulate research into finding ever more cost-effective ways of achieving peace. All initiatives would have a chance: not just those thought up or approved of by a limited number of politicians.

Investors in Israel Peace Bonds would be in a better position than governments to undertake a wider range of peace-building initiatives. They might, for example, finance sports matches between opposing sides, promote anti-war programmes on TV, set up exchange schemes for students of the opposing sides. They might even subsidise intermarriage between members of the opposing communities, or try to influence the financial supporters of conflict outside the region to redirect their funding into more positive ways. They could offer the Palestinians and the citizens of neighbouring Arab countries different forms of aid, including education and scientific aid, and measures aimed at enlightening Arab citizens. All these measures would be a cause of suspicion and mistrust if undertaken by governments. But when done by private sector bodies that either hold Israel Peace Bonds themselves, or are financed by bondholders, the motivation for them would be clear: they would be a commercial undertaking, with no hidden agenda other than to bring about peace, as defined by the bonds' redemption terms.

Bondholders could lobby, or work with, the Israeli and Arab governments to, say, give a higher priority to peace studies in schools, but they could also develop peace-teaching projects of their own. While immediate peace might not result, much more could be done to enhance the prospect of peace in the future. Bondholders could, for instance, make strenuous efforts in

Israel and the neighbouring countries to have some mixed classes of Jewish and Palestinian children at kindergarten and school. Both groups could be given the chance of spending time with each other. At the very least, bondholders might think, there should be opportunities for the younger people from both sides of the conflict to meet, discuss, argue and form friendships.

Some powerful people in governments, religious institutions or militant organisations would resent the targeting of such objectives by external agencies in this way. But, while under the current system they can oppose peace in ways that attract support, under a Peace Bond regime, they would have to openly declare their opposition to peace itself. It is precisely this focus on the outcome of peace—rather than activities or institutions—that would help strengthen the coalition working to achieve it.

Too many small bondholders could probably do little to build peace. The bonds would most probably end up in the hands of a few large holders, who would have incentives to co-operate with each other, and to finance those projects that they believed would be most effective in reducing the level of conflict.

By appealing to people's self-interest, Israel Peace Bonds are likely to be more effective than conventional efforts aimed at reducing violence. In channelling market forces into the achievement of this objective the bonds could bypass or even co-opt the corrupt or malicious people in government or elsewhere who stand in the way of peace.

In today's emotional climate decision-making is too often reactive. It is too easily swayed by those with a propensity for violence or those who benefit from it, whether financially or emotionally. Governments can evade or deflect censure on grounds of communal affiliation or patriotism, because the adverse effects of their policies are difficult to relate to their cause. Israel Peace Bonds would focus on an identifiable outcome and channel market efficiencies into exploring the ways of achieving it. They could be the most effective means of achieving the peace that the people of the Middle East yearn for and deserve.

### **2.8.3 Subsidising oil consumption (2005-08-17 13:52)**

A Social Policy Bond would subordinate policy to meaningful, agreed, outcomes. It's unlikely, I think, that we'd choose to divert scarce resources to, amongst other things, oil consumption:

Jan Lundberg, veteran petroleum analyst who joined the environmental movement and fought industry expansion, has a different explanation for record gasoline prices than the one provided by his former firm, Lundberg Survey, which on Aug. 14 attributed them only to high crude oil prices.

"Lundberg ... told Fox News that it is erroneous to calculate that the adjusted

price for gasoline, including inflation, is under the price of two and a half decades ago. This is because "subsidies - direct, indirect and hidden, such as the War on Iraq - to oil and refined products, if included in the price, would make oil cost perhaps \$120 per barrel today. This is one reason people must work longer hours and obtain extra jobs," he explained." [1]Source

#### **2.8.4 Sponsoring intermarriage (2005-08-19 19:10)**

In my post about [1]Israel Peace Bonds I raise the possibility that one way of solving the Arab-Israeli conflict is intermarriage between the two communities. This seems to be controversial, so I will elaborate.

First, I am not advocating intermarriage. Rather, I am advocating a policy that will encourage anything that will end the conflict peacefully. If intermarriage is likely to do then, I believe, it should be rewarded. Second, note that it is not me, nor any government official, who would sponsor intermarriage: it would be holders of Israel Peace Bonds. They would reward intermarriage only if they think doing so would help solve the conflict. I can't see anything very controversial about this. As human beings, most of us agree that anything that resolves conflict peacefully should be encouraged. Apart from fanatics, most of the devout on both sides of the conflict would also put human survival above ethnic purity or identity politics. There is very little intermarriage between the two communities today. Even a little could go a long way. Bondholders would be unlikely to pursue intermarriage as their sole solution - though if they did, and were successful, who could argue with that? Most likely it would be one of a range of policies aimed at increasing informal contacts between the two sides including, as I suggested, school exchange visits, sports teams and freer trade.

Serf (2005-08-22 05:42:00)

OK I am biased, I have a non-British wife. I believe that intermarriage can go a long way toward solving lots of conflicts between ethnic groups. The only worry I have is where religion is a big issue.

#### **2.8.5 Pluralism versus central planning (2005-08-22 08:39)**

The Social Policy Bond mechanism encourages diverse responses to social and environmental issues. It does this via market forces. Unfortunately, many believe that market forces must

inevitably conflict with social goals. This is understandable, since in recent decades an enhanced role for markets has made many people very wealthy indeed, while the less well-off have gained relatively little and many social and environmental problems appear to have worsened.

So it is important to remind ourselves that market forces and self-interest can serve public, as well as private, goals. Often, these private goals coincide with social goals, so that, for instance, the market routinely performs vital tasks such as food distribution and the provision of such indispensables as home medicines, baby needs, furniture and other consumer goods. These are exceedingly complex tasks but, left to the multiplicity of agents operating in reasonably competitive markets, they are accomplished in ways that fulfil not only the private goals of the firms and consumers involved but also society's goal of efficient supply of goods and services. This feat results from the combination of the self-interest of large numbers of market players, and their ability to react appropriately to ever-changing circumstances.

Some would attribute the triumph of the western market economies over the state-controlled, centrally-planned economies of the Soviet Union and its satellites to the victory of materialist motivations over political ideals. But it is more likely that the efficiencies and incentives of pluralism had won out over central direction; in short, that decentralisation and diversity had triumphed over dirigisme and central planning.

Governments tend to be centralist in their instincts. In practice, this has meant that market forces are rarely allowed to play a significant role in organising the production and distribution of those goods and services that governments supply. Government agencies also operate in a non-competitive environment, which discourages self-evaluation. Since governments in the developed countries now spend on average about 37 per cent of national income, these are significant deficiencies. One result is that public services, such as health, education and housing, seem perpetually to be in crisis. Another is that crime and the fear of crime are soaring. I recently spent several weeks in a compact, English city during the summer, and was surprised at how dead the city centre was after 6pm, even on warm, dry days.

Yet another result of the central planning is that large sums of consumers' and taxpayers' money are spent on perverse subsidies to sectors such as agriculture, road transport and energy. Perverse subsidies are those that are economically inefficient, socially divisive and environmentally destructive. They also favour the large and global over the small and local. So, for instance, in the US about 88 per cent of support to the agriculture sector goes to the largest (in terms of gross sales) 25 per cent of the farmers. Perverse subsidies are significant: those for agriculture in the developed countries alone amount to more than \$300 billion annually.

Social Policy Bonds would enable governments to continue to set society's goals, and the market to achieve them. Clarity and single-mindedness in achieving social goals are important, and governments can have those qualities. But diverse and adaptive solutions are necessary to achieve these goals, and that is where markets, through Social Policy Bonds, can play their part.

Hey Ronnie - the invisible hand theory of Adam Smith is probably the only thing I remember from Uniniversity - great to see it in action and explained so well and then used in such a good context.

Jimmy

Ronnie Horesh (2005-08-24 09:43:00)

Thanks Jimmy - put a good word in with your new colleagues about Social Policy Bonds will you?

### **2.8.6 Even imaginative governments are limited (2005-08-24 09:34)**

Here in Thailand there is a grim insurgency by Islamic fascists in the deep south of the country. As one response, the Thai Government has put up tv screens in coffee shops and bars in an effort to distract potential militants. I myself believe that the role of tv, movies, and pornography in weaning people (men, I mean) away from militarism has been underestimated, so I do approve of this government initiative. Unfortunately, simply the fact that it has been undertaken by government could be its downfall. Partly because anything the government does is bound to be deliberately misinterpreted to the impressionable, partly because in putting up these public tv screens the government has exposed itself to ridicule if the insurgency continues.

The private sector is much freer to experiment with initiatives of this sort. If Social Policy Bonds targeting the insurgency were issued, bondholders could go further than government, for instance by screening raunchy DVDs. They would not be deterred by fear of ridicule if they failed and, most important, they would have incentives to terminate failed initiatives as soon as their failure becomes apparent, and concentrate on finding successes. I cannot see this Thai Government, nor any other, being so ready to admit that their ideas are ineffectual and to explore and implement new ones.

### **2.8.7 Design versus liberalism (2005-08-27 15:43)**

The desire to overcome politics is based on the assumption that, if not subject to structures imposed from on high, free human action - whether in international affairs or domestic politics - is unstable and dangerous. People who think in this way cannot conceive of their being an order which they have not consciously designed: they cannot imagine that people and states themselves might be able to develop rules, perhaps unspoken ones, to foster peaceful free commerce. John Laughland, [1]'The tainted source', p162

Laughland argues persuasively in favour of the constitutional foundations of the liberal order and against post-national structures, such as the European Union, which he sees as corrosive of liberal values.

What does this mean for an advocate of Social Policy Bonds? Essentially that policymakers have a tendency to be overly prescriptive. Suspecting, probably correctly, that a market free-for-all would bring about unacceptable levels of poverty and a collapse in the social order, they finance programmes and institutions ostensibly aimed at avoiding these disasters. They legislate well-meaning (at least at first) measures, such as trade restrictions, which have such unarguable objectives as the maintenance of decent standards of living for their (alleged) beneficiaries. Within a generation or so, these measures become corrupted, fossilised and counterproductive. Vested interests take advantage of them and ensure their persistence, while the intended beneficiaries gain nothing. If this sounds far-fetched simply look at agricultural subsidies in the rich world, or subsidies to other sectors, such as energy and transport. Under a Social Policy Bond regime, on the other hand, government would not prescribe how its social and environmental objectives are to be met. It would simply reward people for achieving them, however they did so.

Another quote from the same book:

[M]any countries of the European Union ... often have a corporatist understanding of the state. There, the activities of government are identified almost entirely with spending money. Federal states are particularly prone to this understanding of statehood, because the bulk of their domestic politics is devoted to wrangling between the various layers of government over funds. I bid, p 194

### **2.8.8 Issue your own (2005-08-30 08:39)**

If you are feeling rich and altruistic, you might think about issuing your own Social Policy Bonds. Say you wish to see crime fall in your part of your city. You don't think more policing is either forthcoming or the answer, but you still don't know what the answer is. Rather than accept the situation or moving away, you could issue Crime Reduction Bonds for your area. These bonds would be redeemable for a fixed sum once crime, however you decide to measure it, falls below a threshold for a sustained period.

Essentially, you would be contracting out the achievement of crime reduction to the market. Holders of your bonds would have incentives to look for the most efficient ways of reducing crime. Criminals themselves could buy your bonds and make a profit by seeking alternative forms of distraction. Non-criminals might buy your bonds and do things that are beyond the imagination or experience of police forces: subsidise taxis for young men emerging from pubs; offer adult literacy classes; subsidise marginal types to move away; subsidise employment for youths etc.

You might have other objectives. You could, for example, issues Social Policy Bonds that target pollution in your city, or the water quality of a local river or lake. Or you might want to see better health or education standards in a developing country. As a first step, you

could download a [1]handbook (pdf file) I prepared, using the example of literacy amongst schoolchildren in Pakistan. Feel free to get in touch directly with me (via the Comments, below, or through email link given in my Profile), if you would like to take it further.

## 2.9 September

### 2.9.1 Maintaining the status quo (2005-09-05 15:10)

In the aftermath of Hurricane Katrina it's worth stating that maintaining the status quo - avoiding loss of life, keeping cities functioning, etc - are goals that can be targeted by Social Policy Bonds. The expensive way of dealing with a natural disaster like Katrina may, or may not, be to cut back on anthropogenic emissions of greenhouse gases. The way I advocate is to contract out the maintenance of the status quo to the private sector, via a Social Policy Bond issue. The value of such bonds, if issued by, say, the state of Louisiana, would have collapsed at exactly the same time as the levees were breached. There would have been a powerful, unambiguous and direct incentive on bondholders to maintain the levees.

We see now the unedifying alternative: spin-doctoring and the real underlying motivation of many senior officials the world over: doing everything possible to avoid being publicly identified as incompetent. Financial incentives, *inextricably correlated with performance* via Social Policy Bonds would, I suggest, be more effective.

### 2.9.3 Memo to Government: make sure my milk is fresh (2005-09-09 07:40)

This [1]letter appeared in today's *International Herald Tribune* in response to the story published yesterday (see below):

As a French-American who opened a retail store in Rome four years ago, I read with interest your report "Rules, rules, rules: Germans fed up" (Sept. 7). ...

Special milk containers required by law are meant to protect consumers from spoiled milk. Haven't you ever had a restaurant serve you milk with your coffee only to find that it was spoiled after pouring it into your cup?

Is this what we expect of government? It's ok to destroy our physical and social environment, just so long as it makes sure the milk is fresh?

### 2.9.4 Price stability is not a goal (2005-09-14 07:42)

Much confusion in, for example, the [1]UK Government about price stability, in this case the price of petrol. One of the first benefits of a Social Policy Bond regime is that it would clarify what are ends and what are means to ends. Price stability is not, or should not be, a goal of government policy. Market prices are signals that allocate resources efficiently. They embody masses of information that cannot be assessed by planners. If the price of some essential commodity is too high for some people, then government should give financial assistance to those people to enable them to make their own decisions about how much of the commodity to buy. Today's agricultural subsidies should be a lesson to all politicians: like a drug habit, they are easy to start and hell to give up.

### 2.9.5 New Public Management (2005-09-16 08:18)

'The state is denoted primarily by its monopoly of power, force, and coercion on one side and its orientation towards the public good, the commonweal or the ben commune, on the other; the business world legitimately focuses on profit maximization.

N[ew] P[ublic] M[anagement], however, as it has been said, "harvests" the public; it sees no difference between public and private interest. The use of business techniques within the public sphere thus confuses the most basic requirements of any state, particularly of a Democracy, with a liability: regularity, transparency, and due process are simply much more important than low costs and speed.' Wolfgang Drechsler, [1]The Rise and Demise of the New Public Management post-autistic economics review, issue no. 33, 14 September 2005

There is much of interest in the article. At first sight, Social Policy Bonds would appear to suffer from the problems Drechsler correctly identifies as afflicting conventional attempts to replicate in the public sector the profit maximisation imperative of the business world: a narrow definition of efficiency isolated from context; and, on all the evidence, failure to deliver on its promises. 'Contracting-out has proven to be excessively expensive and often infringing on core competences of the state as well as on the most basic standards of equity.'

Since Social Policy Bonds embody the contracting out principle, how would they square up against Drechsler's, in my view, legitimate strictures against New Public Management?

The most important consideration is that a bond regime would be entirely subordinated to 'transparency and due process'. Indeed, the agreement on explicit, transparent, outcomes would be the starting point of a Social Policy Bond issue. Formulating policy in terms of outcomes, (rather than, as at present, inputs, outputs, activities and institutions) would draw more people into the policymaking process. Outcomes would have to be meaningful to real people to attract consensus and support, rather than government agencies or corporate bodies. A government-backed Social Policy Bond regime would therefore aim to achieve broad social goals. Profit maximisation fails when, as in NPM, it tackles narrow objectives, where non-quantifiable social and environmental externalities can be safely offloaded onto wider society.

A Social Policy Bond could explicitly tackle some of the social and environmental problems created by profit-maximising private entities. Instead of targeting the ever-proliferating array of micro-objectives that characterise New Public Management, it could target meaningful societal goals, like better basic health and literacy outcomes, reduced crime, and a cleaner environment.

NPM fails, I believe, because of the narrowness of its vision; itself a result of its ideological origins. Social Policy Bonds, on the other hand, would be compatible with a large state, a small state or anything in between. Governments would articulate society's wishes about what people want to see done; they would issue Social Policy Bonds as a way of making sure not only that social goals would be achieved efficiently, but that they would be genuine goals defined and agreed upon by all.

## **2.9.6 Social Policy Bonds - an overview (2005-09-21 13:53)**

(This is a first draft of an article intended to introduce Social Policy Bonds to a wider audience.)

Outcomes: a better policy driver than ideology

Most policy issues are now so complex, so voluminously documented that each side of any argument can be certain to find a very large quantity of supporting evidence. Whether it is war in Iraq, smoking in bars, capital punishment, gun control, or provision of day-care facilities for three-year olds; there are so many facts and seemingly valid interpretations of facts, that 'there are arguments on both sides' is about the only useful thing to say.

Those who are involved, those who have a position, are predisposed to select only the information that suits their ideology, or the bottom line of the institution that pays their bills. It is not just on matters like the Arab-Israeli conflict. Even scientific issues, which should be more amenable to objective analysis, are controversial and inconclusive to those who try to follow the propositions made by Bjorn Lomborg in *The skeptical environmentalist* and the rebuttals, counter-rebuttals, and counter-counter-rebuttals that have ensued. Rather than one's position being in the middle of a Bell-curve, it is more like that at the centre of a dumbbell with hefty but equal weights at each end: a new fact favouring one side can tip the balance markedly.

War, terrorism, climate change: our most urgent problems are too complex for any expert specialists fully to comprehend. There are so many relationships, so many variables, and such large distances of time and space between cause and effect, that to disinterested observers, there are good cases to be made on both sides of such concerns as the Kyoto Protocol or conflict in the Middle East.

Should we, as ordinary members of the public, and voters, therefore give up trying to work out what is the best line to take, when even the highly qualified experts disagree with each other? Or should we take the lazy way out and choose one political faction – left, right, conservative or socialist – and look to them to do the thinking for us? Or should we turn away from policy issues altogether and become cynical or despairing? We do all these things, with and the result is that policy is decided less by engaged members of the public, more by special interests, including the politicians, corporates and media. If this sounds far-fetched, look at the figures for election turnout.

Rather than wait till such scientific arguments are resolved, or to pursue some abstract notions of justice in matters of human conflict, we might do better on efficiency grounds, to subordinate all our activities to our intended outcomes: climate stability, for example, or conflict reduction. This would take the form of rewarding all actions – and only those actions – that lead to achievement of the desired outcome.

Currently, governments that are supposedly interested in a particular goal finance institutions, or people, or activities that have as their stated objective the solution of these problems. But another, much simpler but also much rarer, is to reward people for actually solving the problems. That's what they used to do in the Wild West when they wanted to

eliminate problems caused by particularly nasty individuals. They put together a cash reward, printed some 'Wanted - Dead or Alive' posters, and let the private sector do the rest. It is the targeted outcome – the killing or capture of the public enemy – that determines who shall be rewarded not current institutional structures or activities. The same principle, more or less, underlies an innovative new financial instrument that can channel the market's incentives and efficiencies into the achievement of social and environmental goals.

### Social Policy Bonds

Social Policy Bonds would reward people only when they actually achieve targeted social or environmental goals. A fixed number of Social Policy Bonds ('bonds') would be issued. The bonds could be issued and backed by local or national government, or by non-governmental organisations (NGOs), or by private individuals. They would initially be auctioned to the highest bidders. The bonds' backers would undertake to redeem these bonds for a fixed sum only when a specified social objective has been achieved. The bonds would not bear interest. They would be freely tradeable after issue, and their market value would rise and fall. Social Policy Bonds would therefore differ from conventional bonds in that they would have an uncertain redemption date which, in combination with a fixed redemption value, implies an uncertain yield: holders would raise their bonds' yield by achieving the targeted objective quickly. Once the targeted outcome had been achieved, whoever backed the bonds would redeem them.

How would Social Policy Bonds work? They would create an interest group — bondholders — who have powerful incentives to achieve the targeted social objective efficiently and quickly, or to pay others to do so. Consider an example. Assume that an urban authority is prepared to spend a maximum of say \$10 million to reduce the crime rate within its borders by 50 per cent. It issues one million bonds that become worth \$10 when the crime rate falls below 50 per cent of current levels for a sustained period — say one year. Because the market would see this objective as unlikely to be achieved in the near future, it would put a low value on the bonds when they are floated. Assume successful bidders pay as little as \$1 for each of the bonds. (This sum would be held by the issuing authority partially to offset the cost of redemption of the bonds.) Now, they hold an asset that could appreciate in value by 900 per cent if a sustained halving of the crime rate were achieved. This provides the motivation for bondholders to do what they can to reduce the crime rate.

Social Policy Bonds could in principle, be used to solve any social or environmental problem that can be reliably defined and quantified. Key criteria for policy areas within which Social Policy Bonds would show the most marked improvement over current programmes are:

- existing policies have objectives that are unstated, uncosted, obscure or conflicting;
- financial rewards to those involved in achieving objectives are uncorrelated to their effectiveness in doing so;
- a wide array of diverse approaches may be necessary; and
- our knowledge of the problem, its causes and solutions, is scanty and improving all the time.

That is the approach taken by Social Policy Bonds. Without presupposing whether climate

change is happening, what is causing it, or how best to stop it, Climate Stability Bonds can be issued that would encourage people to stabilise the climate. Similarly, Conflict Reduction Bonds that focus on, say, the Arab-Israeli conflict could aim to reduce the numbers of people killed, injured or made homeless in that conflict. People's need and wish for peace is more important than trying to bridge the gaps between the ideologues, the historians, the militarists and those in authority. A bond regime could bypass, co-opt or undermine those who stand in the way of peace.

Targeting specified outcomes that are meaningful to natural persons, as the US Results Act begins to do, is a necessary first step, but it is not sufficient. The other necessary step is to ensure that resources are allocated in ways that can most cost-effectively achieve these outcomes. This is where market incentives come into the picture.

A symptom of this malaise is the disengagement of many from the political process. Even the United Kingdom's Labour Party's 'landslide' majority in the British House of Commons is not what it seems. Labour received just over 40 per cent of the vote in 2002, with a 60 per cent turnout. So only 24 per cent of the electorate actually voted for Tony Blair's party. In the US President George W Bush received votes from fewer than a quarter of the voting age population. It is the same in most other western democracies. We have begun to accept that whichever party receives 25 per cent of the popular vote has 'won' the election. In most countries, this represents a dramatic decline in popular engagement with politics over the past few decades.[1][i]

Perhaps one reason for this is that people are sceptical about the ability of the different political parties to deliver. In the absence of any great ideological divide, most parties have approximately the same manifesto at election time, and seem equally (in)capable of achieving results that are meaningful to electors. If such voter apathy co-existed with satisfaction or optimism about the political environment it would not be a worry. But unfortunately it goes hand-in-hand with deepening dissatisfaction, cynicism and even despair, at the ability of our politicians to deal with urgent domestic and global concerns.

[2][i] Democracy disconnected from the electorate, Ralph Dahrendorf, Project Syndicate, 2004.

Ronnie Horesh (2005-10-26 17:35:00)

Hi Northsouth and thanks for your query. Much depends on the targeted outcome. It could be something easily achievable within the current regulatory environment. For example; bondholders aiming for a reduced crime rate in a particular city wouldn't need to seek regulatory changes. They could devote more resources to crime detection, reporting, deterrence, or punishment etc. But say we are talking about a US city where guns are legal. Bondholders could reduce gun crime by all sorts of initiatives, but they might find it most efficient to lobby for a change in the law that would make possession of guns illegal.

In general, bondholders can lobby for changed regulations if they think that is the most effi-

cient way of achieving the targeted objective. Regulations are the outcome of a political process. As under the current regime, bondholders will try to alter the regulatory environment to suit their goals. This sort of pressure goes on nowadays of course. Under a bond regime, the source of the pressure and the reason for it would be much more transparent.

Regards

### **2.9.7 Goals for a bond regime (2005-09-27 16:27)**

Social Policy Bonds are versatile in that they could deal with any quantifiable social or environmental goal. That said, broad objectives would be ideal. To see this take, as an example of a narrow goal, that of reducing burglaries in a small locality. Bondholders could solve this problem merely by laying on taxis to transport burglars to areas outside the scope of the bond regime. Or they could offer courses that would upskill burglars so that they could become white-collar criminals instead. Either way, the bondholders would achieve their objective and cash in. But society's broader goals would not be helped. It would be far better to issue bonds targeting all crime in as large an area as is feasible.

Similarly with other goals. It would be better to target all forms of pollution simultaneously than a single pollutant. It would be better to target a broad definition of poverty than a narrow definition.

That said, if a Social Policy Bond regime is to get off the ground, it is most likely to be by social entrepreneurs or philanthropists with fewer resources than government, who will issue their own bonds to achieve a specific goal with which they identify closely. Careful specification of the goal will be crucial. Any readers interested in issuing their own Social Policy Bonds could first visit the [1]Social Policy Bond website. Then feel free to contact me directly.

### **2.9.8 On the commons (2005-09-28 13:39)**

A good post on Peter Barnes's blog from [1]OnTheCommons.org makes these points:

Common wealth, as we've seen, is immensely valuable. Common illth — the shadow side of private wealth — is likewise vast. But while mainstream economists acknowledge the existence of common wealth and illth, they don't bother to measure them or include them in their models. They assume the commons side of the ledger is

trivial, or ignore it because dollar signs are hard to attach. This is tantamount to professional malpractice. ... They count America's sales (a.k.a. GDP), but not our expenses (the negative externalities of those sales). They keep track of private income and wealth, but not common wealth or illth. As a result, they miss at least half the story.

I agree with the thrust of this post, though (as I posted in a comment), I think most economists don't necessarily assume the negatives arising from economic development are zero, but rather that they are less than or equal to the positive externalities. The point being that there are positive externalities of wealth generation beyond those that appear in company accounts and GDP. These could be the positives, important to society, of employing people, such as a reduced crime rate, and a reduced poverty rate - which itself has important positive spin-offs for the commons. My point, in other words is that just as almost all the negative externalities of economic development are ignored, so too are some of the positives.

Social Policy Bonds are one way of dealing with the negative externalities of our way of life. Because they do not prejudge *how* a particular negative externality shall be eliminated, they would reward the most efficient way of solving the problems they cause. If we take climate change as an example, reducing anthropogenic greenhouse gas emissions a la Kyoto, may be necessary but, on the other hand, there may be far more cost-effective solutions that deserve investigation. Efficiency, not ideology, would be the sole criterion.

## 2.10 October

### 2.10.1 Environmentally harmful subsidies (2005-10-04 12:14)

In my current work, I'm citing the existence and persistence of environmentally harmful subsidies - similar to perverse subsidies - as solid evidence that government is inefficient. Though anecdotes abound, it's difficult sometimes to get an idea of just how inefficient, on a global scale, government is. But a workshop given by the OECD attempted to quantify environmentally harmful subsidies. The sums are staggering:

Subsidies probably total over \$1 trillion per year. Around two thirds of the subsidies occur in OECD countries. Those OECD subsidies are heavily concentrated in agriculture, mining, road transport and manufacturing. Non-OECD countries mainly subsidise energy, water, fisheries and some agriculture. Relative to GDP, subsidies

are twice as large in non-OECD countries. As a percentage of world GDP, global subsidies account for a staggering 4 per cent. Perhaps most notable of all, agricultural subsidies in OECD countries account for over 30 % of all subsidies.

The workshop was done in 2002, but the dollars referred to are in 1994-98. It's not just the financial sums that matter: these are environmentally harmful subsidies, most generally paid to increase production. In agriculture this means switching to intensive production techniques and expanding production onto marginal lands and environmentally valuable areas such as woodlands, ponds and hedgerows.

Apart from OECD work, another useful source is [1]Earth Track.

## **2.10.2 Incentives for development (2005-10-07 16:47)**

After 43 years and \$568 billion (in 2003 dollars) in foreign aid to the continent, Africa remains trapped in economic stagnation. Moreover, after \$568 billion, donor officials apparently still have not gotten around to furnishing those 12-cent medicines to children to prevent half of all malaria deaths. With all the political and popular support for such ambitious programs, why then do comprehensive packages almost always fail to accomplish much good...?....

The biggest problem is that the rich people paying the bills do not share the same goals as the poor people they are trying to help. The wealthy have weak incentives to get the right amount of the right thing to those who need it; the poor are in no position to complain if they don't. William Easterly, *The Utopian Nightmare*, [1] *Foreign Policy*, Sept/Oct 2005

Exactly. I have been seen saying for years that our social and environmental problems are caused by perverse incentives. The big financial rewards in today's world are for those who can cater to the whims of the rich, by which I mean those who constitute much of the population of the developed countries and a tiny minority of those in the poor countries. One example: only 1 percent of all new medicines brought to market by multinational pharmaceutical companies between 1975 and 1997 were designed specifically to treat the tropical diseases plaguing the third world. In numbers, that means thirteen out of 1,223 medications. This is not a problem of lack of ingenuity or even compassion. It is a problem of incentives.

Social Policy Bonds would rejig the incentives on offer. Not blindly, so as to favour one set of people over the others, but in accordance with the wishes of those who put up the funds to redeem the bonds. The current mismatch has more to do with lack of transparency and deliberate deception than the wishes of those who put up the cash. Governments pay out hundreds of billions of dollars annually in explicit and indirect subsidies to (for instance) large agribusiness corporates, multinational energy companies, and arms manufacturers. If consumers and taxpayers were told explicitly that they were subsidising these bodies they

would, I am certain, do so with less enthusiasm. Under the current system, this whole system of corporate welfare is fudged. Under a Social Policy Bond regime, the first thing taxpayers and government would decide would be: what are our goals? All spending decisions, all programmes, projects and initiatives, all institutional establishments and structures, would be subordinated to these goals.

A mirror image, in other words, of the current setup.

### 2.10.3 Numerical indicators (2005-10-11 07:38)

In a tragic sort of way, inferior prenatal care could actually boost average life expectancy while lowering health care costs. Adequate prenatal care may reduce the incidence of miscarriage, especially in the second half of pregnancy. Had my wife's perinatologist not detected her dilating cervix in the 22nd week of pregnancy, we would probably have lost our daughter. And she would have been a miscarriage statistic, not an infant mortality statistic.[1]Source

This highlights the need to specify very carefully the sort of indicators that are targeted, whether under the current regime, or using Social Policy Bonds.

Jimmy Jangles (2005-10-12 20:32:00)

That's a really interesting way of looking at thing R. Things are not always as they seem... this is nt really related ...but the post reminds me of this - I read on the Dom Post (?) paper some American economist believes that in allowing abortion to be more common, crime rates can reduce....

Apply that to social bonds... If the bond was to reduce crime rates, would paying for/promoting/providing abortions be a legitimate means to achieve that?

Have you given much consideration as to the means by which bond holders would use to achieve the goal? Are there any particular areas which society's values and morals would conflict with achieving certain goals?

Meh, I've had too much caffiene. I doubt this makes any sense. Hope ya well dude!

Ronnie Horesh (2005-10-13 09:07:00)

Jimmy! How are you doing? Yes, this is the problem with fixing on one thing: you have to be very careful about the things that aren't specified. It's not a problem unique to Social Policy Bonds: it

applies to all policymaking above say village level. At that sort of level, then the things that matter don't have to be anticipated or specified in advance; still less do they have to be quantified. It's at higher levels of aggregation that unwritten, informal behaviours and customs have to be formalised and (sometimes) explicitly anticipated.

As for abortion and crime: first, the argument that abortion reduced crime figures in the US is refuted (to my satisfaction anyway) [1]here. But assuming that the relationship holds: well you could have a bond issue targeting crime that carried provisos such that the bonds shall not be redeemed if the abortion rate increases to a certain level. More generally, bond issues could carry provisos that stipulate they will not be redeemed if certain moral or legal behaviours are contravened. Basically it's up to the bond issuers, remembering that for many negative behaviours there are existing legal sanctions in place anyway. This applies whether the bond issuers are government bodies or private individuals.

Anonymous (2005-10-13 20:11:00)

R, that article truly lays waste to that theory! sadly now though, the theory will probably stick around for ever like an urban myth. JJ

#### **2.10.4 Causes: interesting but irrelevant (2005-10-14 16:35)**

Everyone agrees that Africans are desperately poor and typically endure governments that are, to varying degrees, corrupt and capricious. The dispute is about causes and consequences. One group—call it the poverty-first camp—believes African governments are so lousy precisely because their countries are so poor. The other group—the governance-first camp—holds that Africans are impoverished because their rulers keep them that way. The argument may seem pedantic, but there are billions of dollars at stake, and millions of lives. The fundamental question is whether those who are well-off can salve a continent's suffering, or if, for all our good intentions, Africans are really on their own.

[1] Why is Africa still poor?

, Andrew Rice, The Nation, 24 Oct 2005

I disagree: I don't think looking for causes is necessary when it comes to devising policies that will eradicate poverty. Doing so might even be a distraction. In this, I share common ground with Tolstoy who, when writing about conflict, wrote:

The deeper we delve in search of these causes the more of them we discover, and each single cause or series of causes appears to us equally valid in itself, and equally false by its insignificance compared to the magnitude of the event. ' War and peace', Signet Classic, 1968 (page 730)

Life is so rich and varied that anybody can ascribe anything they don't like to a racial group, set of persons, ideas or sequence of events they don't like. This is the stuff of demonology, ideologues and party politics. Tyrants in some African countries seize any chance they can to blame colonisers for the problems they themselves inflict on their subjects.

I don't think it's necessary for any single person, ideology, government or international agency to try to explain why Africa is poor. Rather, the challenge is to set up a system that will subordinate all activity, policies and programmes to the desired outcome: the eradication of poverty. This is what Social Policy Bonds would do. We could issue Social Policy Bonds that would not be redeemed until poverty had been at a low level for a sustained period. We would, in effect, be contracting out the eradication of poverty to whoever will be most efficient at achieving that targeted outcome. Whoever buys the bonds might well spend some time trying to analyse causes of poverty, but they will be rewarded only if that is a necessary and efficient way of eradicating it. More likely, the people who buy bonds will just get on with the job. Looking for causes is probably best left to ideologues and academics.

### **2.10.5 Perverse subsidies: a continuing story (2005-10-19 13:37)**

Perverse subsidies are subsidies that are economically irrational, environmentally destructive and socially inequitable. Apart from agriculture (which is fairly well documented and quantified, especially by OECD), other recipients are the road transport and energy sectors. Subsidies to private road transport include the hidden costs of providing road users with roads, space and complementary traffic services such as highway patrols, traffic management, and paramedics. For the years 1991 and 1989, two different studies estimated the net subsidies to road transport in the US at \$55 billion and \$174 billion, respectively, or 1 and 3 per cent respectively of that country's GDP. (The wide range reflects the different estimates for parking subsidies and for providing complementary traffic services.) Questionable on many grounds road funding — as well as funding for public transport schemes — would appear to be another example of middle-class welfare. Most of the benefits of these works go overwhelmingly to those who have more money to spend on travel, and more time in which to do so.

In the mid 1990s it was estimated that subsidies for energy in OECD countries were running at between \$70 billion and \$80 billion; their main purpose being to support energy production. Coal is most heavily subsidised, followed by nuclear energy and oil.

Estimates are bound to be imprecise, but it would be reasonable to put the total sums wasted on perverse subsidies in the developed countries at about 3 per cent of their combined GDP — this is equivalent to about 8 per cent of their governments' total spending.

My case for Social Policy Bonds, or rather, against existing ways of spending on social and environmental goals, relies heavily on perverse subsidies. They, and all the other forms of corporate welfare, are significant in themselves, but their size and persistence also cast a heavy shadow over other government interventions. This is not an argument about big against small government; it is more about the distance between government and the people it is supposed to represent. However, big government does seem to be remote government, and remote government also seems to be unresponsive government.

And that's how a few agribusiness corporates, pretending to represent family farmers, have done so much to destroy the landscape and social fabric of rural Europe, the US and Japan, have siphoned off billions that could have been spent on hospitals and schools and people in genuine need, and are even now threatening to derail the global trading system.

### **2.10.6 Shock News: CAP rips off Europeans (2005-10-22 07:50)**

Overall, the average UK household of four could be around £1,450 (€2,175; \$2,600) per year better off in ten years' time, compared to £1,360 (€2,020; \$2,436) across the EU on average, if all global trade were liberalised, including removal of the C[ommon] A[gricultural] P[olicy], and the government and EU monies devoted to the CAP were spent instead on R &D. Source: [1]Open Europe

The CAP diverts funds from the poor to wealthy landowners and trans-national agribusiness corporates, so getting rid of the CAP would benefit the poor disproportionately.

### **2.10.7 Bangkok's new airport (2005-10-25 16:23)**

Bangkok's new airport, at Suvarnabhumi, is scheduled to open next year. The area around the airport will be designated Thailand's 77th province. The current Thai Government intends it to rival Singapore as an Asian air hub.

Bangkok though already has a perfectly good airport at Don Muang, with two runways and a highly developed infrastructure. Surely there are more pressing priorities for this developing country than building a massive new airport, much further away from the city?

The new airport's province will be called Suvarnabhumi Maha Nakhon: Suvarnabhumi the Great City. It will become 'a modern economic centre'. Local landowners can expect a huge rise in the value of their land.

Actually the names of major land owners in the vicinity of the airport were revealed recently by the press. Most of the owners are known to have close relations with the ruling Thai Rak Thai party.

### 2.10.8 Extension transference (2005-10-26 17:23)

I've just started reading *Beyond culture*, by Edward T Hall, an anthropologist. The book is largely about 'extension transference'; the process by which people misapply or are led by their 'extensions', which include language, tools and institutions. Bureaucracy, as I think Hall will point out later in the book, is another of these extensions. There are, I think, parallels between the way our minds not only use language, but are in important senses controlled by it; and the way our society is governed by institutions that no longer have objectives congruent with those of society. In both cases, the tool (or 'extension') has become overly influential, primarily concerned with its own survival, and dangerously controlling.

On a different note: my geocities mirror seems to be down, so to access the Social Policy Bonds site now and in the future, please change your bookmarks to [1]<http://SocialGoals.com>.

Anonymous (2006-04-24 06:23:00)  
Hi,

You are de man! I have also JUST started getting interested in ET Hall myself because after 7 years in France, two in Tokyo, I realise most of what is professed by my French bosses is context-specific - ie they talk a different language even if the vocab is the same. This applies to complex government and politics as well as to small repeated phrases - so when a Frenchman talks about 'transparence' or 'open market' or 'level playing field' 'market forces' he is really thinking about another thing! If you see what I mean! It's tricky but the French are laconic like the Japanese precisely because they are linked to a silent traditional cultural world of centralised control (I think) and shared meanings according to their own historical perspective. A simple example would be that they give warnings every five minutes in conversation 'Attention!' 'Il faut faire attention!' 'Prudence' all the time, I started to get sick of this - but I realise they are just linguistic goblins although they denote a pessimism and fear they also show a desire to control. The French are control freaks and another thing you hear in conversation non-stop is 'N'importe quoi!' (any old way) usually directed at the US and UK Anglo Saxon visitors in other words they have disdain written into their discourse. Very odd. Pascal Baudry is a French psychoanalyst along similar lines to ET Hall, shows how non-explicit the French are because it suits them. Thus they are ambiguité bouyant in opinion.

But anyway the ultimate high context society according to Hall is Japan where words are almost not necessary. On the Tokyo metro silence reigns partly in my opinion due to state control. All is obvious so no need to talk! (I may be simplifying here. They call it 'Haregei' language of the stomach. France is very similar. We Anglo Saxons (Asses) have big mouths. But at least we have a tradition of

thrashing out meanings which I like.

What I wanted to say with your social Bonds idea is that it's great the only problem is who decides when targets are met? After all a 'drop in crime' is actually a subjective thing. Perhaps a 'DIC' means police are going mad locking up everyone on any old pretext or you double the policemen rather than show civil obedience and good behaviour. Likewise good health standards mean one thing to France with it's amazingly high consumption of drugs, hospital helicopters, fantastic facilities and hypochondriach mentality -but means something totally different to the five-month waiting list patients in the UK. To make the social goals standardised and agreed upon is difficult and politically contentious . Still I think you are on fantastically right lines and have probably considered this problem.

KEEP IT UP !!!! Mark Lawrence

Ronnie Horesh (2006-04-24 08:17:00)

Many thanks for your feedback Mark; much appreciated. The differences between cultures are interesting, but from the policy point of view perhaps less critical than the similarities - but then 'policy' itself, as a separate discipline, is only a recent and not (yet) universal phenomenon. Globalisation and migration will eliminate some of the differences, but the distinction between policymaking (with its implied specialised caste of policymakers) and everyday life will widen and proliferate. And the danger that Hall points out is that we shall start to see the world through the eyes of our policymakers, who are necessarily detached from our everyday existence.

So this ties in neatly with your query: who shall decide when targeted goals are met? Well the answer is to pick broad, readily measurable goals, that are inextricably linked with increases in social welfare. This tends to mean helping the worst off people (where the correlation between income, wealth, nutrition etc and well-being is strong), but can also include global environmental problems, such as climate change. Now one advantage of Social Policy Bonds is that they will subordinate all policy to outcomes, and this makes it easier for the public to participate. It's much easier to understand, for example, broad measures of literacy, housing, poverty etc, than it is to understand the strange, arcane arguments about funding, institutional structures, etc that are features of the current regime.

Cheap Edegra Online (2010-06-25 08:16:10)

What I wanted to say with your social Bonds idea is that it's great the only problem is who decides when targets are met? After all a 'drop in crime' is actually a subjective thing.

Buy Cheap Zenegra online (2010-06-28 12:50:36)

But anyway the ultimate high context society according to Hall is Japan where words are almost not necessary .

Ronnie Horesh (2010-06-29 20:12:12)

Thanks for your comments. The key, when it comes to picking targets, is to make them as objective as possible. Crime victim surveys could be more helpful than 'reported crimes'. Or insurance payouts. Indicators could include foot traffic on urban streets or objective statistics of (admittedly) subjective criteria (eg: 'do you feel safer now than you did give years ago?').

On Japan, yes, I include a short section at the end of my [1]book on how the Japanese currency of respect is more efficient than our large and increasing use of money to indicate status.

### 2.10.10 Small government: not an end in itself (2005-10-30 06:01)

Small government, despite what [1]some thinktanks believe, is not an end in itself. I think the real issue is not so much the overall size of the state, but the distance between it and the voters. The rich countries in some ways have the worst of both worlds: big government that does (a) the wrong things and (b) some of the right things, badly. So the UK Government (for instance) maintains extravagant corporate welfare schemes, social engineering experiments, and high food prices, because that's what the French want. But it's failing to do things like ensure safe streets and decent rates of basic literacy. If government were efficient, responsive and doing things that improved the welfare of real persons (rather than favoured corporations and lobby groups) and enjoyed popular support then I shouldn't see anything wrong with a big state. In other words, the issue is not the size of the state but what it does with the power and resources we give it. It all comes down to outcomes in the end. Small government may be a means towards that end, but it's not an end in itself.

Bravo!!

## 2.11 November

### 2.11.1 Riots in Paris (2005-11-02 09:18)

As far as I can tell nobody else has traced the current riots in Paris back to what I think is one of their main causes: French protectionism and the Common Agricultural Policy. So here goes. By blocking imports of farm products (and textiles and clothing) France, consistently and with great success over the past few decades has:

- Kept more people in farming than otherwise, leading to shortages of labour in manufacturing and services sectors; and
- Blighted the prospects of economic development in poor countries, particularly in Africa.

The result has been *reluctant* immigration – the worst sort – into France, by people with no other chance of providing decently for themselves and their families. French protectionism has directly led to the violence on the streets of Paris. The tragedy is that the French have so manipulated the European Union that it is not just France that will suffer.

Anonymous (2005-11-17 23:21:00)

I agree with all that, but there are much deeper, more internal issues, that were created in the past. These rioters live in state-created ghettos, and to this day are still unable to get out. In the 60s, with the flood of "reluctant immigration", the state thought it could help out by dumping these immigrants into council estates, basically they provided really cheap rent, but the tenants lived (and still do) one on top of the other, in a completely closed environment outside the city (the "banlieue"). Now there are no job opportunities there, but how can that be surprising when there is over 10 % of unemployment in the whole country? The key words are *labour laws*, these are way too rigid, employers just don't want to employ, let alone foreign-looking applicants (who are now known to torch cars, which really doesn't help their unemployment situation)...

As for the CAP, it should be scrapped, and we all know that France is the only EU country that fully supports it. This kind of stubborn behaviour is unacceptable in the face of African poverty, and in my opinion the EU should boot France, let it rot alone in its pathetic protectionist "social model".

BTW feel free to email me at lone.canaanite@gmail.com

Ronnie Horesh (2005-11-18 09:01:00)

Thanks for your comment Dov. I agree: once the reluctant immigrants had arrived, their problems were worsened by the protectionist 'social model', of which the CAP is one element. I also agree that the EU should boot out France: see my [1]earlier comment.

1. <http://socialgoals.com/blog/2005/05/european-union-without-france.html>

Anonymous (2006-04-23 05:35:00)

Hi,

I'm an English teacher fully qualified living in France 7 years. I completely agree with all said above about protectionism and CAP. Personally I stumble along on a tiny salary non renewable contract because they arrogantly don't accept my UK qualis plus TEFL and twenty years experience!!The French are terrified of free enterprise. Could I just add another extra slant on protectionism?

The CPE riots were valid but convenient for the French government. Why? Because the real issue is the incredible tax burdens and cotisitions(Pay check take-offs)and the dependence the centralising of power in health take-offs, MGEN insurance, ASSEDIC debts and lugubrious ANPE costs, the government have convinced the French people dependence on the state and removal of their power is normal.

The CPE shows the government cynically devalueing labour and supression of the chance for people to create wealth even more.

It's incredible . VERY BEST with this site! Mark Lawrence

Anonymous (2006-04-23 05:44:00)

Hi ,

Me again, I forgot to menton a slightly off-beat idea I had on those CPE riots too-although I don't believe in jobs for life at all, I think it is wrong to say the students just want a meal ticket for life. The opponent don't so much as object to the letter of the CPE (they know that the CPE is not intrinsically flawed) -it's that they know the mentality of French biosses-very different to the basically reasonable Anglo-Saxon mentality-the French mentality is one that sees a dire hierarchy and a ruthless fuck the underling mentality. Just look at any documentary of how a French kitchen in a top restaurant is run. The students know that that 1789 got rid of one king but gained a reign of Terror and 10,000 little dictators,

So it's a 'Spirirt' thing as well. Apart from that, the French idea of a contract in our Anglo Saxon sense is non-existent. That is empirical!

VERY BEST AGAIN Mark lawrence

Ronnie Horesh (2006-04-23 09:21:00)

Thanks Sean and Mark for your comments and good wishes.

### **2.11.2 Kyoto is dead (2005-11-05 16:57)**

'The blunt truth about the politics of climate change is that no country will want to sacrifice its economy in order to meet this challenge', said UK Prime Minister Tony Blair [1]recently. He's right, and some of us have been working on practical alternatives to the absurd Kyoto Protocol.

For people whose priority is dealing with climate change, rather than merely demonstrating their concern for humanity without actually doing anything, I suggest Climate Stability Bonds. These would be backed by governments or the private sector, and auctioned to the highest bidders. They would be redeemable for a fixed sum only when some meaningful climate stability target had been achieved and sustained. Bondholders would have incentives to do whatever is most cost-effective. They might opt to reduce greenhouse gas emissions, but they might well find that sending mirrors into Earth orbit, or developing new species of

cyanobacteria (that can soak up atmospheric carbon dioxide and convert it into a raw material for biodegradable plastic), or researching into many other possibilities would be far more efficient. Click [2]here for a short published article on Climate Stability Bonds .

### **2.11.4 Kyoto is dead ...still (2005-11-16 10:32)**

*This article was published in today's [1]New Zealand Herald*

'The blunt truth about the politics of climate change is that no country will want to sacrifice its economy in order to meet this challenge.' Tony Blair, speaking at the G8 Climate Change Conference on 2 November, confirms what many of us suspected: the Kyoto agreement to cut back on greenhouse gas emissions is dead. It is unworkable, hugely expensive, politically divisive and most important, ineffectual. Unlike many who oppose Kyoto I do not think all its supporters are insincere or motivated purely by a wish to secure funding for their research programmes. The evidence that the climate is changing is strong and getting stronger, and there is no question that it could have catastrophic effects on large numbers of people.

It also seems likely that anthropogenic greenhouse gas emissions are a cause. But that doesn't mean that cutting back on these emissions is the best way of preventing or mitigating climate change. In their efforts to get the absurdly unworkable Kyoto agreement off the ground, its proponents have squandered precious political capital, and set back the cause of those looking for realistic alternatives.

Perhaps some of them, including some in the New Zealand Government, knew Kyoto would never fly, so could support it safely. They'd thereby be demonstrating their immense care and compassion for humanity, knowing all along that Kyoto would come to nothing and

they wouldn't actually have to sacrifice anything themselves. This certainly seems to apply to the European Union: the EU had pledged to reduce its total greenhouse gas emissions to 8 per cent below 1990s levels by 2008-2012, but by 2002 they had dropped only 2.9 per cent - and carbon dioxide emissions had risen slightly. Only four EU countries are on track to achieve their individual targets. And the EU is economically stagnating: any significant growth would probably end its chances of meeting the Kyoto targets.

Given the dimensions of the climate change problem, we should not spend too much time allocating blame for failed policies. Rather we should be looking for practical ways of preventing climate change and mitigating its effects.

Kyoto suffers from the same flaw as many of our other environmental and social policies: it assumes that government knows the best way of achieving our goals. Kyoto is focussed entirely on reducing net greenhouse gas emissions. But with climate change the biological and physical relationships involved are many and complex. Even specialists in climatology disagree about the degree to which the multitude of biological and physical variables cause climate change.

The best way of addressing climate change would not embody the assumption that it knows exactly how the Earth's climate is changing, what is causing it to change, and what is the best way of dealing with any change. It would not ignore a potentially catastrophic problem, but it would try to be as cost-effective as possible, especially because of the colossal expenditures involved. An ideal policy would stimulate the investigation and adoption of promising new technologies, and be responsive to our fast-increasing knowledge about the causes and effects of climate change. It would most probably seek to mitigate the negative effects of climate change, while doing little to discourage positive effects. Ideally too, it would use markets, the best way yet devised of allocating society's scarce resources, to channel people's self-interest into achieving climate stability.

If such a solution could be found, it would be certain to attract more support than Kyoto both from decision makers and ordinary people. Widespread support is essential, because stabilising the climate is going to entail enormous costs and sacrifices.

We need to recognise explicitly that we don't know all the answers. Achieving a stable climate will mean investigating a wide range of diverse approaches that don't have anything to do with greenhouse gas emissions - but Kyoto will do nothing to encourage such research. Reducing greenhouse gas emissions or sequestering carbon might turn out to be helpful and cost-effective. But what if new science tells us either that greenhouse gases are not as important as originally thought, or that there are far more cost-effective ways of achieving climate stability? Kyoto would grind on, with its expensive and futile controls on greenhouse gas emissions.

Our problem, of course, is not greenhouse gases; it is climate change. So our objective should not be to cut back on greenhouse gas emissions, but to achieve climate stability. A successful policy would encourage those who help stabilise the climate, however they do it.

My own suggestion is that governments collectively issue Climate Stability Bonds. These would be sold by auction, and redeemed for a fixed sum only when the climate has achieved an agreed and sustained level of stability. In this way there is no need for the targeting mechanism to make assumptions as to how to stabilise the world climate - that is left to

bondholders. Climate Stability Bonds would not bear interest and their redemption date would be uncertain. Bondholders would gain most by ensuring that climate stability is achieved quickly.

Once issued, the bonds will be freely tradeable on the free market. As the climate became more stable, so the bond price would rise. Bondholders have incentives to cooperate with each other to do what they can to achieve climate stability, then to sell their Bonds at a higher price. Governments decide only on the degree of climate stability they want - not on how to achieve it. That is left up to investors in the Bonds, who have every incentive to maximise the taxpayer's benefit per unit outlay. So, in contrast to Kyoto, a Climate Stability Bond regime would stimulate research into finding ever more cost-effective ways of achieving climate stability.

Kyoto is flawed because its focus is entirely on net greenhouse gas emissions. We need instead to look at solutions, such as Climate Stability Bonds, that have as their goal the achievement of climate stability. There is too much at stake to rely on the fossilised science that underpins Kyoto.

Ronnie Horesh (2005-11-20 03:37:00)  
Hmmm; I just deleted it. It seems the *Herald* has copyright....

Ronnie Horesh (2005-11-22 09:08:00)  
Sean: no the climate's never been truly stable. My suggestion is that we be very clear what definition of stability we go for. It could include such indicators as temperature range and variability, but it could also embody more meaningful indicators that don't have anything to do with climate as such. So, for instance, a bond regime could aim to reduce the number and severity of adverse climatic events, or the amount that insurance companies pay out, or the numbers of people made homeless by floods etc. The bond concept is a versatile one and it could embody a wide range of meaningful goals simultaneously.

### **2.11.5 Subsidising our oil addiction (2005-11-21 09:25)**

Reading Jane Jacobs' new book [1]*Dark Age Ahead*, published in May, I'm reminded that the western world's dependence on cars, highways and fossil fuels is not a market-driven outcome. Rather it's a product of government-subsidised road building programmes, government-backed corporate welfare for oil companies, a government-funded military to secure oil supplies and guard their routes; and (in the US) sales of tramways to General Motors that breached anti-trust laws. I have had spirited arguments with people who claim that public transport is heavily subsidised; true, but let's not forget that not only was our private transport infrastructure subsidised, but the external costs that it continues to impose are effectively underwritten by the taxpayer. These include the grievous accident and environmental costs, the unquantifiable but large losses of community, and the direct and indirect costs that arise from our dependence on oil imports.

### **2.11.6 Eradicating small businesses: all join in (2005-11-21 10:32)**

Government and big business seem to run a cartel with a single aim: to eradicate small businesses. In this they are aided by all sorts of organisations. This, from today's (UK) [1]*Daily Telegraph*:

The misery women go through all over the world queuing for public lavatories would be eased under new principles proposed by the World Toilet Organisation. Guidelines issued at the weekend by the National Environment Agency in Singapore, where the WTO is based, would mean women have at least equal facilities to men.

The code requires medium-sized restaurants, bars and nightclubs to have as many female cubicles as they have male cubicles and urinals. Larger venues, and those such as theatres and cinemas where usage is confined to peak periods, would have to favour women's facilities by a ratio of 14:10.

"It's very important where there are a lot of people," said Elisabeth Maria-Huba, a German social scientist. "Women need longer. And in a lot of cases women have to arrange themselves to go out again."

The World Toilet Organisation [2]does exist.

### **2.11.8 Achieving social goals requires imagination, not selection (2005-11-28 14:03)**

Even if you could get more RAM for your brain, the extra storage probably wouldn't make it easier for you to find where you left your car keys. What may help ... is a better bouncer - as in the type of bouncer who manages crowd control for nightclubs.  
[1]Source

This research measured the brain activity of people asked to remember arrays of colored squares or rectangles. In one experiment, researchers told subjects to hold in mind two red rectangles and ignore two blue ones. Those considered to be 'high-capacity' individuals excelled at dismissing blue, but low-capacity individuals held all of the rectangles in mind. The researcher said that:

People differed systematically, and dramatically, in their ability to keep irrelevant items out of awareness. This doesn't mean people with low capacity are cognitively impaired. There may be advantages to having a lot of seemingly irrelevant information coming to mind. Being a bit scattered tends to be a trait of highly imaginative people.

There are many ways to interpret these results, (published in full in *Nature*, 24 November). From the Social Policy Bond point of view, I would make these points:

- Today's society defines 'high capacity' individuals as those who can be most selective in the choice of information they consider; and
- Policymakers - politicians, government officials, corporate bosses - are overwhelmingly drawn from the ranks of those considered to have high capacity.

Excluding extraneous information may be desirable, and even necessary when looking at defined tasks where success will be measured in terms of one-dimensional units such as sales,

market share, profits, or numbers of people on waiting lists, etc.

But aggregating such uni-dimensional targets, whether corporate or government, will not optimise society's well being. For this, we need to target broader social and environmental outcomes. These could, and should, include quality of life indicators; the provision of a tight safety net that maximises rates of basic literacy, health and housing; baseline environmental indicators; and the maintenance of law and order.

A government could define such broad social and environmental goals, but it should not prejudge how best to achieve them. Such achievement requires an awareness of a huge number of variables and a responsiveness that policymakers do not have: all the evidence bears this out, and the research mentioned above explains it. Excluding information is necessary for articulating society's wants and raising funds – which governments do quite well. But when it comes to actually *achieving* our goals, we need a different sort of intelligence; one that is comprehensive, imaginative, pluralist and highly adaptable. Markets, in the service of social goals, are the answer. Social Policy Bonds are a means through which government and markets could each do what they are best at.

## 2.12 December

### 2.12.1 Rewarding outcomes, not effort (2005-12-02 10:06)

“But the public seems to be losing patience with airy-fairy ideological crusades—and growing ever hungrier for down-to-earth pragmatism.” So says Lexington in a column headed ‘The End of Ideology’ in the latest (3 December) issue of *The Economist*. And it's true America's 1993 Government Performance and Results Act ‘seeks to improve the management of federal programs by shifting the focus of decision-making from staffing and activity levels to the results of federal programs’.

What has been the result?

As I argue in my forthcoming book, existing institutional structures constrain a truly outcome-based policy. In the US, there has been an emphasis on rewarding effort whatever the result. But for efficiency it is not the quantity of effort that should be rewarded, but its quality, as measured by its effectiveness in achieving outcomes. It is crucial, in short, that *outcomes be rewarded, however they are achieved*. The risk and consequences of underachievement should be borne by the institutions themselves, not by ordinary members of the public. Outcome measures for bodies engaged in long-term activities, for example, research and

development, should be subsumed into broader strategic goals. It should not be up to the government or a government agency to monitor how efficient agencies are in achieving sub-objectives. More crucially, the *resource allocation should not be on an agency basis*. Resources, ideally, would shift in and out of different activities depending on how efficient each activity is in contributing to the achievement of the strategic goals.

There is no question that the GPRA does represent a big step forward for outcome-orientated government. But, in my view, progress is being impeded on two fronts: existing government agencies have too much say in both the choice of long-term goals to be targeted, and in how resources aimed at achieving these outcomes are to be allocated.

Policy as if outcomes mattered  
SocialGoals.com

---

### **2.12.2 More subsidies for the rich (2005-12-06 00:20)**

The British Government, like many others, has become dependent on maintaining high property values. So it's doing it's best to prop them up. Yesterday it [1]announced that it (ie the taxpayer) will subsidise the purchases of couples who can afford only 75 per cent of the purchase price of a new house. Anyone with basic economics will know that this will merely bid up the price of all houses. Perhaps that is the Government's real purpose. If it wanted to do something about poverty or homelessness it would tackle them directly. Instead it shovels taxpayer funds into the property market. Its appears that the Chancellor's priority is to keep consumer spending high - at least for the duration of his political career - by inflating property values.

A Social Policy Bond regime would do away with this sort of nonsense from the outset. It would first identify the desired outcome and then let bondholders, not government, decide on how best to achieve it. It's possible that a government issuing bonds would say that its purpose was to boost property values so that consumers would spend more. But it's hard to imagine such a use of taxpayer funds being admitted, let alone approved. The current policymaking regime depends absolutely on fudge, obfuscation and deception. It allows government to favour its own alleged ways of achieving vague, unspecified or conflicting goals. Very often the actual result, as here, is to subsidise wealthy individuals or corporations at the expense of small businesses or the disadvantaged.

Policy as if outcomes mattered  
SocialGoals.com

1. [http://www.iii.co.uk/reg/wealth/?type=shares\\_and\\_funds&lo=3](http://www.iii.co.uk/reg/wealth/?type=shares_and_funds&lo=3)

---

### **2.12.3 Politics without outcomes (2005-12-08 09:32)**

If you're a politician and you don't target outcomes, anything goes. If you're not in the government you can attack the government for spending too much on this, or not enough on

that. If you are in the government you can blame all the bad news on what the opposition did when it was in power. Relationships between cause and effect are nebulous and accountability can always be fudged. So it's all a lot of fun for politicians: all they really need a research team who can mine data and bring up a few favourable soundbites: there's no shortage of data. And if you've done so badly that even that is unconvincing, well you can always attack the personal history of your opponent. So Gordon Brown, UK Chancellor (Minister of Finance) yesterday was reduced to [1]pointing out that the chief defect of his new Tory opponent is that he was an Old Etonian.

Politicians should be allowed to have their fun, but not at the expense of the rest of us. We really need to get them to target explicit social and environmental outcomes. We need to join with them in articulating our goals and costing them.

#### **2.12.4 Stabilisation wedges (2005-12-13 09:28)**

The current issue of *The Economist* has a [1]feature about climate change. In it, there is talk of 'stabilisation wedges' invented by Rob Socolow. Essentially, this is a way of decomposing 'a heroic challenge (eliminating the emissions [above the trend line]) into a limited set of merely monumental tasks.' Dr Socolow lists six such tasks: greater efficiency, decarbonised fuels, decarbonised electricity, fuel displacement by low-carbon electricity, methane management, and natural carbon sinks. Each of these can be further broken down. For example, decarbonised electricity can imply nuclear power, renewable energy etc.

This way of looking at climate change is encouraging in that it's about diverse approaches solutions to broad, defined, problem.

My reservations about it are:

- That the defined problem is taken to be anthropogenic greenhouse gas emissions, not climate change nor the negative effects of climate change;
- That it is still too prescriptive in that it doesn't do much to encourage the exploration of as-yet-unknown possible solutions;
- That it lacks market incentives, so would not maximise cost-effectiveness as that Climate Stability Bonds would, and would shift the burden of failed or inefficient technologies on those - presumably taxpayers - who would be financing, upfront, the entire enterprise.

Click [2]here to read a published article about Climate Stability Bonds. Details of how to order my book on Climate Stability Bonds can be found [3]here.

### 2.12.5 Markets and 'markets' (2005-12-14 09:42)

Talking about Social Policy Bonds I find that some people are initially put off by the concept's reliance on markets. They associate markets with big business and its largely successful efforts to manipulate the social and political agenda in its own interests. So let me quote [1]Chomsky:

Only economists talk about markets. Business can't tolerate markets. They don't want markets in which informed consumers make rational choices. What they want is deluded consumers who will make irrational choices. That's what hundreds of billions of dollars in advertising are spent on. You don't get any information about the product.

There is a huge difference between big business and government on the one hand, and small businesses and natural persons (as distinct from corporate bodies) on the other. Big business and government are suspicious of markets, which depend for their vitality on numerous decisions made by people and firms acting diversely and responsively within ethical and legislative bounds. They don't fully trust markets because they cannot fully control them. But they do try:

Large companies are less and less about making something for a specific market and increasingly about manipulating the arrangements behind such makings. Harvey Molotch, *Where stuff comes from*, Routledge, 2003 (page 204)

When they are not corrupted or distorted, markets are the best way of allocating our scarce resources: all the evidence of history as well as economic theory supports this.

Markets do get a bad press, because they *are* often corrupted and distorted. But [2]Social Policy Bonds offer a way in which market forces can be channelled *directly* into achieving social and environmental goals.

● An [3]article about Climate Stability Bonds appeared in yesterday's *Dominion Post* (Wellington).

## **2.12.6 Social Policy Bonds and developing countries (2005-12-17 13:30)**

I'm often asked whether Social Policy Bonds could be applied to developing countries. The answer is yes. They could be issued by interested, wealthy outsiders, concerned, for instance, about female literacy in Pakistan (click [1]here for a pdf file on how philanthropists could issue Female Literacy Bonds).

Of course, developing country governments could issue their own Social Policy Bonds. Their public sector is not so well documented as in the rich countries. This makes discussion of their policymaking more difficult, but it should not inhibit the transition to a Social Policy Bond regime for several reasons:

- Public sectors are growing even faster in developing countries than in the developed world from, of course, a smaller base. There is the opportunity therefore to avoid the mistakes that developed countries made when their public sectors grew.
- While public sectors in the developing countries are growing rapidly, they are still not big enough to cope with their very severe social problems and the enormous social changes that are occurring. Developing countries are urbanising rapidly, with all the social dislocation this entails. Crime rates are high, and there is a great deal of urban poverty and unemployment. Many children are outside the educational system altogether and standards in state systems, while variable, are generally very low. Environmental problems are especially severe in developing countries.
- Public sector employees in developing countries are generally not well paid, and are more susceptible to corruption than in most developed countries. This lowers their motivation to act in the public interest. So, even more than in developed countries, there is often little relationship between government spending and desirable outcomes. One pointer: an International Monetary Fund (IMF) survey of 50 developing countries concluded that 'there is little empirical evidence to support the claim that public spending improves education and health indicators'. (Source:

Anjeev Gupta, Marijn Verhoeven and Erwin Tiongson, *Does higher government spending buy better results in education and health care?* , IMF Working Paper WP/99/21, February 1999.

### **2.12.7 Markets and 'markets', continued (2005-12-20 12:49)**

For all the grandiloquence, however, there is no hiding that last week's meeting did little to promote free trade. [1]*The Economist*

You'd almost always be safe, if you've fallen asleep at a meeting and woken up to find yourself being looked at expectantly, to say something like *there are arguments on both sides, or it's not black or white, it's a continuum*. But when it comes to agricultural subsidies these statements would be wrong. There is only one side, and it is black not grey: agricultural subsidies are economic nonsense, *and* socially inequitable, *and* environmentally catastrophic. We knew this 30 years ago, but the subsidies continue. Right now, they are threatening to undermine, yet again, the international trading system. Still their proponents - step forward France - keep them going. They continue to put up high barriers to imports from food-rich developing countries, raising food prices for their own consumers and making it impossible for people in the poorer countries to prosper. The main beneficiaries of these absurd policies are wealthy landowners, large agribusiness corporates, the bureaucrats who administer them, and their political friends.

For those who preach 'markets' but are anti-market in everything except rhetoric, the interests of these wealthy, selfish bodies outweigh the millions of ordinary people, some of them desperately poor, who would benefit from the removal of barriers to agricultural trade.

### **2.12.8 Government favours industry concentration (2005-12-21 11:52)**

A recent report by the ETC Group,[1]*Oligopoly, Inc. 2005* points out, inter alia, that in the past two years alone:

- the world's top 10 seed companies have increased their control from one-third to one-half of the global seed trade;

- the top 10 biotech enterprises have raised their share from just over half to nearly three-quarters of world biotech sales; and
- the market share of the top 10 pesticide manufacturers rose modestly, from 80 to 84 %, but industry analysts predict that only three companies will survive the next decade.

I think government intervention tends to favour oligopolies, in that it favours big business at the expense of small businesses and natural persons. Government identifies big business with economic success, and most corporate welfare programmes go to the largest companies. Agricultural subsidies, for instance, are claimed to be for 'family farms', but they mainly go to wealthy landowners and large agribusiness corporates. (Import barriers for food, as well as hurting the third world, also transfer cash from poor (western) consumers to wealthy farmers.) Big business can manipulate the regulatory environment, eg regarding health and safety, to make it very difficult for small businesses. The result is increasing concentration in industries like agriculture, where government intervention is dominant and sustained.

### 2.12.9 The middle-class housing crisis (2005-12-26 05:26)

In 1970, about 50 per cent of all families could afford a median-priced home; by 1990 this number had dropped below 25 per cent. *The next American metropolis*, Peter Calthorpe

This quote, refers to the US, but could equally apply to New Zealand and the UK.

How has it come about? The authors of [1]*Suburban Nation*, point out that one factor is the way that planners and developers design our cities. In most residential developments it's now almost impossible for any adult to function without a car. The cheapest cars (in the US) cost around US \$6000 a year to run, which at typical mortgage rates equates to US \$60 000 in home-purchasing power. For two adults, the impact on housing affordability is obvious.

Another crucial point, which I'm pleased the authors make:

The atomization of our society into suburban clusters was the result of specific government and industry policies rather than of some popular mandate.

It's not markets, in other words, that have led to urban sprawl, but government subsidies, notably for oil extraction, consumption, and for highway construction, along with disastrous single-use zoning laws.

### **2.12.10 Climate change: subordinate policy to outcomes not process (2005-12-27 11:52)**

Dealing with climate change as if it's just another problem is going to be disastrous. Governments, especially at the supranational level, subordinate all policy to process. Their only concern is that they comply with the rules - or rather, that they are not seen to have failed to comply with them. To politicians and officials, outcomes are irrelevant. This is especially the case with climate change, where they can easily escape or deflect censure because of all the scientific uncertainties and because their failures will not be directly attributable to them.

What's prompted this diatribe? Researchers in the UK have found that warmer temperatures have stimulated microbial activity in 6000 soil borings across Britain. This means that much of the carbon that used to be stored in the soil is now being released into the atmosphere. "The quantities were large enough to negate all the work that Britain had done to switch away from coal to reduce carbon in the atmosphere."

This is one of several scary feedback findings [1]published recently. How will Kyoto absorb them into its mechanisms? How will policymakers respond? Answers: it won't, and they won't, respectively. That's because Kyoto is a typical government conceit: it assumes government knew the scale of the climate change problem, the cause of the problem, and the best way of solving it *in the 1990s*. Kyoto cannot respond to our rapidly expanding knowledge.

Instead of Kyoto we urgently need an adaptive policy, that rewards people for preventing or mitigating climate change, *however they do so*. My suggestion is that we ditch Kyoto and governments, along with concerned non-governmental organisations and philanthropists issue [2]Climate Stability Bonds instead. Even if the entire premise for Kyoto eventually turns out to be false - the climate is not changing, in other words - Climate Stability Bonds, because they are priced by the market, would still be the lowest-cost policy.

### **2.12.11 2005 (2005-12-31 09:45)**

It hasn't been a great year, either for Social Policy Bonds or for policies that are subordinated to outcomes.

Nobody has issued Social Policy Bonds, as far as I am aware, during 2005, nor has there been much professional interest. I have been updating the text of my book *Injecting incentives into the achievement of social goals: Social Policy Bonds*, to reflect my view that the private sector is more likely to issue Social Policy Bonds than government agencies. I expect to have the text completed during the first quarter of 2006. I haven't begun looking for a publisher yet. Anybody who has purchased any of my books can email me for an electronic version of the new book, free of charge, at any time. There has been no media coverage of Social Policy Bonds apart from a couple of articles in New Zealand newspapers, in which I offered Climate Stability Bonds as an improvement over the wildly expensive, moribund, Kyoto process.

As regards policy: there has been some delinking of subsidy from production levels in EU agriculture, but absurd tariffs and other import barriers remain as a serious impediment to would-be food exporting developing countries and a continuing threat to the global trading system. Other perverse subsidies, including those to oil extraction and consumption, continue.

Despite this lack of progress, I continue to work on refining and publicising the Social Policy Bond principle. Any suggestions as to how to advance it would be most welcome. I wish all my readers a happy, healthy 2006.

# 2006

## 3.1 January

### 3.1.1 Ideology destroys neighbourhoods (2006-01-01 14:09)

By applying theories from the incipient quasi-sciences of psychology and sociology, architects invented new forms of buildings and cities that they believed would transform their inhabitants into the most benevolent of creatures. [1]*Suburban Nation* (page 238)

The excellent source of that quote (subtitle: *The Rise of Sprawl and the Decline of the American Dream*) makes painful reading. I wrote [2]below about one of the consequences of government policies that systematically favour suburban sprawl and car-based settlement patterns. Others are equally tragic: for instance, the excess deaths from air pollution in the US (estimated at between 50 000 and 125 000 annually).

While vested interests, such as those of developers and highway construction firms, play their part in this dolorous tale so too does ideology, as the quote shows. You might think that urban and architectural planning disasters are so obvious we'd stop building them. But the organisations responsible, whether government or private sector are just like any others. They are poor self-evaluators. Myths, false propaganda, and anachronistic beliefs persist in the absence of strong evaluative institutions to test ideas against logic and evidence. Organisations turn against their own evaluative units as they threaten jobs and the status of incumbents. Organisations will attack their own thinking apparatus if that apparatus ever does become effective.

Ideology and organisational survival become ends in themselves. The consequences for ordinary people and communities, conscripted into the ideological experiments of people like the architects referred to above, can be disastrous.

A Social Policy Bond regime would not be driven by any ideology with its theories and abstractions. Instead it would stipulate and reward only transparent, explicit, targeted social and environmental outcomes - outcomes, moreover, that are meaningful to natural persons, as distinct from corporate bodies or ideologues.

### 3.1.2 More about Climate Stability Bonds (2006-01-04 11:00)

My [1]article about Climate Stability Bonds in Wellington's newspaper prompted one correspondent to suspect that my sole intention is to sink the Kyoto agreement. What is disappointing is that climate change and how we should respond have become so politicised that everybody is suspected of having a hidden agenda. So let me be clear: my intention is not solely to sink Kyoto. It's to get something going that will most effectively deal with the concerns of the many scientists who think climate change is happening at an alarming rate *and* those who either don't think climate change is happening or who believe that we can't do anything about it if it is happening.

With such a vast range of views, and so much at stake, it's no wonder climate change has polarised opinion. But, as my article suggests, climate change is one potential catastrophe that should not be delegated to the usual suspects. Unfortunately Kyoto and the reaction to it are typical of what happens when policy is subordinated to the agendas of existing institutions and governments. We get an effort that manages to be wildly expensive *and* ineffectual *and* so unpopular that it alienates vast sections of the public from its premises, let alone its supposed solution.

Climate Stability Bonds might not be perfect, but I think they are far better than Kyoto in achieving what we actually want to achieve: a stable climate. Climate Stability Bonds would not bear interest: they would be issued by a consortium of interested bodies for whatever price they would fetch when auctioned. They would be redeemable for a fixed sum only when the climate had stabilised. Stability could be defined in terms of an index of measures of the climate, its variability, and *the effects* of the climate on human, animal and plant life. If world opinion thinks climate change is not happening, the issuers would receive a high price for the bonds when they are floated. If the bonds fetch a low price, bondholders would gain a lot by doing whatever they can to bring about the issuers' targeted goal of climate stability. They could sell their bonds at any time, to those who think they can do better at further stabilising the climate and who could therefore bid more for the bonds. Bondholders have direct incentives to achieve the climate stability goal.

Climate Stability Bonds would reward those who help achieve a stable climate, *however they go about it*. The issuers would set the goal, the market for the bonds would allocate society's scarce resources *not* in proportion to bondholders' efforts, *but to their success in achieving that goal*.

Click [2]here to read a published article which goes into more detail about Climate Stability Bonds. Details of how to order my book on Climate Stability Bonds can be found [3]here.

### **3.1.3 Eminent domain (2006-01-06 12:29)**

Eminent domain in the United States, or compulsory purchase in the UK and New Zealand, gives the state the power to appropriate private property for its own use. This use is supposed to be in the larger public interest. But in the US (at least) eminent domain is being abused. In the nineteenth century and much of the twentieth, the individual states did invoke eminent domain primarily for public uses, seizing smallholder land to build roads, parks, railroads, hospitals, and military bases. But since then the public good has been redefined, so that it now interpreted as including economic growth that generates increased tax revenue for a local authority. [1]*Condemnation Nation* by Joshua Kurlantzick describes how city governments in the US combine with large real estate developers and 'big-box' retailers to exploit eminent domain for their own purposes. The losers are homeowners and small businesses.

Everywhere, it seems, government and big business have interests that are at least different from, and often opposed to, those of small businesses and natural persons. Eminent domain is similar to other manipulations of the legislative and regulatory environment, and corporate welfare, which might have started out as well-meaning initiatives genuinely aimed at the larger public interest but have been so abused so that they now achieve the opposite.

I've added a link to [2]Reclaimdemocracy.org, which hosts the excellent Kurlantzick article, to the list of other blogs and sites in the right hand column. Its slogan is 'restoring citizen authority over corporations': a necessary objective, I think. Social Policy Bonds, because of their focus on outcomes, could help. In the case of eminent domain, the city governments that abuse it are doing so to increase their tax revenues. Doing so has become their objective, much as increasing per capita Gross Domestic Product has become the *de facto* objective of national governments. A Social Policy Bond regime would start out by clarifying and targeting not abstractions like tax revenue or economic growth, but outcomes that are meaningful to natural persons.

### **3.1.4 Policymakers need numbers (2006-01-08 12:06)**

Accepting that our societies are big and complex, policymakers need to base their decisions on quantifiable data. This applies under the current policymaking system, and would also apply in

a Social Policy Bond regime. It poses serious problems in trying to measure societal well-being, but fortunately more and more indicators of elements of well-being are becoming quantifiable. [1]This story is about a new electronic nose that can sense and monitor low concentrations of gases and odours.

### **3.1.5 Government should concentrate on eradicating poverty (2006-01-10 10:10)**

Contrary to expectation, there appears to be no link between the size of the welfare state and the level of well-being within it. In countries with generous social security schemes, people are not healthier or happier than in equally affluent countries where the state is less open-handed. Increases or reductions in social security expenditure are not related to a rise or fall in the level of health and happiness either. [1] Source given [2] here

In my forthcoming book I argue that, when it comes to targeting societal well-being, the case for government intervention is strongest when there is a high correlation between government spending and measurable indicators of social welfare. It is mainly at lower levels of real income and wealth that the correlation between a quantifiable indicator and social welfare is strong and therefore valid as a guide to policymakers. At higher levels of income numerical targeting can be futile or even counter-productive. I suspect this is what lies behind the research that led to the conclusion quoted above. It is the poor who are also most in need of government intervention and it is the poor who would most benefit from it by any objective criteria. But too much government spending has been hijacked into the provision of subsidies to corporations, the wealthy and the middle class. From at least one angle then, western countries have the worst of both worlds: big and remote government, large (absolute) tax revenues, co-existing with pockets of real poverty.

---

Anonymous (2006-01-11 16:45:00)

Why should we eradicate all poverty? Even J.S. Mill, way back in the 1850s, acknowledged most poverty was cultural, rather than economic. Why should some be forced to pay for the irresponsibilities of others?

Ronnie Horesh (2006-01-12 09:18:00)

Good question. What is defined as poverty for targeting by government-issued Social Policy Bonds would be decided through the political process. The advantage of a bond regime is that all poverty-reduction activities would be directed at achieving society's desired poverty-reduction outcome, which would be explicit and transparent. Under the current regime government can get away with taking huge tax revenues ostensibly to reduce poverty, but actually to fund their own institution and powerful corporate interests.

### **3.1.6 Abandon your principles! (2006-01-14 10:13)**

The important thing in moral life is to do what is right, not to expound the principle which makes it so; and so often the principle eludes us, even when the rightness of the act is clear. [1] *England*

, Roger Scruton (page 114)

Regular readers of this blog will be aware of my periodic outbursts against ideology as a policy driver. How often do we speak with good, well-meaning people who are committed to a particular political party, or who identify themselves with a particular political grouping? Then you come across their blind spot, where application of their ideology led to undeniably unfortunate results...but they can't see that. We probably all have such blind spots. The richness and complexity of history, and the application of selective memory mean that most of us can plausibly attribute all the bad things that happen to the beliefs, politicians, countries or cultures that we don't like, and all the good things to the successes of the ideology that we favour.

It's just not good enough now, if it ever were. In an increasingly complex world, relationships between policy programmes and their outcomes are ever more difficult to identify and the consequences of failure ever more disastrous. Our lazy tendency to impose a binary worldview on such potential crises as climate change, terrorism or a nuclear-armed Iran could easily prove fatal - to all of us.

It's time to quit looking for an all-embracing ideology that tells us whom we can rely on, or how best to approach every political, social or environmental problem. We cannot rely on any god, religion, political approach or economic belief system. All the evidence is that they insufficiently diverse and adaptive to a very complex, dynamic world.

The solution? Subordinate all policy to outcomes. It's much easier to get consensus on what we as a society want to achieve. A government can then issue [2]Social Policy Bonds. And if we don't want to get a government involved, and we have a clear idea about what we want to achieve, and sufficient wealth (or wealthy sympathisers) we can issue our own Social Policy Bonds. Ditch ideology, and think in terms of outcomes. Or, as a memorable line in [3]*Southern Comfort* put it:

Comes a time when you have to abandon principles and do what's right.

### 3.1.7 Governments don't learn (2006-01-18 10:23)

[G]overnment bureaucracies non-self-evaluate. At a minimum, agencies with evaluative responsibilities are not invited to evaluate - they are kept out of the loop, their opinions unsought. At a maximum, government agencies actively suppress their own internal evaluative units and are discouraged from evaluating the beliefs and policies of other agencies.

The quote is from [1]*Why states believe foolish ideas* by Steven van Evera, which is well worth reading in full. We need to be reminded that around 40 per cent of the rich world's income is spent by organisations that resist, almost to the death, the idea of examining their policy blunders and learning from them. I mean, of course, governments. Van Evera says that even in the world wars of the 20th century, when policy mistakes could have grievous consequences: 'the belligerents made large errors without carefully assessing their options. Even rudimentary analysis often would have exposed these errors but was omitted.'

In my limited experience, it is often the smallest decisions in government that receive most scrutiny: whom to offer a three-month contract; which brand of computer printer to buy; that sort of thing. The larger decisions often escape detailed analysis. Sometimes this is unavoidable but what is inexcusable is that lessons from policymaking disasters are never learned. It's now [2]estimated that the war in Iraq will cost the US about 10 times more than the White House projected. This calculation was done by a non-governmental body and it's a safe bet that it will never be referred to when similar enterprises are considered in the future.

### 3.1.8 The smoking gun (2006-01-21 11:35)

We have become so accustomed to reading of children being knifed for their mobile telephones, men robbed and then gratuitously stabbed to death, and grannies beaten over the head for a few pence, that we are no longer surprised by it. But if you have a memory as long as mine, you will know how alarmingly we have descended. [1] Source

So writes Bill Deedes, about crime in the UK. Looking at a broad indicator of crime, the number of indictable offences per thousand population in 1900 in England and Wales was 2.4 and in

1997 the figure was 89.1. Over the same period the population has increased by 63 per cent – far less than the increase in number of crimes. Even so, taking homicides (which in England and Wales include murder, manslaughter, and infanticide) the number *per million population* more than doubled from the early 1960s to 1997.

We can assume that the statistics are unequivocal and that crime has risen sharply in the past few decades. But can we blame government for the increase? Poor government performance may have had little to do with this. Indeed, government may have performed superbly, given the many diverse factors that contribute to lawlessness. As well, there is the question of how much weight we should attach to crime, compared to other areas in which similarly broad indicators show unequivocal improvements. For example: from 1901 to 1999 the life expectancy of new born children rose from 45 years for boys and 49 years for girls, to 75 years and 80 years respectively. Similar improvements can be seen for most of the measurable indicators of housing and education. In these areas, as in crime, government has played a large role.

The point is that a worsening of even quite broad indicators, even when government is spending increasing sums aimed at improving them, does not in itself *prove* poor government performance. There are simply too many other variables involved.

So what does constitute conclusive evidence that governments are inefficient? In two words: perverse subsidies. These can be defined as subsidies that are economically inefficient *and* environmentally destructive. In most cases they are also socially inequitable. They include policies that subsidise environmentally-intensive sectors or sub-sectors such energy, mining, fishing, forestry, transport, construction and intensive farming and agribusiness. They amount to hundreds of billions of dollars a year.

Perverse subsidies are nothing new, and neither is knowledge about their perversity. The abuse of resources that is the European Union's Common Agricultural Policy has been known about, and quantified, for decades. Its environmental depredations and the burdens it imposes on developing countries have been estimated and documented for almost as long. Their size and persistence are all that is really required to show that government does indeed squander our resources, and they cast a shadow over all government programmes where the evidence appears at first sight more equivocal.

Anonymous (2006-01-30 13:50:00)

I repeat what I said there, that your idea is interesting, but that it needs field tests before getting applied on critical issues. Social goal bonds can also create perverse incentives. Imagine, for instance, if the government of Singapore decided that the problem of chewing gum on the sidewalks was better handled by social bonds than by public flogging (or whatever sick things they practice there...)

Now, imagine that the bonds quickly fall in value to almost zero (because no one feels like herding cats/14-year old boys), then the mob buys them. Now they start their campaign of doing nasty things to teenagers who spit gum on the sidewalks.

This illustrates that sometimes (probably always!) the way matters as well as the goal. How do you plan to avoid such scenarios? Explaining that in this concrete example would help :-)

Ronnie Horesh (2006-01-30 22:58:00)

Harald, thanks for your comment, and sorry not to have followed it up in the Deltoid forum.

I agree absolutely: Social Policy Bonds would be a radically new way of doing things, and the idea needs discussion, application on a small scale, and refinement before it can be deployed to solve critical problems. I have suggested that it be used initially for such self-contained goals as improving the water quality of a river, or reducing the quantity of litter dropped in a city, or the incidence of petty crime in a city. One problem with small-scale trials is that the bonds are best deployed when their goal cannot be achieved simply by transferring the problem to another area.

Anticipated, negative-but-legal actions could be deterred by including provisos in the terms of the bonds' redemption that stipulate that the bonds shall not be redeemed if the provisos are broken. Examples don't readily spring to mind but I suppose the Singapore Government could stipulate that its bonds would not be redeemed if (for example) incentives were paid for parents to beat their gum-chewing teenagers.

But the main problem with Social Policy Bonds is that they might stimulate unanticipated negative actions that are not already illegal. It's not impossible to imagine such scenarios, though even in the example you give, I'm not sure what the mobster-bondholders could take that would not already be illegal. Note that they could legitimately bribe teenagers to chew their gum away from sidewalks, or bribe gum retailers to stop stocking the stuff. They also, of course, could intimidate the retailers to stop selling gum, which would be a negative-but-illegal action, against which there is existing sanction.

In my book I explore ways in which the possible unanticipated negative-but-legal effects of Social Policy Bonds could be avoided. In ascending order of severity a government could:

- persuade, shame or cajole bondholders into toeing the line. They could do this publicly or privately — initially, at least, bondholdings could be registered in the same way as shares;
- buy back the Social Policy Bonds, which would have the effect of lowering the market price of bonds remaining on the market (by reducing the total redemption funds); or
- legislate against the negative activity.

One final but crucial point: a Social Policy Bond regime has to be compared with the current

system, under which all sorts of corrupt and negative actions are encouraged, because there's so little accountability and transparency about what funds are for, where they're going or whether they are being used for their intended purpose.

Thanks again for your comment. If you have any further comments or thoughts, please get in touch again.

Anonymous (2006-01-31 10:39:00)

One problem with "bribing" is that it's a temporary solution, which may eventually eat up any profits you get. For example, bribing my antisocial neighbors to turn the music down so I can sleep would be a bad idea, because I would have to keep on paying and paying - at least if they act in their own economic self interest without regard to my well-being (and if they already cared about my well-being, we wouldn't have the problem in the first place, would we?)

In a situation like that, one could say that my neighbours have a duty to respect my sleeping hours, and the problem appears because they disregard this duty.

Wouldn't littering fall into a similar category? It's not a natural problem; it appears because people do something antisocial and/or illegal. Using a SPB to try to control this - wouldn't it be a little like paying ransom money?

(An even uglier example, imagine a SPB to prevent kidnappings in Iraq. That money would find its way to kidnapers and potential kidnapers, and they would in practice be free to set whatever price they wanted)

Now, to climate change. The question is: Is that a problem which has its roots in antisocial behaviour? If the warming is natural or mostly natural, SPBs may be a good idea (provided there aren't any other weaknesses), but if the warming is man-made, then it's similar to the littering or hostage-taking scenarios, and SPBs may be worse than doing nothing.

Ronnie Horesh (2006-01-31 11:44:00)

Thanks again Harald. My use of the word 'bribe' was perhaps too elliptical. Let's take the litter example: insofar as littering's illegal, Social Policy Bonds could mean subsidising the operations of people who will track and convict serious malfeasors. Now say the litter dropping is just anti-social but not illegal: Social Policy Bonds would direct resources (bribes) to litter-droppers *only if that were the most efficient way of solving the problem*. More likely, bondholders would find more efficient solutions: strategic deployment of sexy litter-bins (there's been no incentive to produce them yet!); competitions for the cleanest streets; aggressive street sweeping; sponsorship of anti-litter ads on tv; more subtle inculcation of local pride etc. I think the same applies to the example of kidnapers. Sure, it's conceivable that kidnapers could benefit directly from Social Policy Bonds, but (1) it's also likely that kidnap-prevention would be contracted out to the most efficient operators. It might be cheapest to build golf courses solely for the use of men with long beards, or lay on raunchy DVDs etc; which might be effective but cannot be done under the current regime. Social Policy Bonds would encourage diverse, adaptive responses - which we don't have now. And (2) again, the comparison is with the current system, under which kidnapers (and polluters etc) can already exert a sort of blackmail pressure on everyone else.

To see this more clearly, let's look at climate change. Remember that there is competitive bidding for the bonds, and remember also that bondholders can lobby the government for changes in the law. So it is far more likely, I think, that bondholders would either concentrate on bringing illegal

polluters to the attention of the law, or lobby for more stringent rules, than that they would pay off recalcitrant polluters. The polluters would see which way the wind is blowing. The bonds aren't just dreamed up: their targets, expressed in terms of outcomes (ie in terms that are meaningful to people) would be decided with public participation, so in a contest between blackmailing polluters and bondholders, public sympathy support would go to the bondholders.

### **3.1.10 Looting the common wealth (2006-01-24 12:55)**

We're not just destroying our environment, we're subsidising its destruction. Perverse subsidies take many forms, but [1]this story presents an angle that is new - to me at least. Essentially the Bush administration in the US has expanded loopholes that allow the value of gas collected from public lands and coastal areas to be undervalued. The shortfall is estimated at a minimum of US \$700 million.

### **3.1.11 Government to millionaires: here's more taxpayers' cash! (2006-01-26 00:12)**

You might think that government would concentrate on doing the things that only a government can do: eradicate poverty, supply public services like law and order, defence...that sort of thing. But such matters are hardly very glamorous so government also wants to be an investment company, and we get grotesque stories like this, [1]from New Zealand:

Director Peter Jackson's blockbuster King Kong has devoured at least \$25 million of taxpayers' money from a government scheme to encourage big-budget movies. ...

Government is good at taking money from small businesses and ordinary people. But when it comes to dishing it out it's that familiar story...big is beautiful:

... The [New Zealand] Government's large budget production grant offers a rebate of 12.5 per cent of costs incurred in New Zealand. But it is available only to movies with a budget of more than \$50 million, or to movies that cost between \$15 million and \$50 million if 70 per cent of their budget is spent here.

Once again, government extracts taxes from small businesses and ordinary working people, to pay for its own programmes and subsidise big business. If the New Zealand Labour Party had stood on a manifesto of subsidising the rich I'd have no objection to this policy. But you will not find this principle anywhere stated on[2] its website. Bill Clinton's campaign advisor once said "politics is show business for ugly people". By trying to ingratiate themselves with the beautiful people using tax revenue, this New Zealand Government has revealed its distinctly ugly side.

## **3.2 February**

### **3.2.1 Subordinating policy to outcomes (2006-02-01 12:10)**

Social Policy Bonds are about defining policy goals in terms of outcomes that are meaningful to real people. 'Outcomes' as distinct from activities, organisations, inputs (spending) and outputs; and 'real people' as distinct from government agencies or corporations.

Without going any further, subordinating policy to outcomes would screen out a lot of wildly expensive lunacies, such as EU or US agricultural policies, allegedly designed to help small farmers, but in fact consumer- and taxpayer- funded subsidies for wealthy landowners and large agribusiness corporates. It would also bring into question the lazy assumption that increasing spending for an organisation with high-sounding ideals will actually help bring about the organisation's stated objectives. Giving billions of dollars in 'aid' to bodies such as the United Nations or corrupt governments doesn't alleviate poverty. It is gesture politics at its worst. Likewise increasing domestic spending on health or education doesn't necessarily improve health and education outcomes - as UK taxpayers (for instance) are finding.

But subordinating policy to outcomes would, in fact, go a lot further. For a start, meaningful outcomes are more comprehensible to ordinary people than the process-driven platitudes and obscurities that justify policies under the current regime. Being more comprehensible, they are more open to public participation: an end in itself, as well as a means to better policymaking. People would be entrusted with making real decisions rather than delegating them to a group of people who are experts at nothing other than gaining power and serving their party. Example: crime rates are rising. Under the current system, anybody interested in dealing with this problem would have to bone up on police structures, legislation, the state of the justice system, prisons etc. It's too complex and arcane for non-specialists. But in a Social Policy Bond regime, crime rates would be explicitly targeted. Not spending on the police versus spending on prisons; not whether parents, schools, alcohol, drugs or the media are to blame. Not any number of genuinely difficult questions that even specialists cannot definitively answer. No; all the public would be asked under a bond regime is: "should we spend more reducing crime rates, given our other objectives, and if so, how much?"

Thanks to the market for Social Policy Bonds, and the mass of constantly updated information that their market prices would generate, people would also have a pretty good idea as to how much crime reduction they could buy for each marginal dollar.

Subordinating policy to outcomes has other benefits. One is that targeted outcomes would most likely be more stable than the views of ruling parties. They would be less subject to political interference or media images. This is critical for long-term goals, including global environmental goals.

### **3.2.2 Madness (2006-02-03 12:45)**

The 2002 reforms to the CAP mean that farmers now receive subsidies based on the historical value of the land and crops produced. This means that farmers who have retired or moved abroad since 2002 can still claim subsidies - often up to tens of thousands of pounds - provided they rent a hectare of land and meet the European definition of a "farmer" at the time of transfer. [1]

*Source*

It's not just the insanity, it's the persistence of it over the decades that makes one despair. Climate change, nuclear proliferation, genetic engineering mistakes ... what hope is there that we can tackle any of our serious problems if we cannot even stop corrupt, stupid and entirely self-inflicted disasters such as the Common Agricultural Policy, even after decades of solid evidence about its catastrophic economic, social and environmental effects?

### **3.2.3 Why I don't like Proportional Representation (2006-02-06 09:06)**

I don't like Proportional Representation because it widens the gap between ordinary people and the people who are supposed to represent them. It does this in several ways. First, it hands more power to the party hacks who compile the lists. They can make it impossible for people to vote out someone they don't like. Second, on all the evidence, PR gives more power to smaller parties, who use it irresponsibly. Third, many ordinary people simply can't understand complicated PR systems, such as New Zealand's Mixed Member Proportional system.

But most of all, I dislike PR because it institutionalises the corrosive assumption that a Member of Parliament can represent people only in their capacity as voters for a particular political party, rather than as citizens with interests beyond party politics. It's an assumption that entrenches widespread cynicism, because under PR Members of Parliament they can hardly be expected to question the party line: their party is after all their only important qualification for being an MP at all. Under PR MPs see it as their duty to represent only the people who voted for the party that employs them, and I think that's worse than what went on under first-past-the-post, where there was a hope, even an expectation, that Members would act responsibly on behalf of all their constituents. The theory and practice of PR entrenches the worst aspects of party politics.

SocialGoals.com

---

Anonymous (2006-02-08 09:43:00)

I like PR myself. It has disadvantages, but it's not as bad as disproportional representation systems. Let me comment on some of your objections.

You say that it gives more power to small parties, and that they often use it irresponsibly. This seems correct in practice, but I think it's a poor solution to just say that minority opinions don't count. The minority may be right, after all.

You talk about "citizens with interests beyond party politics", but what "party politics" means depends on whether those parties grew up in a FPTP system or a proportional system. Here, just about all issues are party politics. As voters, we have plenty of parties to choose from (as well as a quite realistic alternative of starting a party on our own, if that is necessary - one of the largest parties in Norway, FrP, is quite young), and we know what we get. We don't have to psychoanalyse each and every candidate to divine when they might vote for something other than what we want them to vote. And they do act responsibly on behalf of all the people - if that's what we want them to do! Sometimes that is the wrong thing to do.

As for widespread cynicism in PR systems, it seems to me there's a lot more cynicism in the UK and US, where they have disproportional systems, than where I live (Norway). But that's just my impression. Someone should do a multivariate analysis of factors affecting voter turnout.

PR systems don't have to be complicated, but we shouldn't underestimate the voters. They can get a simple choice, going with a party list, but they should also get the option of delivering a personalised list. We have that here, and it happens from time to time that a party favourite is rejected by the electors - but of course, the possibility of this happening is something the parties take into account when deciding the lists.

Ronnie Horesh (2006-02-08 10:30:00)

Thanks Harald, and much food for thought in your comment. I'm not saying minority opinions shouldn't count; rather that expressing them as votes for a specific political party can be unnecessarily divisive and strengthen political parties vis-a-vis ordinary people. But I take your point about whether parties grew up in a FPTP or PR system: perhaps my disillusionment with the New Zealand system is because it's new. To me it seems a shame that under the New Zealand system, once the votes have been counted, the decision about who shall govern is ultimately made by the leaders of parties doing deals in secret. Of course FPTP has its faults; perhaps it's because these faults are so obvious that they can act to restrain the excesses of 'elective dictatorships', rather like the inherited right to sit in upper houses ends up limiting their formal and informal powers.

Anonymous (2006-02-09 09:13:00)

"To me it seems a shame that under the New Zealand system, once the votes have been counted, the decision about who shall govern is ultimately made by the leaders of parties doing deals in secret."

Yes, that is to some degree a problem here, too. Usually, parties tell the voters which parties they are willing to govern with, and publicize a binding document of political cooperation ("Soria Moria" for the current coalition). Problems do arise when governments are felled mid-term, but they are to some degree limited, since most of the real power here is in the legislative branch anyway.

PR makes "weak" governments more likely, and I suspect this is the most important reason why some nations don't like it. But I feel that when the public is divided, government shouldn't be to strong; I think a weak mandate should give less power - that is not the case in the big FPTP countries.

### **3.2.4 Immigration and public policymaking (2006-02-09 11:47)**

Western governments, through laziness or incompetence, should be held partly responsible for such outrages as London bombings of last year and the current madness about the Danish cartoons. Why so, and what has all this to do with Social Policy Bonds?

First, western governments, by blocking imports of clothing, textiles, footwear and agricultural products, have made life difficult for would-be entrepreneurs in developing countries. They have done this over decades, and continue to do so, beholden as they are to their own corrupt politicians, self-interested subsidy-disbursement agencies, and big business corporates; all of whom are the real beneficiaries of perverse subsidies. The effects of these trade barriers are incalculable. (One[1] think-tank puts the human cost of the European Union's trade barriers alone at 275 deaths per hour, mainly in Africa.) They help to make life so unpleasant that the most rational option for energetic people in poor countries is very often to migrate to the west. Their migration can be legal or illegal, but either way it tends to be reluctant.

Second, western countries' immigration policies appear to be decided mainly not by ordinary people, but by a combination of big business (which wants low-cost labour) and ideologues in high positions (who say they believe in multiculturalism and are [2]possibly coveting senior jobs at the United Nations). But something as fundamental as immigration should not be left to these usual suspects.

Only under the current system, where policy is made for the few by the few, could billions of dollars be transferred annually from the poor to the rich, and the entire composition of our societies be transformed without reference to the wider public. Many in the west have no objection to immigration, provided people come to the west willingly and are accepted willingly. A Social Policy Bond regime would be a big improvement over the current system, in that it would most probably lead to the abandonment of trade barriers that enrich the wealthy and impoverish the third world and at the same time bring more people into the policymaking process. Immigration would still occur, but it would be of willing migrants and it would have the blessing of our existing citizens - something that would benefit the migrants and existing citizens alike.

Anonymous (2006-02-09 12:30:00)

Interesting, but how? What kind of bond do you imagine to solve immigration-related problems?

Ronnie Horesh (2006-02-09 13:16:00)

I think Social Policy Bonds could tackle higher-order goals, to which immigration policy would be subordinate. The bonds would clarify the distinction between ends and means of policy; these would be a matter for debate, but I believe immigration (I won't say 'immigration policy' because I don't think it's been coherent) has generally been driven by short-term considerations of government and corporates. Under a bond regime immigration policy would probably be secondary to higher-order priorities. For example; a government could issue Social Policy Bonds aggressively targeting low unemployment and low crime. That would probably lead to a more selective immigration programme than the targeting of economic growth (GDP) as an end in itself - which seems to be the *de facto* setting of most governments in the absence of any transparent, long-term goals meaningful to normal people. Of course, bond issuers might have other views. They might be upfront about their multiculturalism and target ethnic diversity as an end in itself. Or they might target inter-ethnic strife for reduction, on the basis that it's worse than other sorts of crime. I think it's more likely that Social Policy Bonds would see a focus on non-immigration issues, with immigration policy being subordinate to these.

### **3.2.5 Letting go (2006-02-12 09:51)**

[U]nless you 'inhibit' the stimulus, say, of sitting down or standing up, you react in the tense and distorted way which it is necessary to change. Wilfred Barlow, *The Alexander Principle*, 1973 (page 174)

Many of us carry tension in our bodies most of the time. Our bodies have adopted patterns of misuse that make it impossible to relax properly. We are constantly tense; in the back of the neck, shoulders, throat. If you're lucky you can have lessons in, for example, the Alexander Technique and re-educate the body to its proper functioning; but most of us haven't the resources to do that - or have so lost sight of our original unstressed state that we don't see any value in it.

Mentally too, we rarely stop thinking. There is very little space between one thought and another, and our minds are constantly chattering. Meditation is one way of calming the mind, of realising that we have powerful faculties other than thought - insight, intelligence - with which to approach life. But few of us rarely meditate, and thinking is dominant.

Thought is the response of memory, experience, knowledge. Knowledge, experience, memory, are always old and so thought is always old. Therefore thought can never see anything new. [1] Krishnamurti, *You Are the World*, 1972 (page 52)

Physically and mentally then, we are tense, preoccupied, under stress and have to re-educate ourselves to a relaxed, intelligent state. Most of us cannot or will not do that: it requires time out and goes counter to our established patterns of doing and thinking.

Is there a parallel in the world of policy? Not just in the way we approach issues, but in the self-entrenching features of policies that are inefficient? Perverse subsidies are costly, wasteful examples: these are policies that are hugely expensive, socially inequitable *and* environmentally destructive. Yet they persist. Democratic governments in Europe and US, beholden to the interest groups that fund them, lack the will or the ability to stop them.

But this sort of paralysis goes further. What is it that policymakers are afraid of? It's not saddling their citizens and the third world with disastrously wasteful and destructive policies, otherwise there would be no perverse subsidies. No, the worst thing that can happen to a policymaker is to be seen to try something new that doesn't work. Existing policies that are proven spectacular failures are fine. Tried and tested are the main justifications for existing policy. If they're tried, tested and failed, no matter.

Even more crucially, policymakers don't want to relinquish control. They're no different from us as individuals: whatever else we can say about them, we can't accuse them of being relaxed, unstressed and unhurried. They're constantly working and extremely reluctant to give up any part of their portfolio; as of course are their officials in the bureaucracies. They're becoming incapable of *not* intervening, just as physically and mentally, we're incapable of reverting to a switched-off equilibrium.

The result is that our insight, our great intelligence, is rarely brought into play in answering the big questions: how to end war, how to eradicate world poverty, how to deal with global environmental challenges such as climate change. Instead we get bureaucratic responses: tired old approaches that meet administrative requirements, more funding for established bodies and more control by government agencies. We get more centralisation and so more distance from real people, less diversity of approach, and less responsiveness to changing events.

With a nuclear-armed Iran or any of a number of looming potential catastrophes: a clash of

civilizations, climate change, genetic engineering mistakes, bioterrorism or whatever, the bureaucratic approach is not good enough.

Policymakers should think about backing off. Not completely: democratic governments are quite good at articulating society's wishes, and if they formulated policy in terms of outcomes, they'd be much better. They are also very diligent in raising revenue. But they are proven failures when it comes to actually achieving society's goals. For that we need inventiveness, intelligence and insight: those qualities, energised by a powerful incentive system, that have generated most of the world's wealth.

Social Policy Bonds would see government giving up control over *how* to solve our social and environmental problems. Government would still articulate our objectives and raise finance for their achievement, but bondholders, motivated by their financial self-interest, would actually do the achieving. Under the current system the bodies supposed to be solving our social problems don't have much incentive to do so. They certainly don't have incentives to try out innovative, imaginative solutions. A Social Policy Bond regime would change all that. Investors would be rewarded not for their activities, their celebrity status, media savvy or political astuteness, but for actually achieving society's goals. Just as we can learn to let go and so become more supple physically and mentally, so our policymakers, by giving up total control and issuing Social Policy Bonds, could profoundly improve our quality of life.

Hey R,

I've been a policy beureaucrat for about 6 months now and I'm getting institionalised already! and ur right about the 'how' to implement policy goals - its some thing I worry about - is what I recommend actually the right way ? Some of the stuff I get 2 cents input in scares me!

Ronnie Horesh (2006-02-12 23:21:00)  
jj! Good that you are questioning it...which means you probably won't get promoted. Let's have a chat over lunch or a pint. Is that Paris place still open?

### **3.2.6 Costs of doing business (2006-02-14 13:50)**

The [1]Doing Business website provides objective measures of business regulations and their enforcement. The Doing Business indicators are given for 155 countries, and give some idea of the regulatory costs imposed on business. New Zealand does well: it is actually named as best performer in the overall category of 'Doing Business' and is best performer in the sub-categories of registering property and protecting investors. Particularly interesting from my point of view are the costs, expressed in terms of average income of certain regulations. For instance: compare the costs of starting a business in sub-Saharan Africa compared with the OECD: 11 procedures, versus 7; 63 days versus 20; and 215 % of per capita income versus

6.8 %. Minimum capital requirements for sub-Saharan Africa and the OECD are 297 % of per capita income and 41 %, respectively. The website allows analysis of individual countries.

### **3.2.7 What happens when you subsidise big business? (2006-02-16 09:12)**

Small and independent shops may vanish from the UK's High Streets by as soon as 2015, politicians have warned. [1]BBC

How is big business subsidised? Our old favourite, the Common Agricultural Policy, has been shown overwhelmingly to benefit large agribusiness corporates and wealthy landowners. Central government also finances a transport infrastructure that heavily favours the large and global at the expense of the small and local. A - sometimes well-meaning - regulatory environment tries to deal with problems that are very often generated only by big business, but small businesses also have to comply at much higher proportionate cost. Large firms can more readily convert income into capital gains, and so pay lower taxes than most small business proprietors and of course the financial and administrative costs of compliance as a proportion of revenue are generally much lower for big businesses than small. The result can be seen in the high streets not only of the UK but of many other countries in both the developed and developing countries: small local businesses selling out to large, often trans-national chain stores.

We need reminding that it's not consumers nor markets that have led to this global takeover: it's government and big business scratching each other's backs.

### **3.2.8 How many synonyms for 'insanity' are there? (2006-02-19 12:30)**

From [1]Open Europe Bulletin, 17 February:

Retired farmers continue to collect CAP subsidies.

"This month the Scottish Executive published details of CAP payments to farmers for the first time. The Scotsman reported that recent reforms mean that nine people living outside Scotland who have retired from farming received a total of 177,000 pounds in 2005. (3 February) Aberdeen Press and Journal reported that Scottish Water received 170,000 pounds, part of which was an annual premium for a sheep flock sold off in 2002. A deer farmer from

Auchtermuchty was quoted saying, "It seems to me that this is the scandal to beat all previous Common Agricultural Policy scandals. It is widely known that there are hundreds of retired farmers who are nominally renting naked acres on barren hillsides that they neither visit nor do anything with and getting huge sums." (14 February) The third 'auction' of Single Farm Payments - the first of which have allowed people to bid for subsidies sold at around 2.5 times their value - is due to take place on 17 February, and a fourth on 3 March."

### 3.2.9 Current policymaking is limited (2006-02-22 11:52)

There is no doubt that mankind is taking over the reins of global geochemical balance. Industrial production of fixed nitrogen for fertilizer now matches the natural rate of nitrogen fixation on the planet. Rates of fossil-fuel CO<sub>2</sub> emission dwarf the natural rate of CO<sub>2</sub> release in volcanic gases. [1] Source

It is a real worry that mankind is now so dominant that the mistakes our governments make threaten our environment as well as our societies. Our intellects cannot cope with the enormous number of variables that make up a single human economy, let alone a global ecosystem. And policymaking, which will decide our ecological fate, has become an almost entirely intellectual process. It excludes insight and imagination and tends to rely overmuch on information that (1) is available and (2) is quantifiable. This is not always where where attention is most urgently needed, but it's an understandable tendency and, you may ask, what's the alternative?

My suggestion would be first to thrash out the outcomes that policy is being designed to achieve. Rather than try to anticipate what might, for instance, cause a global environmental catastrophe, I would first try to define the effects such a catastrophe might have, and then issue [2]Social Policy Bonds that target and reward the sustained *absence* of these effects. Just *how* a global catastrophe might come about cannot be anticipated by a limited number even of well-meaning government employees with a long time horizon - they are too few and their training is inappropriate. A bond regime would require that they have the humility to recognise this, and contract out the actual achievement of their targeted objective - the maintenance of positive aspects of the status quo - to the private sector.

It might sound outlandish, and indeed the Social Policy Bond idea probably does need discussion and refinement, then small-scale application, before it's applied on a global level. But the real question is: given that mankind does now control the global environment, how else is it to be managed?

### 3.2.10 The costs of subsidised parking (2006-02-26 05:33)

In the US city governments ... require developers to provide extensive off-street parking. ... The required parking lot at a restaurant usually occupies at least three times as much land as the restaurant itself. [1] Daniel Klein

reviewing [2] *The High Cost of Free Parking*

by Donald Shoup.

As Klein says, the extent of free parking is so enormous and so normal that people just think it nature's endowment, like air. Everyone feels entitled to free air and free parking. Hence, Shoup points out 'most people do not see it as being any subsidy at all ...Because parking costs so much and motorists pay so little for it, the hidden subsidy is truly gigantic.' Shoup estimates the value of this subsidy to parking in the US at between \$127 billion and \$374 billion a year.

If we also count the subsidy for free and underpriced *curb* parking, the total subsidy for parking would be far higher. . . Do we really want to spend as much to subsidize parking as we spend for Medicare or national defense?

The answer seems to be yes, just as we apparently decide to subsidise other aspects of car use, other forms of transportation and other environmentally destructive activities, including: oil-intensive agriculture, energy production (mainly in the developed countries) and consumption (developing countries), and over-use of water.

Actually, it's probably not as bad as that: these subsidy decisions are made without reference to ordinary human beings. They don't reflect our wishes; rather they result from a corporatist agenda, where the corporatists are government agencies just as much as big business. It's only because policy goals are expressed in terms of spending decisions, activities, institutional structures and priorities, and Mickey Mouse micro-targets, that the corporatists can get away with it. If they were to come clean and admit that one of their targeted policy *outcomes* was to subsidise the destruction of our planet, then it's unlikely, I think, their policies would be adopted so enthusiastically.

In an increasingly complex and interlinked world, I believe it's essential that government re-orientate its policies so that they reflect the wishes of real people. This means determining what broad social and environmental outcomes we wish to pursue and rewarding the achievement of those outcomes. Under a Social Policy Bond regime, the market would ensure that this achievement would be carried out with maximum efficiency.

---

David Jeffery (2006-03-07 06:00:00)

Like the blog. 'Free parking' is one of those seemingly very innocuous but actually pretty damaging subsidies. I read a study recently which suggested that the number of employees using public transit or carpooling was more than a third lower at companies that provided free parking for their workers. Surely there's cheaper, better and more responsible perks you can provide your employees than that.

Ronnie Horesh (2006-03-07 09:40:00)

Thanks David. I agree.

## 3.3 March

### 3.3.1 We care... about selling dog food (2006-03-01 11:27)

In an uncertain, changing world, most decisions are wrong, and success comes not from the inspired visions of exceptional leaders, or prescience achieved through sophisticated analysis, but through small-scale experimentation that rapidly imitates success and acknowledges failure. This disciplined pluralism is the true genius of the market economy. [1] *The Centralised Road to Mediocrity*, John Kay, 'Financial Times', 28 February

It's unfortunate that this true genius is mainly channelled into improving the sales and profits of private corporations. There's probably more ingenuity lavished on TV commercials for dog food than on solving global problems, such as how to end nuclear proliferation, bring peace to the Middle East or eradicate world poverty. There's certainly a stronger correlation in the private sector between the achievement of a goal and the financial rewards to those who achieve it.

Where centralisation can help is in articulating society's wishes. It's also a good way of raising revenue from countless individuals who cannot themselves do much to bring about social and environmental goals. But it fails when it comes actually to achieving those goals. That's why I propose a Social Policy Bond regime, which would combine the best features of centralised decision making with the pluralism of markets. Under a bond regime, diverse, adaptive approaches would be encouraged - a contrast to the stultifying and failing centralised ways in which we are currently trying to solve global problems. Self-interest would be channelled into the public good and our limited problem-solving resources would be allocated rationally. In absolute terms, dog food commercials would still be entertaining and effective under a Social Policy Bond regime - maybe even more than nowadays - but their *relative* effectiveness, when compared with campaigns to achieve *society's* social and environmental goals, would surely diminish.

### 3.3.2 Kyoto will fail because it's central planning (2006-03-03 10:12)

Reviewing [1]*The Weather Makers*, by Tim Flannery, [2]*The Economist* writes:

'[Tim Flannery] mercilessly dissects the alternatives [to Kyoto] —particularly the idea of replacing hydrocarbon fuels with hydrogen, which he regards as expensive and probably technically unfeasible. And he dismisses the hydrogen-economists' idea of "sequestering" the carbon dioxide generated underground or in the oceans as both impractical and environmentally catastrophic. The answer, according to Mr Flannery, lies in revamping the way electricity is generated. That means abandoning coal, the most carbon-intensive fuel around, and employing sunlight, wind, geothermal power (which he believes is an underappreciated resource) and also nuclear power. Having done that, the problem of dealing with petroleum-consuming transport becomes one of storing electrical energy in a sufficiently dense form that vehicles can use it. Here, he thinks, hybrid petrol/electric cars point the way forward.'

That's a good summary of the alternatives currently on offer and for what it's worth I agree with most of it. The problem is that it's one man's view and one man, however well-informed, cannot possibly investigate every alternative to Kyoto, nor anticipate future technology, nor take into account our rapidly expanding knowledge of the causes and consequences of climate change, nor the ever-changing economics of climate change, its prevention and mitigation. As a statement of where we are it's fine. As a prognosis for the future it's as dangerous as Kyoto, and that's as dangerous as the central planning that brought the Soviet Union to its knees.

Policymakers need a certain humility. Climate change is a potential catastrophe, and policymakers can help us deal with it. But they are as poorly placed to tell us *how* to deal with it as the Soviet or Chinese central planners were when they thought they knew best how to stimulate economic growth. Kyoto assumes that it knows what's causing climate change - anthropogenic greenhouse gas emissions - and on this it may well be right. But it's short-sighted to then assume that the only feasible way of dealing with the problem is to cut these emissions. If Mr Flannery's alternatives were prescriptive they would be similarly misguided. The best cost solution will be an array of diverse, adaptive approaches, which cannot be pre-judged by any single person or institution, however well-funded.

A [3]Climate Stability Bond regime would not prejudge the most likely solutions to the climate change problem; it would not even prejudge the size of the problem. Instead it would allow the market to judge the scale of the problem and to allocate resources to most efficiently achieve whichever climate stability target policymakers agree we should aim for. The anti-market approach led to the environmental disasters of the Soviet Union. And the anti-market approach, in the shape of perverse subsidies to energy, agriculture, water and transport is also responsible for a great deal of today's global environmental degradation. Markets are not perfect, but their inventiveness and efficiencies can be channelled into the public good. Climate Stability Bonds would create incentives to solve what is probably our most urgent environmental problem. Kyoto will fail because it's central planning, which stifles efficiency, imagination and inventiveness.

Anonymous (2006-03-09 09:03:00)

I've probably said it before, but I think the idea needs testing out in practice before you apply it to critical issues.

And also, reducing greenhouse gas emissions is so obviously necessary that if it didn't become a part of the solution in a social bonds regime, I would consider it proof that the idea is flawed.

I can put it like this: I am strongly convinced that reducing greenhouse gases is necessary, I am not so strongly convinced that social policy bonds would work.

A problem, which I may have also pointed out before, is that to make climate stability bonds a viable solution, there has to be a lot of them, enough to make them preferable to business as usual. That is a problem, because there's no doubt that business as usual will be extremely profitable (for some) in the short run. And I have to ask: offering industry a part of the climate bonds payoff in order to keep them from polluting - is that not like bribery? Shouldn't such antisocial behaviour be regulated by laws, and not paid off?

Harald Korneliussen

Ronnie Horesh (2006-03-09 10:01:00)

Thanks Harald for your comments, which I shall take in turn.

*I think the idea needs testing out in practice before you apply it to critical issues.*

I agree absolutely. It would be best to try it out at first on small self-contained issues, such as the water quality of a river or lake, or crime rates in a particular city. The idea needs discussion, application then refinement before it can be deployed to solve global problems.

*reducing greenhouse gas emissions is so obviously necessary*

I certainly agree emissions should be reduced, but *not necessarily because that is the best way of tackling climate change*. I'd say they should be reduced because their social and environmental costs (including any effect they have on the climate) are not internalised: in other words, these emissions impose social and environmental costs not borne by the polluters.

If we are talking about just the effects of emissions on climate I'd not be so dogmatic. Rather than reduce emissions it might be cheaper to remove the gases from the atmosphere, for instance, or of course there are many other possible solutions to climate change, which will not at all be encouraged by the top-down Kyoto approach.

And has there been robust analysis showing that the benefits to the climate of reducing emissions will outweigh the costs? Remember that many - perhaps most - of these costs will fall on those least able to adapt: most likely large proportions of the population in developing countries.

*to make climate stability bonds a viable solution, there has to be a lot of them, enough to make them preferable to business as usual*

Sure, or to be a bit more accurate, the total redemption value of the bonds would have to be significant. Note though (1) that the bonds could complement existing efforts and (2) the funds could be supplemented by contributions from government or anybody else throughout their lifetime. In my book (forthcoming), I go into more length about the extremely valuable information generated by bond prices, and changes in bond prices, which would help the bonds' backers decide whether to issue more bonds after the initial float. (Let me know Harald, or indeed anybody reading this, if you'd like me to email you my text on this - it's a few pages in MS Word.)

*offering industry a part of the climate bonds payoff in order to keep them from polluting - is that not like bribery? Shouldn't such antisocial behaviour be regulated by laws, and not paid off?*

It's not black or white that factories that emit pollutants are engaging in antisocial behaviour. They might be generating many positive as well as negative externalities. If their pollution is illegal then I agree they should be tackled by the law. But what about behaviour that is not illegal, and that is partly antisocial and partly pro-social, like a typical factory in a non-corrupt part of the world? Bondholders would have powerful financial incentives to seek out those factories that pollute most and (1) see whether they are in fact complying with the law and if they're not report them to the authorities, and (2) if they are operating legally, offer a subsidy (bribe) to install cleaning equipment, or to reduce its output, or close down completely.

Note that bondholders will also have incentives to lobby for more stringent laws, and to monitor all factories etc for their compliance with the laws. Note also that this sort of bribery already goes on: owners of dirty cars are often rewarded for trading up.

### **3.3.3 No, I'm not bitter (2006-03-07 09:33)**

Private sector operators have objective measures of their success: profits or sales, survival or expansion of their enterprise. When there's no objective measure of achievement, as in most government activities, anything will do. Sometimes the gap is filled by a plethora of Mickey Mouse micro-targets, usually thought up in response to media stories: hospital waiting lists, for example, which administrative staff become adept at massaging to look better than they are. In the branch of the New Zealand public service for which I used to work, middle managers 'succeed' by implementing a restructuring. Nobody monitors these numberless restructurings to see if they actually enhance performance. That's partly because performance itself means little more than toeing the line, ticking off 'to-do' items dictated by politicians: certainly in New Zealand and possibly in the UK, the status of top civil servants has been eroded, even as their pay has increased rapidly. Typically they now work under short-term contracts. Strategy, if it's considered at all is up to the politicians, in the very short intervals when they are not fire-fighting, campaigning or asleep.

Adherence to an ideology, and gesture politics are other stand-ins when there are no other criteria by which to judge success or failure. I think that's one reason market solutions are virulently opposed when applied to the achievement of social and environmental goals. I talk to quite a few well-meaning people who instinctively react against the Social Policy

Bond principle, simply because bondholders, be they institutions or people, would make a profit if they help achieve social goals. Ideological soundness trumps effectiveness every time.

I used simplistically to summarise Social Policy Bonds as 'right-wing' methods of achieving 'left-wing' goals. In my naivety I thought such a description would appeal to the ideologues on both sides. But being an ideologue in the field of public policy seems to be more about bonding with your cohorts and uniting against non-believers than actually achieving public goals. The result? Social Policy Bonds end up appealing neither to the left or the right.

And so it goes on: major global challenges: climate change; nuclear proliferation; conflict in Africa and the Middle East; all are now entirely politicised. The last thing anybody cares about are the interests of real people. Policy is subordinated to ideology, appearances, and meaningless bureaucratic processes - just as in national politics. Where self-interest does operate in the public sector it takes the form of venality. Social Policy Bonds were devised as a way of channelling self-interest into the public good. Under the current regime self-interest actually works *against* our global survival, just as it already cripples the prospects of many countries in the third world and has condemned millions to death in futile conflicts.

### **3.3.4 Another Mickey Mouse micro-objective (2006-03-10 11:02)**

From today's [UK] [1]*Daily Telegraph*:

A senior surgeon has made a public apology to patients whose operations are being postponed - because he has been too efficient. Peter Cox, a general consultant surgeon at the West Cornwall Hospital, Penzance, and his colleagues have been told to slow down by the local health authorities. Not only has Mr Cox met the current six-month waiting list target but he has surpassed it. As a result, more than 50 of his patients are being sent letters telling them that their surgery dates will be put back. ... The directive has come from the Primary Care Trust for the next financial year. [Mr Cox said:] "They have informed the Royal Cornwall Hospitals Trust that they will not pay for routine operations unless the patients have waited at least 18 weeks from the time that they were put on the list."

This is what happens when instead of broad, social and environmental objectives that are meaningful to real people, you target Mickey Mouse micro-objectives devised by bureaucrats.

### 3.3.5 Government by the rich, for the rich (2006-03-12 08:59)

Today I chatted with a friend who recently spent a couple of days in San Francisco. One impression was the large number of beggars and homeless people on the streets of that city. They'll be comforted, no doubt, when old copies of this week's [1]*Economist* descend to their level, to be reminded of their mayor's policy priorities:

"We will not stop until every San Franciscan has access to free wireless-internet service." It was a typically bold statement from Gavin Newsom, the charismatic young mayor of San Francisco, as he announced plans in October 2004 for a Wi-Fi network that would blanket the city with wireless-internet coverage.

### 3.3.6 Social Policy Bonds: the book (2006-03-14 10:03)

I have finished updating a draft of my core text on Social Policy Bonds: *Injecting incentives into the achievement of social and environmental outcomes*. The first three chapters are available as a pdf file (254 kB) free of charge [1]here. The basics of the Social Policy Bond mechanism are described in chapter 3. Comments are welcome. Having failed to interest mainstream publishers in the past, I will not try too energetically to get this book published, but I will make a final version available soon as an e-book from the [2]Social Policy Bonds website. Anyone who has bought any of my books in the past is welcome to email me for the full text of the current update, free of charge. I will post the remaining chapters on this blog, so devoted readers will be able to pick up the entire text (40 000 words) at no cost. Any prospective publishers are also welcome to contact me directly.

### **3.3.7 Incentives and the developing countries (2006-03-17 11:39)**

In my latest book on Social Policy Bonds (first three chapters [1]here) I point to perverse subsidies as the only really compelling evidence that governments in the western world can and do implement policies that damage the finances, social fabric and physical environment of their citizens. It's the persistence of these policies, given the longstanding evidence of their failure, that indicts them and casts a shadow over all government activities.

For countries outside the privileged west, though, we don't have to search hard for evidence of policy failure. Wars, civil wars, environmental depredations, and relentless poverty are commonplace. There's more democracy than there used to be, but it's clear that if governments were genuinely concerned about the fate of their populations they could do a lot better.

There are many thousands of dedicated westerners who devote themselves to improving the quality of life of people in the developing world. It's unfortunate though that the financial incentives on offer do not match the contributions they make. Financial incentives are important, not because would-be benefactors of the poor are greedy, but because they are human beings who want to do the best for themselves and their families, and if they can earn more for designing alluring packets of dog food than running an eye clinic in Ethiopia, then they will respond rationally and take the dog food contract. It's not greed, just as it's not greed when we make a decision to save a few cents by using a coupon to get a discount on dog food from the supermarket.

Life in the third world won't improve until the incentives change. Improving the incentives to achieve meaningful outcomes for the poor in the third world would not only motivate people more powerfully (or allow them to recruit agents and motivate them more effectively) but would enlarge that pool of people.

Fortunately we can do something about that. If we're wealthy, or have wealthy friends, we could back and issue our own Social Policy Bonds, perhaps swelling any redemption funds by encouraging contributions from the public. If you're interested, have a look at [2]this document, which is an 18-page pdf file that takes female literacy as an example of how we in the west can bring about better outcomes in the developing countries.

### **3.3.8 Subordinate organisations to objectives, not vice versa (2006-03-19 08:21)**

Take any social or environmental problem that a government, local or national, decides must be solved. In many cases some government agency will have the job of solving the problem. However competent and well-meaning are the individuals who work for this agency, *as an organisation* the agency will generally have little or no financial incentive to minimise its costs.

However, the government could decide to contract out solution of the problem. It could do this by carefully specifying the outcome it wants to achieve, and putting a contract out to tender. This would be much better than, as is more common, specifying tasks that must be undertaken and paying on completion of these tasks. Rewarding outcomes transfers the risk of failure from the government (tax- or rate- payers) to the private sector, but only if the successful bidder cannot simply go out of business and plead bankruptcy if it fails to complete the contract.

Better would be a tradable contract to achieve an outcome, which could be bought from a failing company by people to whom it would be more valuable because they believe they are better placed to achieve the outcome efficiently.

But perhaps best of all would be to issue Social Policy Bonds, which would disaggregate the contract, making it much more fluid. Rather than being limited to a single successful bidder, the contract to achieve the outcome would then be dispersed amongst a coalition of interests, bondholders, whose composition could constantly adapt to changing circumstances. The existence, structure and goals of this organisation would be subordinated entirely to the targeted outcome. In this way government could specify longer-term, more ambitious social and environmental goals than is possible currently, when the scope of its goals is severely limited by the scope and objectives of existing problem-solving agencies, whether they be government or private.

•

See this [1]holding message from the New Zealand Minister Responsible for Climate Change issues, in response to my suggestion that [2]Climate Stability Bonds be considered.

### 3.3.9 Don't despair (2006-03-20 09:32)

There's a lot of human ingenuity that is currently *not* being channelled into the solution of our most urgent social and environmental problems. What's it doing instead? Developing a five-blade razor, for example, which apparently cost Gillette about the same as creating the three-blade razor, according to this [1]source. That's about US \$680 million, which represents a lot of skill and talent. Unlike some ideologues I don't think it's self-evidently 'wrong' that such sums are spent on products that might seem trivial. People after all are behaving rationally given the incentives on offer. The good news is that all it would take is a re-jigging of incentives for these people's skills and talents to be made to serve public goals instead of private ones. We need to get over our ideological hang-ups that decree that financial self-interest and the chance to get rich must be limited to people working in the private sector. By issuing Social Policy Bonds we could switch a significant proportion of human ingenuity away from developing, say, a six-blade razor, and into achieving more social goals.

### **3.3.10 Flying blind (2006-03-24 09:46)**

SIR - The results reported by the Office of National Statistics on measuring productivity in the National Health Service do indeed demonstrate that a wide variety of estimates are possible depending on the inputs and outputs used and the assumptions made about them (“[1]Take your pick”, March 4th). The reality is that, at present, there is no accepted measure of the value of total NHS output and comprehensive data to calculate one does not exist. ...

This letter from the UK’s national statistician appears in the current [2]*Economist*. It tells us that billions of pounds of taxpayers’ money are spent without a clue as to how many billions are being wasted. If there is a debate, it’s over the measures of inputs, outputs and assumptions. Nobody dare tackle the fundamentals. The UK’s National Health Service has iconic status, rather like the principle of non-selection in state schools. The ideologues and public sector unions in both cases stand like road blocks in the way of anything except the most trivial reforms.

A Social Policy Bond regime would not take as a given any ideology, nor the vested interests. It would instead start with broad social goals, including targeted outcomes for physical and mental health. It would not assume that a National Health Service or even a government-run agency is the best solution. It might decide on a safety-net type insurance scheme for every citizen; it’s quite possible it would allocate a lot more funding to preventive medicine. It would have no incentive to obscure measurement of how well it’s doing by putting off debates about how well it’s doing until 60 years after its founding. On the contrary, bondholders would have every incentive to measure their progress accurately, because in maximising their returns they would also maximise returns to the taxpayers’ investment.

### **3.3.11 Ideology blights medicine, not just policymaking (2006-03-25 14:42)**

If you think that medicine and publications such as [1]*The Lancet* rise above ideology, read [2]this post by Dr Mike Eades, and think again. Without going into detail, it appears that some doctors believe in low-fat diets and others believe in low-carb diets, and that these doctors’ beliefs impede impartial scientific investigation. In medicine then, as in policymaking, ideology gets in the way of rational decision-making. Ideology should not drive medicine and it should

not drive policymaking. Ideologues cannot help but distort facts and respond inadequately to events. Outcomes, not ideology, should drive policy.

### **3.3.12 Policy priorities (2006-03-28 09:30)**

Much wailing and [1]gnashing of teeth here in New Zealand in reaction to our team's apparently less than stellar performance at the Melbourne Commonwealth Games. Like everything else these days it becomes a matter of government policy. Or rather, like all the other stories that the media decide to run with - which are not at all the same as those things that matter to the public. Now I'm not saying here that the media are engaged in some vast conspiracy to manipulate the public. I am saying that when it comes to making public policy it would be better to ignore the short-term priorities of the media.

Many of the crises facing New Zealand and the world are too slow-moving for tv or the newspapers. Climate change, social collapse, and the piling up of armaments, for instance. When these three challenges alone are so enormous and potentially catastrophic, there seems (to me) something wrong with a government - any government - that spends its time and our resources reacting to frivolous media stories. Don't get me wrong: frivolity and sports are fun; but I do question whether the attention they get from policymakers truly reflects public concern. Perhaps if the public had a chance to participate actively in government policymaking, we'd see some sensible policies for dealing with urgent problems. Instead, the media's obsession with sport and government's pandering to this obsession are symptomatic of the remoteness of governments who have no real objective aside from continuing in power.

Under a Social Policy Bond regime, only broad social and environmental goals that are meaningful to natural persons (as distinct from government agencies and corporate bodies) would be targeted. Ordinary people would be drawn into the policy formation process, because we understand outcomes. (The media realises this and brings up issues - like medal tallies at international games - that are vivid and visual, but very often trivial.) What we don't and don't want to understand are arcane decisions about funding for myriad government agencies, the restructurings that seem *de rigeur* for every government department every couple of years or so, and the Mickey Mouse micro-targets devised by bureaucrats that do nothing for real people. With such ploys, government has widened the gap between itself and the people it's supposed to represent.

Two hundred years ago, when the United States was a modest commercial republic, the president could take a walk down Pennsylvania Avenue—by himself—and talk to anyone who approached him. If he wasn't on a walk outdoors, he was most likely at home, and you could speak to him by knocking on the door of the White House and presenting yourself. ...

Today? The president moves about like Caesar Augustus, with a vast, graded court of civil and military aides, doctors, secretaries, valets, hairdressers, makeup artists, bodyguards, drivers, baggage handlers, cooks, food tasters, Praetorian guards, snipers, centurions, bulletproof limos, a portable hospital, and an armored rostrum. And that's when he travels in the U.S. [2] Source

### 3.3.13 Gesture politics or meaningful outcomes? (2006-03-30 12:14)

The Kyoto treaty is ... the quintessential expression of the higher multilateralism: the point of Kyoto is not to do anything about "climate change" but to give the impression of doing something about it, at great expense. If climate change is a pressing issue and if the global economy is responsible - two pretty big "ifs" - then Kyoto expends enormous (diplomatic) energy and (fiscal) resources doing nothing about it: even if those who signed on to it actually complied with it instead of just pretending to, all that would happen is that by 2050 the treaty would have reduced global warming by 0.07 degrees - an amount that's statistically undetectable within annual climate variation. [1] Source

Thank you Mark Steyn, for stating the obvious. Sometimes I think I'm the only one inveighing against the gesture politics that manages to waste resources, polarise issues and achieve nothing. I think climate change is more pressing than does Mr Steyn, but [2]Climate Stability Bonds would be the least-cost way of dealing with it *regardless*: the market would decide how much should be spent on stabilising the climate, and where to direct resources. Under Kyoto, it's a handful of bureaucrats who would make those decisions based entirely on today's fossilised scientific knowledge.

As Mr Steyn says, it's not just climate change. When it comes to many other policy decisions, outcomes that are meaningful to real people seem to be the last thing that's considered. Decisions are made by politicians or bureaucrats, and they embody political or bureaucratic goals: retention of power and institutional survival, first and foremost. There's a disconnect, in our complex, highly specialised societies between the government and the governed. In [3]New Zealand and possibly other countries, the proliferation of ministerial policy advisors and tacticians, and the effective downgrading of the civil service, mean that strategic policy formation insofar as it happens at all, is more and more done by the politically committed; that is, by people whose incentive is to serve narrow party political interests, rather than the national interest. Politicians are becoming a caste, a priesthood, from which ordinary mortals feel excluded. Symptomatic are electoral apathy and cynicism.

A Social Policy Bond regime is one way in which ordinary people might reclaim interest

in policy formation. Such a regime would take as its *starting point* broad meaningful social and outcomes.

## 3.4 April

### 3.4.1 Transport targets should favour pedestrians (2006-04-03 09:41)

Even relatively enlightened agencies don't really know what to do for pedestrians. Road congestion, because it's more visual, seems to drive transport policy, even for enlightened local authorities. Here in New Zealand the Greater Wellington Regional Council has proposed its 10-year plan entitled[1] A Sustainable Region. I approve of the plan's designating clear, explicit and (mostly) quantifiable targets to be achieved by 30 June 2016, for the environment, water supply, parks etc. Its transport targets included these:

- At least 80 % of all trips up to 1 km and 60 % of all trips between 1 and 2 kms will be walked or cycled (74 % and 19 % respectively in 2004; and
- Average congestion on selected roads will remain below 20 seconds delay per km travelled despite traffic growth (currently 20 seconds delay per km).

My submission was:

" Making Wellington more pedestrian-friendly would be better for the environment and people's health. It would make Wellington city centre more vibrant and more pleasurable for shopping and walking in. My main quibble is with your congestion objective. Car drivers inflict huge social and environmental costs on all of us. They are not charged per km travelled, so about the only check on car use is congestion. The objective of reducing congestion could be used to justify more road building, but car users are already over-catered for in Wellington. If you doubt this try crossing Taranaki St at Courtenay Place, or just see how little time pedestrians get to cross the road at any junction. Wellington should be a great walking city, but cars get priority over pedestrians at all junctions. Not only that, there is little law enforcement, so cars get away with dangerous life-threatening manoeuvres all the time. Reducing congestion without any law enforcement will simply lead to more car use, more deaths and injuries, and reduced walking.

As for cyclists: in the city centre, they are frankly a menace. I would approve of measures to cater for responsible cyclists, but merely making increased cycle use a target without

any such measures and without any more law enforcement would further imperil pedestrians.

A further point: I hope you will consider introducing a scheme that will favour buses at traffic lights, which would speed up their journeys and help fulfil the public transport objective.

So my pleas can be summarised thus:

1. Give higher priority to pedestrians and buses on the city's roads.
2. Curb car-driving, perhaps by charging for using the city centre's roads and making it more pleasant to walk and use buses as per my point 1.
3. Introduce some effective law enforcement against irresponsible car-drivers and cyclists who constantly get away with performing illegal, dangerous manoeuvres making life - literally - difficult for pedestrians.

Thanks for the opportunity to submit. "

### **3.4.2 Exactly! (2006-04-04 10:54)**

Tim Coates, a former head of Waterstone's (a book store), is trying to persuade the British Government to spend more on books for libraries. [1]His comments on the UK are worth quoting at length (my emphasis):

Half the management in this country is public sector. The rules are different: income does not depend on judgment, efficiency or performance; cash is available; there is no such thing as bankruptcy and nor are there the disciplines, anxieties, skills and systems which are used to avoid it. Employment is secure and very well paid. Projects thrive on persuasive plans but **rarely on actual outcomes**. To a private sector manager, the regime is unfamiliar.

We have become used to the idea that only a small portion of charitable donations reach their intended recipients; we should get used to the idea that the great part of the money we thought was for public service will never reach any public beneficiary. We live in an economy which is the travelling equivalent of a crowded roundabout. Huge amounts of public funds travel on a journey which goes nowhere in an unpleasant and wasteful manner.

For seven years I have studied the public library service in both central and local government where most of the operation is managed. This is a £1.2bn pa operation which has no accounts, no boards of directors, no planning or budgeting,

no measurement of performance and no management of the kind a garage mechanic would recognise. It is a disaster from the tip of its branches to the lengths of its ancient roots. Use of the service has fallen to half its rather successful level of twenty years ago and no one can even agree whether that is a good thing or a bad one. No junior manager learns the basic skills of "yes" or "no" from his senior because he, or she never learned those skills either. The operation is a national disgrace and nobody even knows.

We have an extremely and potentially devastating problem of the economy in this country and it is the management of public sector activities. We worry about political incompetence, global warming and the management of our soccer team. We should be sensible and start worrying about the management of public services. That really is frightening.

### **3.4.3 The CAP is killing Europe as well as Africans (2006-04-06 10:32)**

For dealing with illegal immigrants from Africa:

[t]he EU's official strategy also involves tackling the European black market, and sending large dollops of aid to Africa to 'create better conditions of daily life' in migrants' countries of origin, and to encourage transit nations like Mauritania to shut down migration routes. [1] Source

A better solution would be to allow free trade between the EU and Africa. This would mean dismantling the Common Agricultural Policy and other trade barriers that do so much to keep Africans poor (or [2]kills them). It would give Africans a chance to develop without having to leave their cultures (and in many cases, families) behind. It would mean that the only immigrants into Europe would be *willing* immigrants. What chance is there of that happening? With France still in the EU and still, shamefully, being allowed to blackmail the rest of Europe into submission the chances are precisely nil.

### 3.4.4 Nature therapy (2006-04-06 13:08)

Referring to the communities in which 75 million Americans live, [1]Richard Louv says:

Try to put up a basketball hoop in some of these communities, let alone build a tree house. The message to kids and parents is very clear: nature's in the past. It doesn't count anymore. The future's in electronics. The bogeyman lives in the woods. Playing outdoors is illicit and maybe even illegal.

It's an important topic. As the introduction to Louv's interview says, 'after tens of thousands of years of children playing and working primarily outdoors, the last few generations have seen such interaction with nature vanish almost entirely.' Louv argues that this has incalculable implications for children's physical and mental health, and for the future of environmentalism. At last research linking nature to healthy child development is starting to be investigated.

What does this have to do with Social Policy Bonds? Conventional ways of trying to solve health problems such as Attention Deficit Disorder or vaguer feelings of anxiety and depression involve specific, targeted, treatments, which can be biochemical, psychological or psychiatric. There's very little interest in trying to *prevent* such problems because there are no institutions that can benefit from doing so. The massed ranks of drug companies, psychologists and psychiatrists, while they *individually* may suspect that 'nature therapy' can invigorate communities, do not belong to organisations that can act on that suspicion. There are no incentives in place to prevent health problems by living closer to nature. Government-run health services are influenced by narrowly-based interest groups. Something as diffuse, unprofitable and poorly researched as nature therapy stands little chance of becoming policy under the current set-up in most countries.

A Social Policy Bond regime would be different. Society would target broad physical and mental health goals. Bondholders would have powerful incentives to seek out whichever ways of achieving these goals will maximise benefits per dollar outlay. There would be no prejudices in favour of existing ways of doing things or existing institutions and lobby groups. Existing studies already show that 'prisoners in prisons, people in the infirmary - those who have a view of a natural landscape heal faster.' A Social Policy Bond regime would act on such research, rather than be sidetracked into safeguarding vested interests.

### 3.4.5 Goals must correlate with welfare (2006-04-09 13:17)

[1]The Cruncher (February) is wrong to conclude that the [UK's] N[ational] H[earth] S[ervice] comes out poorly just because British five-year cancer survival rates are lower than in other countries. An alternative explanation is that Britain does not waste money on extensive testing procedures for diseases it cannot cure. For such

diseases, and many cancers are among them, earlier diagnosis merely serves to raise the number of years between the identification of the disease and death—it does not affect expected mortality. [2] Peter Sugarman [3]

This illustrates the danger of relying too heavily on seemingly appropriate but overly narrow indicators, whether under the current regime of micro-managed Mickey Mouse indicators devised by bureaucrats, or under a Social Policy Bond regime. We need, as a society, to think very clearly about the role of government and what we want our taxpayer contributions to achieve. These decisions today are largely made by lobby groups, corporate interests, politicians and bureaucrats whose over-riding goal is to retain power. A Social Policy Bond regime would express its objectives in terms of meaningful outcomes, which would be discussed and refined rather than, as now, falling out of long, complex, inaccessible, administrative procedures.

### **3.4.6 'I don't know what to do' is not good enough (2006-04-12 09:07)**

Nuclear weapons under the control of the current Iranian regime are scary. Is there anything we can do apart from try to distract ourselves or take the fatalistic approach? Well yes there is. We could issue Nuclear Peace Bonds. To do this we'd have to be prepared to contribute or raise funds that would be paid out if there were no use of Iranian nuclear weapons over the next, say, 10 years. The bonds could carry provisos stipulating that certain other, slightly less scary scenarios, would not be played out: for example, conventional military action resulting in large numbers of deaths.

That's just an idea, but it does show that we do not either have to continue to disengage from the political process, or pretend that these challenges don't concern us or that we can and should do nothing about them. Of course, some of our lethargy is because we feel powerless in the face of large-scale problems like Iranian nukes, or climate change, or other potential catastrophes. But we are not as powerless as we think. We might not know how to respond, but Social Policy Bonds give us a means by which we can *contract out the response* to those best able to meet whichever problems we target. For more on issuing your own Social Policy Bonds take a look at this 18-page pdf [1]publication, which takes the example of bonds promoting female literacy in Pakistan. We don't have to know all the answers. All we need are concern, and access to enough cash to motivate others to find the answers.

### 3.4.7 Social Policy Bonds aren't perfect (2006-04-17 10:19)

It's difficult to specify in quantifiable terms exactly what we want, when 'we' are society acting through a government. It's even quite difficult to do so as individuals. For most of us, happiness cannot be readily expressed as a list of numerical indicators. We should probably all feel happier with *incremental* increases in bank balances, salaries, or years of healthy life, but for most of us our overall level of happiness is more a state of mind than a list of numerical circumstances.

This makes specifying targets for a Social Policy Bond regime difficult. Take something that seems readily quantifiable, such as climate change. Critical questions immediately arise: do we want to mitigate or prevent climate change? climate change is likely to increase flooding, drought, storms and (in some countries) food shortages - would we be better off targeting these detrimental human outcomes, rather than climatic variables? But then what about the entire global ecology - is it to be valued solely in terms of the services it provides to humans?

Important and difficult questions to be sure, but *exactly the same questions arise however we attempt to address climate change*. When decision-making on behalf of our large and complex economies, let alone at global level, we do unfortunately have to look at quantifiable measures of success, otherwise we cannot reliably monitor how well we are doing. Gone are the days when a government could, for instance, recognise that Ms A receiving unemployment benefit (say) does in fact benefit from such a payment, while Mr B's long-term interests would be best served by putting some pressure on him to find a job. Perhaps the necessarily out-of-touch nature of a big, remote, government, and its expanding role in our lives, has something to do with our [1]endemic anxiety and depression.

There are no simple answers, except perhaps to note that it's mostly at lower levels of income, nutrition, wealth, or environmental status, that well-chosen numerical variables correlate most strongly with what most of us would consider improvements. Social Policy Bonds are not perfect: they don't avoid this difficulty. In fact, they entirely subordinate policy to specified, targeted, quantifiable outcomes. While this can be irksome, especially to those who benefit from unspecified, obscure or mutually conflicting goals under the current regime, it's actually an advantage from society's point of view. Under a Social Policy Bond regime, hard decisions about what we want to achieve could not be ducked, as at present: they would, in fact, have to be made explicit to all of us, right at the beginning of the policymaking process.

### 3.4.8 The law of social diversity (2006-04-19 11:43)

It appears that as in the natural world, our social world requires symbiotic and complex relationships to produce a healthy system. ... "Now why should that be? [Steve] Rayner [of the Pacific Northwest National Laboratory] asks. "If you have only hierarchy, like in most governments and in business, and something goes wrong or you

encounter a new situation that's not working, the only solution available to you is more hierarchy."

This quote (and the title of this post) is from [1]*Naked Ape to Superspecies*, by David Suzuki and Holly Dressel. More and more, it seems to me, our way of doing things at the national or global level is a projection of the way our individual intellects work. We find it difficult to relinquish control, whether to markets, the 'vibrant civic society' that Adam Smith saw as a precondition for successful markets or, at the individual level, to our instincts or insight. The complexity of our social and environmental problems is simply too great for a single organisation, however large, to grasp. We need diverse, adaptive solutions, not top-down, one-size-fits-all, fossilised approaches. Humankind has tremendous ingenuity, but much of it is devoted to frivolous pursuits - tv commercials for dogfood - at a time when our planet and social systems face alarming crises.

Social Policy Bonds would channel our ingenuity into the public good. People would have powerful incentives to solve social problems, and their rewards would correlate with their success in doing so. Social Policy Bonds, by targeting and rewarding the achievement of targeted *outcomes* would stimulate the necessarily diverse and adaptive solutions to our complex problems. Governments that issue the bonds would relinquish control over how to solve these problems, but would be responsible for deciding which problems to solve and for raising the revenue with which to reward successful problem-solvers.

### 3.4.9 Farm subsidies: get rid of them all (2006-04-22 09:57)

United States' sugar subsidy policies, including barriers to imported sugar, have been widely and justifiably [1]criticised for supporting a relatively small group of sugar producers at the expense of consumers, taxpayers, sugar-using industries, and the environment. A recent [2]paper (pdf) on US sugar points to the New Zealand experience of withdrawing subsidies from farmers. I've written elsewhere about the [3]irrationality of agricultural support. What's significant is how difficult it is to withdraw subsidies, often for reasons that are quite genuine. Take those agricultural subsidies that are paid according to volume of production (the majority). Economic theory and empirical evidence say that their main effect will be to raise the price of the least elastically supplied input, which in this case is farmland. Now many farmers will have borrowed money to pay for land inflated by the capitalised value of these subsidies. It's politically difficult to take away the subsidies and erode erode the asset base of such indebted farmers.

But it should, I believe, be done. It would at first sight seem reasonable to offer some form of compensation, or to signal in advance that the subsidies are going to end in X years. But it would be kindest of all never to get involved in subsidising farming in the first place. It would be far better to subsidise poor, deserving people, not the most effective lobbyists. The

possibility that the government will withdraw of subsidies is a legitimate business risk, and those who invest in subsidy-inflated assets should be prepared to accept it.

### **3.4.10 Economy or well being? (2006-04-26 12:40)**

Here in Thailand, the difference between a successful economy, as indicated by a few well-chosen economic variables, and the welfare of much of the population is especially graphic. Focusing, in particular, on Gross Domestic Product per head, and its rate of growth, can obscure what's really going on. The failings of GDP as an indicator of social well being are well known and well documented: it fails to account for destruction of the physical and social environment and it takes no account of leisure time. There are other defects, but these are ones that strike me most forcibly in Bangkok. I doubt whether most Thais or anyone else for that matter, would rank maximising GDP per head as a high priority. A successful economy is a means to various ends, not an end in itself. The challenge to policymakers is to articulate what these ends are, and to help achieve them, rather than simply to chase growth in GDP at all costs.

### **3.4.11 Become an insider by ..er..screwing everyone else (2006-04-27 11:11)**

Many insiders work in the public sector: many who do not still enjoy the benefits of secure jobs, generous social welfare and high levels of public services. These armies of the privileged will not vote to give these privileges up[.] [1] John Kay

John Kay takes a more sanguine view of the privileges than I do, and his case is well argued. He says that 'Europe's economic problems are real, intractable and not very serious' and that most people who protest against, for example, the recent proposed French employment rules, were hoping to become insiders:

The victims are those who can never hope to become insiders - immigrant minorities, unemployed young people in sink housing estates.

Where I think I differ from John Kay is that I believe the privileges he refers to enlarge the number of outsiders and widen the gap between them and the insiders. Farm subsidies and barriers to agricultural imports, for instance, make food more expensive for everyone, but for the poor

disproportionately. The same defence of privileges has contributed to rising house prices, and expanding the number of people who cannot expect to own their own homes, however hard they work. And while Kay may be right in that Europe's *economic* problems are not very serious that doesn't tell us very much. My previous post referred to the difference between economic success and social well being, which is to a great extent becoming a divergence. I also question whether in fact there is a majority of insiders in the affluent west. Insiders would feel some sense of coherence, not the alienation and pervasive anxiety that seem to be [2]characteristic of our western lifestyle. We would feel more committed to the societies in which we live and engage more in the political process. We may all want to be insiders, but it's hardly a feature of a successful society if the main route to becoming an insider is by screwing the government and everyone else.

### **3.4.12 Kyoto may not go far enough (2006-04-30 07:04)**

Whenever I [1]write or speak against the Kyoto Protocol I'm often taken as an apologist for the anti-climate change lobby. Reading Tom Flannery's book, [2]*The Weather Makers* makes me again want to stress that I am certainly not a climate change skeptic. I advocate that governments collectively issue [3]Climate Stability Bonds, which would reward the achievement of a stable climate. It seems likely that this would entail massive government expenditure, but it would be up to the market, via the price it pays for the bonds when they are floated, to decide exactly how much would be spent. It would also be up to bondholders to decide how best to stabilise the climate. It may very well be that they will concentrate on reducing anthropogenic greenhouse gas emissions, as does Kyoto, but it's also likely that other projects will be considered and undertaken.

Flannery is beginning to convince me that Kyoto will be far too little far too late, even if it's actually implemented. If that's so then Climate Stability Bonds could see a greater transfer of resources into mitigating or preventing climate change than Kyoto. When the bonds are first issued, potential investors would decide how much they are worth. If they believe that governments aren't putting enough resources into redeeming the bonds, they will ignore the bond issue or buy the bonds for virtually nothing and just sit on them. At that point, the issuing governments would have to put in more resources and issue more bonds. The value of all Climate Stability Bonds would then rise as would-be bondholders see that they can make worthwhile gains by doing something to stabilise the climate.

What all this means is that the commitment to stabilise the climate would *not be* the result of bargaining and deals struck between the various members of the relevant bodies: that's what Kyoto is. Instead, the resources devoted to mitigating or preventing climate change would be decided by would-be investors in Climate Stability Bonds: these people have powerful incentives to get a handle on the climate change problem, and to *investigate the least-cost ways of solving it*. Climate change, in short, is too serious to be left to the top-down compromise that is the Kyoto Protocol.

## 3.5 May

### 3.5.1 Give to charity directly, rather than via government (2006-05-03 01:27)

It makes a big difference to uptake whether the default is to opt in or opt out of, for example, a pension scheme. This made me think about income tax. Many people try to minimise their tax payments, but are more than happy to give to charities and deserving individuals. They can of course deduct charitable contributions from their taxable income when they make their tax return.

So here's an idea: why not reduce income tax drastically and let taxpayers either opt in to paying their current rate of tax, or choose to give a decent proportion of their income to charities or individuals whom they (and the government) think are deserving?

Ask yourself," wrote John Fund of the Wall Street Journal a decade ago, "If you had a financial windfall and wanted to help the poor, would you even think about giving time or a check to the government?"

Those who don't opt in to paying the higher rate of income tax would be highly motivated to ensure that their contributions to good causes were spent wisely. This could be a big improvement over the current system because governments cannot or do not discriminate between those who are genuinely poor and really do need a helping hand, and those who would actually benefit by being coerced into finding a job. This scheme could (initially) be restricted to donations to charities, who could expect to see large increases in their funding. There would be inefficiencies of course, and some ripoffs, but in comparison with the current system, whereby taxpayers fund people they do not know and with whom, increasingly, they cannot identify, is breeding cynicism and resentment.

More and more groups could be brought into the realm of registered charities, including those that supply public goods such as environmental benefits, and who are often more efficient and highly motivated than government bodies.

The benefits of this 'give to charity directly' scheme are:

- Taxpayers would be empowered and take more interest in their contributions;
- The deserving poor would most likely receive more benefits;

- Those currently on benefits who don't need really them would be coerced into finding work, and would probably also benefit in the long run by doing so;
- The supply of public goods, including the relief of poverty and the cleaning up the environment would become much more efficient, because charities and other groups dependent on direct public contributions are much more highly motivated than government employees; and
- The supply of these public goods would more closely cohere with the public's wishes than when, as now, it is mediated by a large and remote bureaucracy.

### 3.5.3 Markets reduce adjustment costs (2006-05-07 03:50)

When forecasting the costs of new environmental regulations, economic analysts routinely ignore a primary economic lesson: Markets cut costs through innovation. And innovation can be promoted through regulation. [1] Eban Goodstein

...or targeting via Social Policy Bonds. If we define explicitly what we want to achieve, whether they be environmental or social goals, and let the market find the best ways of reaching those goals, we'll see our ingenuity channelled into unexpected but creative pathways. It's tragic and ridiculous that our massive collective brainpower is currently channelled overwhelmingly into achieving private goals: that is, improving the bottom line of corporations. These corporations do a lot of good; employing people, reducing poverty, etc (though they also inflict unpriced social and environmental externalities on us all). But their objectives are for the most part frivolous, at least when compared with the environmental and social challenges that we collectively face. There *are* financial incentives on offer to those looking for solutions to, for instance, climate change or human conflict, but they are pitiful in relation to the size of magnitude of these problems and they are only weakly correlated with people's success in solving them.

A Social Policy Bond regime would be different. By explicitly targeting our major problems, and by rewarding people in proportion to their success in solving them, it would focus our innovative

capacity and ingenuity where they are most needed. Goodstein's article shows how markets can stimulate unanticipated, creative solutions when there are incentives to do so.

### **3.5.4 US and EU follow my suggestion! (2006-05-10 02:52)**

Well, in one sense:

UN Secretary General Kofi Annan said the mediators had agreed to help the Palestinians through "a temporary international mechanism - limited in duration and scope - and fully accountable". The mechanism, he said, would ensure "direct delivery of any assistance to the Palestinian people". [1] BBC

In other words, western aid would bypass the Palestinian Government. Without getting embroiled in Middle East politics, I think it's fair to say that this arrangement has a higher chance of successfully helping real people than the usual way in which western aid is doled out. This announcement follows, within days, my [2]post advocating that taxpayers should be allowed to nominate recipients of that proportion of their tax that goes into social welfare or other good causes. Government wouldn't redistribute; it would just fix how much should be redistributed and ensure it wasn't being siphoned off to underserving causes. The US/EU Palestinian aid arrangement has one similar feature, in that the aid will (one hopes) go directly to the people who need it.

This is very good, and perhaps could serve as a model for future international aid programmes. It's largely the corrupt governments of the poorer countries who are responsible for so much of their people's misery. Now, how about government adding some symmetry and economic rationality, and instead of directing our funds to those it thinks most deserving - a category that, thanks to the Common Agricultural Policy, [3]includes some of the wealthiest people in the land - allowing us to give them to people in genuine need?

### 3.5.5 War is a statist response (2006-05-11 09:08)

The costs of the Iraq war are officially estimated around \$500 billion, a sum which may be compared to the one spent in the Korea and Vietnam wars. However, this is likely to be less than half of the war's real economic cost. If proper accounting principles are adopted, reasonable estimates lie between \$750 and \$1269 billion - or between 6 % and 10 % of America's GDP. Taking other economic costs into account, such as the medical costs borne by seriously injured soldiers, the loss of income produced by reservists on duty, and increases in oil price and greater uncertainty, adds \$380 to \$1400 billion in present value terms. [1] Source

How would a Social Policy Bond regime deal with violent political conflict? In the first place, it would clarify, and make explicit, objectives. Under the current regime, those who initiate armed conflict may have very different goals from their stated intentions.

Second, issuing Social Policy Bonds necessitates estimating and *capping* of the maximum cost to society of achieving the targeted goals.

Third, Social Policy Bonds would not assume that armed conflict is the best way of achieving such stated goals. The Iraq war appears to be an example of a typical government response to a perceived threat. Let's say the actual agenda of the conflict was regime change and the installation of a democratic government over the whole of a politically united Iraq. Does anyone seriously believe that contracting out these goals to the market would be as costly - to everybody and in every sense - as the current conflict? War seems to be very much like the ludicrous subsidy programmes, or the crazy construction schemes that characterise so much of big government: real people don't want it, but it goes ahead anyway because of (1) the power of corporate interests and (2) the obsessive need of government bodies *to retain control*.

● An fascinating [2]article by George Monbiot in *the Ecologist* ends by asserting that 'there's one obvious question with which every journal and journalist should begin: "who is funding you?"' I can answer this question accurately and concisely: nobody. If I were to say that this is because there's no money for original policy ideas or outcome-based policy, but only for vested interests and ideologues I'd be accused of being bitter and twisted, so I shan't say it, even if it's true - which it is.

### 3.5.6 Summing it up (2006-05-14 05:03)

The selection of issues that should rank high on the agenda of concern for human welfare and rights is, naturally, a subjective matter. But there are a few choices that seem unavoidable, because they bear so directly on the prospects for decent survival. Among them are at least these three: nuclear war, environmental disaster

and the fact that the government of the world's leading power is acting in ways that increase the likelihood of these catastrophes. It is important to stress the "government," because the population, not surprisingly, does not agree. That brings up a fourth issue that should deeply concern Americans, and the world: the sharp divide between public opinion and public policy...

This [1]excerpt from Noam Chomsky's *Superpower and Failed States* sums up humanity's predicament accurately, though I would not myself ascribe particular blame to the US Government but rather to political systems everywhere, which all emphasise image, identity and ideology rather than outcomes. In an increasingly complex world it's too easy to escape or deflect censure for corrupt or incompetent policies: relationships between cause and effect are too obscure; blame can always be shifted. Political debate mirrors the system's obsession with irrelevance. But clear away the fog of strident commentary and party politics and you will find a high degree of consensus over what people actually want. Chomsky's probably right: most of us would see nuclear war and environmental disaster as humanity's most serious challenges. But our system doesn't allow us to articulate them as priorities; at best we can choose people who say - amongst many other things - they care about these issues but who when in power cannot or will not focus on them. It's not the politician's fault: they are part of a corrupt, corporatist system, whose raison d'être is basically to keep things going as they are. Hence the chasm between public opinion and public policy.

Chomsky blames the US Government, but I rather think that blaming this or that faction is to get dragged into the very system whose failure he so well describes. As long as we see particular ideologies, parties or people as the problem, we're not going to change anything. So here is my suggestion for a transition to meaningful policymaking:

1 Politicians and their parties should check out real people's actual priorities. I believe, as I say, that they would then find themselves having to deal with the possibility of nuclear war and global environmental challenges, of which climate change is the most pressing. If, having too much of a stake in the existing circus, they won't do this then it may be up to you, readers of this blog, to do the right thing, which is:

2 Issue Social Policy Bonds that target these priorities. Social Policy Bonds are non-interest bearing bonds, sold on the open market, that would become redeemable for a fixed price once the targeted goal had been achieved. Click on the links in the right-hand column for more information. Afterwards, have a look at my [2]handbook for those interested in issuing their own bonds.

Targeted outcomes need to be built into policies right from the start. These outcomes must be meaningful to real people, not government agencies or corporations. Every other way of doing things has been tried and has failed. The power of vested interests has seen to that.

### 3.5.7 Motivation (2006-05-15 10:16)

[M]ost firms are ephemeral. It is not immediately obvious that the real business world is like this, because we notice the firms that last, such as General Motors or Ford. But most do indeed go under (or get taken over) on a relatively short timescale. Of the largest 5000 US firms operating in 1982, for example, only 35 per cent still existed as independent entities in 1996. There is a high 'turnover' of companies, which many economic theories of the firm do not acknowledge.

So why do firms fail? In [Robert] Axtell's model there is a typical trajectory. First, a new firm grows more or less exponentially over time as increasing returns cause workers to flock to it. But at some point the firm reaches its peak, after which collapse is usually sudden and catastrophic. ... This collapse is a consequence of the firm's own success. Once it grows big enough, it becomes a haven for free-riders who capitalize on the efforts of others. So the firm becomes gradually riddled with slackers, until suddenly the other workers decide they have had enough and jump ship. (Note that firms fail in this model because the workers leave for better jobs, not because the market for their products disappears or because there is a terrible warehouse fire, or for any other reason.) [1] *Critical mass: how one thing leads to another*, Philip Ball (page 333).

Some firms though are not allowed to fail. It's unfortunate that these are the ones whose remit is to solve our serious social and environmental problems. I refer of course to government agencies. However many slackers they employ, and however many diligent people leave them, these agencies are notoriously difficult to kill off.

So why not hand the solution of our social and environmental problems to the private sector? I don't mean letting private companies perform one or two processes previously done by the public sector, or merely changing the ownership of existing public operations. I mean contracting out the achievement of broad social and environmental outcomes to the private corporations in such a way that *their success is strictly correlated with public goals*. This is what a Social Policy Bond regime would achieve. Unlike under the current system, the companies that employed slackers under a bond regime would quickly go out of business. Taxpayers would get value for money and society as a whole would benefit from a more motivated workforce striving to achieve public goals.

### 3.5.8 What do we really want? (2006-05-18 02:47)

Some years ago, when the Chinese Government was rounding up Falun Gong meditators and bundling them into vans for 're-education' (ie torture or worse), there were extraordinary scenes of protest in the United Kingdom - against a small rise in the price of petrol. That's

what we really care about it seems. Through perverse subsidies, governments have got us all hooked on our cars; so much so that we don't really seem to mind that we are trashing the planet and piling up weapons of mass destruction. It's the same the world over:

Whatever else is happening, from temporary triumphs in Iraq to Administration scandals, when prices at the pump jump for more than a month, the [US] President's popularity almost always falls. [1] *Businessweek*

I shouldn't read too much into this, and *Businessweek* does point out that the relationship is one of correlation rather than causation, but still, it is a bit disheartening to see so much attention given to trivia, while urgent global challenges go unmet.

### **3.5.9 The unimportance of outcomes in medicine (2006-05-21 11:19)**

From [1]*Medical Guesswork*, by John Carey, 'BusinessWeek', 29 May: the first quotes refer to Dr David Eddy, a heart surgeon turned mathematician and health-care economist:

He began to ask if there was actual evidence to support what doctors were doing [ie cardiac surgery]. The answer he was surprised to hear, was no. Doctors decided whether or not to put a patient in intensive care or use a combination of drugs based on their best judgement and on rules and traditions handed down over the years, as opposed to real scientific proof.

...Eddy proved again and again that the emperor had no clothes. In one study, he ferreted out decades of research evaluating treatment of high pressure in the eyeball, a condition that can lead to glaucoma and blindness. He found about a dozen studies that looked out outcomes with pressure-lowering medications used on millions of people. The studies actually suggested that the 100-year-old treatment was harmful, causing more cases of blindness not fewer.

Carey rightly sees, in a [2]related article, the importance of incentives:

The way the U.S. health-care system is structured offers doctors, hospitals, and companies enormous financial incentives to provide more and more care. Surgeons will get paid if they do a bypass operation, insert ear tubes in children, or take out a prostate. If they recommend waiting or doing drug therapy instead, there's no pay-day.

Of course, as the article does make clear, there are plenty of areas of medicine where the benefits have been huge and unarguable. But the message is clear. Medicine in the US has been badly skewed by perverse incentives, and the information asymmetry between health-care providers and consumers.

Speaking not for attribution, the head of health care at one of America's largest corporations puts it more bluntly: "There is a massive amount of spending on things that really don't help patients, and even put them at greater risk. Everyone that's informed on the topic knows it...."

### **3.5.10 A new type of organisation (2006-05-22 06:51)**

I'm often asked about the apparent mismatch between the fluidity of holdings of Social Policy Bonds and the targeting of long-term objectives. At first it seems unlikely that the tradability of the bonds would enhance the achievement of such objectives.

Essentially bondholders would form a coalition whose main interest is to enhance the likelihood of early achievement of the targeted social or environmental goal. The composition of this organisation might be changing all the time because the Social Policy Bonds could constantly change hands. That need be no impediment to solving short-term, small-scale social or environmental problems, where progress toward solution can be readily monitored. But how could such a protean organisation of bondholders work to solve long-term social and environmental problems?

It's actually quite easy: consider what people buying bonds targeting global climate change might do. They would want to see some appreciation of the value of their Climate Stability Bonds even if they have no intention of holding on to them until the (in all probability) extremely remote target of climate stability has been achieved. They would quickly see that their bonds will lose value *unless they set up some sort of body with a longer-term commitment*. One possibility is that larger bondholders would collude to set up an investment company for the lifetime of the bonds. This company would have a stable structure and its job would be to vet potential climate-stabilising projects and help finance the efficient ones. The bondholders, once they've set up this company up could of course always sell their bonds on the open market: the setting up of the investment company could be one of the first projects they undertake in order to maximise the appreciation of their bonds. In principle, it's no different from any other project. Climate Stability Bonds sold after the formation of this company would perform in the market like shares in the investment company. In keeping with the Social Policy Bond ethos, of course, all the company's activities will be dedicated toward achievement of, in this case, climate stability.

More generally, in order to maximise the value of their bonds, those who buy Social Policy Bonds at flotation will have incentives to set up the most efficient objective-achieving

institutional structure they can. And they will be free to set up any institutional structure that maximises their gains from bondholding.

Anonymous (2006-05-22 22:30:00)

Aren't SPB just the optimistic side of Catastrophe Bonds - bonds whose principal is forgiven if specific triggers are met? Cat bonds on climate change risks are being issued already - see <http://www.gechs.org/activities/holmen/Park.pdf>

Ronnie Horesh (2006-05-23 08:19:00)

Thanks. Yes, cat bonds, like other insurance concepts, are similar to Social Policy Bonds. It looks as though the main difference is that cat bonds are always held by passive investors, who are not expected and do not intend to do anything about preventing the catastrophic event. Social Policy Bonds would be designed to appeal to active investors. Also Social Policy Bonds may have wider application when it comes to goals other than avoiding catastrophe, such as raising basic literacy rates. But in principle, they do seem to be similar concepts.

### **3.5.11 Social Policy Bonds and free-riding (2006-05-24 15:26)**

In my work on Social Policy Bonds I've tried to make the concept accessible and so haven't emphasised the versatility and other advantages that variants can bring to the concept. One such is time binding: in other words, making redemption conditional on the targeted social goal being achieved *by a specific date*. Time binding would on its own reduce the market value of Social Policy Bonds, and increase the proportional payouts for early achievement of the targeted social or environmental outcome. I think it would also have the effect of deterring still further would-be free riders: Social Policy Bonds could be issued that target, say, achievement of a 99 per cent literacy rate for children aged 11 in the UK. But if the issuers anticipated too much free-riding, they could stipulate that they would redeem the bonds only if the target rate were achieved within, say, five years. Would-be free-riders then would be holding a wasting asset, whose value as the target becomes more remote would decline even faster than if there were no specified time limitation.

There are other reasons, which do not depend on time binding, for believing that free-riding would be a self-cancelling activity: assume that most of a particular issue of bonds were held by would-be free riders. Then very little, if anything, would be done to help achieve the targeted objective. As the objective became more remote, the value of all the bonds would fall. And as the bonds lost value, they would make a more attractive purchase for people who were prepared actively to help achieve the targeted objective. So free riders would be tempted to sell, even at a loss, rather than see the value of their bonds continue to fall. Some history of falling bond prices would tend to make free riding on Social Policy Bonds less appealing with future issues.

Free-riding, in my conversations with economists, always seems to loom large in their doubts about the Social Policy Bond concept. But for the reasons given here, and for others that I mention in my longer work, I don't think it would be a serious problem.

### **3.5.12 Transport: a means not an end (2006-05-28 15:58)**

Bangkok is a particularly dire example of a city that has sacrificed much of its quality of life to road transport. In this it's not unique, of course, but it is particularly sad to such large numbers of such exceptionally decent, dignified and (for the most part) gentle people living in the ever-shrinking interstices of such a hideous, brutal infrastructure. Most Thais have no, or very limited access to cars, but that doesn't stop the government building more roads and imposing its own view of development on society.

Perverse subsidies to the road lobby are common the world over; add in the subsidies to oil extraction and consumption and you get the financial cost of our governments' obsession with road transport. Other costs are equally grievous: the deaths, mutilations, noise pollution and air pollution.

Once this sort of thing starts it's self-perpetuating. The perverse subsidies strengthen the power of the road lobby to oppose alternatives. Busy roads make it more dangerous and expensive to get about in any other way.

How would a Social Policy Bond regime differ? It would not necessarily oppose easier transport links, but it would see that they are not an end in itself. They are at best a means to other ends and a bond regime would target these ends. A bond regime would focus on genuine outcomes: things that matter to people - real people, as distinct from corporations.

As it is though, we get the typical government view of how society should develop: along the lines that favour the big and global at the expense of the small and local.

-  
Policy as if outcomes mattered  
SocialGoals.com

---

### **3.5.13 Why do I always go on about perverse subsidies? (2006-05-30 16:02)**

Here in the UK where the role of government in the economy is ever-rising, and where in regions like Wales it accounts for [1]66 per cent of economic activity, it's worth asking whether this constitutes a problem. I don't see big government as a problem in itself. But when big government becomes remote government I think that reduces accountability and responsiveness. It also makes for inefficiency. Actually though it's quite difficult to prove how inefficient government is at spending our money. Relying on particular narrow statistics, such as the number of cancer survivors, or exam results, is not enough. Perhaps we are simply getting better at diagnosing cancer? Or perhaps poorer exam results are the result of more people staying on for education and are anyway the best that can be done given the multitude of other variables that are acting to depress aptitude and ability?

More robust indicators of poor government performance would be deteriorating broad

poverty or health indicators but these also have difficulties. So perhaps the most compelling evidence that all is not as it should are perverse subsidies: not just their size but also their persistence. Perverse subsidies may be the smoking gun: proof that even the governments in the rich democratic countries can be inefficient and corrupt. Perverse subsidies are subsidies that are economically nonsense *and* socially inequitable *and* environmentally disastrous. Europe's Common Agricultural Policy is one such. Because of it, taxpayers and consumers subsidise the richest landowners and corporations and have been doing so for decades after it became widely known just what was going on. Perverse subsidies in just four sectors - agriculture, water, energy and transport - were estimated by the [2]Earth Council in 1997 to amount to between \$700-900 billion. This is an enormous sum in itself but also an indicator, in the absence of other indisputable evidence, that the rest of government spending may be similarly mismanaged.

## 3.6 June

### 3.6.1 Judging our leaders (2006-06-01 13:01)

How do we judge our politicians? Not by outcomes, such as how healthy or well off we are. Not by outputs, such as how much they achieve. Not even by inputs, such as how many hours they actually work. No, here in the UK the Depute Prime Minister [1]is judged by his *apparent* input as captured at one point in the working week.

---

### 3.6.2 Social Policy Bonds and Catastrophe Bonds (2006-06-02 14:12)

An anonymous reader of this blog pointed out that Social Policy Bonds are very similar to Catastrophe Bonds or 'Cat Bonds'. Catastrophe Bonds are mainly used as a form of insurance. They are issued by a body, such as an insurance company or local government, that stands to lose if a specified catastrophic event occurs. The issuers typically pay fixed payments unless the event occurs - which helps the issuer to meet the cost of insurance claims. In return, cat bonds pay more interest and have a lower rating than an issuer's other bonds. Apart from [1]their higher yield they are attractive to investors because their riskiness - the risk of a catastrophe occurring - is uncorrelated with other market risks.

Catastrophe Bonds are therefore primarily an insurance concept. They're not designed to make people avert any specified catastrophic event, which so far I think are exclusively natural disasters such as hurricanes or earthquakes. In that respect they differ from Social Policy Bonds. It's interesting that the Social Policy Bond concept has been in the public arena for about 17 years: I have spoken about it on numerous occasions at think tanks, universities and once at OECD in Paris, but nobody before now has brought Catastrophe Bonds to my attention.

The two concepts diverge when we change the nature of the specified event to something that can be averted quite readily, or when the redemption funds grow to such a size that it's worth investors in the bonds doing something about avoiding or mitigating the results of even a natural event such as an earthquake.

here <http://www.moneysavingfreetips.com/ibonds-rates.html> it says you can buy i-bonds from treasurydirect online... anyone ever bought such ibonds from treasury direct?

is it a safe investment? what interest rate did you get?

### 3.6.3 Targeting conflict (2006-06-02 20:26)

[1] ✖

[2] ✖ The graph - taken from the most recent CIDCM-INSCR [3]*Peace and Conflict* report - illustrates the decline in armed conflict since the early 1990s, which may come as a surprise. As the report says:

"Despite the prevailing sense of global insecurity, the positive trends traced in previous editions of this report have continued into early 2005. The decline in the global magnitude of armed conflict, following a peak in the early 1990s, has persisted and few of the many societal wars contained in the last decade have resumed. Major societal wars are down from twelve at the end of 2002 to eight in early 2005."

The report does a great job of listing and as far as possible quantifying the effects of armed conflict. It's worth mentioning in this blog because it shows the extent to which much of the quantitative work that would be needed for targeting such goals as armed conflict is already being done. Put it this way: if there were the political will to issue Social Policy Bonds that aim to eliminate war, civil war and armed political conflict, then measurement issues, difficult as they might seem, will not be an insurmountable obstacle.

### 3.6.4 Kyoto and common sense (2006-06-04 19:57)

[T]he costs of ambitious front-loaded carbon abatement programs (such as the Kyoto Protocol, fully implemented) would have had (a) only a modest impact on our climate prospects, according to the current models, and (b) enormous economic costs. Yes, something must be done - but need it be as costly and as ineffective as that? [1]  
*Clive Crook*

, *National Journal*

Unfortunately the debate about climate change is so politicized that anybody speaking out against the ludicrous Kyoto Protocol is assumed to be either scientifically illiterate or a corporate shill. Clive Crook is neither (as far as I know) and has some sensible suggestions for the US:

An initially moderate carbon tax, an initially gentle scheme of mandatory caps on greenhouse-gas emissions, and an honest plan to promote long-term energy efficiency could nudge the economy with minimal disruption on to a path of much lower climate-change risk. At the same time - anathema to many environmentalists - serious thought should be given to policies for adapting to climate change.

[2]Climate Stability Bonds are compatible with all this. Investors in the bonds would implement such measures, but only if they were convinced that they are the most cost-effective ways of dealing with climate change. And they would implement them on a global basis, so that the sources of emissions aren't simply transferred from one country to another. In short, they would take an over-arching, global view of what is, after all, a global challenge. Mr Crook's suggestions are more clearly thought out than Kyoto or the 'do nothing' approach, and are probably much better than either. But they still suffer from their narrow perspective. The goal, remember, is not to reduce anthropogenic greenhouse gas emissions from the US, but to stabilise the global climate. Climate Stability Bonds can divert resources into this objective without prejudging how best to achieve it. They would reward only the most efficient climate-stabilising projects, *whatever form they might take.*

2. <http://socialgoals.com/ieakytotext.html>

Anonymous (2006-08-22 13:11:00)

Ronnie Horesh, I never understood your opposition to Kyoto. While it's not a social policy bond program, it's a tested and valuable market based mechanism, cap and trade. You insist that the effort should be focused on outcomes, but CO2 in the atmosphere IS a very good indicator of climate change. Perhaps the best there is. There is no scientific dispute about this, only a lot of noise raised by paid advocates for the oil and coal industries.

Finding a good indicator of "outcomes" is hard. In other fields, you seem to accept much poorer ones. CO2 has a big advantage over counting the storms in the atlantic and other attempts to attach a measure to climate change: It's not nearly as affected by random fluctuations. Much randomness in the indicators will give rise to speculation. You risk that people treat it as just another gambling market, focus on "outsmarting" the other traders, and don't care about influencing the outcomes, since it's so unpredictable anyway.

Also, with climate change, it's the issue that our institutions should ensure that people pay for the damage they cause, rather than be rewarded for not polluting. We risk encouraging anti-social behaviour this way.

One thing about indicators: You want them to be as early as possible. If they only indicate a catastrophe after it's happened, they are less useful, no matter how accurately they measure it.

Ronnie Horesh (2006-08-23 08:09:00)

Thanks Harald for your comment. I just think the stakes are too high for something that may or may not work. I agree the scientific consensus is coming round to the view that CO2 is a good indicator of climate change and even that it is a cause of climate change. Even accepting this, and even accepting that anthropogenic emissions of greenhouse gases including CO2 (ghgs) are *the* main cause of climate change, I still think Kyoto is flawed. These are my reasons:

1. Reducing anthropogenic ghgs might not be the best way of reducing the concentration of ghgs in the atmosphere;
2. Reducing the concentration of ghgs in the atmosphere might not be the best way of preventing or mitigating climate change;
3. Preventing climate change might not be the best way of preventing the worst effects of climate-induced catastrophe;

(Less relevant perhaps, I also think that preventing climate-induced catastrophe might not be the best way of avoiding catastrophic reductions in welfare.)

Two other points:

Assuming that you are right, and Kyoto is the best way of targeting climate change, I think that holders of Climate Reduction Bonds would target anthropogenic ghgs in a similar fashion to Kyoto, but more efficiently: for example, they wouldn't be bound by political correctness or realpolitik of the sort that exempts some countries that emit huge quantities of ghgs from any disciplines at all. They would simply buy these regimes off or otherwise undermine opposition to the disciplines. And this brings me to another important point: the presentational aspects. Kyoto doesn't focus on a desirable outcome: it's focused on processes and activities. So it is now so politicised and its money flows so unpalatable that it is seen as an imposition; in the rich countries it's seen as an imposition

by the greens on everyone else, and in the poor countries it's seen as an imposition by the rich countries on them. Kyoto means huge upfront costs for a very small payoff well in the future. So large parts of the world disagree with it, or are totally exempt from it. A triumph for the bureaucrats but a tragedy for the planet. In times of financial stress, or slowdown, everyone will repeat the George Bush and Tony Blair line: "I'm not going to sign onto anything that involves economic sacrifice."

Now what I am entirely focussed on here is the outcome - and this excludes justice, morality, the historical record, or the venalities of politicians. Unfortunately Kyoto, being a political construct, is I think so compromised that even its most ardent advocates will agree that it's ineffectual. And there's little argument that it's going to be ruinously expensive. They justify it as a first step, but that step is unlikely ever to be taken.

A bond regime would target an outcome that people could empathise with and understand, and that would entail taxpayer spending only when it had been achieved. So even if we took reducing anthropogenic ghgs as an end in itself (which I certainly don't); even then it would be more acceptable as well as more efficient than Kyoto.

I have said this baldly because my computer's on the fritz, but please don't hesitate to try to convince me I am wrong - in a way I hope I am and that Kyoto will avert a calamity. It's certainly got more traction than Climate Stability Bonds at the moment....

### **3.6.5 Perhaps insurers? (2006-06-05 18:58)**

When I first started promulgating the Social Policy Bond idea I naively thought that government would be the first to issue them. They have the resources, after all, and solving social and environmental problems is a large part of their remit. Since then, and especially since I addressed a meeting at the OECD in Paris a few years ago, I have become convinced that government is too risk-averse and self interested to experiment with a new financial instrument that hands over the responsibility for achieving social goals to the private sector.

I have urged, so far without success (as far as I'm aware), private individuals to [1]issue their own Social Policy Bonds. I have tried and tried to interest philanthropic organisations but with not a single exception they fail even to acknowledge my messages.

Now I am beginning to think insurance companies might be the first to take the Social Policy Bond concept to the point of implementation:

Insurers could use their influence as some of the world's biggest investors to make companies in which they have stakes act more responsibly by encouraging "'climate proof' behaviour from the boards of large corporations", the report says. [2] Source

### 3.6.6 So it's come to this (2006-06-07 13:57)

Many of us remember the current UK Prime Minister and his Chancellor proclaiming that the Common Agricultural Policy must be dismantled. Several years later and there's talk of at last winding down the subsidies to the richest landowners. And what do we read in today's [1]*Financial Times*?

[T]he British government said yesterday it would fight to preserve the big payouts for large farms, claiming that its blue-blooded gentry were exponents of modern, large-scale, efficient agriculture.

These are big payouts indeed and they go to some of the wealthiest people in the UK as Oxfam to its great credit, [2]pointed out. Now the British 'Labour' Government is resisting efforts to cap them at Euros 300 000 a year (about US \$388 000). These sums, let us remind ourselves, come from the European taxpayer and consumer. They take the form of direct budgetary payments and higher food prices. Apart from transferring money from the poor to the rich, they have also played a large part in destroying the rural environment in Britain and the rest of the European Union.

Of course, there's politics involved: the UK Government knows that British farms, because they are generally larger than those on the continent, benefit disproportionately from open-ended subsidies. The remark about 'efficient agriculture' is bogus: UK farming might yield more per farmer (or possibly per hectare) but that is because it uses more capital per farm worker than other countries - largely because of subsidies and generous tax allowances for machinery. The capital-intensive nature of UK agriculture uses more fossil fuels and contributes to rural unemployment.

The British Government knows all this, but it is putting politics above principle. Or perhaps it's being subtle, and in trying to shore up the CAP's jackpot payments to the wealthy it is doing its bit to undermine not only the corrupt, insane, CAP, but the EU itself. I wish I believed that.

### 3.6.7 The need for broad, meaningful targets (2006-06-08 20:56)

Broad targets, rather than proliferating Mickey Mouse micro-targets, are essential if government is going to maximise societal well being. The British Government has opted for narrow, micro-targets in its attempts to run education and the National Health Service, but another perhaps even more crucial area is that of monetary policy. Mr Han de Jong of the ABN Ambro Bank in a letter to the editor of the *Financial Times* (published today) reckons that controlling banks don't know how to deal with asset price inflation. They have targets for 'normal'

inflation - typically the costs of consumer or producer goods and services - but these generally exclude (except indirectly) asset price inflation.

... Central banks are reluctant to include asset prices in monetary policy decision-making. They argue that they cannot determine the right level of asset prices any better than the market. Funny that, as central banks have no such reservations about their abilities when it comes to the price of money. In addition, they are not sure how to fight asset price inflation. To me it seems relatively simple. A combination of strong growth, modest consumer price index inflation, easy money, strong credit growth and strong asset price increases suggests that monetary conditions are too loose. The economy in the eurozone is recovering and growing at a rate close to its potential. In spite of two European Central Bank rate increases, real official interest rates are barely positive. This is asking for trouble. As far as the eye can see, euribor futures contracts are pricing in money rates below 4 per cent. Assuming a 2 per cent inflation rate, that means rates will peak in this cycle well below their long-run average in real terms. If this happens, asset markets will continue to bubble. From time to time, those bubbles will inevitably pop.

For myself, I think monetary targets should be subordinated to outcomes that more directly measure social and environmental well being. Things that would take in, for example, homelessness and poverty. Under a Social Policy Bond regime targeting poverty an independent central bank would be motivated to reduce asset price inflation ... if doing so were an efficient way of dealing with poverty. Unfortunately what we have now are monetary targets that aim to restrain 'normal' inflation, but leave asset price inflation untargeted. For hard-working families in the UK and New Zealand (the two countries I know most about) this makes owning their own home a dream for ever.

### **3.6.8 Whose infrastructure? (2006-06-09 20:27)**

Having recently spent time in Bangkok, where quality of life has been almost wholly sacrificed to the car, I was interested to read about Fred Harrison's publication [1]*Wheels of Fortune: Self-funding Infrastructure and the Free Market Case for a Land Tax* in the *Financial Times* (9 June). It makes a strong case for taxing the beneficiaries of infrastructure development, who are invariably landowners. Increases in land values give a good indicator of the benefits of infrastructure investments, but they also supply a just way of financing their costs. Needless to say, this doesn't happen. In most countries, including Thailand, infrastructure development generates windfall gains for existing landowners. Some financial gains probably do percolate down to everyone else, but randomly and at huge non-financial cost in the form of the destruction of communities, accidents, noise pollution and air pollution.

### **3.6.9 Letter from America (2006-06-12 20:53)**

Sometimes the government machine just seems to be way of obscuring flows of funds. Vested interests, adept at pleading their cause, talk about government funding in the abstract, as if it's inexhaustible. The notions of trade-offs and opportunity costs seldom enter political debate, and it takes an outsider to remind us that they are basic.

This letter from Mr Paul DeRosa in New York appeared in the [1]*Financial Times* on 12 June:

Europe sacrificing the young to their elders

Sir, Richard Lambert's prescription for the failures of European universities is to have them charge tuition fees .... But from where will the money come? In nations that take fifty cents of every dollar earned in taxes, money that might otherwise be available to pay fees is taken away and used for pensions, healthcare, and subsidies for loss-making rail systems. The future of European youth is, in effect, being sacrificed so that their elders can retire young with free healthcare.

### **3.6.10 Rejigging incentives (2006-06-13 15:38)**

As individuals, our activities don't seem up to meeting the serious environmental and social challenges we face as a society. Our work lives, even if we are in the public sector, don't appear to contribute much to solving such global problems as climate change and nuclear proliferation. And while we might do a lot, even if we don't realise it, to help individuals either directly or through tax payments, there does appear to be a disconnect between our work and achievement and the scale of the social and environmental problems we face.

Yet there's no shortage of skill, talent and ingenuity. To take just my recent experience here in England: you can't fail to be impressed by the quality of the voluminous journalism about the English team's World Cup team and its performance. In the bookshops there is a huge number of well-written books about science, history and almost any other subject as well as fiction. Advertisements in all media are slick, humorous, probably very effective, and have unquestionably benefited from some extraordinary brain power.

It all comes down to incentives. We react rationally to the incentives on offer. And there are few direct incentives for us to seek solutions to global problems. There are scientists, politicians and officials part of whose remit includes addressing these problems, but their financial rewards are in no way linked to their success in solving them. Rather than hope for a mass conversion to altruism, or despair at the improbability of a bright human future, we can do something to rejig the incentives. That's when (in my view) Social Policy Bonds come in. Social Policy Bonds inextricably link rewards to outcomes – not inputs, outputs or activities. Under a bond regime, people would not get paid merely for turning up to work at a bureaucracy that includes the words 'Environment' or 'Climate Change' in its title. They would, in essence, be on performance-based contracts of the most flexible sort: if they fail to deliver, then the rewards will go to those who can deliver.

We need to agree on what we want as a society. For starters we'd probably opt for some climate stability target, and the absence of a nuclear conflict. Then rather than employ swarms of bureaucrats with the stated objective of achieving , these goals, we should issue Social Policy Bonds targeting them. Rewards would then be inextricably linked to achievement of a stable climate and nuclear peace, and we'd find a significant fraction of our species' awesome collective skill, talent and energy channelled that way.

### **3.6.11 Financial incentives (2006-06-15 20:28)**

Reading the excellent book [1]*Critical mass: how one thing leads to another*, you realize quite graphically in just how many ways quite small causes can have very large effects in physics and in society. You get the same impression when looking into the causes of social calamities such as war or violence of any sort. I find this encouraging. There are many people working for the social good but there is also a very large pool of extraordinary talent, creativity and diligence that is, to put it mildly, not fully aligned with public goals. Much of this skill and ingenuity is deployed in the pursuit of private goals, many of which have negative social and environmental externalities - as well, of course, as benefits, both private and public. For instance, there are prodigious talents, very evident here in the UK, devoted to marketing of just about anything. Humanity could gain a lot if a fraction of them were encouraged to move into fields paying a greater social dividend.

There is no need for compulsion though. A Social Policy Bond regime could do the job quite simply, by increasing the financial incentives on offer. Collectively we are squeamish about paying people large sums of money to achieve social and environmental goals, and I share this feeling too, to a degree. But people do respond positively to incentives, and it's not always greed. People crave respect and in the west nowadays that comes largely through being wealthy.

As an aside consider Japanese society:

The Japanese have understood that what people are largely pursuing in the workplace is not so much money as the respect of the people around them, and therefore maintain a sophisticated - indeed, bizarrely over-elaborate to the Western eye - economy of respect in addition to the economy of money. They have understood that a large part of what money-seeking individuals really want is just to spend that money on purchasing social respect, through status display or whatever, so it is far more efficient to allocate respect directly. [2] *Japan, a refutation of neo-liberalism* , Robert Locke.

But this aspect of Japanese society is exceptional in the world context and we cannot rely on it, or on altruism, to meet the serious social and environmental challenges we face. Under a Social Policy Bond regime people or institutions would become richer and many of them would be rich to start with. But such wealth would be concentrated only if the public good were also served. A bond regime would create a means by which wealth would be inextricably linked to our social goals.

### 3.6.12 Ideology and education in Britain (2006-06-16 19:23)

Ideology is bad enough when adults inflict it on each other. It's even worse when innocent children are the victims. Since state funding for grammar schools in the UK began to be phased out in the 1960s for narrowly ideological reasons, what has happened to social mobility in that country?

The latest research, published today, reveals that the percentage of top positions in the British media going to former private school pupils has risen by more than 10 per cent since 1986. The report on the media follows reports on the legal profession and on MPs which reached similar conclusions. The research, published by the Sutton Trust education charity, shows that of the leading 100 media opinion-formers, 54 per cent came from private schools, compared with 49 per cent 20 years ago. Thirty-three per cent of the remainder came from selective grammar schools and only 14 per cent were from comprehensive schools, which cater for 90 per cent of all pupils.

The report on the legal profession shows that almost 70 per cent of barristers from leading chambers were educated at private schools. And in the House of Commons, 42 per cent of those holding government office or shadowing ministers are former pupils of private schools. Just 7 per cent of all pupils are educated in the private sector. [1] *Source*

Meanwhile, we can see from another newspaper article an indicator of the value some Britons put on their kids' education:

World Cup haircut pupils get the boot from school.

Two pupils have been suspended from a Blacon school because they had St George's flags cut into the back of their hair. ... The two 14 year-olds have been told they cannot go back to lessons unless they shave the motif out or wait for it to grow out. [The father of one of the boys] said his son would not back down. "It is just stupid. The boys are not having it shaved out." Source: *Chester Standard* 18 June

Here's another idea: instead of running our schools as social engineering experiments or suppliers of mass babysitting services, how about we subordinate their structures and activities to educational outcomes, instead of ideology? Issue Social Policy Bonds that target basic verifiable achievements, such as numeracy or literacy. Let motivated educators decide how these shall be achieved, and let parents decide on their other priorities.

### **3.6.13 Leave it to the government (2006-06-23 15:23)**

Having travelled a bit recently around northern England and Wales it seems to me that we are living in a physical and social environment that is becoming more and more a creation of government and the intellect, rather than nature and our own social instincts. There doesn't appear to be much investment in the provinces at least, that isn't initiated or heavily subsidised by government. (In Wales, for instance, government accounts for [1]66 per cent of economic activity .)

Perhaps it all began when government started subsidising an infrastructure that intrinsically favours the large and global at the expense of the small and local. Fifty years ago this month that US President Eisenhower signed the Federal-Aid Highway Act of 1956, which committed his government to invest heavily in a national network of interstate highways. In the rich and the developing countries we see that big business has the ear of government; that it can steer policies in its favour, at the expense of small- and medium- sized enterprises and ordinary taxpayers and consumers, and the environment. Our current politics favours top-down, once-size-fits-all policies, rather than bottom-up, local decision making. It means more and more that ordinary folk look upwards to government, to a specialised caste of policymakers, either as a source of income or for guidelines on how to live our daily lives.

So, in this [2]excellent piece about climate change from the current *New York Review of Books*, we find:

As with the extinction of species, the disintegration of ice sheets is irreversible for practical purposes. Our children, grandchildren, and many more generations will bear the consequences of choices that we make in the next few years.

I'd just make one small but significant change: it's not really our choice; it's that of our governments, who are not only indifferent or unresponsive to climate change but are actively helping it along by subsidising fossil fuel extraction and use.

On a more day-to-day level, the desolation and danger of some of the UK's provincial towns also owes something to the top-down, inorganic nature of town planning. Zoning and government's subsidies for road transport have divided shops from dwellings and commercial premises. A centralised and ideologically driven education system, in which the worst schools are not allowed to fail, compounds the problem, and even on the long summer evenings in the very pleasant small English city centre where I'm a visitor, the streets are mostly deserted, apart from a few bewildered tourists looking for somewhere that's open.

More contentiously, the social fabric of our countries is changing rapidly and inorganically, in the sense that it's driven by policymakers rather than people:

In Norway, a tiny Scandinavian nation that was until recently 99 % white and Lutheran Christian, native Norwegians will soon be a minority in their own capital city, later in the whole country. And still, Norwegian politicians, journalists and University professors insist that there is nothing to worry about over this. Multiculturalism is nothing new, neither is immigration. In fact, our king a century ago was born in Denmark, so having a capital city dominated by Pakistanis, Kurds, Arabs and Somalis is just business as usual. The most massive transformation of the country in a thousand years, probably in recorded history, is thus treated as if it were the most natural thing in the world. To even hint that there might be something wrong about this has been immediately shouted down as "racism." [3]Source

Now I am not saying this migration should not occur. My point is that it's happening without ordinary people's involvement in the decision-making. On such a sensitive issue, more public participation is an end in itself, as well as a means toward wider acceptance of new citizens. I would also argue that much immigration to the west is driven in fact by the rich countries' corrupt trade policies, which do so much to impede imports of goods from the third world. It's crony capitalism, carried out at the expense of consumers. Norway's barriers to agricultural imports, for instance, are some of the [4]highest in the world. Western governments have contributed to the collective impoverishment of poor countries, so stimulating *reluctant* immigration to their own countries.

What can we do about all this? An essential first step, I believe, is to formulate policy in terms of *outcomes that are meaningful to real people*, which would make it harder for governments to justify dodgy expenditures. After all, if mad schemes like the Common Agricultural Policy had to say from the outset that their prime aim is to transfer resources from the poor to the rich, to denude the environment and to impoverish the third world; if, in other words, they did not rely on deception for their existence, then it's unlikely they'd ever be implemented.

### 3.6.14 Targeting mental health (2006-06-25 18:37)

Definitional and measurement difficulties aside, it's clear that mental health is a serious social problem. According to the [1]UK's Mental Health Policy Group in the UK 'one in six of all people suffer from depression or chronic anxiety, which affects one in three of all families'.

Mental health is of course difficult to quantify - to put it mildly. So how can government aim for improvement? It can readily measure and increase *spending* on treatments like psychological therapy, as the Group advocates. But how are we to know whether such spending is cost-effective, or even effective? Quantifying well being, or as economists put it 'social welfare' is a broader question than mental health and I have no easy answers. The [2]World Bank and [3]United Nations publish tables of social indicators of development, encompassing such variables as literacy, water supply and sanitation, and natural resources. These are obvious priorities for developing countries, and they do happen to be easy to quantify. But even in these countries mental health is a hugely important issue: should it be ignored just because it's difficult to measure?

One approach could be to take small randomised samples of a population, and measure their behaviour and responses to specific questions or psychological tests. This is the approach taken by crime surveys, which are thought to be more reliable indicators of criminal activity than numbers of crimes reported to the police. These surveys simply poll a sample of people and ask whether and how they have been affected by crime.

A Social Policy Bond regime should probably target mental health explicitly, but so too should our current political system. Like the physical and social environment, with both of which it's inextricably bound up, psychological wellbeing is in danger of being allowed to deteriorate by default, because nobody got round to quantifying it until the effects of its degradation were too catastrophic to ignore.

### 3.6.15 Airbus: the flying Common Agricultural Policy (2006-06-26 14:08)

"I have the choice between being considered someone dishonest or someone incompetent who doesn't know what is going on in his factories," said Arnaud Lagardère [co-chair of EADS, the Airbus builders]. "I prefer the second version."

What is it about the French elite and their corrupt hauteur that so intimidates the rest of us? As with the land-based Common Agricultural Policy, so with Airbus they are doing their best to ensure that efficiency and common sense are subordinated to backwards-looking visions of French glory.

Compared with Mr Lagardère, who has no operational role at EADS, the man who actually runs the group was not at all contrite. Noël Forgeard [the other co-chair] claimed in numerous interviews that Airbus, the subsidiary of EADS making the A380, was not late in admitting its production problems. (In fact, it took Airbus two months to make them public.) The relationship between Airbus and EADS is completely transparent. (In fact, Airbus is run as a semi-autonomous fief.) The war between German and French shareholders and managers is over. (In fact, they are at each other's throats.) And he categorically denied using inside information when he pocketed €2.5m for himself and his family after exercising share options in March. He was, he said, "shocked by presumptions of his guilt". [1]Source

The sadness is that a European Union without the French elite and its hang-ups could actually work very well. For a start, the Common Agricultural Policy could be dismantled, allowing the food-rich developing countries to export to Europe, greatly enhancing the survival prospects of, especially, [2]Africans. Then the EU members could conduct all their business in one official language - English - instead of the 20 or so currently used. Rather than being an unpopular and failing way of projecting French power and its centralised, remote system of government onto Europe populations, it could then become more responsive to the genuine concerns of its people.

### **3.6.17 Portentous prose about nothing (2006-06-30 08:26)**

Here in England following the World Cup is a lot of fun. What I like best is the eloquent, well-informed moaning about England's inevitably lame performances. The calibre of the commentary on football, from professional journalists and the people who ring talkback radio, is very high. (Motoring is another field where the quality of journalism is far greater than you'd expect.) Ultimately of course (whatever Bill Shankly said) it's only an entertainment and the commentators realize that.

The mismatch between the tone of equally high-calibre political journalism and its content is more jarring. Much attention is lavished in this country on the precise timing of the end of Mr Blair's Prime Ministership, the qualities of his likely successor and other trivia. Serious, competent journalists and politicians spend a great deal of energy giving us their views in well-crafted portentous prose. (See [1] here for a recent example.) Good luck to them, and it can be as entertaining as football journalism. Unfortunately it can also distract us from what politics should be about. It's another branch of the celebrity-driven news and entertainment industry that threatens to crowd out politics and policymaking as far as ordinary members of the public are involved.

Is this emphasis on image and personality a symptom or a cause of public disengagement from politics? Politics and economics are about vision and strategy, priorities and trade-offs; but you will rarely hear them discussed or even read about except in the more serious journals. Their presence in the mass media are almost totally eclipsed by fatuous speculation or frivolity. As the gap between normal people and politicians widens, so it's being filled with frothy stuff that signifies nothing. Politicians are becoming a priesthood, as remote from the people that pay their salaries as the elite multimillionaire footballers in their private jets.

Part of the reason is that they express their intentions in terms of money spent, institutional structures or vague promises about almost anything - except verifiable outcomes that are meaningful to natural persons, as distinct from corporations. We expect no better nowadays; the opinion formers are largely acolytes to the political caste, beneficiaries of the same mystique they bestow on our masters.

## 3.7 July

### 3.7.1 Why England lost the World Cup (2006-07-02 06:39)

I know very little about football, but even I could see, watching England's match against Portugal yesterday, that England played well only after their captain had retired injured and their star player had been sent off. I wonder whether there's something in the English psychology that values a win - in any field - only when it's against the odds? Deep down the players perhaps know just how pampered they are. On the 90th anniversary of the beginning of the Battle of the Somme did they feel undeserving of the fabulous material rewards they'd receive for winning a football game? These players are on contracts of several tens of thousands of pounds per week. They had nothing to prove by winning until they had a real battle on their hands. Only then did they play to their full potential.

There is a wider policy question. In the UK, as in most other western countries, the government tries to help people who are out of work. It gives cash payments to the unemployed. Because such schemes are run nationally, they cannot and do not discriminate between those who need the money and those who would actually be better off without government help. There is such a class of person, and there's no telling how big it is. But it is a downside of remote government that welfare programmes delivering cash benefits to people on the condition that they do nothing with their lives is likely to stifle any sense of pride and achievement. As with the multi-millionaire footballers (whose salaries aren't paid by the taxpayer, thankfully), this generosity gives people no challenge to overcome, nothing to play for.

### 3.7.2 Entrepreneurs and managers (2006-07-03 14:56)

Arriving in Germany from the UK dramatises the difference between entrepreneurship and management. The British have historically been pre-eminent at setting up enterprises, but not at all good at managing them. That appears to be Germany's forte, at least in my initial experience. In contrast to the UK, public transport is well-organised and clean. But, as Richard D North says in [1] a fascinating essay:

The Continentals pay for their orderliness. Only the most crushing civilisations can keep violence at bay. Perhaps France can do it, except when its over-wrought tidiness of society gives way to revolution or upheaval. They saw violence in the 90s, and was suburban. It was a revolt against Corbusier-in-exile, against the peripheral estate, in which neither of the traditional continental virtues - self-conscious urbanism and full-bloodied ruralism - is expressed. The German historic propensity to break out of dullness into violence is the expression of a society which doesn't understand the need for routine hooliganism, the British triumph.

Is this relevant to Social Policy Bonds? Perhaps: a bond regime could convert management and bureaucracy into a profit-seeking endeavour. It would grant supernormal profits to people who

excel at achieving stated social or environmental goals. It would, in short, inject entrepreneurial incentives into solving our problems. Our current system sets up institutions mostly either government or run along bureaucratic lines, that provide only civil service type incentives to their employees. There is little correlation between the financial rewards to, say, UN peacekeepers, or researchers into climate change mitigation strategies and their success in achieving their objectives. They are paid salaries on the basis that they turn up to work. But meeting our serious global challenges needs more than good management. Social Policy Bonds could play a part in channeling some of our awesome ingenuity and creativity away into achieving public sector goals.

### **3.7.3 Contracting out UK Government services (2006-07-05 21:55)**

From the [UK] [1]*Guardian* of 3 July:

The government is creating a new generation of multimillionaires and turning charities into multimillion-pound businesses by contracting out services provided by the state, a report commissioned by the Whitehall trade union the Public and Commercial Services union, reveals today.

I'm pleased with this. It's not Social Policy Bonds, because the contracts don't appear to be tradeable, and the newspaper article talks about the provision of services, rather than the achievement of outcomes but it's a start. Naturally it provokes opposition from the ideologues:

Mark Serwotka, PCS [Public and Commercial Services Union] general secretary, said: "There is a real danger that government plans to increase the role of the private and voluntary sector in the provision of public services will mean a step back to a model of prewar welfare provision. The fear is that this is 'soft' privatisation, with the voluntary sector opening up services for contests which can subsequently be won by the private sector."

### **3.7.4 Sprawl is subsidised (2006-07-08 19:29)**

I argue that smart growth is actually a conservative notion, because it saves money. It saves money because cities and towns don't have to extend infrastructure so far.

You're taking advantage of existing infrastructure with redevelopment, and you're also leveling the playing field. Those who believe in the free market shouldn't like government picking winners and losers, and that's exactly what government has done over the last half century in terms of favoring sprawl. What smart growth does is level the playing field - make it as easy to build in the city or in older suburbs as it is out in the countryside. Anthony Flint in an [1]interview with Grist Magazine

### 3.7.5 What's good about the status quo? (2006-07-10 14:02)

A Social Policy Bond regime would contract out the achievement of social and environmental objectives to the private sector by issuing tradeable bonds redeemable when specified goals have been achieved. The bonds could help meet new global and national challenges, such as climate change or crime reduction, but they should also specifically target the maintenance of some aspects of the status quo. Peace within secure borders, freedoms to live under fair laws, fair administration of justice...these are all of immense value - but tricky to define. Unfortunately, much like 'the environment' or 'quiet' or 'social cohesion' they tend for that reason to be taken as given by policymakers, and so exploited, until they are in such a parlous state that they can no longer be ignored.

Could these desirable features of our current way of life be targeted explicitly? It's an important question, worth posing even if we were not contemplating the issue of Social Policy Bonds targeting, for example, world peace. Why? Because many important defences against social or environmental disaster appear to be eroding. We face catastrophic risks arising from climate change and nuclear proliferation, but it's difficult not only to see progress being made, but also to conceive of a way of measuring whether we are moving towards or away from achieving our goals. So how to specify our goals and quantify progress towards them is not just an abstract question.

If we assume that it is worth channeling scarce resources into retaining some degree of climate stability then under a Climate Stability Bond regime, we should have explicitly to quantify climate stability, in such a way that maintaining (or increasing) it can be explicitly and objectively verified. This sounds very difficult, and indeed it is, but *exactly the same difficulties apply when attempting to monitor the success or otherwise of alternative ways of preventing or mitigating climate change*, including the Kyoto agreement to limit anthropogenic emissions of greenhouse gases.

### 3.7.6 France: world champion of hypocrisy (2006-07-11 12:17)

Europe must be careful not to turn itself into a fortress just to keep out immigrants, a French minister has said. Addressing a European-African migration conference, French Interior Minister Nicolas Sarkozy said the concept of zero immigration was a dangerous myth. Ministers from 57 European and African nations are meeting in the Moroccan capital Rabat to discuss ways of dealing with migrants. [1] BBC

The fact is, Mr Sarkozy, that it is your benighted France that has already turned Europe into a fortress. France, with its loathsome trade policy, has led Europe in refusing to allow imports of agricultural products from poor countries, especially in Africa. Through its support of the corrupt, insane Common Agricultural Policy, France has helped impoverish the third world, and made escape to the west the only option for hard-working [2]Africans who want to make a better life for themselves and their families. Not content with that it is the ludicrous French elite that does its best to ingratiate itself with thugs and kleptocrats like Robert Mugabe, whose actions encourage immigration, legal and illegal, to the west.

Anonymous (2006-07-14 23:54:00)  
Hi Ronnie,

I am wondering where to draw the line.

On one hand, access to western markets could be beneficial for the so called developing countries, on the other hand we see the negative effects of free global trade, such as the transformation of their economies to purely export oriented ones, as happening under the regime of structural adjustment programs.

The "poor" will only benefit from exporting their, mainly agricultural, goods if they own the land the goods are produced on. But what actually seems to happen is that the peasants are bought out by foreign investors (thanks to the unrestricted flow of capital under the WTO rule), Production is then moved to export goods like sugar or coffee with all the negative environmental effects.

How could we get the best of both worlds? A good start might be to remove tariffs on fair trade goods. Maybe this would meet less resistance in the western countries, as their market share is small. But it would make them cheaper and more attractive to "mainstream" consumers.

What do you think?

Cheers,  
Frank

Ronnie Horesh (2006-07-15 16:43:00)  
Thanks Frank for your comment.

I don't think free global trade leads to purely export economies, or to the extent that it does,

that such economies are wholly worse than the alternative. I certainly agree with you though that free trade in goods should precede free flows of capital. But this is how I see it.

First: trade barriers lead to industry concentration. In fact they work the other way as well. Trade barriers in agriculture go mainly to the largest landowners and wealthy agribusiness corporates. This is partly because they take the form of market-based support, which rewards most the inputs that are most inelastic. In agriculture the least elastically supplied input is farmland, so its price rises and farming becomes more land-intensive as a result. The other major beneficiaries of the current corrupt subsidy regime are suppliers of purchased inputs and agricultural processors. Richer landowners buy more of their products and services and can be charged more. These companies tend to be large corporates who can and do lobby government to maintain trade barriers, and in this they are successful, lamentably.

So negative environmental effects arise partly from intensive farming in the protected economies, but also as a result of the impoverishment of the third world. Yes, there are negative environmental effects of production for export, but there are also negative impacts arising from lack of development. This is a thorny question, but in general the negative effects of trade are also the negative effects of economic growth under the current model, which favours big and global businesses at the expense of the small and local. Subsidies to cronies and government intervention are features of the current model.

Economic growth under the current model, where many large environmental impacts are externalised, does have many negatives, but it also has many positives, not only those that are internal to large corporates. It has lifted many millions out of poverty, most notably, and this has to be weighed against the indisputable negatives. Economic growth accompanies trade, not necessarily cross-border trade, but that does help when it's not distorted by corrupt lobby groups and their friends in government. On economic theory and on all the evidence, trade is necessary, though not sufficient for economic growth and economic growth is essential for rising standards of living. I certainly agree though that the current growth model is flawed, perhaps fatally, but I don't see that limiting trade is a solution. Getting rid of all trade barriers - including subsidies to cronies and including subsidies to roads, energy extraction and consumption, ports, airports - is a start. Internalising the negative environmental effects of economic activity should also be attempted. There is also the important question of freedom. What business is it of government to intervene between willing buyers and willing sellers of goods or services? There are cases where it's necessary to protect plant, animal and human life, but for the most part government trade barriers are as spurious as they are corrupt.

I hope this is helpful, but don't hesitate to respond. Regards

Anonymous (2006-07-17 09:58:00)

Hi Ronnie,

thanks for your elaborate reply.

what concerns me is that the policy makers and the corporations are urging for free trade but not also for measures to cushion the negative impacts.

And it seems to me that it is very hard to weight the positive against the negative consequences.

Do you have objective numbers, e.g. about what happened in Mexico since NAFTA was implemented? GDP does not count, at least I don't accept it as a measure of well being.

Regards,  
Frank

Ronnie Horesh (2006-07-17 12:39:00)

I agree that GDP is very badly flawed. However, there does seem to be a correlation between a high GDP per capita and (1) lower levels of poverty and (2) more concern for the physical environment. There are also of course many negative impacts that correlate with a high GDP, but I don't think they justify trade restrictions. It's better to tackle the problems directly. Government intervention that blocks trade is an abuse that has favoured corporations at the expense of people; that's why I hold French trade policy in contempt. (This sort of debate is so politicised that I should reassure you that I don't think a high GDP should be a government objective.)

The problems we have at the moment are precisely those caused by managed trade and other corporatist/government schemes that are biased in favour of large corporations and their lapdogs in government.

I don't know the detail of NAFTA. But I can say that the US still has many corporate welfare schemes that favour large companies at the expense of natural persons. One of these are the very high trade barriers to farm produce. Another are the subsidies to oil extraction and consumption. 'Free' trade under these conditions may well be overall negative and damaging, but it is market distortions and biases that are the problem, not the principle of unimpeded trade between willing buyers and sellers.

In general I think government should allow as many freedoms as possible and work to avoid and mitigate the negative impacts, rather than use such impacts to push its own agenda, much of which dictated by the large corporates anyway. But first it should get rid of all corporate welfare schemes - including trade barriers.

### **3.7.7 Government failure is catastrophic (2006-07-12 14:49)**

In the 'world of truth' [ie markets] ... such disasters [as the Mao-induced famine in China that killed from 10 million to 60 million people] cannot happen. Mistakes, certainly, will be made - perhaps more frequently than under central planning. But the mistakes stay small; in market economies we call them 'experiments'. Tim Harford, [1] *The Undercover Economist*, page 237

Spending time in provincial England is a reminder of just how bleak life can be when government fails. The physical infrastructure of cities is very much a government creation, as is an education system driven by ideology. Government thought it knew best not only what to achieve, but how to achieve it. The intentions were good, the execution has been disastrous.

A Social Policy Bond regime would play to government's strengths: articulating what society wants and raising the revenue to finance achievement. But it would contract out to the market that process which the market does best: ensuring that scarce resources generate the maximum return to the taxpayer's dollar. Government would decide what to do; the private sector would decide how to do it.

### **3.7.9 Measuring quality of life (2006-07-18 22:17)**

Here in Cologne it is liberating to be able to walk around the city late at night and feel safe. It's difficult to do this in much of the English-speaking world. To some extent, fear of crime is subjective. Issuing Social Policy Bonds targeting this essential element of a decent quality of life relies on some reliable way of measuring it, or at least measuring how it changes. But it's important to try to quantify such variables under the current policymaking regime too; otherwise it will tend to be ignored, much like other critical components of a decent life, like social cohesion or (until recently) the physical environment. The need for objective data on these features is a function of the size and complexity of our societies. These rise inexorably, partly because of the influence of lobby groups especially large corporations and government agencies, which can use their muscle to maximise their short-term objectives. Social Policy Bonds would subordinate such goals to outcomes that are meaningful to natural persons. Targeting the safety of our streets and homes would be one way of doing this.

SocialGoals.com

---

### **3.7.10 Solitudinem faciunt... (2006-07-23 08:35)**

It's too late to do anything much to stop the current wars or to avoid the imminent ones, but we can at least set in place mechanisms to prevent those violent political conflicts that are not yet inevitable. I've blogged [1]before on the need to inject incentives into peace

building. An equally fundamental question though, is what constitutes peace? This is not just an abstract point. A Social Policy Bond regime targeting peace would differ radically from the conventional, and not always successful, approaches. Most markedly it would not directly try to address war's alleged causes; or rather, *it would not prejudge what those causes are.*

Such an approach has (in my view) great merit. War is so complex that it is not always obvious, even after a long conflict has ended, what its 'root causes' were, and perhaps the very notion of a 'root cause' needs questioning. It implies that factors such as 'poverty' or 'ethnicity' can be removed from their social context, and somehow dealt with, and that then a desired result will follow. But human societies are complex. Poverty can feed grievance, but grievance can be a result of poverty. No single formula, no single set of parameters will always lead to conflict, and guarantee freedom from conflict. Indeed, even the notion of 'causation' in this context is questionable. Perhaps Tolstoy summed it up best:

The deeper we delve in search of these causes the more of them we discover, and each single cause or series of causes appears to us equally valid in itself, and equally false by its insignificance compared to the magnitude of the event.

If we were going to issue Social Policy Bonds that target the elimination of violent conflict, how exactly would we define our goals? Peace - the absence of open war, the minimising of numerical casualties - would probably not suffice. Regimes can pile up armaments and blackmail neighbouring countries into making concessions or suffer the consequences. Under such circumstances, the open outbreak of military conflict would be unlikely, but it's hardly the sort of peace that we'd like to target.

I have no definitive answers, but I think that apart from the numbers of soldiers and civilians killed in armed conflicts, we could include elements such as the expenditure on armaments, numbers of full-time equivalents in the military, and mass media indicators of impending conflict. This last is interesting: there appears to be strong evidence that the underlying intentions of governments can be accurately gauged by a systematic analysis of opinion-leading articles in the mass media, regardless of the relative openness of the media in question. (See *Getting to war: predicting international conflict with mass media indicators*, W. Ben Hunt, University of Michigan Press, 1997.) Such analysis allows the prediction of both the likelihood of conflict and what form of conflict - military, diplomatic or economic - will occur. This sort of indicator could be useful as a target where military conflict has not begun, but appears possible, and where other data are scarce.

Once we have a set of indicators for peace, we could set about issuing Conflict Reduction Bonds, with national, regional or global objectives. We'd most probably have to refine the indicators over time, but the important point is that we'd be building a strong and highly motivated coalition for peace - in contrast to the current mess, under which the most dedicated individuals and groups seeking peace are the least rewarded, and the most highly rewarded are those who sell weapons of war.

-  
Policy as if outcomes mattered  
SocialGoals.com

1. <http://socialgoals.com/blog/2006/07/incentives-for-peace.html>

### **3.7.11 Nothing positive here (2006-07-26 08:32)**

Trade barriers are subsidies to favoured groups. Except when erected to protect animal, plant or human life they are essentially rewards to those corporations who have most muscle over government. So the collapse of the Doha Round is particularly depressing for those, like me, who believe that economies and governments are supposed to serve natural persons, as distinct from corporations, not the other way round.

The broader question is why governments are now so remote from their populations that the interests of corporations matter more to them than those of the people they are supposed to represent. Is it a function of size alone? There does seem to be circular relationship: corporations lobby for subsidies and spending on a certain type of infrastructure; a type that favours large corporations at the expense of small businesses and the environment. So our economic system becomes more complex, and more dependent not just on that complexity, but on the growth of that complexity. Interdependence, alienation and the remoteness of decision making all rise inexorably. People lose sight of how their best interests will be served. Somewhere along the way, the system becomes more important to policymakers than the wellbeing of the people whom it's supposed to serve. But the system resists organic change. Its main beneficiaries, large corporations and government agencies, find it easier to feed at the government trough.

The collapse of the Doha Round blights the prospects of millions in the developing countries. It will keep many of them in poverty and despair. Unfortunately the connection is too obscure and slow-moving for television, and our elected representatives and their paymasters in the large corporations will carry on regardless, subsidising the rich at the expense of the poor.

### **3.7.12 Making aid work (2006-07-27 16:15)**

An important [1]article from Abhit Vinayak Banerjee describes what happened when a group of economists tried to get aid organisations to spend a few minutes saying where their help was going after the 2005 earthquake in northern Pakistan. The economists wanted to make sure the aid was going to the right people.

All that was needed was an office or Web site to which everyone could report the names and locations of the villages where they had sent aid and the amounts sent. ... So, with the help of some contacts in the IT industry and some students at Lahore University, they designed a simple form and approached donors with a simple request: whenever you send out a consignment, please fill out one of these. There were paper copies available as well as a Web-based form and a call center. The reaction, when it was not actually hostile, tended to be derisive: "Are you mad? You to want us to spend time filling out forms when people are dying? We need to

go and go fast.” Go where? the economists wanted to ask. But nobody seemed to care.

In many ways this episode captures very well one of the core problems with delivering aid: institutional laziness. Here many of the standard problems were not an issue: the donors and the intermediaries were both genuinely trying to help.

As Banerjee points out, this episode is symptomatic of aid programmes. I would argue also that it is typical of all programs run by government agencies. There is simply no incentive to be efficient. One result:

Primary education, and particularly the question of how to get more children to attend primary school, provides a fine test case because a number of the standard strategies have been subject to randomized evaluations. The cheapest strategy for getting children to spend more time in school, by some distance, turns out to be giving them deworming medicine so that they are sick less often. The cost, by this method, of getting one more child to attend primary school for a year is \$3.25. The most expensive strategy among those that are frequently recommended (for example by the World Bank, which also recommends deworming) is a conditional cash-transfer program, such as Progresa in Mexico, where the mother gets extra welfare payments if her children go to school. This costs about \$6,000 per additional child per year, mainly because most of the mothers who benefit from it would have sent their children to school even if there were no such incentive. This is a difference of more than 1,800 times.

Banerjee is optimistic that two of disciplines applying to, for example, the pharmaceutical drugs industry can help. These are randomised trials (where possible), and using evidence to support funding decisions. Indeed, as he says, a number of the larger philanthropic organisations are now basing their decisions on evidence.

As I believe, it's not just aid. There are few incentives for any government agency or policymaker to get things right for any but the most publicity-rich short-term initiative. There are two main reasons. First, given the complexity of our society the relationships between any particular policy or programme and an actual outcome are difficult to identify. Second, there are no incentives for anybody to identify such relationships. Politicians and officials aren't paid according to how objective criteria. Government organisations don't benefit if they become more efficient – often the reverse is true and they are disbanded if their ostensible reason for existing is actually achieved.

What we have seen in aid, less obviously tragic perhaps, we see in the western countries too: the persistence of corrupt, environmentally disastrous policies, such as the mad farm support schemes that have just recently derailed the Doha round of trade talks, threatening the entire world trading system.

### **3.7.13 Farm subsidies are evil (2006-07-29 07:27)**

Daniel Davies writes about agricultural support on the [1]Guardian's website, under the heading *Africa does not need more expensive food*. He believes that farm subsidies in the west reduce prices of food for African countries. It is true that there are some net food importing developing countries who would lose out in the short term if subsidised overproduction from the west were not available. However, the net losses to the developing world as a result of farm subsidies are much greater, I believe. Once I receive confirmation of registration from *the Guardian*, I will post a comment along these lines:

" Daniel, I don't think anybody objects to flat subsidies to farmers that are fully decoupled from production. The problem I think is that these are not the main way in which farmers in the rich countries are supported. I don't have the latest figures, but OECD data for 2003 show that market price support to agriculture in the rich countries amounted to US \$160 billion. These mainly take the form of import barriers rather than budgetary subsidies. They raise consumer prices, hence they are transfers from consumers (not taxpayers) to farmers. The CAP's import barriers do therefore constitute a volume subsidy. The effects on the food-rich third world countries are cumulative; these barriers have been around for decades. So they may well help explain exactly why there are no good roads or railways in Africa. High tariffs not only inhibit exports; they also export price instability to the rest of the world. You say you can't have a development strategy based on low value-added commodities. Granted the sums of cash may not be large to us; but they would mean more to Africa. And didn't Argentina, New Zealand and Australia start out on their route to prosperity by exporting bulk agricultural commodities? "

### **3.7.14 Real people lose interest (2006-07-31 13:14)**

Writing about the failure of the Doha round of multilateral trade talks, [1]Clive Crook says:

Wherever you look, in the United States or abroad, you see capitulation to special interests and an utter lack of ambition and leadership.

Precisely so. We have a political system driven by everything except identifiable outcomes. So there's no correlation between what a party or politician says and what actually happens. Our economies are made increasingly complex by subsidies, favours and trade barriers that do everything to favour the large and global at the expense of the small and local. The result? Any relationships between policies and outcomes are further obscured. Unaware of what's really

going on, real people give up. In our place are the corporations and the bureaucrats. It's in their interest, and their interest only, to allow governments to continue with their economic, social and environmental lunacies such as the agricultural subsidies, which as well as derailing Doha amount to a [2]death sentence for Africans.

## 3.8 August

### 3.8.1 Outcomes: anything else is self-indulgence (2006-08-02 08:18)

The US is the evil representative of capitalism. Capitalism will lead to the perdition of humankind and destroy everything, including friendship. Imperialists are lower ranks of human or even sub-animal because they dropped a nuclear bomb on a city.... Hugo Chavez, Venezuela president, speaking at the Vietnam Chamber of Commerce and Industry, 1 August.

I have long thought that outcomes should drive policy. And I've long suspected that many of the people who heave bricks through fast-food cafes when they protest against 'capitalism', or perform similar stunts allegedly in support of environmental objectives actually have another agenda. Certainly they're not doing much for their ostensible cause (how else to explain the re-election of the disastrously incompetent Bush administration?). But they do boost their self-esteem and successfully advertise their moral purity to their cohorts.

Sometimes advocating outcomes above everything can seem a lonely pastime So I was glad to read this message from Kathryn Compton to the editors of [1]Grist magazine:

.... Rush Limbaugh and the rest of the blabocracy wouldn't stand a chance if the liberals, progressives, and greens hadn't worked so hard at making the working-class stiff feel stupid for his lifestyle and his choices. Their movement gets its oomph from the proud working person's backlash against exactly the snarky attitude your article demonstrated.

If you want to keep appealing only to your core readership, carry on. But if your goal is to actually grow the environmental consciousness of this country and preserve a hospitable climate, you might want to take a look at your own prejudices and see what they're costing our planet. If we want the green movement to be embraced the world over, wouldn't it be a logical choice to encourage the most global of all global corporations rather than ridicule every step they try to take? ....

It's an important point. My fear is that the genuine human need for bonding with like-minded others can easily be channelled exclusively into a rage against 'the enemy'. Then there's an equal, or more-than-equal and opposite reaction. Pretty soon the issues are so polarised and politicised that dialogue becomes impossible. The cause has been subordinated to our own status seeking and it's always easier to fight for your principles than live up to them. And there isn't enough fighting in the world?

So I keep chanting my mantra: let outcomes drive policy. Not ideology, not spending, politics, activities, nor institutions' need for self-perpetuation, nor our need to boost our fragile self-esteem.

### **3.8.2 Social Policy Bonds are not utopian (2006-08-04 13:43)**

The suggestion that, as under a Social Policy Bond regime, we might contract out the achievement of such goals as basic health and literacy, crime reduction, climate stability or world peace sometimes scares people. They wonder whether I'm serious. I have to remind them that a government that issues Social Policy Bonds would be contracting out only the achievement of these goals. It would still be defining the goals and raising the revenue that would ultimately pay for their achievement. Of course there would be difficulties: defining what we want as a society could be problematic; and expressing such goals in quantifiable terms even more so. But the comparison I'd wish people to make is not with some utopian ideal, but with the current system. And rather than look at the conceptual difficulties, let's look at what's actually wrong.

It seems very likely that we now inhabit a planet on the brink of environmental catastrophe. Nuclear proliferation, even that which has already occurred, is already a baleful threat. At national level the wealthiest countries in the history of humankind are blighted by soaring crime rates, large rises in mental illness, and other more intangible but no less real concerns. Moving away from the rich countries into the developing world...ok, you get the idea. It's not just that there are problems; it's that their scale and severity threaten large human populations and the current policymaking machinery is too slow and cumbersome to do much about them, even when it's well-intentioned.

Social Policy Bonds, I repeat, have their own difficulties but they do provide a means by which human ingenuity and creativity can be channelled into achievement of public goals. A bond regime would inextricably link rewards to achievement of these goals. The possibilities, once we have a system where benefits are correlated with the public interest are immense. Today, in contrast...well:

Zidane's head butt spawns unlikely pop hit

Three weeks after France's defeat in the World Cup, the infamous moment when

national footballing hero Zinedine Zidane lost his temper has been immortalised in the form of an unlikely hit song called Head Butt. [1] *The Times*

### 3.8.3 Recasting political debate (2006-08-06 13:01)

Public disenchantment with, and disengagement from, the political process are a concern; not only in themselves, but also because of their major secondary effect: politicians get away with murder. Ok, not always literally, though often it's something [1]not very different. They certainly get away with massive misallocations of resources in the form of perverse subsidies and help create an economic and legal system heavily biased in favour of their mates (and paymasters) in big business.

Efforts to close the gap between politicians and the people they are supposed to represent don't seem to be very sincere or successful. There is talk of changing the basis of party funding in some of the western democracies. That might cut out some of the most obvious cases of corruption, but it's unlikely to make real people take an interest in policymaking.

I think that one of the reasons for the widening gap between people and politics is that policy debates centre on matters whose relevance to ordinary voters is obscure. We are not interested in process, or institutional structures, volume of spending, or arcane discussions about remits and regulations. We are - unfortunately - interested in personalities, emotion and ideology, but I believe these should not drive policy and that they would not if there were a better alternative on offer.

And I believe there is: what really concerns us, when we are given a chance to reflect, are results - outcomes, in other words. A Social Policy Bond regime would recast political debate in terms of outcomes. By doing so it would encourage more natural persons, as distinct from corporations, to participate in the policymaking process. Again, this is not only an end in itself, but a means to more relevant, responsive and responsible decisionmaking.

julio (2010-02-01 23:59:00)

I think there's a bit of what you say and should have management analysts in Argentina that are public and detached from the press that determine if a certain person ruled well or badly, or you can occupy a position superior political effectiveness is not by popularity.

Ronnie Horesh (2010-02-02 00:09:00)

Thanks Julio. Under Social Policy Bonds ruling would be more about articulating society's wishes than about courting popularity. And people's wishes would be determined and then targeted; they would therefore be quite calculated, rather than (as now) responsive to immediate events and so more likely to be based on emotion.

### **3.8.4 Taking stock after 17 years (2006-08-09 07:37)**

With so many ideas of wildly varying quality in circulation, and being frustrated at Social Policy Bonds' lack of visible progress, I thought I'd compile a brief resume of the concept, intended to show that it does have some respectability.

It's 17 years since I first wrote about and spoke publicly about Social Policy Bonds. Since then it has had an unusual fate for an unusual idea. It has not been adopted anywhere, to my knowledge. But neither has it been dismissed outright. It tends to provoke initial enthusiasm amongst economists and decision makers, but then to be forgotten as day-to-day issues demand immediate attention. In 1991 it won an award for the Best Political Social Invention from the UK Institute of Social Inventions; now the [1]Global Ideas Bank. In early 1997 I received [2]a letter from Robert Shiller, Professor of Economics at Yale University, praising the Social Policy Bond idea, saying that it creates 'a large interest group for the solution of important problems. The political and other effects of creating such an interest group could be incalculable.' Professor Shiller later mentioned the concept in his book [3]The New Economic Order. The first draft of my core text (see *Social Policy Bonds at length*, in the right-hand column) elicited extreme comments at both ends of the range from the two referees: one dismissed the text as an irrelevance. The other called the idea 'original and ingenious' and 'a substantial contribution to debate about public policy'. My draft was rejected and my books have since failed to find a mainstream publisher.

In 1999 an essay on Social Policy Bonds was one of the three finalists at the inaugural US \$25000 St Andrews Prize given by Conoco and St Andrews University, UK. I have given presentations on Social Policy Bonds at other fora, including the University of Cambridge, the Institute of Economic Affairs (London), and the Institute of Public Affairs (Melbourne). I have also discussed it with a former New Zealand Prime Minister's Chief Policy Advisor.

In April 2002, I presented a paper on the Social Policy Bond concept to a joint meeting of the Agriculture and Environment Committees at the Organisation for Economic Cooperation and Development (OECD) in Paris. Delegates from most of the OECD's member countries commented on the paper. These were mostly along the lines of 'this is very interesting — but unworkable in practice.' Perhaps one of the delegates articulated the deeper feelings of those present, who were overwhelmingly government employees: 'if this gets adopted we'll all be out of jobs!' My paper went no further at OECD.

Over the years quite a few private individuals have talked with me about issuing their own Social Policy Bonds, for projects as diverse as boosting voter registration, raising literacy in developing countries, reducing homelessness and developing open-source software. Sad to say, as far as I am aware all these discussions have come to naught. I am particularly disappointed because I believe Social Policy Bonds could improve greatly on current approaches to what I see as very grave concerns: climate change and nuclear proliferation. Common to both

these challenges are (1) their complexity, which means they need adaptive, diverse solutions, the precise nature of which cannot be known in advance; (2) their urgency and enormity; and (3) the failure of the current policymaking system to address them adequately.

Anonymous (2006-08-18 14:13:00)

It's really bizarre that people admit the idea is good, and that they like it, and it could work, and it's worth trying, and yet... nothing happens.

I wonder if it's the prophetic thinking of economists that is the cause. If it's good, why isn't it here already? If it works, the market will make use of it so ... it's no need for us to take the first step.

That is really one of the most profound "market" failures (it's not really just a market failure, it applies to other things, too. Many of the predictions of Marxism, for instance, failed as a result of their own prediction.

I didn't realize you've been doing this so long. I hope you hold on, Ronnie Horesh. It's a good idea, it can be made to work, eventually.

Ronnie Horesh (2006-08-19 08:46:00)

Thanks Harald. I think the novelty of the Social Policy Bond idea makes it difficult for most people to advocate. It probably needs someone already quite eminent, but without much to lose - who is also not too busy to take the time out to consider the concept deeply. Such a combination of characteristics is rare. Another obstacle to the bonds being issued is that they work best on a large scale, which does make it more difficult to try them out. But I will keep going. It's encouraging to read your comments.

### **3.8.5 War and asymmetric incentives (2006-08-12 09:13)**

We are not quite rational about war. We regard its opposite, peace, as an ideal: as unattainable as it is desirable; something to be worshipped from afar, and something that will never actually happen. War appears to many of us, as it did to the ancient Greeks, to be part of the natural order of things.

Perhaps our inbuilt expectation of a never-ending succession of wars is why we don't take efforts to stop it very seriously. Sure, we have international bodies ostensibly committed to peace-building, and we have countless well-meaning dedicated individuals working behind the scenes trying to prevent or defuse armed conflict. It's not obvious but thankfully their efforts helping reduce the numbers of people killed in armed conflict, as I have [1]blogged before.

But the potential for catastrophe is rising with nuclear proliferation, and it would seem

worthwhile trying a new approach. The resources going into conflict prevention are derisory when we look at some of our other expenditures. Why is that? I suspect it's because the achievement of peace is either a national or international government initiative, or because the non-governmental organisations involved are essentially charitable organisations. They cannot be seen to pay very large salaries to their personnel. While these bodies unquestionably attract some of the best and brightest, as well as the most altruistic, these heroic men and women in turn cannot deploy the resources they might need.

The contrast with the private sector is striking. Large corporations operate in an environment in which if they are not efficient they go under; efficiency here doesn't always measure how much output they can generate per unit input.

Particularly for the largest corporations it can describe how effective they are in lobbying government for special favours, such as trade barriers. Nonetheless, their achievement in rewarding their shareholders, performing all the tasks necessary for such unglamorous goals as exchanging warehouses full of toilet rolls for cash, is impressive. Would they be as effective if they faced the same rewards on offer as government employees or NGOs? I think not.

So why don't we channel some of these incentives into the achievement of public goals, such as world peace? Not just the avoidance of armed conflict, but the avoidance of its preconditions. The asymmetry between the incentives on offer to the public and private sectors is as marked as that between their efficiency in achieving their objectives. There is no inevitability about such a disparity. It's mainly historical accident that some hugely important tasks, such as peace-building, impeding trade, building roads educating children are largely the responsibility of government; while others, such as distributing food, printing books or making computers, are mainly carried out by private corporations. There's no need to perpetuate this state of affairs.

A Social Policy Bond regime targeting world peace, broadly defined so as to include secure borders, reduced threat levels etc, could combine the efficiency of the private sector with the needs and goals of ordinary members of the public - those who don't benefit from armed conflict. It wouldn't assume that the idealists and ideologues, the politicians, the generals, and the men of religion are the best people to bring peace to the world. But neither would it assume that none of them have any contribution to make. A bond regime would not represent a single way of ending violent political conflict, but rather it would be a way of stimulating solutions to war that does not prejudge its causes.

As an aside, and to put things into perspective:

...two bringers of mass death were at work in 1918.... By late October the influenza pandemic was killing 7000 people in Britain every week and in all it claimed over 500,000 American lives, exceeding US deaths in battle in the two World Wars, Korea, and Vietnam put together. Worldwide fatalities far exceeded combat deaths in the [First World] War and may have topped 30 million. David Stevenson, [2] *1914-1918: The History of The First World War* (page 498) .

### 3.8.6 Outcomes trump ideology (2006-08-14 07:50)

Negotiating with rogue regimes may not be pretty, but the evidence shows that it works far better than tooth-gnashing. Nicholas Kristof, [1] *International Herald Tribune*

(subscription only), 14 August

I read this column in a cafe's issue of today's *IHT*, and don't have a subscription, but my recollection is that, unusually, the writer compares the outcomes of two different policy approaches. He looks at former US President Clinton's policy of talking with North Korea, and contrasts that with President Bush's approach: no engagement with rogue states. Mr Kristof, I'm pleased to say, looks not at the principles, the politics, or the morality of the two styles, but at their results. And on that basis, the Clinton approach is the clear winner. Under Clinton, no nukes manufactured in North Korea. Under Bush, ten - with more to come. I'm pleased that somebody else cares more about policy outcomes in this critical subject than they do about ideology, image or anything else.

### 3.8.7 It's the outcomes, stupid (2006-08-16 08:51)

Incentives for distant goals, like the ending of terrorism, can take years to work, so I've steered clear from commenting on the short-termist approaches followed nowadays. In an important sense, we've already failed when we've got to where we are today. Even now, though, there would be far better ways of doing it than the one mentioned on [1]theDenverchannel.com:

Marshals: Innocent People Placed On 'Watch List' To Meet Quota  
Marshals Say They Must File One Surveillance Detection Report, Or SDR, Per Month

DENVER - You could be on a secret government database or watch list for simply taking a picture on an airplane. Some federal air marshals say they're reporting your actions to meet a quota, even though some top officials deny it. The air marshals, whose identities are being concealed, told 7NEWS that they're required to submit at least one report a month. If they don't, there's no raise, no bonus, no awards and no special assignments.

This is the antithesis of the outcomes-based approach that I advocate. It attempts to convert fighting terror into a civil service type activity, with boxes to be ticked, norms to be met, procedures to be followed - and who cares what actually happens? What is needed, and quite desperately, is a system that rewards people and institutions not for turning up to work, but for achieving results: in this case prevention of terrorist acts. It's the outcomes, stupid.

- Policy as if outcomes mattered SocialGoals.com

1. <http://www.thedenverchannel.com/news/9559707/detail.html>

---

Anonymous (2006-08-18 14:05:00)

Yes, this is a prime example of misguided attempts to reward/punish people based on "outputs". It's really amazing if people can be so stupid today. I mean, that Stalin arranged his purges that way should perhaps give us a hint that it isn't very smart, or very morally acceptable?

### **3.8.8 Obscuring and entrenching our irrationality (2006-08-19 08:24)**

Filmmaker Michael Moore happened to note on CBS' popular *60 Minutes* last year that "the chances of any of us dying in a terrorist incident is very, very, very small." His interviewer ... promptly admonished, "But no one sees the world like that." Both statements, remarkably, are true — the first only a bit more so than the second. It would seem to be reasonable for someone in authority to try to rectify this absurdity. In [risk analyst Howard] Kunreuther's words, "More attention needs to be devoted to giving people perspective on the remote likelihood of the terrible consequences they imagine." That would seem to be at least as important as boosting the sale of duct tape, issuing repeated and costly color-coded alerts based on vague and unspecific intelligence, and warning people to beware of Greeks bearing almanacs.

This, and the other quotes in this post are from John Mueller's, [1] *A false sense of insecurity* (pdf). Is there a case to be made for valuing deaths caused by terrorism more highly than those caused by, say, road accidents? There may be, but it is not made. Yet:

...an American's chance of being killed in one nonstop airline flight is about one in 13 million (even taking the September 11 crashes into account). To reach that same level of risk when driving on America's safest roads — rural interstate highways — one would have to travel a mere 11.2 miles.

Media attention and consequently public resources are overwhelmingly devoted to the terrorist risk, while something like 900 000 people die on the world's roads every year. As so often, policy is made according to an agenda dictated by visual imagery, fear and irrationality. I don't think there would be anything necessarily wrong with this, provided we did it knowingly, explicitly and with our eyes open. If society truly believes it's worth, say, destroying the airline industry - which could happen if there were another 9/11 disaster - because we'd rather 10x people die on the roads than x people die through terrorism, then let us be transparent and say so when we make resource decisions. Unfortunately obscurity is built into the current policymaking system. We fund institutions and activities, which all sound good and well-meaning and highly

principled. But the outcomes that result are perverse. And even more unfortunately, these outcomes can be self-reinforcing, creating and enriching government agencies or corporate bodies, giving them the muscle to oppose any move to wind them down. So, decades after it was known that, to take just one example, farm support policies are economic nonsense, socially inequitable and environmentally disastrous, these programmes persist, at great cost to everybody except a few well-padded landowners and agribusiness corporates. Anti-terrorist measures look like going down the same path:

What we need is more pronouncements like the one in a recent book by Sen. John McCain (R-Ariz.): "Get on the damn elevator! Fly on the damn plane! Calculate the odds of being harmed by a terrorist! It's still about as likely as being swept out to sea by a tidal wave. Suck it up, for crying out loud. You're almost certainly going to be okay. And in the unlikely event you're not, do you really want to spend your last days cowering behind plastic sheets and duct tape? That's not a life worth living, is it?"

### **3.8.9 The sterility of British politics (2006-08-21 07:34)**

When you're a senior politician and you don't have any idea what leadership is, nor do you dare do anything radical like target outcomes for a change, there isn't much left really:

The [UK] Tory leader will announce that in future at least half the names on the final shortlist for selection in these seats must be women.

Yes, that's right; just follow everybody else, except more so. What a bunch of losers. With the world facing serious environmental challenges; with the UK's soaring crime rate and disintegrating social structure... this is the reaction from the British Parliamentary Opposition. Someone should teach these people the difference between ends and means, between actions and results - and between gestures and reality.

-

### **3.8.10 Why I don't like Kyoto (2006-08-25 08:50)**

In response to a [1]comment on a previous post, I will elaborate on my opposition to the Kyoto Protocol, and explain why I think Climate Stability Bonds could do a better job.

Like most people on the planet I don't really know what's going on. As far as I can tell

the case that the climate is changing faster than ever before is strong and growing stronger. It is the speed of change, not necessarily the end point of the change, that is of concern: it's changing too fast for many of the earth's species and ourselves to adapt.

It also looks increasingly as though there is as strong causal link between anthropogenic greenhouse gas emissions and climate change. Proof is of course lacking, but the stakes are too high to wait for it. Accepting this, and even accepting that anthropogenic emissions of greenhouse gases including CO<sub>2</sub> are *the* main cause of climate change, I still think Kyoto is flawed. These are my reasons:

1. Reducing anthropogenic greenhouse gases might not be the best way of reducing the concentration of greenhouse gases in the atmosphere;
2. Reducing the concentration of greenhouse gases in the atmosphere might not be the best way of preventing or mitigating climate change;
3. Preventing climate change might not be the best way of preventing the worst effects of climate-induced catastrophe.

A Climate Stability Bond regime would be more adaptive than Kyoto. Right now it certainly looks as though capping greenhouse gas emissions is the best way of preventing or mitigating climate change. But our knowledge of the scientific relationships is growing all the time.

However, even assuming that capping anthropogenic greenhouse gas emissions is consistently found to be the best way of averting climate change; even then I still think Kyoto is deeply flawed. How would a Climate Stability Bond be better in those circumstances? Holders of Climate Reduction Bonds would still target anthropogenic greenhouse gases in a similar fashion to Kyoto, but they would have strong incentives to do so more efficiently. They would want and would have wider scope for action. For example, they wouldn't be bound by political correctness or *realpolitik* of the sort that exempts some countries that emit huge quantities of greenhouse gases from any disciplines at all. They would simply buy these regimes off or otherwise undermine opposition to the disciplines. And this brings me to another important point: the presentational aspects. Kyoto doesn't focus on a desirable outcome: it's focused on processes and activities. So it is now so politicised and its money flows so unpalatable that it is seen as an imposition; in the rich countries it's seen as an imposition by the greens on everyone else, and in the poor countries it's seen as an imposition by the rich countries on them. Kyoto means huge upfront costs for a very small payoff well in the future. So large parts of the world disagree with it, or are totally exempt from it. A triumph for the bureaucrats but a tragedy for the planet. In times of financial stress, or slowdown, everyone will repeat the George Bush and Tony Blair line: "I'm not going to sign onto anything that involves economic sacrifice."

Now what I am entirely focussed on here is the outcome - and this excludes justice, morality, the historical record, or the venalities of politicians. Unfortunately Kyoto, being a political construct, is I think so compromised that even its most ardent advocates will agree that it's ineffectual. And there's little argument that it's going to be ruinously expensive. They justify it as a first step, but that step is unlikely ever to be taken. (As distinct from being talked about, recommended and embodied in law.)

A bond regime would target an outcome that people could understand, empathise with

and support, and that would entail taxpayer spending only when it had been achieved. So even if we took reducing anthropogenic greenhouse gases as an end in itself (which I certainly don't); even then Climate Stability Bonds would be more acceptable as well as more efficient than Kyoto.

I have said this dogmatically to save time, but I am ready to be convinced otherwise. In a way I hope I am wrong and that Kyoto will avert a calamity. It's certainly got more traction than Climate Stability Bonds at the moment.

### **3.8.11 Coming next: a fake kidnap (2006-08-29 09:46)**

Here in Thailand the buzz is all about the bizarre alleged bomb plot against the Thai Prime Minister Thaksin Shinawatra, who appears to be as unpopular in Bangkok as he is popular in rural areas. A car packed with explosives was found near the PM's home a few days ago, but there are several indications that [1]all is not as it seems - as so often in Thai politics. So the rumours are that it was a stunt, set up by the PM or his allies to win sympathy for Thaksin at a turbulent time. The shame is that it's quite plausible, and not just in Thailand or the developing countries. Objective criteria count for so little in our political system that winning sympathy is as good a way of getting elected, or re-elected as any other. City dwellers are deeply skeptical, but early indications are that this assassination attempt, real or staged, will be to Mr Thaksin's benefit.

### **3.8.12 Moral blindness (2006-08-31 04:26)**

It's tempting sometimes when confronted with the arrogance of power and the results of its abuse to think that any opposition to it is justified. Who could not react to the heart-rending images of team A's bombings of team B's children by concluding that anything done in the name of team B deserves our support? It's a very human response, a natural reflex to man's inhumanity to man. But being just such a reflex it does nothing to stop the violence. It is purely a reaction, with no other organising principle. It perpetuates the cycle by strengthening a coalition allegedly in support of team B, which strongly believes in its right to oppose team A. Which it does by adopting similarly murderous tactics.

So it's not surprising, though it will be disappointing to some, to [1]read today that:

[Venezuelan President] Mr Chavez was given the red-carpet treatment as Syrian President Bashar al-Assad welcomed him at the presidential palace on a hill overlooking the capital, Damascus.

In one corner, then, we have the US and its allies, in the other those who are defined entirely by their opposition to the US. We are all part of this process and most of us lose from it, but perhaps outcome-orientated policymaking can break the cycle. It could start fairly small: by issuing Social Policy Bonds that target localised conflicts. A bond regime could build a coalition that is motivated by ending violence, rather than promoting it. Under the current system, the financial incentives on offer tend to augment our base human instinct to oppose violence with violence. A Social Policy Bond regime that rewarded peace would supply countervailing incentives. In other words: [2]give greed a chance.

## 3.9 September

### 3.9.1 Oxfam: almost right (2006-09-02 06:55)

Key conclusions of an [1]Oxfam report published yesterday are:

- Governments must take responsibility for providing essential services that are free or heavily subsidised for poor people and geared to the needs of all citizens.
- Civil society organisations and private companies can play a crucial role but they must be properly regulated and integrated into strong public systems, and not seen as substitutes for them. Only governments have the capacity to deliver on the scale required.

I haven't read the full report, and may be in touch with Oxfam when I have, but I'd just make a subtle change to the wording of the conclusions. I should much prefer that the conclusions were:

- Governments must take responsibility for **ensuring that** essential services are free or heavily subsidised for poor people and geared to the needs of all citizens.

- Civil society organisations and private companies can play a crucial role but they must be properly regulated and integrated into strong public systems, and not seen as substitutes for them. Only governments have the capacity to **ensure delivery** on the scale required.

A Social Policy Bond regime would not mean that government ducks its responsibilities to its citizens. It would still set a country's health and education objectives, and it would still raise the finance to achieve them. But it need not necessarily provide the services itself. With the proper regulatory environment that Oxfam rightly sees as necessary, the whole process of service provision for poor citizens might be much better handled by a motivated private sector. Yes, government should ensure that the services are there; yes, government should ensure that they are delivered on the scale required; yes, government should ensure that they are free or subsidised for poor people; but *no, government does not need to provide them itself.*

### 3.9.2 An Inconvenient Truth (2006-09-05 09:23)

I saw the movie *An Inconvenient Truth* today. Well worth seeing, I think, as Al Gore presents the evidence from different angles. One telling point for me was his comparison of the number of peer-reviewed articles in scientific articles that believe we are experiencing climate change, 928 articles, or 100 per cent, and the number of popular media articles that doubt this: 53 per cent of the several hundred (I think) surveyed. Gore appears fairly optimistic about the prospects of reducing global emissions to 1970s levels by efficiency gains and application of existing technologies (not nuclear). But he didn't say what even such large cutbacks would mean for the climate. I suspect the answer is not very much. [1]Climate Stability Bonds were not mentioned.

I don't go much for party politics, but the man appeared impressive, human and coherent in this movie, and I couldn't help wishing he were in the White House now. One passing comment was that he had presented his slide show on climate change at least 1000 times.

### 3.9.3 The public interest (2006-09-07 16:42)

A couple of interesting excerpts from the [1]Oxfam Report, *In the Public Interest - Health, Education, and Water and Sanitation for All*:

The World Bank promotes the private provision of basic services through interlocking conditions on aid and debt relief to poor countries. This appears to be driven more by the Bank's internal targets than by evidence of what works in each country — for example, the Bank's Private Sector Development Strategy aims for private sector participation in 40 per cent of its loans to the poorest countries. (page 9)

Why 40 per cent? Why not 60 per cent, or 77.77 per cent? This is what happens when you get Mickey Mouse micro-targets. It probably took at least 10 minutes to think of 40 per cent. Probably the person who did so just looked up the current percentage, and added something plausible to it to come up with something nice and round. And why not? If anybody bothered monitoring the results of World Bank policies the meaninglessness of such figures might be challenged... but this is project management subordinated to ideology, not outcomes.

Later, discussing the rich countries' recruitment of health workers from developing countries:

With the cost of training a general practice doctor [in Africa] estimated at \$60 000 and that of training a medical auxiliary at \$12 000, the African Union estimates that low-income countries subsidise high-income countries to the tune of \$500 million a year through the loss of their health workers. (page 67)

The rich countries put up import barriers to the few goods – agricultural, textiles, clothing and footwear – that offer the developing countries their best chance for prosperity. This helps impoverish people in Africa (or even [2]kill them). But we then freely import their most valuable personnel to prop up our own health services. This is a destructive and self-reinforcing trend. The worse we make life for people in the third world, the more desperate they become to escape to the west. If successful, they become reluctant migrants; leaving their cultures and, in many cases, their families behind. The only long-term beneficiaries of these absurd policies are the people who are paid to make and administer them.

Anonymous (2006-09-09 10:59:00)  
Hi Ronnie,

since you keep referring to the article on "free-europe.org" I finally need to make some comments about it, especially for -I believe- the benefit of those people who only read the "key findings" and not the rest of the article.

The authors claim that "6,600 people die every day in the world because of the trading rules of

the EU". This figure is purely based on assumptions and no attempt whatsoever is made to justify those figures. What's more the article does not even try to explain why people die because of trade barriers. I am not speaking in favour for trade barriers, but if they are to be challenged, this can not be done by populist articles like the one in question.

Cheers,  
Frank

Ronnie Horesh (2006-09-09 15:15:00)

Hi Frank, many thanks for your comment. I will agree the report is based on assumptions and that the authors of the study express this particular conclusion bluntly and almost offensively, probably in an effort to raise awareness. However, the assumptions seem to make qualitative sense to me. In economic theory, and on all the evidence, trade leads to financial prosperity, largely through specialisation and division of labour. Take a small country like Singapore: how many people could it support if it did not trade? Or if we don't like globalisation, what about trade within a country? I don't think anyone would say that autarky actually enhances quality of life. Or quantity of life, which is also important.

Now Oxfam estimates the financial costs of the rich world's trade barriers to the poor countries at £69 billion (2002 figures). I have seen similar estimates by OECD and other bodies. The methodology, I agree, is not described in the link I supplied, and it is open to question, but it is not widely considered to be controversial. Now, I am not sure whether you are questioning these financial costs (which seem to me reasonably robust) or the translation of such costs into people killed - which may be less defensible. However, I think that if, as the authors say, 24000 people in the poor countries die of starvation or malnutrition every day (and again, this seems close to reality) then the implication for human life of the cost of lost trade, as expressed in the link, doesn't seem unreasonable. And if it's not unreasonable, then I think it does deserve publicity: it is the cost of the selfishness of corporate lobbies in the west and spinelessness of their political friends.

I will of course agree that trade does have negatives: alienation and interdependence, for example. But here we are talking about barriers erected against people living at the very margins of subsistence. Most things in politics are rightly contentious and can be seen from many angles. But I am not the only one who makes an exception for trade barriers that affect the third world. They cost the rich countries (financially) even more than the poor countries - and they are also economic nonsense, socially inequitable and environmentally destructive.

Anonymous (2006-09-13 06:48:00)

Hi Ronnie,

thanks for your elaborate response.

Claiming that 20000 people die each day because of trade barriers is a rather serious allegation and I would deem it appropriate for the authors to explain how the link between the financial loss and the loss of life works.

But what bothered me most, was how they actually arrived at the figure of 6600 people dying each day from trade barriers. It is completely arbitrary but is announced to be \_the \_ outcome of their work ("This paper quantifies, for the first time, the cost to Africa of EU protectionism.").

Regards,  
Frank

Ronnie Horesh (2006-09-13 08:12:00)

Thanks Frank as always for your coment. You are right to challenge the allegation. The url I linked to I think pointed to a version of the report that excluded references. [1]This includes them.

That said, I still think the authors have a powerful argument. The fact is that trade barriers do lead to loss of income, and that loss of income to people living in poverty does mean severe deprivation. There is not, nor can there be, proof that a particular trade barrier kills a particular person. But then neither is there proof that a small increase in atmospheric CO2 generated the hurricane that wiped out this particular community, or that lowering the drinking age led to the deaths of this particular family. These are examples of statistical deaths, and have plausible deniability at the individual level, which is one reason nobody bothers much about them. But they are real, and at the aggregate level the linkages are meaningful. They are the sort of figures that planners use when deciding where to allocate limited public funding. (You know all this, I am sure, but other readers may not.) So the argumentation may be ugly, or as the authors themselves say, may sound unreasonable. But I think the burden is on the upholders of trade barriers to disprove it. They certainly are wealthy enough to try.

### **3.9.4 Why I go on and on about farm subsidies (2006-09-08 16:28)**

From today's *Economist*:

The [US] federal government spent over \$20 billion on farm subsidies last year: much less than the European Union lavishes on its mollycoddled farmers, but more than Washington spent on foreign aid and almost twice what it spends on subsidising college for poor children. ... Over half the subsidies go to large commercial farms.

### **3.9.5 Social Policy Bonds and complexity (2006-09-14 08:18)**

One of the the bonds' main pluses is that it doesn't specify *how* a particular policy objective shall be achieved. So when the relationship between cause and effect is obscure, and when there are a multiplicity of possible solutions to a problem, a Social Policy Bond approach might be preferable. As society grows ever more complex, I expect such policy areas to increase in number. I have argued at length about the need for outcome-based policy to deal with climate change. I also think that something like Social Policy Bonds could be issued to eliminate violent political conflict, whose causes vary wildly and are extremely difficult to anticipate and close down.

Less grandly, I am also interested in literacy in the developing countries. In Bangladesh something like 20000 non-governmental organisations operate, many of them supplementing the Bangladeshi Government's literacy initiatives with their own. With literacy-raising, most

methods will be well-tried and tested, but at a country level there is scope for diversity and experimentation. Social Policy Bonds, unlike centrally directed projects, would encourage such adaptive approaches because of their inextricable linking of rewards to efficiency. They could lead to a mosaic of different approaches over a whole country, each precisely targeting the local circumstances in which they operate. Something like that is happening now in Bangladesh, but unfortunately (as I see it) with little orientation toward a national objective. Thus, many of the non-governmental organisations, principally those financed by Islamic institutions, favour the teaching of boys over girls, and literacy in Urdu (which is the language of Pakistan), rather than Bengali.

A Social Policy Bond regime would have a single, unifying, literacy objective, and this would be quite compatible with diversity of approach - if such diversity were found the most efficient way of achieving it.

### **3.9.6 What's a couple of rainforests? (2006-09-16 17:20)**

There's been some discussion in the letters section of *the Economist* about whether it's 'morally appropriate' to convert food crops into fuel. This week, a correspondent points out that 'clearing rainforests to increase the cultivation of palm oil will bring ecological destruction to Indonesia and Malaysia.' I wish I could believe that pointing out this fact would change anything. But let's face it: our car madness already kills hundreds of thousands of people every year, disables several millions more, helps poison our atmosphere, paves over thousands of hectares of land, and destroys wildlife on a massive scale. We shall need stronger arguments than saving the rainforest if sanity is to prevail. In the same journal we read that a Japanese body supposed to rein in the corrupt alliance of bureaucrats, politicians and the construction industry (and, I interpolate, organised crime) has voted to build another 9000 km of expressways....

([1]This is an interesting paper describing how road deaths affect the poor more than the rich in the developing countries.)

### **3.9.7 'Fooled by Randomness' (2006-09-19 16:23)**

From [1]*Fooled by Randomness*, by Nassim Taleb (page 38):

[I]t is ... a scientific fact, and a shocking one, that both risk detection and risk avoidance are not mediated in the 'thinking' part of the brain but largely in the emotional one.... The consequences are not trivial: It means that rational thinking has little, very little, to do with risk avoidance. Much of what rational thinking seems to do is rationalize one's actions by fitting some logic to them. In that sense the description coming from journalism is certainly not just an unrealistic representation of the world but rather the one that can fool you the most by grabbing your attention via your emotional apparatus....

Exactly right; and since policymaking is very much driven by media reporting, it's a crucial point. The media are focused on the short term, on the visual and on the emotions. What gets lost are the crises that are long term, not telegenic, nor creating an immediate emotional impact. A Social Policy Bond regime, by stipulating outcomes, would help avoid such biases, by making them explicit. So, for instance, a policy that aimed to raise longevity (however defined) would have to be impartial as to causes of early death. A bond regime would not, as current policy appears to be doing, target such emotional but statistically marginal causes of death as terrorism, at the expense of road deaths.

Hi Ronnie,

just checking whether everything is O.K. with you.

Frank & Gabi

Ronnie Horesh (2006-09-21 16:17:00)

Hi and thanks for your concern. All is fine with me thanks; I will do a post about my not very remarkable experiences here in Bangkok. R

Jimmy Jangles (2006-09-26 21:20:00)

Can this explain why women get scared by spiders ?

Ronnie Horesh (2006-09-27 09:35:00)

Jimmy! I'm into outcomes, not explanations, activities, inputs, outputs. You could of course issue bonds against anything you like, including female arachnophobia. Explanations are less important than defining a targeted outcome. Indeed, looking for explanations can distract us from seeking solutions.

### **3.9.8 Life in Bangkok... (2006-09-21 16:20)**

...is remarkably normal, 48 hours after the bloodless military coup. For a while I was less informed than if I were overseas: the tv was playing old footage of the royal family. Guests at my hotel were advised not to stray too far away yesterday (Wednesday). The streets around the hotel were strangely calm. There were no stalls up at the daily street market. Some shops were open, but the mood was subdued, with none of the usual chatter and animation. Today, Thursday, life has returned to normal. In retrospect something like this now seems inevitable; there has been no parliament for seven months and the Thai Prime Minister was deeply divisive, power-hungry and corrupt. For myself, I'm very relieved it has turned out bloodless. The Thai King's carefully calibrated 'reported' endorsement of the caretaker government will no doubt help.

The BBC, desperate for something dramatic to report, had to settle for a 1 per cent fall in the value of the Thai baht - something that can happen on any perfectly normal trading day.

### **3.9.9 Thailand, democracy and policy outcomes (2006-09-24 12:59)**

My last day in Thailand for a while. The recent political events have made it clear that democracy is just that, democracy. It does not mean freedom from corruption, it does not mean peace or unity. Democracy can accompany rampant abuse of power and serious divisions. If the circumstances are wrong, democracy can even legitimise such flaws.

-  
Policy as if outcomes mattered  
SocialGoals.com

---

### **3.9.10 Defining democracy (2006-09-27 09:37)**

En route to Bangkok Airport I passed Government House and a couple of rows of tanks parked behind metal barrier fences. Most of the tanks were garlanded with flowers and young couples took each other's photos with the tanks as backdrop. The Thai coup d'etat brings home the difficulty of defining the important features of democracy. Mr Thaksin, the deposed Thai Prime Minister had installed his placemen in the Senate, the law courts, and the Electoral Commission. Through, as far as I can tell, legitimate means, he controlled a high proportion of Thai media. Most recently, and this might have precipitated the coup, he wanted to appoint his army classmates to top positions in the Thai military. It's difficult to anticipate and guard against all abuses of power. New Zealand's three-year period between elections, which does have disadvantages, may be one helpful weapon against them.

### 3.9.11 Incentives for peace (2006-09-28 12:34)

Did "codes of honor" inhibit men like Hitler and Stalin? [1]Chirot and McCauley reply that genocidal followers typically think less fanatically than leaders. Farsighted policies of engagement can thus stem genocide from the bottom up rather than the top down. "Those who want to set forest fires," the authors write in a rare punchy image, "will always be around, but if they have less material to work with, they are more likely to fail." For all that, they warn, "no single method seems to us to offer a comprehensive solution." [2]*Is the Crematorium Half-Full or Half-Empty?* Carlin Romano

Exactly. No single method will work. We cannot therefore delegate the prevention of genocide to existing organisations, however well resourced, however well meaning. Organisations have their own objectives, of which the over-riding one is self-perpetuation; they have few incentives to be imaginative in their approaches to social problems. What is needed are highly motivated new organisations, whose goals are exactly congruent with society's. These organisations might not have a stable structure, nor a stable composition, but their societally determined goal *would* be stable. Prevention of genocide and other violent conflict could be the *raison d'être* of such organisations, if their rewards were inextricably tied to their achieving it. I suggest Conflict Reduction Bonds, redeemable only when absence of conflict had been sustained for a defined period. These bonds would contract the achievement of peace to the market, instead of to the inevitably poorly-resourced, distracted or corrupted bureaucracies that are currently charged with the task.

### 3.9.12 Brilliant (2006-09-29 12:51)

[1]Good Jobs First, is a brilliant website, which I've added to my blogroll. From [2]just one of their many pages:

" What causes sprawl? Urban experts cite many factors. ... But another important factor [sic] are economic development subsidies like tax increment financing (TIF) and enterprise zones that have gone awry and are being abused in ways their creators never intended. In essence, taxpayers buy sprawl with the following types of subsidies.

-TIF is an arrangement in which a portion of the property tax associated with a redeveloped property is diverted into a subsidy for the developer. ... [O]ver the years, about a third of the states have loosened their TIF rules, so that even affluent areas qualify. The wealthy Chicago suburb of Lake Forest, for example, has a TIF district-and a Ferrari dealership! Pennsylvania's TIF statute allows a trout stream near Pittsburgh called Deer Creek to be TIFed because the land has "economically or socially undesirable land uses."

"-Enterprise zones, another geographically targeted program originally intended to help poor inner-city areas, have also been weakened in many states so that affluent areas can grant lucrative zone subsidies. New York, for example, allows zones to be gerrymandered non-contiguously. As a result, Buffalo's two original enterprise zones have morphed into more than 130 non-contiguous areas, thus raising questions about favoritism. A scathing Buffalo News investigative series found that "[t]he program, crafted to create business in distressed areas and jobs for the down-and-out, has transmuted here into a subsidy program for the up-and-in. "

Also of interest, though a couple of years old, is [3]this study (pdf), which showed that Wal-Mart:

...the giant retailer has received more than \$1 billion in economic development subsidies from state and local governments across the [US]. Taxpayers have helped finance not only Wal-Mart stores, but also the company's huge network of distribution centers, more than 90 percent of which have gotten subsidies.

## 3.10 October

### 3.10.1 Social Policy Bonds to reduce crime (2006-10-03 09:49)

After the high stakes of UK politics and the military coup in Thailand, public affairs in New Zealand seem both parochial and small minded. But news of the larger issues can still be found in the public arena. Violent crime in New Zealand [1]rose by 10 per cent last year; in the Wellington Police District (where I live) [2]there were 5988 violent incidents in the year ended June 2006.

Current policy approaches seem to be failing and there are no simple solutions. These are key criteria that indicate that Social Policy Bonds might improve things. Bonds targeting reduced crime rates could encourage a mosaic of diverse solutions, adapting to local circumstances and events that cannot be anticipated. Highly motivated investors would be rewarded for their success in tackling crime. Their objectives would be congruent with those of society. This contrasts with the current approach, which is inherently cynical: while composed of heroic men and women, police forces as institutions are more likely to be disbanded than rewarded if they were to succeed in slashing crime rates.

### **3.10.2 Politics and accountability (2006-10-05 09:30)**

From [1]*Fooled by Randomness*:

Our attribution of heroism to those who took crazy decisions but were lucky enough to win shows the aberration – we continue to worship those who won battles and despise those who lost, no matter the reason. ... The situation is not much better in a bureaucratic economy. ... The contributions of civil servants might be even more difficult to judge than those of the executives of a corporation – and the scrutiny is smaller.

In our complex societies politicians and officials can always evade or deflect censure for their terrible decisions. We can rarely prove that one particular decision was a bad one: there are just too many variables and linkages, too many obscurities and time lags between cause and effect. This is one of the reasons I emphasise the rich countries' agricultural subsidies. These represent not only a calamitous waste of society's scarce resources; they transfer wealth from the poor to the rich, and they accelerate the degradation of our physical environment. They are also now threatening to derail the entire world trading system. It is their size and persistence over decades that make quite clear that there are no systemic checks on government policymaking; that much of the bad news may result from government activity and much of the good news may occur despite government activity.

As P J O'Rourke put it a while ago (in [2]*Parliament of Whores*):

I spent two and a half years examining the American political process. All that time I was looking for a straight forward issue. But everything I investigated – election campaigns, the budget, lawmaking, the court system, bureaucracy, social policy – turned out to be more complicated than I had thought. There were always angles I hadn't considered, aspects I hadn't weighed, complexities I'd never dreamed of. Until I got to agriculture. Here at last is a simple problem with a simple solution. Drag the omnibus farm bill behind the barn, and kill it with an ax.

One of the aims of a Social Policy Bond regime is to bring some accountability into the policy-making process. Framing policy decisions in terms of costed outcomes is an essential first step.

Currently policymakers can - indeed must - express their decisions as vague declarations of intent, backed up by funding programmes for favoured bodies, be they government agencies or other interest groups. Issuers of Social Policy Bonds would in contrast have to be explicit about their objectives: transparency and accountability are built into a bond regime, as surely as they are excluded from the current policymaking apparatus. Insane, corrupt programmes, such as Europe's Common Agricultural Policy, have platitudinous, vague, mutually conflicting goals, which sound lofty and high-principled but actually end up shovelling vast sums of taxpayers' and consumers' money into the myriad bank accounts of massive agribusiness corporates. If outcomes were built into policymaking, as they are with Social Policy Bonds, such policies would get nowhere. Instead they have lasted for decades, at great cost to everybody except a few millionaire businessmen, and a burgeoning, parasitical administrative bureaucracy.

### 3.10.3 Policy and rationality (2006-10-07 09:10)

John Kay [1]points out that:

Each year, a million children die from malaria. Those who live in areas where the disease is endemic, and survive, acquire a degree of immunity. They remain vulnerable through their lives to episodes of disease, which sap their energy and productivity. Perhaps a billion or more malarial episodes occur every year. We mostly judge risks by their salience. ... Salient risks are those that everyone is talking about or that we have recently encountered.

It's natural, though still irrational, that in our own lives we respond to events that are 'salient', even if they are unlikely to occur or recur. We are fallible human beings, and it's our nature to respond emotionally to salient events. But policymakers should do better. They fail us when they react irrationally, with taxpayer funds, to events that have assume a media profile out of all proportion to their real impact.

In the five years since 11 September 2001, Patrick Buchanan [2]writes, "85,000 people have been murdered in the USA ...not one in a terror attack." But you'd never know that from the actions of our politicians.

The solution? Social Policy Bonds, which would target, say, premature deaths impartially; that is, without regard for whether they are caused by terrorism, murder or road accidents. Or, if we truly believe that deaths from terrorism count more than those caused by conventional acts of violence, then under a Social Policy Bond regime we'd be forced to be upfront and explicit about it. Transparency in policymaking is an end in itself, as well as a means to greater rationality and efficiency. Under a bond regime we could still over-react to high-profile

media events and throw money at fast-moving, highly visual problems, at the expense of slower-moving and less dramatic tragedies – such as malaria. But Social Policy Bonds mean we'd have at least have to be honest about it.

- 

### **3.10.4 The limits of quantification (2006-10-09 11:35)**

Anything that exists, exists in some quantity, and can therefore be measured. Lord Kelvin

Social Policy Bonds would target quantifiable outcomes. In traditional societies, where people lived closer to each other, people probably knew a lot more about each other's general state of happiness. They knew when the people that mattered most to them were happy, and they had a fairly good idea of the events and circumstances that would make them happy. They probably would not be able to quantify or even articulate these matters, but neither would they have needed to.

[W]e prefer to take our chance of cholera and the rest than be bullied into health - a leading article from the [London] *Times*, 1 August 1854, in response to government measures to provide basic sanitation.

The same applied when our own societies were less complicated. Problems themselves were more obvious; the causes of problems could be more readily identified, and so could solutions to some of them. Governments were largely successful in their policy interventions on behalf of the disadvantaged: they instituted basic health and education for their own populations. They provided other public goods, such as law and order, and sanitation. And they did so with great success and sometimes, as the quote above shows, against strident opposition.

In our industrial societies, with their large, complex economies, government bodies have far more complicated tasks, but they still believe that the best way solving problems is to look for causes and try to treat those. And they still believe that they are best placed to perform these tasks. Government has enlarged its role and largely supplanted families, extended families and local people in supplying a range of welfare services to those who need them. Increasingly government is turning to numerical indicators to manage its resource allocation.

But this use of indicators is relatively recent, unsystematic and unsophisticated. Few indicators are targeted explicitly for a sustained period: the targeted range of inflation is a rare (and not especially helpful) exception. Other indicators, such as the size of hospital waiting lists, don't measure what matters to people, or are prone to manipulation. Even when numerical goals are clear and meaningful they are rarely costed, they are almost always too narrow, and they are largely driven by existing institutional structures. Those broad targets

that are targeted with some degree of consistency tend to be economic aggregates, such as the inflation rate, or the rate of growth of Gross Domestic Product — which appears to be de facto indicator par excellence of rich and poor countries alike.

But GDP's shortcomings as a single indicator of the health of an economy are well known: amongst other failings, GDP does not take into account changes in the quality of the environment, or the distribution of income, it ignores human capital (the education and skills that are embodied in the work force) and leisure time, and it ignores such social problems as crime and homelessness. Under a bond regime statistics like GDP would never assume the authority they appear to have nowadays. The goals of government policy should be social and environmental outcomes that are meaningful to natural persons (as against government agencies and corporate bodies), not growth rates or other abstract economic indicators.

Lord Kelvin's remark is nonsense, of course. Much of what matters most to us - family, relationships, connection with nature, meaningful work etc - is impossible to quantify. But if we take the large-scale organisation of our society as a given, then we can expect that societal goals will increasingly have to be represented by numerical indicators. It would appear that the choice will increasingly be between (a) the current *de facto* targeting of per capita GDP along with an almost random array of narrow, easily manipulated indicators that have no necessary relationship to societal goals, and (b) the targeting of consistent, transparent, mutually supportive indicators that represent meaningful social outcomes. A Social Policy Bond regime would be a step away from the apotheosis of GDP and toward the systematic use of indicators where they can be of most value.

### **3.10.5 The limits of quantification, continued (2006-10-10 09:47)**

When numerical indicators are strongly correlated with what we as societies want to achieve, then they are invaluable. In setting up the basic health, education and welfare programmes of large societies, quantification is indispensable. We need the numbers to measure where we are, and where we are going. But my question, raised in the previous post, is whether we are in danger of applying numbers where they don't actually measure anything meaningful. GDP per capita, for instance, was, and for many countries still is, an easily measured and occasionally useful indicator of a country's well being. But at higher levels of wealth, the relationship between it and well being breaks down. Nevertheless, maximizing GDP per capita appears to be one of the main *de facto* priorities for governments of countries at every level of development.

The limits of quantification become more important as government expands its role. They help make the case against that expansion. on efficiency grounds at least, because once we have the basics, the things that really matter to us cannot be quantified. In some ways we in the rich countries are getting the worst of both worlds. We have under-provision of programmes that eradicate poverty and provide a tightly-woven safety net to the most disadvantaged members of society. Here numbers, such as basic health and literacy indicators are meaningful and strongly correlated with welfare. At the same time, government funds its corporate buddies with massive funding of the construction, agribusiness and other sectors, through perverse subsidies, which, as well as representing a transfer from the poor to the rich, impose deadweight losses on the entire economy and devastate the natural environment.

Perverse subsidies and other forms of corporate welfare invariably rely on vague, qualitative arguments, or they use numbers where there is no correlation between the numbers and societal well being. The case for universal safe water and literacy education for children, for instance, is solid; that for exacting funds from taxpayers for post-graduate programmes, or lining rivers with concrete (as in Japan) needs to be made explicit and subject to challenge. A Social Policy Bond regime would achieve this level of transparency; right at the outset it would specify its targets in objective terms. By subordinating policy to outcomes, instead of to obscure, misleading or mutually conflicting objectives, it would impose some rigour on the function of government.

### **3.10.6 Roads are for the rich (2006-10-12 09:35)**

Aucklanders should oppose tolling every step of the way. Tell Transit we do not want to spend \$14 every time we drive between Manukau and Albany. We don't want fast roads for the rich and slow roads for the poor. It is the government that should be funding roads, not the people of Auckland - they have already paid their taxes." Auckland City Councillor, Cathy Casey, [1]saying why she opposes Transit NZ's tolling solution for the funding of State Highway 20

Does Councillor Casey think that toll-free roads benefit the poor? Ok, maybe in Auckland even very poor families have one vehicle of their own - otherwise they'd be unable even to shop for groceries. But it's a mistake to think, that just because they pay nothing for access to almost all roads like rich people, they benefit as much as the well off from lavish provision of roads. They don't. They have fewer vehicles per household, less money to spend to keep them running, and less leisure time for driving. They also suffer disproportionately from noise and air pollution. The big beneficiaries of roading programmes are construction companies and the wealthy.

### **3.10.7 There is such a thing as society (2006-10-13 11:45)**

The right therefore has an affinity for market economies, both because people will always be more motivated to work for themselves and their families than for something called "society," and because no planner has the wisdom, information, and disinterest to run an economy from the top down...And since we are always teetering on the brink of barbarism, social traditions in a functioning society should be respected as time-tested workarounds for the shortcomings of an unchanging human nature, as

applicable today as when they developed, even if no one can explain their rationale. ... The idea that people have a right to paid vacations, central heating, and a college education, for example, would have been unthinkable throughout most of human history...my freedom to have my teeth fixed impinges on my dentist's freedom to sit at home and read the paper. Steven Pinker, quoted in [1] EconLog

While I agree with the comment, I cannot dismiss 'society' as readily as Dr Pinker appears to, and as many policymakers definitely do. There *is* such a thing as society, and its loss or erosion means a lot to people who aren't lucky enough to fulfil all their social needs in their daily lives. We are not just adjuncts to an economic system, and perhaps we think we have rights to housing and holidays because we regard these things as a *quid pro quo* for our society's being systematically dismantled by government policies - of all parties - that favour their large, global buddies (via subsidies to big business, infrastructure; the externalising of social and environmental costs; and a biased regulatory system) at the expense of the small and local.

### 3.10.8 Ignorance all round (2006-10-16 12:39)

At a fringe meeting at the Conservative Party Conference the head of the EU Commission's representation in the UK, Finnish national Reijo Kemppinen, argued that the general rise in 'euroscepticism' polled across the EU recently is "fuelled by ignorance, and a lack of knowledge." He said, "People don't know much about the EU and the benefits it can bring," arguing that the Commission has a job to do in explaining the EU and its policies to people. When questioned about his remarks by members of the audience, Kemppinen later denied having used the word "ignorance". He then went on to concede that he didn't know as much of the detail of many EU policies as some eurosceptics. [1] Open Europe Bulletin, 13 October

Commissioner Kemppinen is probably correct, but there's plenty of ignorance too about the costs the EU imposes on its citizens. Not just the regulatory costs, which the EU's own 'Enterprise Commissioner' reports as being around 600 billion Euros every year (about 5.5 % of total EU GDP!); but the costs of subsidies, and protectionism, the latter of which does not appear on the EU budget. It's ignorance about these costs that, in my view, that is the more scandalous.

### 3.10.9 Measuring government performance (2006-10-19 09:45)

The contribution of government to the economies of the rich world exceeds that of Communist China or the Soviet Union in many regions. (In Wales, for example, the public sector accounts for [1]66 per cent of the economy.)

One problem arising from this is that governments have to use numerical indicators to measure the success or otherwise of their policies (if they attempt that sort of monitoring at all) and that these indicators, as in the former USSR, may have very little correlation with anything meaningful to people - other than the bureaucrats whose careers rise or fall on how well they can make those figures look.

The problem becomes more serious as government crowds out our non-numerical ways of doing things. In many areas of life, and for most but not all of us, these ways are more efficient, adaptive and responsive than government approaches. They are also more obviously sensible, though more resistant to codification, systemisation and other bureaucratic processes. What areas of life am I talking about? Things like child rearing, personal health, and the arts. Well-meaning government programmes, initially developed to deal with extreme cases, expand to dominate more and more of our routine activity: like the private sector, but without its disciplines, growth is the public sector's imperative.

Etc. The one thing for which neither you nor anyone under your management will be held responsible are outcomes for young people. It would be the same if the issue were crime, or health care, or education.... Plausible reasons for poor outcomes can always be found outside the performance of your agency, and many of them will be perfectly valid. There are just too many variables for your performance to count for much.

All this should imply a certain humility on the part of government. If it works in areas where it cannot think of measurable outcomes that are inextricably linked to social welfare or environmental benefits it probably should not be involved in that field of activity. In those areas government is very likely to be crowding out less formal, but more efficient ways of doing things. Government should stop its subsidies to its corporate friends, which it currently gets away with because they allegedly benefit 'domestic industry' or 'the family farm' or 'transport links'. Instead it should concentrate on the most extreme cases of social and environmental deprivation, where its help is unquestionably needed and where the numbers do correlate with social and environmental well being.

What we have now, and are increasingly suffering from, is in some ways the worst of both worlds: big, intrusive and growing government working hand-in-with big business the expense of everyone else. Tragically this co-exists with expanding pockets of social deprivation, and in many areas, a deteriorating social and physical environment.

### 3.10.10 What drives immigration policy? (2006-10-21 10:07)

We happily delegate many decisions to government because politicians and officials are specialists; they have deeper understanding of most of the issues, and we trust them to act on our behalf. Sometimes our trust is misplaced. But even more often, I think, government drifts into policies that have major impacts on citizens' lives, without realising what it is doing. Some of these policies can be self-reinforcing, acquiring an inertia of their own, which makes them very difficult to stop. Much of the western world is, in my view, experiencing this with immigration policy. Immigration has undoubted benefits, but my beef today is about its effects on house prices. I am thinking of New Zealand and the UK, and what I see in those countries is that ordinary working couples who cannot rely on family help are struggling to buy houses. I also think that governments in these countries are now in a position where they feel compelled to keep house prices high, or risk (1) offending middle-class property owners and (2)

a house price crash, leading to a slump in consumption, unemployment and electoral unpopularity. It is in these governments' interest, at least in the short run, to keep immigrants coming to buttress the housing market.

The purpose of this post is merely to point out that this immigration has much wider effects on society than this, and that maintaining house prices is hardly a legitimate policy outcome. Certainly it's on nobody's election manifestoes. Yet it does seem to have become an implicit policy goal; one that's been reached by default, and will be very difficult to reverse, even if some far-sighted politicians see and care about the long-term effects it has on the social fabric of New Zealand or the UK - or the societies that migrants leave behind. Like farm subsidies or a drug habit, policies to support the housing market are far more difficult to end than to start.

More transparency at the outset is essential. If governments want to subsidise wealthy landowners and agribusiness (as most rich countries do) then they should come out openly and say that that is their policy. And if they see high house prices as an end itself, then they should openly admit it, and we could vote accordingly.

I am not of course objecting to immigration. I am though objecting to policies that have huge effects on people being made by default and without any sort of consultation. A Social Policy Bond regime would from its very outset specify explicit policy goals. People would vote for the outcomes they favoured, not for the least unappealing party leader or phatic statements of intent. Greater informed public participation in the political process would not only be an end in itself: it would be a way of securing more 'buy in' to crucial policies, like immigration policy. Immigrants would feel and actually been more welcome and more willing to integrate if the host population had first been consulted about whether they were to be admitted.

### **3.10.11 Target outcomes, not alleged means of achieving them (2006-10-23 09:14)**

We assume that if we raise pollution prices, pollution will come down. But not even the smartest economist can know how quickly it will come down, or by how much. We can only proceed by trial and error. Much of the tax-setters' time will be spent debating how much of a price hike will produce how much of a reduction in pollution, when in fact what we should be debating is how quickly we want pollution to drop. Once that debate is settled, we should be able to set a value at the agreed-upon level. We can't do that with pollution taxes. Pollution taxes, in short, though better than nothing, are far from an ideal way to protect nature.

An excerpt from the excellent [1]Capitalism 3.0: a guide to reclaiming the commons, by Peter Barnes. Economists love pollution taxes, which are beguilingly elegant. Unfortunately, as Mr Barnes points out, their apparent sophistication has over-ridden their value: a common failing of policy that is driven by anything - except outcomes that are meaningful to natural persons. The elegance is often seen as an end in itself. No doubt I shall have more to say about this book when I have finished reading it. Meanwhile, another excerpt, quoting Kevin Phillips, a former (US) Republican party strategist:

"The timber industry spent \$8 million in campaign contributions to preserve a logging road subsidy worth \$458 million—the return on their investment was 5,725 percent. Glaxo Wellcome invested \$1.2 million in campaign contributions to get a 19-month patent extension on Zantac worth \$1 billion—their net return: 83,333 percent. The tobacco industry spent \$30 million for a tax break worth \$50 billion—the return on their investment: 167,000 percent. For a paltry \$5 million in campaign contributions, the broadcasting industry was able to secure free digital TV licenses, a giveaway of public property worth \$70 billion—that's an incredible 1,400,000 percent return on their investment." The reason our political system works this way isn't that our politicians are particularly venal. Rather, the cause is structural.

### **3.10.12 Monetising public goods (2006-10-25 09:01)**

The case of Wal-Mart makes us realise just how badly we lack a way of talking about the public good that is not framed purely in terms of economics. The huge fortunes

made at the end of the 19th and start of the 20th centuries were broken up by anti-monopoly and anti-cartel legislation , because they had been accumulated at the expense of the public good. That is a useful idea, and one that needs to be revived and used as a yardstick. John Lanchester, [1]*The Price of Pickles* (reviewing books about Wal-Mart).

I agree. Corporate power has grown immensely and politicians are increasingly in its thrall. Our physical and social environments are more and more determined by corporate wishes than by any idea of the public good. The government policies I know best are perverse subsidies. Their effects have been disastrous: they help denude and destroy our countryside and cities; they protect large, global concerns at the expense of small, local businesses, and they represent a massive waste of scarce resources. I say 'have been' but these policies persist - and that's even more shameful. If you look carefully amongst the news stories, (skipping the serious stuff about Princess Margaret's alleged illegitimate son, the skateboarding rhinoceros etc) you will see [2]reports of the WWF's study saying that humanity's use of resources is unsustainable. The evidence does seem to be piling up, but what is disheartening is the widening gap between where we are headed, and what most people presumably want.

Many of those in power, if they think at all about the public good, probably identify it with the financial health of corporations. A Social Policy Bond regime puts off some well-meaning people, because it offers cash rewards to those who would supply public goods. I understand their apprehension: a bond regime would use markets to solve classic problems of market failure. Unfortunately we live in a monetised world. Without financial incentives there's little hope of reining back the corporations and their puppets in government. It's paradoxical and perhaps regrettable but also, in my view, necessary, to pay people to do the right thing. After all, we'd not be rushing headlong into planetary collapse if it were not for the monetary incentives and taxpayer-funded corporate welfare programmes that currently reward the destruction of public goods.

### 3.10.13 Insuring against catastrophe (2006-10-28 10:17)

In retrospect most of us probably wish more resources had been devoted to stopping the spread of nuclear weapons. Many of the things we most value are difficult to define precisely, and so require some effort to incorporate into a Social Policy Bond regime. 'Peace' for instance is perhaps the most valued outcome of all. It would probably need to be expressed in terms of an array of outcomes and indicators. Nuclear proliferation, again, would need to be defined quite technically before it could be made the object of Social Policy Bonds aimed at preventing it. Nevertheless I believe such targeting could be done and should be attempted as a complement to existing efforts to solve these problems.

More readily definable is the detonation of nuclear device in anger. This would be a catastrophe in itself, and would represent a discontinuity in human history that could precipitate untold further suffering. The policymakers, as with nuclear proliferation, seem to be failing. This is where Social Policy Bonds targeting such an explosion could score heavily over the current approach. Their objective would be simple to define - the *sustained* avoidance of a nuclear explosion - and easy to verify. It's an objective that almost everyone would support, and one that, in my view, requires more imagination and brainpower than is currently being channelled in that direction. It's also an ideal goal for Social Policy Bonds in that it's not at all clear from where the most obvious threat to its achievement is likely to originate. Helen Caldicott, for instance, [1]points to the fact that Russia and the US together own 96 per cent of the world's 30000 nuclear weapons. With current efforts at keeping the nuclear peace apparently faltering; with an easily expressed, easily verified goal that is highly correlated with human well being, and with a real need for imaginative solutions and rewards beyond those available to bureaucrats, maybe Nuclear Peace Bonds would be the way forward.

### 3.10.14 Government taxation is not government spending (2006-10-30 09:06)

Suppose the federal budget is balanced at \$1 trillion. Now suppose Congress reduces taxes by \$200 billion without reducing spending. One result is a \$200 billion deficit. Another result is that voters pay for only 80 percent of what government actually costs. This of this as a 20 percent discount on government. As everyone knows, when you put something on sale, people buy more of it. Logically, then, tax cuts might increase the demand for government instead of reducing the supply of it. *Stoking the beast*, Jonathan Rauch, 'Atlantic Monthly', June 2006

Rauch goes on to cite research showing that there is no sign that deficits have ever constrained government spending. To the contrary; the evidence shows that a tax cut of 1 per cent of GDP increases the rate of spending growth by about .15 per cent of GDP per annum. The same research shows that taxation above 19 per cent tends to shrink government and taxation below it makes government grow.

Thanks to the Bush tax cuts, revenues have been well below 19 percent since 2002.... Perhaps not surprisingly, government spending has risen under Bush.

There are several policy implications arising from this. The critical one is that reducing government income does not necessarily reduce government spending. The two are not synonymous. This sounds obvious, but it's the sort of fact that is rarely made accessible to the electorate. It means that reducing taxation does not mean small government – it can mean quite the opposite. This means that we, the public, should (ideally) vote for meaningful outcomes; not slogans. If a political party is advocating small government as an end in itself, then it should come right out and say so. If, on the other hand, it really wants tax cuts, regardless of whether (as in the US) they increase government spending, then it should admit that that is its objective.

Politicians currently get away with this sort of shell game, because we, the voters, are not used to distinguishing between policy ends and means. Small government, except to ideologues, is not an end itself. It may be a means to various ends, but in my view it would be more efficient to *target those ends explicitly*, rather than the alleged means of achieving them. We should demand and respond to greater transparency from the politicians as to their true intents. We should, indeed, be voting for explicit outcomes that are meaningful to citizens; rather than vague promises and slippery slogans. Such outcomes would be at the very core of a Social Policy Bond regime. People would know exactly what they were voting for. A revolutionary concept, no doubt, but one that would hold politicians accountable and bring greater public participation into the policymaking process – at the expense of the spin doctors and ideologues.

## 3.11 November

### 3.11.1 Subsidising environmental destruction (2006-11-01 08:43)

My suggested response to climate change, which applies regardless of whether it is actually happening, is Climate Stability Bonds, which would reward who stabilise climate, however they do so. (Something has gone very wrong with blogger.com's html links: for a short article on Climate Stability Bonds please see <http://socialgoals.com/ieakytotext.html> .)

A bond regime would need no prejudging of what is happening to climate, what is causing it to happen, or how best to stop it happening if it is, indeed, happening. I'd rather a bond regime replaced Kyoto, which would be inadequate even if it weren't failing - which it is. But Climate Stability Bonds could also complement such efforts to cut back on greenhouse gas emissions as are being made.

Actually, the human species could go a long way to cutting such emissions simply by withdrawing subsidies for the extraction and use of fossil fuels. These can take the form of direct subsidies or tax breaks to the oil and road construction industries. Or they arise from the unpriced negative environmental impacts of fossil fuel use.

You'd think that such first steps would be the easiest to take, at least in comparison to the heroic demands of Kyoto. But we are not taking them. Perverse subsidies continue to wreak environmental havoc. Given these facts, is there anyone who genuinely believe that we are capable of making the sacrifices necessary to comply with Kyoto - as divisive and ineffectual as it is? Climate Stability Bonds would need a lot of discussion and refinement before they can be deployed. But to my mind it's essential that they, or some other scheme that directly targets a stable climate in ways that people can support, be considered - urgently.

SocialGoals.com

---

### **3.11.2 Thank you Anatole Kaletsky (2006-11-02 11:36)**

Commenting on the Stern report on climate change in *the [London] Times* Mr Kaletsky makes a point that deserves emphasis:

Global subsidies for energy research are now running at a pitiful \$10 billion annually, compared with the \$250 billion spent on subsidising the extraction of fossil fuels (mainly on the most polluting of all energy sources, coal).

*A new slogan for the environmental pressure groups: Some Gain, No Pain, 2 November.*

Does anyone believe that our political system can meet the urgent environmental challenges we face, when our leaders haven't even the courage to stop subsidising their corporate buddies in the energy business? I don't.

### **3.11.3 Tying it all together (2006-11-06 09:34)**

Conversations with friends over the weekend have encouraged me to tie together the strands of my thinking on policy. Social Policy Bonds are an attempt to address certain policy problems: what follows is my explanation of the origin of these problems.

Essentially, corporations have too much power. As James S Coleman, in [1]*the Asymmetric Society* describes, the major influence on our society has changed from natural persons to corporate actors. The two parties might have nominally equal rights, but they have vastly different resources, which in any actual transaction can be decisive. Corporations have drifted apart from natural persons, partly by default. Their objectives are not necessarily congruent with those of society. Through a vast array of subsidies and trade barriers, through their unpriced negative social and environmental impacts, and through manipulation of the regulatory environment, they can and do entrench their power, and make life worse for

natural persons. (To some degree offsetting these impacts, and seldom mentioned in the literature, are their unpriced positive externalities.)

Corporations and governments support each other in creating ideal conditions for corporate growth. They protect, foster and subsidise the large and global at the expense of the small and local. The large scale of social organisation, and the very high degree of specialisation and complexity of our economies, while helpful to corporations, does not therefore arise from undistorted market forces, and do not therefore originate in decisions made by natural persons; though they are certainly maintained by such decisions, as viable alternatives become ever more scarce.

Big corporations and big government go hand-in-hand. A large scale of aggregation tends to go with remoteness: people feel they have nothing to contribute to decision-making and tend to disengage from the political process: another self-reinforcing trend. The big losers from all this are natural persons and the commons.

Social Policy Bonds are an attempt to redress this balance. Their starting point would be explicit, verifiable outcomes that are meaningful to natural persons. At a local or national level their goals could be things like: universal literacy, or high levels of health and housing, low levels of pollution and unemployment. At a global level, targets could include reduced levels of violent political conflict and climate stability. Social Policy Bond regimes would inject market forces into the achievement of such social and environmental goals. Perhaps equally important, their emphasis on meaningful outcomes would draw more public participation into the policymaking process. No longer would policymakers get away with protecting their corporate friends (and paymasters) with policies whose principles sound well-meaning, but whose effects will be obscure and as far as real people are concerned, entirely wasteful. Policymakers' goals would of necessity be transparent right at the start.

### **3.11.4 Markets better than Kyoto at minimising costs (2006-11-07 11:24)**

Markets are good at allocating scarce resources. This is not just a conclusion from economic theory, but accords with all the historical evidence. That said, it's unfortunate that policy decisions that entail the expenditure of colossal resources, are taken without reference to the market.

Take climate change: under the Kyoto Protocol the resources spent on trying to prevent it will be decided largely by national governments. They will be a negotiated outcome based partly on today's current knowledge of the scientific relationships, but mostly on what politicians think they can get away with. The political process will attenuate any the relationship between the magnitude of the climate change problem and the global response.

Now consider what would happen were [1]Climate Stability Bonds to be issued. The

main decisions about the likelihood of climate change, the magnitude of the efforts required to prevent it, and the probabilities of doing so successfully would be taken by the market, when it decides how much the bonds are worth. This, in my view, is vastly superior to the bureaucratic process. As with central planning, bureaucrats make mistakes. Their systems are cumbersome, uniform and cannot adapt – even if the bureaucrats are well meaning. Contrast this with a Climate Stability Bond market: there, the decisions as to how much need be spent on stabilising the climate will be taken by those with powerful incentives to minimise the cost. They will be people (or institutions) who stand to benefit if they get their sums right and particularly, *if they are cost-effective in reducing climate change*. Contracting out the achievement of climate stability in this way vastly expands the pool of people with an interest in researching and minimising its costs.

### **3.11.6 Unleash the private sector - a little! (2006-11-08 11:58)**

As seemingly in all the industrialized countries, in the UK health care is in crisis. For reasons of ideology it does not charge at point of use. Inevitably, demand is unsatisfied. One response – see [1]this post by NHS Blog Doctor – is to ration by bureaucracy. Integrate inefficiency into the system so inextricably that patients either die, or pay for private sector treatment. Another approach is to ration according to the more-or-less random factor of media appeal: the British national health care system's terminal-care budget seems to be allocated on that basis: 95 per cent of it is allocated to the 25 per cent of the UK's population who die from cancer, and just 5 per cent to the 75 per cent who die from all other causes. (See *Alternative endings*, [UK] Radio Times, 13 July 2002. This was the subject of a [UK tv] Channel 4 documentary *Death: you're better off with cancer* broadcast on 16 July 2002.)

These are not necessarily consciously inhumane processes, but they do raise the genuine question as to the role that government should play in health care.

I have long argued in favour of government targeting broad, basic, health outcomes. Instead of micro-managing particular bureaucratic processes, or rationing on the basis of mind-space or celebrity affliction, government could set up well-thought out, meaningful indicators of health, such as quality-adjusted life expectancies at different ages, infant mortality, and ideally some reliable measures of mental health. At basic levels there will be a strong correlation between the numerical value of well-chosen indicators and social welfare. Included in such indicators could be the universal availability of insurance against catastrophic health costs.

Once chosen, government could contract out improvements in these indicators to the private sector, via a Social Policy Bond regime. Bonds could target any or all of the chosen health indicators. A fruitful division of labour would be the result: government would define its chosen health care *outcomes*. And precisely because it targets such outcomes, rather than bureaucratic processes or meaningless micro-targets, it will attract greater public buy in – extremely helpful for a universal scheme. Government would also be the ultimate source of finance for achieving these outcomes. It could perform both these functions – defining targets and raising funds to achieve them – very efficiently and with maximum public support. But under a bond regime the actual achievement of these outcomes will be done by the private sector, which will maximise its profits only by maximising the efficiency with which it achieves society’s health goals, as defined by government.

### **3.11.7 David Lange (2006-11-09 10:20)**

An excerpt from[1] David Lange’s engaging autobiography:

“ It was often remarked that I had no education in economics. This is somewhat ironic. In the early 1980s, nobody was better qualified than a lawyer to understand the New Zealand economy. It was a legal construct. Only the law could allow farmers to earn an income by killing sheep and burying them.... There was a ramshackle wall of legal protection around the economy.... [Prime Minister] Muldoon’s regulatory excesses were increasingly absurd. You did not need to be an economist to understand that; the question was what to replace them with.”  
[2]*My life* (page141), David Lange

### **3.11.9 Why bother to think? (2006-11-12 10:17)**

The New Zealand Government will make all your decisions for you.

One snippet from this week's issue of Brian Harmer's admirable [1]WYSIWIG News:

Simon Collin of the Christchurch City Council says depending on which scientist you speak to, disposables can take between two and 500 years to decompose and the human waste in them contributes to greenhouse gasses. He says in a bid to reduce the amount going to the rubbish dump, they have decided to subsidise washable nappies, as the cost of them is thought to be prohibitive to many families. Mr Collin says they have put aside ten thousand dollars to subsidise 500 starter packs.

In fact, it's not at all certain that cloth nappies are kinder to the environment:

If in a drought, it's best to use disposable diapers. If the area has landfill problems, it's best to use commercially laundered cloth diapers. If there are air pollution problems, resort to disposable diapers. The best diaper ultimately depends on the community's situation. Source: [2] *Institute for Lifescycle Environmental Assessment*

...which is why I always stress that it is environmental *outcomes* that are important, not the alleged ways of achieving them, however trendy or superficially attractive those might be. Besides, the best ways of achieving outcomes are prone to change with time as scientific relationships change, and as knowledge expands.

A second excerpt from WYSIWIG News :

The [New Zealand G]overnment is injecting close to \$2 million into a regional initiative to strengthen Wairarapa's international food and wine reputation.

And a third:

A showcase of New Zealand-made products at Parliament later today, is expected to be tinged with sadness as it coincides with the first anniversary of the death of Rod Donald. The invitation-only event is the first of six regional showcases and kicks off the Government's Buy Kiwi Made programme.

As Brian Harmer rightly comments:

These kinds of jingoistic programmes are understandable at one level, but are not logically sustainable in a country whose economic lifeblood is exporting products to other countries. How would we react to our products being shunned as a result of similar programmes in those countries. Protectionism like this will bite us in the posterior sooner or later.

Yet another item discusses Auckland's proposed waterfront sports stadium, which could cost up to NZ \$1 billion. Much of this will come from central and local government funds.

### 3.11.10 I don't know (2006-11-14 10:00)

Every year, 35,000 children in England - 6 % of all 11-year-olds - leave primary school without basic literacy skills. This casts a shadow over their own future and has huge costs for society as a whole. [1]*Rapid Response* , 'The Guardian', UK, 7 November

[Christopher Monckton] has a degree in classics and a diploma in journalism and, as far as I can tell, no further qualifications. [2]*This is a dazzling debunking of climate change science. It is also wildly wrong* , George Monbiot, 'The Guardian', 14 November

I know even less about education than I do about climate change. But I know that when policy is being made in both areas outcomes are almost irrelevant to the debate. Allegiances are bought and sold, insults are traded, activists use their support as a *quid pro quo* for more power and deep down, at the very heart, is either personal ambition or - which is very much the same thing - the drive to validate an ideological position. The losers are those of us with no input into policymaking; that is, ordinary members of the public and our children. While the politicians and think-tanks [3]debate local control of schools, literacy standards suffer. While they debate greenhouse gas emissions, the global climate may or may not be changing catastrophically and irreversibly.

Policies and ideologies; ambitions and systems; all should be subordinated to targeted outcomes. It doesn't matter who controls schools, as long as basic educational outcomes are achieved. And it doesn't matter what happens to greenhouse gas emissions, as long as the climate is stabilised. Some sort of humility is called for: the ability of policymakers to say 'I

know what I want, but I don't know how to get there. Let the private sector decide: that's what it does best.'

Anonymous (2006-11-21 21:05:00)

Dear Sir

I would agree with your position on educational policy makers. Those that make the policies who live in "elsewhereness" do truly gravitate in that place, somewhere else! (bear in mind that this is a sweeping generalisation). At the chalk face of education I have observed the pressure policies and ideological theories put on teachers, in turn reducing the quality of the educational praxis which is delivered in classrooms, in turn, affecting the quality of the education of the children in their classes. Is this the intention of devising policy? To heap pressure on people (mostly women) who already feel put upon? To make the working conditions so unrealistic in terms of expectations that the working lifespan of a teacher these days is about five years? Even worse, the teachers who are worth more than the \$40, 000 NZD they are paid leave teaching altogether? With the reduction of quality, I fear, there will be more and more children who will leave school, not only illiterate, but also, disconnected from school and education overall.

With regard to targeted outcomes, I ask you whose outcomes are the target? Are you talking about society on the whole, in that we are all working for the "greater public good" or are you talking about community based outcomes? On that note, I am OVER the fact that New Zealand advocates community involvement as an integral part of policy making and strategy devising. The people they choose from the community (Maori/Pacific or the "small" people's voices) are not people I delegated to talk on MY behalf! These people are selected strategically by "hierarchy" who seeks only to fulfill its own purpose. These people are generally those that do not rock the boat, who are compliant and will help to reinforce the systems that are already in place. Do I have a problem with this? Hell YES! Because, the "outcome" is no longer a true appraisal of what the community or people want but in fact, a hidden version of what the institution wants. However, on the face, the institution can feasibly say, "Maori led policy", "Pacific's Nations were consulted". How true and how accurate and how useful is this?

New Zealand's education system needs an overhaul. Imagine, if the rest of the world offers education like we do here in New Zealand than what will our next generation look like?

Ronnie Horesh (2006-11-22 10:18:00)

Many thanks for your comment. The points you make are all well taken. I sympathise especially with your views on consultations with 'community leaders'. Unfortunately this sort of obeisance to existing institutions is rife in all policymaking areas. Institutions have their own objectives - primarily self-perpetuation - and these are not always those of the people they are supposed to represent. Indeed, very often the institutions and their supposed beneficiaries have mutually conflicting goals. As you imply, in our current policymaking environment, consultation with certain institutions, or the appearance of it, has become an end in itself; at the expense of meaningful outcomes for real people.

So we come to your question 'whose outcomes'? I do not think that all the goals of an educational system, or rather parents and children, can be quantified and targeted. That said, there are important goals that can be so quantified, and I should think that universal literacy is one of them. Now in the transition to an outcome-based regime, I envisage that we'd start with such basic, quantifiable goals. In essence these would be 'lowest common denominator' goals; those desired by the vast majority of adults. They could be phrased negatively, recognising that government cannot do everything, but at least can strive for and ensure, in this case, universal literacy, or other minimal societal goals, such as avoidance of catastrophic social and environmental collapse. Similarly in health, poverty-eradication, crime and housing: at first certain widely-agreed, minimal goals would be explicitly targeted. In the transition phase, government could continue with its other activities, but the targeting of these basic specific outcomes would at least ensure a tightly-woven safety net, so that the co-existence of a massive public sector with, for instance, illiteracy in schoolchildren would be stamped out. It helps that, in general, it is easier to quantify minimal goals in ways that are strongly correlated with what society (probably) wants to achieve. For instance: literacy and numeracy of schoolchildren are relatively easily quantified; so too are such basic health indicators as infant mortality, longevity etc. At higher levels of educational attainment or health status, the numbers become less reliable and people might prefer the combination of less government involvement, lower tax rates, and more money to spend on their own goals. Depending always on what society wants, you could imagine a decline in public spending on tertiary education, transport infrastructure or corporate welfare schemes, once the public becomes actively involved in choosing societal goals.

During this transition to an outcome-based policymaking regime, ordinary people would become more engaged in the policymaking process. I say this with confidence, because expressing policies in terms of outcomes that are meaningful to real people (as against institutions) is inherently more interesting to members of the public. Under the current system, policy goals, assuming they are made explicit at all, are expressed in terms of institutional structures, activities, or allocations of funds - anything except outcomes in fact. The result is not only inefficiency but widespread disengagement of ordinary people from politics. But if policy were subordinated to outcomes, then people would understand and take an interest in the goals of government policy. Expectations of what government can achieve with public funds would be constantly refined. Under a Social Policy Bond regime, the market values of the bonds would also generate extremely valuable information as to the costs of government policies. I envisage, that at the end of a transition to a Social Policy Bond regime, a well-educated - universally-literate and numerate! - population would be consulted regularly about what government goals should be. They would be presented with various options and trade-offs. In contrast to what seems to be happening now, this would not only narrow the gap between government and the people it is supposed to represent; it would make for a far more efficient and responsive public sector.

### **3.11.11 Dirty energy is subsidised too (2006-11-17 10:00)**

This week's 'Economist' says ([1]*Green Dreams*, 16 November) that '[a]lmost all clean energy ...relies on government subsidies to make it competitive with fossil fuels.' Recent figures are hard to find, but in 1997, the World Bank estimated annual fossil-fuel subsidies at US \$ 48 billion in twenty of the largest developing countries and US \$10 billion in the rich countries. ([2]Source) Add in taxpayer-financed road construction and non-pricing of the negative environmental impacts of fossil fuel consumption, and it's clear that dirty energy too is heavily subsidised.

The same article also says that 'government subsidy is a wobbly foundation on which to build a business'. I wish that were so. But subsidies on such a large scale are self-entrenching: they fund the very interest groups that are so successful in lobbying against their withdrawal.

### **3.11.12 Compliance costs discriminate against small business (2006-11-20 13:27)**

A [1]revealing graph from the current *Economist*:

[2] ✖

I don't know about the 'tax burden' element, represented by the height of the bars. I can't imagine that Italian companies pay nearly 80 per cent of their actual profits to the government. Eighty per cent of declared profits maybe. But the figures in the rectangles, which is the number of hours per annum that businesses have to spend preparing and filing tax payments are interesting. They give some idea of how complex tax (and regulatory) regimes tend to favour large businesses over small. They range from about 80 minutes per week for businesses in New Zealand and Switzerland, to more than 11 hours per week in Spain. Time costs of compliance with other regulations, such as health and safety concerns, employment documentation etc, are likely to be equally high. Such costs obviously fall disproportionately heavily on smaller businesses. In fact most government interventions, however well meaning and high sounding in principle, tend to favour the large and global at the expense of the small and global.

### 3.11.14 It doesn't really matter... (2006-11-23 10:14)

...what is causing climate change. By the time we definitively identify the cause it may be too late to do anything about it. From a [1]letter to the [UK] *Guardian* by Piers Corbyn of Weather Action:

The global warmers' claim that current extra CO<sub>2</sub> causes warming which gets dangerously magnified through the greenhouse effect of extra water vapour in the atmosphere, consequent to the temperature rise, also fails. The sea absorbs extra CO<sub>2</sub>. Furthermore, increased transpiration-cooling by enhanced growth of plants, which is caused by extra CO<sub>2</sub>, cancels out the extra greenhouse warming of that same CO<sub>2</sub>. Increased greenhouse heating due to doubling CO<sub>2</sub> is 3.7 watts per sq metre. This is negated by about the same amount of enhanced transpiration-cooling of plants, all of which grow faster in extra CO<sub>2</sub>. Therefore there is no CO<sub>2</sub> driven net heat flow and surface temperature rise. Temperature and climate change in our epoch is therefore driven by other factors, especially solar particle and magnetic effects.

Fine: there appears to be reasonable doubt about whether greenhouse gas emissions cause climate change. Should we therefore wait several decades before mitigating the effects of climate change or taking steps to stabilise the climate? In general, do we have to find root causes of a problem before we try to solve it? We can do both, but allocating resources between the two courses of action needn't be done at the initial stages. We strongly suspect, for instance, that smoking causes cancer. But we don't give up all research into prevention and cure of cancer until that particular causal relationship has been proven. Similarly with climate change: let's focus on mitigating its worst effects, *however caused*. And let the market decide, via [2]Climate Stability Bonds, how to allocate scarce resources between prevention and mitigation: something that the market, with its built-in incentives, can do far more adaptively and less divisively than the absurdly expensive, ineffectual bureaucratic testimony to 1990s science that is Kyoto.

### 3.11.15 Milton Friedman and the public sector (2006-11-24 01:25)

Since 1989, the year Ronald Reagan, the American president most in tune with Mr Friedman's ideas, left office, and the Berlin Wall came down, America's government has grown just as fast as its economy—an economy which has barrelled along for much of that time. The state's slice of GDP is forecast to be 36.6 % in 2006, up from 36.1 % 17 years ago. The public sector has also swollen in Europe's three biggest economies—Britain, France and Germany—and in OECD economies as a whole.

This excerpt from an [1]editorial in the current *Economist* reflecting on the achievements of the late Milton Friedman. The point being made is that there is still a lot of work to be done. I don't quite share the assumption that the rising influence of the state is necessarily bad. Sure it means that people have less to spend on what they themselves want but might it not be that they want more spending on public goods and services of the type that only government can supply? Sadly, the answer is probably 'no'. Governments keep getting bigger largely through deception, obfuscation and inertia. Deception, in that it knows and has known for a long time that its subsidy programmes do nothing to help the people whom they are represented as benefiting. So massive farm subsidy programmes, sold as essential to maintain family farms, actually do no such thing: they overwhelmingly go to the largest landowners and massive agribusiness corporates. Obfuscation, in that government (with very few exceptions) does not target explicit policy outcomes, such as universal literacy, low crime rates, or basic health or employment goals. Instead it allocates public funds according to criteria that have little to do with people's considered wishes: media appeal or political expediency. Its decisions concern spending, rather than publicly accessible outcomes. Existing institutions, especially government agencies, and their ways of doing things are taken as a given.

And inertia, because many government programmes are self-entrenching. Subsidies to corporations, or protection for public sector workers, strengthens the forces of resistance to any meaningful reform. The *Economist* editorial goes on:

Governments are as convinced as ever that they know best how to spend their citizens' money.

But it's just as true to say that they may not be so convinced; they may see quite clearly that socially unjust, economically wasteful, and environmentally destructive subsidies (for example) are stupid. It's just that they lack the courage to end them.

### 3.11.16 Killing with kindness, killing with complexity (2006-11-27 09:23)

Not, in this instance, literally:

More than five million Britons now rely on state aid to live and the number of younger people claiming sickness benefit is higher than anywhere else in the industrialised world, a major new study has found. ... Around £64 billion per year — more than 10 per cent of all public spending — is handed out free of obligations. Spending on benefits, not including pensions, amounts to nearly £80 billion a year, more than is spent on education and twice as much as is spent on law and order. ... The central problem has been the way [Finance Minister] Mr Brown has structured the system to keep a strong central grip on welfare. His design for tax credits means that the UK has the highest penalties for increasing income or increasing hours worked – the poverty trap – of any developed country. [1] *Five million Britons on state aid* 'Daily Telegraph', 27 November

Anybody who's been on a vacation of more than a couple of months will be familiar with the problem. We return and, after switching the power back on, we have to re-learn how to set and use the finer features of the microwave, the telephone answering machine, the VCR or DVD recorder...and so on. All this electronic equipment was designed by specialists for people (apparently) who will be using it every day and who have the time and energy to consult the voluminous instructions if they take a break.

It's similar to the composers of modern serious music, whose audience consists entirely of other musicians, or the highbrow novelists who write exclusively for the novelists on prize committees. And so it is with the welfare industry. The experts who construct welfare policy are several stages removed from their supposed beneficiaries. The econometrics is elegant, the proliferation of new features is technically impressive, but the result of all the complexity - if the policymakers but cared about it - is a fiscal, social and psychological disaster.

Here's an idea: why not say, explicitly, what welfare policy is designed to achieve? Express your targets in terms that can be easily monitored and that are meaningful to real people. And if you don't know how to achieve your stipulated goals, don't be embarrassed: just contract the whole process out to a motivated and efficient private sector. Perhaps the UK Government is actually coming round to this way of thinking. The 'Telegraph' article continues:

The report proposes the outsourcing of welfare provision to voluntary and private sector organisations which would be paid on results, in particular for getting claimants into sustained employment.

### **3.11.17 What politicians think of us (2006-11-28 13:27)**

On the rejection of his proposed constitution for the European Union:

It was not France that said 'no' to the constitution, it was 55 per cent of French people.  
Valéry Giscard d'Estaing, quoted in [1]the *Brussels Journal*.

There's a lot that can be read into this that one sentence: the arrogance of a member of the French political elite; that elite's disdain for voters; the concept of a France that is not some representation of a vision shared by the French, but one that is actually in conflict with the French people's wishes. I will just say that the statement represents the logical end point of a policymaking process that has nothing to do with outcomes that are meaningful to real people. The EU constitution on which the French voted was largely incomprehensible. More generally, policymaking is an arcane exercise to the non-specialist, where decisions are about changes to institutional structures or funding arrangements, and are driven by ideological concerns or the need to buy off various interest groups. Matters, in short, that have little relevance to the outsider. Indeed, they help create and widen the distinction between outsider and insider.

Giscard is the consummate insider. The outsiders used to be those who didn't bother to vote at all. But as far as Giscard is concerned, even those who do vote should be considered outsiders if they don't agree with what he and the other members of his priesthood think is best for us.

### **3.11.18 Don't rely on government (2006-11-30 05:31)**

One of the disadvantages of a large public sector is that it crowds out our natural, organic, bottom-up way of doing things. Whether it be care of the elderly or the sick, maintaining our physical environment or defining our cultural identity; the temptation for many of us is to let government do the work. This is not all bad: there are things that only government can do efficiently; but it does tend to reduce our own faith in our problem-solving abilities. It's also an excuse for laziness in the face of urgent challenges. We think that, since we are giving more than a third of our income to the government, we don't really owe society very much more.

Unfortunately, government inefficiency is legendary, and the recipients of its largesse (wealthy landlords, multinational corporates, the military etc) are not always those in most urgent need. But if our priorities are significantly different from government, we can actually do something to solve our social and environmental problems – *even if we don't know exactly how*.

Philanthropists can issue their own Social Policy Bonds to achieve a specific goal with which they identify closely. They can back the bonds with their own funds, to be placed in an escrow account. Once their objective has been achieved these funds would be used to redeem the bonds. The philanthropists, once having got the ball rolling, could solicit funds from members of the public, who could contribute directly into the escrow account, and so increase the incentive for the targeted objective to be achieved quickly.

For those interested, I have written a small handbook, taking as an example female literacy in Pakistan: click [1]here for a pdf file on how philanthropists could issue Female Literacy Bonds. I have tried and tried to communicate with philanthropic organizations and publications directly but, understandably perhaps, they do not seem to respond to my unsolicited emails.

### **3.11.19 Event Loss Swaps (2006-11-30 13:26)**

In an earlier [1]earlier post I mentioned the similarity of Social Policy Bonds to Catastrophe Bonds. Readers might be interested to hear of an initiative by Deutsche Bank which, according to the [2]Financial Times, "has begun making two-way markets in what it calls event loss swaps (ELS), which work in a similar way to credit default swaps and allow investors to buy or sell protection against insurance industry losses from large natural catastrophes."

These derivatives, as with catastrophe bonds themselves, do not a seek to modify behaviour, but in principle there is no reason why they need not encourage a movement toward projects aimed at preventing the losses resulting from those 'large natural catastrophes'. With larger funds at stake, and a broader definition of catastrophe than insurance losses, cat bonds and their derivatives could be equivalent in effect to Social Policy Bonds.

## **3.12 December**

### **3.12.1 Never mind the outcome, feel the sanctimony (2006-12-03 11:10)**

An [1]article in the UK *Sunday Telegraph* says that Chancellor Gordon Brown 'has been launching transport reviews at the rate of nearly one a year since 1998'. According to the same article, in 2000 Brown proposed scrapping older lorries with a £100 million investment fund. 'Asked about this recently, ministers said they did not fund any such schemes.' In 2003, Mr Brown claimed that everyone on Jobseekers' Allowance would be assessed with a mandatory skills test. But 'Ministers recently told the House: "There are no mandatory skills courses linked to Jobseeker's Allowance".'

This sort of thing is typical. Image is more important than reality; and who's going to

keep the politicians honest? Between policymaking and policy delivery there are manifold labyrinthine paths, obscured by the fog of committees, agencies, and the glossy outpourings of PR professionals. The goal is not to deliver outcomes, but to remain in power, and for that, in the ADD era, grandiose but vapid promises suffice. Unveil new well-intentioned initiatives, and you will look good on the tv news. And under the current regime there's no need to bother about outcomes. All the good news can be ascribed to your policies; all the bad news to the confounding effects of unexpected events or the long-term fallout from the previous ruling party's activities.

This randomized or – frankly – deceptive approach is just not good enough. It never was, but given the challenges face as a planet and a species, it could bring us to extinction. Kyoto, for instance, is typical: high-sounding principles; top-level agreements; elegant trading mechanisms...and the outcome? A possible negligible reduction in anthropogenic greenhouse gas emissions. Pitiful: the triumph of process over substance.

Policy and political careers should be subordinated to outcomes. Real, meaningful goals should be made explicit, then targeted. People should be rewarded for how efficiently they achieve societal goals. We can no longer afford the smoke and mirrors of the current political process. It's not a matter of who gets elected any more: it's a matter of survival.

### **3.12.2 Read this and weep... (2006-12-05 10:27)**

*...or Subsidising Planetary Destruction, part 94.*

Last month the United Nations General Assembly discussed banning high-seas bottom trawling, which scrapes the sea-floor bare, devastating habitat and coral. But strip mining of the high seas for fish in this way is not only continuing: it is being subsidised.

The villains – or lunatics – in this particular policy area include Japan, Russia, South Korea, and Spain. And how are their destructive fishing operations subsidised? Mainly by the provision of low-cost fossil fuel! The [1]Fisheries Economics Research Unit at the University of British Columbia's Fisheries Centre [2]estimates (pdf) that bottom trawl fleets operating in the high seas receive an average of US \$152 million per year, which constitutes around 15 per cent of the total landed value of the fleet.

### 3.12.3 Environmental policy must be diverse and adaptive (2006-12-08 01:34)

It's not at all clear whether oft-proposed shifts in the way we do things would actually benefit the environment. I've [1]blogged already about the uncertainties over whether cloth nappies (diapers) are better for the environment than disposables, as is commonly assumed. In June 2004, 'Modern Railways' published an article (*Rail loses the environmental advantage*) pointing out that high-speed rail can consume more fuel per passenger than cars or even planes.

The current issue of the 'Economist' has published a [2]letter questioning the environmental advantages of solar panels over fossil fuels:

Silicon fabrication factories are energy and water intensive and the manufacture of silicon wafers uses energy from traditional fossil-fuel power generators, with the same old pollution. Add the potential problems of disposal towards the end of a panel's life—they are frequently doped with toxic materials like arsenic—and solar power hardly seems like the environmentally benign solution it is often touted to be. Peijing The, 'The Economist', 9 December .

The sort of life-cycle analysis required to establish the environmental benefits or otherwise of shifts in our behaviour are bedevilled by boundary issues, measurement difficulties and the difficulty of weighting one type of environmental impact against another. They are better than blandly assuming that rail is 'better' than air travel, that solar power is better than coal-fired power stations, but for the making of robust policy they would need to be continually reassessed in the light of our ever-expanding knowledge of the environment and our ever-changing environmental priorities. Government policy cannot be so responsive: if government did use life-cycle analysis with the aim of altering our behaviour, it would probably do so on the basis of a one-time, necessarily limited, and possibly quite subjective assessment of environmental costs and benefits. It's not good enough, but even worse would be what we largely have now: government environmental policy based on corporate interests, media stories and the launching of visually appealing initiatives that attract air time but otherwise achieve nothing.

Social Policy Bonds would take a different approach. They would subordinate environmental policy to targeted environmental outcomes. It might be, for instance, that society wishes to reduce its use of fossil fuels. A Social Policy Bond issue that rewarded achievement of such a reduction would generate incentives for bondholders to bring it about *at least cost*. They might well carry out life-cycle analyses in their attempt to do so. But there is an important difference between the way do they would conduct their research and the way government would do so: bondholders have incentives to achieve their goal efficiently. This is likely to mean responding to and stimulating: increased knowledge of scientific relationships, and technical advances.

A single environmental goal, such as reduction in fossil fuel use, entails diverse, adaptive responses. These are precisely the sort of responses that government does very badly. Government can and should articulate society's environmental goals, and can help pay for their achievement: in the democratic countries it performs these functions quite well. But actually achieving these goals requires continuous, well-informed and impartial decisions to be made about the allocation of scarce resources. For that purpose, Social Policy Bonds, with their incentives to achieve targeted outcomes efficiently would, I believe, be far better than the current ways in which environmental policy is formulated.

### 3.12.4 World targets in megadeaths (2006-12-09 15:23)

Two snippets from a newsletter sent out by [1]Carbusters:

- The city of Guangzhou has banned battery-powered bicycles to make more room for the 870,000 cars on the streets. This will negatively affect the almost 100,000 residents who drive these bicycles, but will make space for automobiles, which are appearing on Guangzhou's streets at a rate of 150,000 per year [Reuters].
- On average, 3450 people die on the world's roads every day [RoadPeace].

I write about cars and the depredations they inflict on us all not because I think cars are evil, but because they show very clearly what happens when government and its policies become remote from ordinary people. As with so many government activities, the promotion at public expense of transport was a good idea - at first. Roads used to be as essential as decent sewerage. Now, largely because of the enormous growth in road traffic, any other way of getting about has become expensive or dangerous. We are so hooked on our cars, and the road lobby is so hooked on corporate welfare, that government can do little to stop the juggernaut, even when it kills people at the rate of one 9-11 a day - as well as maiming and mutilating tens of thousands. Oh, and poisons our atmosphere, devastates our cities and countryside, and goes a long way toward shredding our social fabric.

Some years ago when the Chinese Government was bundling Falun Gong meditators into trucks for torture and worse, the British people mounted a remarkably successful demonstration...against a small rise in petrol prices.

### **3.12.5 The rich world's farm policy is corrupt (2006-12-11 12:25)**

I'll leave it at that for today:

"A maverick dairyman named Hein Hettinga started bottling his own milk and selling it for as much as 20 cents a gallon less than the competition, exercising his right to work outside the rigid system that has controlled U.S. milk production for almost 70 years. Soon the effects were rippling through the state, helping to hold down retail prices at supermarkets and warehouse stores.

For three years, starting in 2003, a coalition of milk companies and dairies lobbied to crush an initiative by a maverick Arizona dairyman. Hein Hettinga chose to work outside the rigid system that has controlled U.S. milk production for almost 70 years. The milk lobby said he presented unfair competition because he chose to operate without federal price control. Hettinga fought back but was outgunned on the Hill. In March, Congress passed a bill that effectively ended his experiment...." Source: [1]Washingtonpost.com:

### **3.12.6 GDP: the default target for government policy (2006-12-14 12:48)**

It's about two years since I started this blog. In that time I haven't detected much movement toward outcome-based policy. Instead, we are seeing the ascendancy of a political caste; people who are politicians first and foremost *and always have been*. Their concerns are not those of ordinary people, and their definitions of success or failure are entirely removed from those of the populations they are supposed to represent.

Take this example, from a 2005 [1]statement by the New Zealand Prime Minister, Helen Clark:

Treasury estimates that our GDP per capita would rise by 5.1 per cent if we lifted our participation rates overall to the average of the top five OECD nations. That's a worthwhile objective and at this time of labour shortage, it's a good time to be pursuing it. In last year's Statement I highlighted the need to increase women's participation in the workforce, and a number of steps have been taken to do that.

In other words, an increase in GDP per capita has become an objective in itself. Anybody who has always lived and breathed politics is going to think like that: the things that matter to

such a person are aggregated quantifiable data. The flaw is that such data do not accurately measure the well being of society. Devised primarily to measure the output of manufacturing economies, GDP does not take into account changes in the quality of the physical environment, nor the distribution of income, nor social problems such as crime and homelessness. It ignores human capital (the education and skills that are embodied in the work force) and it fails to account for leisure time or the unpaid work of parents or family members. It cannot account for these things because they do not generate a flow of money. When GDP becomes a target these failings become more important than a measurement error. They underlie policymakers' favouring of the big and measurable.

Statistics like GDP should never have assumed the authority they have nowadays, but they have done so by default, because we have failed explicitly to target outcomes that are actually meaningful, whose quantifiable measures are correlated with societal well being, at least at the lower ends of their ranges. We should, for instance, be targeting such measures as infant mortality, basic numeracy and literacy, basic levels of education and housing, employment levels. At a global level meaningful targets would be the spread of nuclear weapons, violent political conflict, and critical environmental indicators, such as climate stability.

But politicians, especially career politicians, find it hard to think in this way. They are not ordinary people. Their identification of success with GDP per capita is exactly analogous to a corporation's appetite for profits: an end in itself. Nothing else matters. So Ms Clark for all her ambition may well see a small tick upwards in the New Zealand GDP. It's the children whose mothers join the workforce who will bear the consequences.

### **3.12.7 Smoke and mirrors (2006-12-15 02:12)**

In [1]Why I've lost my faith in Gordon Brown in the UK 'Times' yesterday, Anatole Kaletsky says:

Perhaps the most worrying revelation about Mr Brown's approach to politics has been his obsession with institutions and processes, rather than results. Everyone knows that Mr Brown's proudest achievement has been the restructuring of the Bank of England, but is it possible that restructuring other government departments is Mr Brown's "big idea" for the next decade? Following the merger of the Inland Revenue with the Customs and Excise, Brown allies hint at reorganising the Department of Trade and Industry, revamping the Cabinet Office and maybe even abolishing the Treasury itself. Even more depressing is Mr Brown's apparent addiction to commissions and quangos run by

former businessmen, financiers, civil servants and newspaper editors. It is as if the mere appointment of these commissions is enough to satisfy Mr Brown's insatiable desire for information and the appearance of governmental activity.

Unfortunately, on this record Mr Brown is exactly in tune with current policymaking priorities. For political purposes, results hardly count. It's cheaper and less effort to get Public Relations people to spin the facts, rather than to change them.\* The parties tacitly conspire in this shell game, stressing in their election campaigns rhetoric and image, under an electoral system that allows voters a choice between Tweedledum and Tweedledee once every four or five years. Voters are seen as taxpayers or beneficiaries with Attention Deficit Disorder - a self-fulfilling belief system given that (as Kaletsky continues) educational policy itself is subordinated to meaningless spending targets:

On the substance of policy, meanwhile, Mr Brown seems to have nothing of interest to say — or do. Education, for example, is supposedly Mr Brown's top priority for the "next Labour decade". Yet his only positive idea in this sphere is to keep spending more money on school buildings and renovations, without any apparent regard to what these schools teach or how, until he achieves his newly proclaimed target — that the average cost of educating state school pupils should reach the amount now spent in private schools.

This is gesture politics at its worst. *Spending is not a legitimate policy goal.* It is a means to ends, not an end in itself....unless, of course, Mr Brown's real educational objective has more to do with placating the teaching unions than with actually educating the electorate of the future. The solution of course is to express policy goals in terms of results that are meaningful to real people. Meaningful goals for education, oddly enough, are educational goals: things like numeracy, literacy and the physical and intellectual well being of young people. Trickier to measure, to be sure, but far more relevant to real people than the lazy (or corrupt) pseudo-goal of 'higher spending per pupil'.

And if you think I am being overly cynical about the role of image-making in politics, check out this [2]Mail on Sunday report that the British Government has agreed on a multi-million pound PR campaign to make British citizens feel better about the European Union. The plans, entitled *Reframing the Debate*, suggest promoting the 'EU brand' by linking it to popular or 'warm' European themes, like the Eurovision song contest, or the Cannes Film Festival - even though these have nothing to do with the EU. It also suggests banning Ministers and officials from referring to unpopular EU institutions like the European Commission, places such as Brussels and Strasbourg, the euro, terms like 'Eurocrat' and 'EU directive' and controversial policies such as the Common Agricultural Policy and the EU Constitution.

### **3.12.8 Who cares about quality of life? (2006-12-16 13:59)**

A couple of posts ago I castigated the New Zealand Prime Minister for her making GDP per capita as the Government's target par excellence - even at the expense of the welfare of infants and children. Perhaps this isn't the worst possible default target. The current 'Economist', [1]describing UK Finance Minister Gordon Brown's Pre-budget Report says:

Mr Brown has little to say about the quality of people's lives; tellingly, he seeks to boost growth in GDP rather than GDP per person. Stripped of the verbiage, much of his speech could be seen as opening the way to more development in the crowded south-east, whose residents would be less able to object under the proposed planning reforms.

While you can increase GDP per capita by substituting paid childcare for unpaid, you can increase GDP merely by letting more people into your country. Et voila! A visionless politician's problems solved! A high GDP means influence, power; a seat at G8 summits. Quality of life? Who cares?

### **3.12.9 Bureaucrats and lobbyists versus the people (2006-12-19 09:57)**

New Zealand has released a [1]draft forestry strategy to take into account climate change. Or rather, the fossilized science underpinning Kyoto - and that's the problem. There's a lot of internal consistency: to tax nitrogen fertilizer so as to reduce emissions of nitrous oxide; to spend NZ \$100 million over five years to encourage new forest plantings. There's also a lot of elegant economics: tradeable permits for agricultural emissions and offset schemes from tree planting.

All very worthy and, as I say, entirely consistent with the premises underlying Kyoto.

Unfortunately these premises are flawed. Kyoto is not, ultimately, concerned with climate change. Its sole focus is to reduce net anthropogenic greenhouse gas emissions. They are not at all the same thing:

1. Reducing anthropogenic greenhouse gases might not be the best way of reducing the concentration of greenhouse gases in the atmosphere;
1. Reducing the concentration of greenhouse gases in the atmosphere might not be the best way of preventing or mitigating climate change; and
1. Preventing climate change might not be the best way of preventing the worst effects of climate-induced catastrophe.

Even if our ultimate goal *were* solely to reduce net greenhouse gas emissions, Kyoto would be inefficient. Kyoto, and the New Zealand Government, are telling us not only that greenhouse gas emissions must be cut, but *how* to cut them. They are putting in place their own fixed assumptions about the relative contributions that greenhouse gases make to the climate change problem, and similar assumptions as to the contributions that planting trees rather than crops make to solving it. Such assumptions are based on old science: it is in the nature of top-down, micro-managed, bureaucratically administered regimes that they cannot readily adapt; and our scientific knowledge is expanding very rapidly indeed. Even accepting the premises of Kyoto, then, the current responses are inherently inflexible and inefficient – which matters a lot, given the colossal costs involved.

How would [2]Climate Stability Bonds be better? First, they wouldn't *assume* that cutting greenhouse gas emissions is the best way of tackling climate change. But even if it were found that doing so *is* the best way, holders of Climate Reduction Bonds would have strong incentives to do be more efficient. They would want and would have wider scope for action. For example, they wouldn't be bound by political correctness or *realpolitik* of the sort that exempts some countries that emit huge quantities of greenhouse gases from any disciplines at all. They would simply buy these regimes off or otherwise undermine opposition to the necessary disciplines.

There is an important presentational aspect too. Kyoto doesn't focus on a desirable outcome: it's focused on processes and activities. So it is now so politicized, and its money flows so unpalatable, that it is seen as an imposition; in the rich countries it's seen as an imposition by the greens on everyone else, and in the poor countries it's seen as an imposition by the rich countries on them. And to industries, such as the forestry industry, it's seen as a government-imposed threat to their wealth, or an opportunity to seek subsidies from that same government. Either way, it diverts the attention of some clever people away from managing their business efficiently, and into lobbying the government for special treatment.

In the proverbial battle between elephants, it's the grass that gets crushed. With governments and the other Kyoto lobbyists, success is defined bureaucratically. As the *New Scientist* in its editorial of 25 November put it: "Some at the heart of the [UN climate] negotiations claim that the [recent meeting] in Nairobi has been a success. That's baloney. The conference persuaded itself that a review of the [Kyoto] protocol in 2008 is a major outcome, but to an objective outsider it looks more like an excuse for inaction." And for corporate interests, success is measured in terms of how much they will gain or lose as a result of whatever schemes, allegedly to mitigate climate change, are put in place by governments. While these games are being played, the losers, as so often, are we, the people.

### **3.12.10 Biases of big government (2006-12-22 13:39)**

The problem with big government is that it is generally remote government. Remoteness means that government is unresponsive to the real needs of real people and has wildly different priorities from real people. Big government has more in common with other big organisations (corporations, trade unions, other governments) than with the people it's supposed to represent. All these institutions have two main things in common:

- Their over-arching objective is self-perpetuation; and
- When monitoring their performance, they rely heavily on easily quantifiable data.

Self-perpetuation for most of us, most of the time, is a goal with which we can identify as individuals. Some organisations, brought into being to address genuine grievances can, knowingly or not, perpetuate or entrench the causes of their grievances: they see the entire world through the prism of the cause that validates their *raison d'être*; and that can be problematic.

But the reliance on quantifiable data is, I think, equally dispiriting. A benevolent welfare state cannot discriminate between the deserving poor, and those who would benefit more from being refused (say) unemployment assistance and so more motivated to find work. The criteria for receiving such assistance will be numerical data, mainly wealth and income.

Given that we have big government, one way of solving the sort of mismatch between numerical aggregate measures of wellbeing, and actual wellbeing, would be to have sensible numerical targets. Take the unemployment example: instead of detailed, legalistic criteria for the *process* of applying for unemployment benefit, a truly benign government could set a broad target for total unemployment, and contract out the achievement of that lower target to the private sector. (Click [1]here for one suggestion.) The private sector would be motivated to encourage those unemployed at the margin - those least unwilling or unable to go to work - to find jobs. This is in contrast to a bureaucracy, which has no such clear motivation. The proliferation of meaningless micro-targets, and the bureaucratic need for self-perpetuation, combine in this and many other instances, to form a vicious circle, or a downward spiral, which cannot respond sensibly to cases of individual human need.

### **3.12.11 Government will not save humanity (2006-12-25 09:31)**

As the New Year approaches, there are two particularly urgent challenges facing humanity: nuclear proliferation and climate change. Our current approaches, in my view, are going

nowhere, slowly. Iran is [1]rejecting nuclear sanctions, while Kyoto, even if it were to be a success in its own terms, is going to be divisive, expensive and ineffectual. Unfortunately, we are so accustomed to handing over responsibility for social and environmental problems to some level of government or other, that we assume either that solutions to humanity's problems are at hand, or that there's nothing we can do about them anyway.

A third approach is that of Social Policy Bonds. Charge the private sector with tackling these problems. Admit that we don't yet know *how* to solve them, but encourage people to research, investigate and implement diverse, adaptive solutions. Inject the market's incentives and efficiencies into the whole process; so expanding the pool of human ingenuity devoted to solving these real problems. We don't even have to wait for government to do it. We could [2]issue our own (pdf) Nuclear Peace Bonds (here's a [3]similar idea) or [4]Climate Stability Bonds. All it would take would be for some interested philanthropist to put up the funds, and let the market for the bonds do the rest. Of course, once the ball got rolling, contribution from members of the public could be solicited, which would swell the total redemption rewards.

The first hurdle is the one that looms largest, to me anyway. I have tried and tried to contact philanthropists and publications for philanthropists. With not a single exception my emails have not even been auto-acknowledged. No doubt these organisations have devised effective filters to screen out unsolicited messages. Are any readers of this blog philanthropists? Do you know any philanthropists? Do you know how to get in touch with philanthropists? I fear the current alternative, waiting for government to do something helpful, is just not going to be good enough.

### **3.12.12 EU kills off small businesses - what's new? (2006-12-26 10:24)**

Who could argue against this?

A race is on to inform more than a million small businesses that they become responsible for disposing of electrical waste — from dishwashers to calculators – from July next year. EU rules come into force making businesses responsible for taking back the two million tons of waste electrical and electronic equipment...that normally goes to landfill each year. [1]Source

Well I will argue against it. Like much EU regulation it contrives to be both well-meaning – and to miss the point. If the objective is to reduce waste going into landfill, then why not set explicit, verifiable landfill goals and let people other than bureaucrats work out how best to achieve them? Why set up a new bureaucracy – because that is what these rules will do – to

play around with activities that may or may not achieve reduce the rate of expansion of landfill?

It's a typical, top-down, one-size-fits-all, government-mandated, pseudo-solution to what is probably a genuine problem. It's also gesture politics, because it's unlikely to achieve much, apart from employment for bureaucrats. Oh, it will probably achieve something: this sort of nonsense imposes proportionately bigger costs on small businesses. As the newspaper report continues:

But business leaders fear that only large retailers have any idea about the new obligation.

Precisely so: the main effect of these rules will be to increase still more the concentration in the retail industry that has already [2]made clones out of every main shopping street in the UK.

### 3.12.13 Costing policy targets (2006-12-28 09:10)

The primary source isn't entirely clear, but according to an article in the current '[1]Economist' (subscription) around 6 per cent of UK children leave primary school each year unable to read properly. Clearly more government resources could reduce that figure. But, as with all social and environmental problems, the question is: where to draw the line?

I have my own preconceptions. For instance, I strongly believe that an excellent use of government funds would be to buy some low-cost law enforcement that could reduce the number of people killed on New Zealand's roads from its current rate of 400 per annum - along with tens of thousands of serious injuries. We all have our own priorities about where scarce resources should be allocated. But unfortunately we, and policymakers, are very much in the dark as to the costs of our predilections. It's in few people's interests to calculate disinterestedly how much return, in terms of welfare, would be saved by more funding on, say, traffic policing as against (for example) funding of women's refuges or literacy for schoolchildren.

A Social Policy Bond regime would be an improvement over the current system of allocating social funds, but also because it market prices of the bonds would constantly generate information of great value to policymakers about the total costs of their policies.

Take, for example, the objective of lowering some index of water pollution from 50 to 40 units. Assume that a national government issued one million bonds targeting water pollution, each redeemable for \$10 once this lower level has been attained. The *maximum* cost to the government of achieving this objective would then be \$10 million. But if the bonds, when

issued, fetched \$5 each, then the market would be saying that it thought it could achieve this objective for just \$5 million. It wouldn't say *when* it thought it could achieve that objective, but that could be inferred from market behaviour and the market value of the bonds compared with other financial indicators. But what if the bonds sold for virtually nothing, and the market value of the bonds failed to move from that floor? That would mean that the government had miscalculated: in the market's view there would be no realistic chance of the objective being achieved for an outlay of \$10 million in the foreseeable future. The government could respond in different ways:

- It could wait for new technology to arrive, or for circumstances to change in other ways, such that the market would see the objective as becoming more easily achievable, and the value of the bonds would consequently rise. Or,
- It could issue more bonds, with the same specification, also redeemable for \$10. It might do this in stages, gauging the market reaction to each new tranche of bonds, which would tell the government the maximum cost of achieving the objective.

Either way, the government could be reasonably sure that it would be getting the best possible deal, expressed as 'reduction in water pollution per unit outlay'. Valuing the *benefit* of achieving a targeted social or environmental outcome is bound to be an uncertain, and to some extent, subjective task, whichever policy instrument is used. But minimising the *cost* of whatever outcome is targeted is a different matter. A government issuing Social Policy Bonds could determine the maximum cost of achieving the objective because that would simply be the total number of bonds issued multiplied by the redemption value *plus* administration costs *minus* any revenues gained on floating the bonds. And, under a Social Policy Bond regime, it would be the collective wisdom of those in the market for bonds that determines how much the government (that is, taxpayers) would actually pay to achieve the targeted outcome: they will have every incentive to minimise that cost.

The prices of Social Policy Bonds are even more beneficial in that they would not merely minimise the *total* cost of achieving a specified objective. They would also indicate the *marginal* cost of achieving further improvements. But that discussion is more technical, and I will not go into it here.

Instead: two snippets from *Harper's Index* (taken from 'Harper's', October 2006):

- Minimum amount of USDA [US Department of Agriculture] farm subsidies since 2000 that have been paid out to people who do not farm: \$1.3 billion.
- Minimum value of "small business" contracts given out by the US last year that went to Fortune 500 firms: \$1.2 billion.

### 3.12.14 Meaningless Mickey Mouse Micro-targets (2006-12-29 10:57)

Meaningful social and environmental targets must be broad; otherwise we risk a proliferation of Mickey Mouse micro-targets, that may seem unarguably valuable at first sight, but whose achievement comes at the expense of other valid goals. Take this [1]example, where the always-interesting UK-based National Health Service [2]Blog Doctor is writing about a patient, Robert, showing unexplained weight loss:

I have written about this before. The days of the hospitals taking on patients and sorting them out has long gone. NHS hospitals no longer see patients. They process problems. This is a direct result of government targets. To hit the targets, each hospital contact or “event” has to be concluded as quickly as possible. And so it is. Robert’s contact with the hospital is deemed a successful outcome, and points will have been scored. Meanwhile, his weight loss continues.

# 2007

## 4.1 January

### 4.1.1 Government responses to terror (2007-01-01 13:03)

Government responses to random bombings, hijackings and other threats to our personal security are predictably incapable of adaptation, expensive and [1]ineffectual. They owe more to the need to be seen to be doing something, however devoid of value that 'something' is. The problem, as with the provision of other government services, is that government does not know when to hand over to the people.

Provision of city sewerage systems in Victorian Britain was an essential task, and one that only government could do. But [2]labelling cheese as junk food in 2007? A military-industrial complex, with professional forces and huge quantities of materiel was a valid response to threats of invasion. But [3]checking every air passenger's email and credit card accounts? Somewhere between these extremes, government has wandered away from the concerns of real people. It is now driven more and more by the inertia of a large and growing bureaucracy, whose over-arching goal is self-perpetuation.

Social Policy Bonds are an alternative approach. We do need government to articulate society's goals, and to raise revenue to finance their achievement. But we don't need go to stipulate *how* these goals are to be achieved. If the goal is to minimise threats from terrorism, then we need adaptive, diverse responses; not Pavlovian, one-size-fits-all reactions to news headlines. The New Year's Eve bombings in Bangkok killed three people: over the three preceding days 179 people [4]died on Thailand's roads. We can be fairly sure which of the two threats to its citizens' wellbeing the Thai Government will devote more attention to in the coming months. But I have another suggestion: issue Social Policy Bonds targeting premature deaths, and let the market allocate scarce resources to where they will achieve the highest return.

#### **4.1.2 Politics without vision (2007-01-04 11:04)**

Not much is unambiguous in politics, but the European Union's corrupt, insane Common Agricultural Policy qualifies as an unambiguous disaster. It's ruinously wasteful, it destroys the environment, it transfers money from the poor to the rich, and right now, not for the first time, it's threatening to derail the global trading system.

We might expect therefore that the British opposition Conservative Party, not having any power to lose, would come out strongly against the CAP. Previous UK party leaders, did so, at least when they too were in opposition. Their efforts foundered against the intransigence of the France political caste, but at least they tried.

But not the current Conservative leader who takes the absurd CAP as a given. The extent of his vision is to want [1]more subsidies for English farmers. Or it appears to be; I'd be delighted if I'm wrong.

#### **4.1.3 National security: currently subordinated to institutional structures (2007-01-05 13:09)**

Measuring the success or otherwise of a government agency is not always a simple matter. How, for example, would we monitor the effectiveness of the military? Is the non-invasion of your country a reliable indicator of a successful defence agency? No. There could be a mass assembly of hostile troops on your borders. No invasion, sure, and not yet a loss of sovereignty; but the threat of an invasion, and so a potentially imminent loss of security and current rise in fear and anxiety.

The point is not just that there are social and environmental outcomes that are difficult to quantify, but that our current methods of allocating resources do not attempt to do so. Under the existing political system, the main determinant of funds to government agencies is the amount of funding they received in the previous financial year. Percentages are adjusted upwards or downwards, but *the institutional structures are taken as a given*. National security is currently something that the military and intelligence services do, but in this age of [1]asymmetric warfare that approach may no longer be enough. After terrorist incidents there are calls for the funding of these bodies to rise. It's not in their interests to quantify their own effectiveness; only to report on (and exaggerate) any apparent threats.

Something is missing, and that is the scientific allocation of scarce resources. The answer, I believe, is a Social Policy Bond regime that first of all, attempts to measure precisely what we want to achieve, and second, rewards achievement of that goal, or combination of goals, *without assuming a particular institutional structure*.

As I say, defining what we want to achieve in the area of national security is difficult, but *precisely the same difficulty arises when we attempt to measure the effectiveness or otherwise of the existing system*. Under the current system there's less and less definition of meaningful outcomes, and more and more resources being allocated to institutions that may or may not be doing much to achieve them.

A Social Policy Bond regime as applied to national security would subordinate all its projects and initiatives to the targeted goals. Terrorism, for instance, would not be the remit of ever more bureaucracies given ever more intrusive and expensive things to do. Perhaps equally important, though, is that citizens themselves could help define national security goals. Greater participation would mean greater buy in, and so not just the enhanced effectiveness of whatever projects are undertaken, but a wider range of possible initiatives.

#### **4.1.4 Corruption is built into opaque policymaking (2007-01-06 14:42)**

It's sad to see how closely intertwined are the interests of corporations and politicians. 'Barack Obama Inc', an article in Harpers of November 2006 by Ken Silverstein mentions some of the compromises necessary under the current system for even the best-intentioned political movers:

[A]lthough Obama is by no means a mouthpiece for his funders, it appears that he's not entirely indifferent to their desires either. Consider the case of Illinois-based Exelon Corporation, the nation's leading nuclear power-plant operator. The firm is Obama's fourth largest patron, having donated a total of \$74,350 to his campaigns. During debate on the 2005 energy bill, Obama helped to vote down an amendment that would have killed vast loan guarantees for power-plant operators to develop new energy projects. The loan guarantees were called "one of the worst provisions in this massive piece of legislation" by Taxpayers for Common Sense and Citizens Against Government Waste....

The problem is with the indirect way we fund our politics. It's comparable to the obsolescent

ways in which tv programmes have been funded under the now-shrinking 'free to air' model. Viewers pay either a sort of tax to a state broadcaster, or they watch adverts. Either way, there's an intermediate step between the public and the programmes they watch. That model is faltering, and perhaps we'd be better off if similarly indirect policymaking disappeared from politics too.

Currently we have a specialised class, politicians, who are funded by corporations or other institutions. Why can't we cut out the middleman and fund our politics directly? One reason is that the policymaking process is so arcane, so opaque, that only specialists can understand it. Whether this is an inevitable by product of complex economies and societies, or whether there is some patch protection going on by a self-interested and insecure group of professionals, many of whom used to be lawyers, is debatable, but the effect is the same. Ordinary people and their interests shy away from engagement in politics, and that suits the politicians and bureaucrats just fine.

My solution is instead to subordinate politics to outcomes. I believe a Social Policy Bond approach would allocate funds more efficiently than the current system, which is largely driven by the interests of lobbyists and the interests of existing institutions, notably government agencies themselves. But efficiency is only one benefit of a bond regime. Another important one is that, by recasting our politics in terms of meaningful outcomes, we would draw more people into the policymaking process. People understand outcomes: we are less interested in the recondite discussions over funding of the myriad departments of government, or the wording of legal documents, that is such for feature of the current regime. More public participation means more public buy in. These are ends in themselves, as well as a means to more effective and efficient policy.

Mr Silverstein's article on Barack Obama ends by quoting an anonymous Washington DC lobbyist, who pointed out:

that big donors would not be helping out Obama if they didn't see him as a "player".  
The lobbyist added: "What's the dollar value of a starry-eyed idealist?"

#### **4.1.5 Limits of big government threaten us all (2007-01-09 08:27)**

Making policy is very much like thinking, in that it's limited by the way it abstracts from reality the finite range of facts available to it. For makers of policy whose remit covers more than a family, clan, tribe or village, this should be a lesson in humility, because policymaking for large numbers of people inevitably entails the use of quantifiable data. Such data are equivalent, at the level of the individual, to our thoughts. Either way, they are extremely limited; what our minds can grasp, articulate and work on do not describe reality. They are individual facts, selectively taken from memory or, when making policy, aggregated, quantifiable information. Unfortunately, as the saying has it, 'if the only tool you've got is a hammer, you're going to see every problem as a nail'. And the only policymaking tool we have is our intellect backed up, sometimes, by statistics.

In the individual our thoughts have not (yet) completely crowded out our insight. We know, most of us, at some level, that our wellbeing is not defined by a set of discrete quantifiable circumstances, but is rather a state of mind, which we'd find very difficult to describe using the limited vocabulary of whatever language we speak.

Policymaking though is in a more parlous state; at the national and super-national levels anyway. For a start, it cannot interpret unprecedented threats, such as climate change or nuclear proliferation, in any but its own terms: that is, things to be negotiated, dealt with through the political process by existing institutional structures or new ones modelled on them. It cannot see social wellbeing as anything other than aggregated targets, with maximum Gross Domestic Product (or GDP per capita) as the target above all others. But GDP is grotesquely flawed for that purpose, and most other numerical goals are hardly more reliable indicators of social welfare. There *are* quantifiable measures that do correlate fairly strongly with meaningful social goals, but these tend to be at the lower levels of wealth, income, nutrition or education. At these levels, quantifiable increases *do* generate real, meaningful rises in opportunity and welfare.

But government has expanded far beyond helping the disadvantaged. It's expanded into areas where its reliance on aggregated data is not only leading it awry, but into activities that crowd out the more adaptive, responsive and responsible instincts of real people. At the same time, the planet is confronted with challenges, such as climate change and nuclear proliferation, that government cannot meet. Most of the population is now so used to handing over responsibility to a large and remote public sector that we think that government will solve such problems. Or we think that if government cannot solve them, they cannot be solved. The remarkable ability of humans to adapt and survive, our prodigious energy and ingenuity, is stunted, or channelled into cynicism, despair or such flippant, but lucrative, pursuits such as the marketing of dog food, where the goals are immediate, identifiable and no threat to the existing order.

There is a widening gap between government and the people it's supposed to represent. It wouldn't matter very much of the public sector were small, and satisfied to remain so, and if real people controlled their own destiny. But the public sector is none of those things. It's big, remote and intrusive, and it's failing to meet our most urgent challenges. This combination could mean calamity, not just for millions, or hundreds of millions of human beings, but for the entire planet.

-

#### 4.1.6 Target outcomes, not institutions (2007-01-12 10:01)

James Johnson, the chairman of the British Medical Association, said that if the health service failed to break even this year, ministers would "look very carefully" at what should happen next. "Don't assume there's anything automatic about the system we have at the moment continuing in perpetuity," Mr Johnson said.

That excerpt is from an article titled [1]*One year to save NHS*, from today's 'Daily Telegraph' and refers to the UK's National Health Service. I'm pleased that people are phrasing some of the debate in terms of outcomes: Mr Johnson later in the article says "If you get nine per cent of GDP spent on health and you still can't make it work, people will be saying: 'Do you want to carry on doing the same thing or should we be trying something fundamentally different?'"

Quite encouraging, but the rest of the argument seems to be about which sort of institutional arrangements can bring about desired, but unspecified, outcomes. There's a widespread sense that the NHS is inefficient, but that tells us nothing about what would be better and it hardly constitutes proof that the NHS is inefficient.

The problem as I see it is that the politicians - if they ever do get round to tackling the vested interests benefiting from the current setup - will choose some new institutional structure. Only some years or decades later might be shown (or more likely, thought) that the new structure is better (or worse) than the NHS.

Here's a better idea: specify those health outcomes that the Government, in its capacity as representative of the population, wishes to see and is prepared to raise revenue to generate. And instead of choosing a system that appears to work in other countries, or is favoured by other teams of experts, or that conjures up most funds from corporate interests to the ruling political party, let the institutional structures be determined by the targeted health outcomes, rather than vice versa. The UK Government should develop a range of health indicators, such as [2]Quality Adjusted Life Years. It should then issue Health Care Bonds, following the pattern of Social Policy Bonds, and in effect contract out the achievement of these outcomes to the private sector. This need not mean the demise of public sector agencies, but it would mean their funding would be allocated by the private sector which, unlike in the NHS, has incentives to achieve broad, explicit, and publicly agreed, health outcomes.

Allocating scarce resources is something that markets do well, but government has an important role in setting such desirable goals as universal basic health provision, and in raising funds to achieve them. This role can only be played by government, and in fact democratic governments do it quite well. Social Policy Bonds would allow government and private sector each to do what they are best at doing. With health care, as with other social and environmental goals, outcomes are foremost. Discussion about systems, institutions, activities or inputs is wasteful and a distraction.

#### **4.1.7 Burying vegetables (2007-01-14 10:47)**

Millions of Thai root vegetables are used in the production of starch and then dumped in ponds where they emit methane, a gas 21 times more harmful than carbon dioxide. The [British] Government claims that by sealing the pulp in plastic containers, thus preventing the methane escaping, it will offset some of the harm caused by the 600 million miles flown by politicians and officials every year. Source: [1]Sunday Telegraph.

At first sight this idea it seems far-fetched, but for all I know it might work. Of more concern to me is how these schemes are arrived at. Who decides that burying vegetables is a worthwhile way of compensating for aircraft emissions? Or, rather, of stabilising the climate, since that is the ultimate stated objective? And how do they decide? One thing is for sure, decisions like this aren't reached impartially, by people highly motivated to achieve highest reduction in climate change for each taxpayer's pound. That's why, if the real objective is actually to stabilise the climate, rather than just to appear to be doing so, you need something like [2]Climate Stability Bonds.

So what is the likely impact of this burying-vegetables scheme? In the short run it may well reduce net measured anthropogenic greenhouse gas emissions. But in the long run, it's effectively a subsidy to factories that convert vegetables to starch. In common with the even more spectacularly futile idea of running cars on maize and soybean derivatives it sounds to me like yet another form of taxpayer-funded welfare to large agribusiness corporates.

#### **4.1.8 Fad diets; fad policymaking (2007-01-15 12:08)**

The Director of Yale University's Center for Eating and Weight Disorders explains the miracle formula used by diet books to become bestsellers for over a century now: "easy, rapid weight loss; the opportunity to eat your favorite foods and some scientific 'breakthrough' that usually doesn't exist." As one weight loss expert notes, "Rapid water loss is the \$33-billion diet gimmick." [1] Source

Having recently become curious about the Atkins diet, I am struck by the parallels between diet and policy. Both of them are vital, but we choose them in the same utterly careless way.

First, there is the emphasis on one single narrow measurable indicator – one that is inappropriate, but highly visible. In the Atkins world, it's weight, rather than something more meaningful like overall health or life-span. In the world of policy it can be something like anthropogenic greenhouse gas emissions, rather than climate stability; or spending on police forces or education, rather than the crime rate or literacy rates.

Second, there is the *apparent* short-term success – often enough to ensure that the diet or policy sells well to a population with an ever-shorter attention span. Following the Atkins diet does bring about initial weight loss, but it's loss of water:

The rapid loss of initial water weight seen particularly on low carb diets has an additional sales benefit. By the time people gain back the weight, they may have already told all their friends to buy the book, and the cycle continues. This has been used to explain why low carb diets have been such "cash cows" for publishers over the last 140 years. [2] Source

Most policies have their equivalent of water loss; the short-term payoff from reacting to an immediate problem. But as with Atkins, there's very little scientific analysis of whether the regimen is successful *in the long term*.

[G]overnment bureaucracies non-self-evaluate. At a minimum, agencies with evaluative responsibilities are not invited to evaluate - they are kept out of the loop, their opinions unsought. At a maximum, government agencies actively suppress their own internal evaluative units and are discouraged from evaluating the beliefs and policies of other agencies. Steven van Evera, [3] *Why states believe foolish ideas*

Lastly there is the emphasis on presentation over substance. Millions of Atkins' books have been sold; the late Dr Atkins died a very wealthy man and the Atkins corporation was once estimated to be worth billions of dollars (*Fortune* 17 May 2004). Yet, as my source shows, the diet even in its own terms is a failure. It doesn't lead to long-term weight loss; as well it creates serious health risks, and has been recommended by no credible scientific body. Dr Atkins wrote no peer-reviewed articles; his books, it appears, cite only anecdotal evidence of the diet's success. But under the barrage of daily (mis)information that we all face, presentation is everything; substance nothing. As in the world of fad diets, so in policy. This from Monday's [UK] Times:

The [British] Government has been forced to admit that three years after promising to rebuild 3,500 secondary schools not a single project has been completed.

- 

#### **4.1.9 Migration: get rid of barriers to goods and services first (2007-01-17 11:43)**

I haven't yet read Philippe Legrain's book [1]*Immigrants: Your Country Needs Them*, but I have read this article (amongst others) on the subject: [2]*Don't believe this claptrap. Migrants are no threat to us*, in which Legrain says:

Just as EU trade barriers that prevent African farmers selling the fruits of their labour in Britain are unfair, so are immigration controls that stop Africans selling their labour here.

I agree 100 per cent with this comment. But I'd rather see the trade barriers come down first. Then let migrants decide to come to the west because they want to, not because they have no chance of prospering in their own country. We need and want willing migrants, not those compelled to come here because we stifle their country's development by corrupt, insane trade barriers like the EU's Common Agricultural Policy.

A related point, and one that I have not seen mentioned in other reviews, is the effects that emigrants from the third world have on the country from which they depart. Much of the discussion that there is centres on the financial remittances that flow back from the rich countries. But there are incalculable social costs that arise when a country's most ambitious, energetic and talented people would rather work in a foreign country than try to improve their country from within.

- 

Ronnie Horesh (2007-01-21 00:30:00)

Thanks Mike. You say "Gains from migration appear to be larger than those from liberalizing trade. Even if that weren't the case, I'd take either, or both. I don't control what becomes politically possible and when." Fine, but we are talking about what we'd ideally like to see.

I'm also not sure I agree with the narrow definition of "gains" that I *suspect* is being used by the research. It's quite likely, for instance, that migration [1]undermines the willingness of a host country to maintain a welfare state.

On your second point. I can't argue with the research, though I suspect (again) that emigration of a country's best and brightest, positive for that country at first, turns negative when the proportion leaving becomes very large. And again, there may be a conflict between narrow and broad definitions

of gains. Pacific Island countries who lose virtually all their ambitious people to Australia and New Zealand might be financially better off. But the gap in terms of governance between these island states and the west grows wider over time.

1. <http://www.media-diversity.org/downloaded%20articles/Goodhart%20%20Feb%2004.htm>

Ronnie Horesh (2007-01-23 10:31:00)

Thanks again Mike. I guess we'll have to agree to disagree on this. I'd still like to see totally free trade first, then let people move if they still feel they need to. I also should like more people to be consulted as to what their country's immigration policy should be. We are more than economic units, and even if the (financial) gains of free immigration are greater than the losses, that doesn't mean a majority of people (in the immigration-prone countries) would support it. The distribution of those gains is one thing; the other is that intangible; what we call 'society', or a feeling of community, of wanting to share values with (and pay taxes to support) people with whom you can identify.

#### **4.1.10 Five minutes to midnight (2007-01-18 10:37)**

Professor Stephen Hawking and I [1]agree that climate change and nuclear proliferation are probably the most urgent challenges that we face as humans. As Professor Hawking says:

We foresee great peril if governments and society do not take action now to render nuclear weapons obsolete and prevent further climate change.

It's correct, but tragically so, for Hawking to distinguish between government and society when talking about these challenges. The distance between the two, even in the democratic countries, is wide and getting wider. Governments, whether dictatorships or democracies, seem to be transfixed into inaction by these twin perils. Their overwhelming priority is to stay in power, *even if the people who comprise these governments are genuinely concerned about the long run wellbeing of the people they serve*. It is, unfortunately, institutional goals that drive policy that drives outcomes.

Social Policy Bonds reverse this approach, which we can no longer afford: the stakes are too high and the time lags between the perceived need for institutional reform and its payoff are far too long. Instead of waiting for decades, or resigning ourselves to oblivion, we could issue our own bonds targeting whatever social or environmental problem is of most concern. We don't have to second-guess the best ways of mitigating or preventing climate change, or of halting and reversing nuclear proliferation. All we have to do is specify exactly what we want to achieve in those areas, and raise sufficient funds to motivate investors to find their own adaptive, diverse solutions to these looming problems. This [2]link (pdf) gives some guidance to those thinking in issuing their own bonds, but I'd be happy personally to advise those seriously interested in doing so.

#### **4.1.12 Dealing with unknown unknowns: Social Policy Bonds (2007-01-20 13:27)**

One of the big advantages of Social Policy Bonds, in my view, is that they can target problems whose magnitude is uncertain. People have wildly different views about, for instance, climate change or the likelihood of nuclear conflict. (I have wildly different views myself depending mainly on the line taken by the most recent material I have read.) How can policymakers, confronted with luminaries on both sides of an argument about what might be a huge threat, like climate change, best respond?

Issuing Social Policy Bonds is one way in which they could let the market, rather than a handful of government employees, make the judgement. Take [1]Climate Stability Bonds: an enormous amount of valuable information about climate change and the direction in which the climate is moving could be gathered from the market value of the bonds, and from changes in their value. Assume Climate Stability Bonds are issued that would reward bondholders with \$10m once the targeted definition of climate stability had been reached. Then even the initial information garnered from their float value would be extremely useful. If the bonds sold for \$9m each that would mean the market considers climate change a less serious problem than if they sold for \$1m each.

Such information would be continuously available. It would respond to our expanding knowledge of the scientific knowledge and to the expected effectiveness or otherwise of actual and planned policies. Contrast that with the dead hand of Kyoto, where fossilised science and institutionalised cuts in greenhouse gas emissions will continue regardless of changes in the seriousness of the climate change problem.

Social Policy Bonds score heavily over Kyoto and other responses (or non-responses) to potentially serious challenges, because they give people incentives not only to find solutions to urgent problems, but *for finding out how urgent these problems actually are.*

-  
Policy as if outcomes mattered  
SocialGoals.com

#### **4.1.13 The institutional goal par excellence: self-perpetuation (2007-01-22 12:14)**

I'm not going to comment directly on the latest British Airways strike, or on the way it's being (mis)reported; (though [1]this is colourful: "British Airways workers are to strike for the right to take time off for a cold or ingrown toenail, without it counting as sick leave."). I'll just use it as an excuse to point out that all big institutions have one thing in common: their objectives are different from those of the people they are supposed to represent. Sometimes the two sets of goals are in conflict with each other. In this respect trade unions are no worse, or better, than religious bodies, government agencies, schools, universities or large corporations.

How can this be, and what are the consequences? With large institutions of any kind there is a disconnect between the attention that those lower down (ordinary people) can give to those higher up the hierarchy. Trust is not *always* misplaced, but in practice it works best within families, extended families, small communities and small organisations. Large organisations, including big government, tend to be remote organisations. And the consequences can be disastrous.

Large organisations have as their over-arching goal that of self-perpetuation. This can not only conflict with the goals of individual trade union members, churchgoers or taxpayers – those who fund the institution – but also with the individual goals of the people working in the organisation. Most senior politicians the world over, I am sure, would do anything to avoid a nuclear exchange or global environmental catastrophe – in their capacity as individuals. But how seriously are they confronting these challenges as politicians?

They may think they don't have the answers, but that should not stop them issuing Social Policy Bonds targeting [2]peace, or [3]environmental stability. Under a bond regime, politicians would contract out the achievement of social and environmental goals to the private sector.

If politicians targeted the outcomes that mean most to their citizens; well, that would be a change from their usual business of trying to maintain power, but it would have its own rewards and, - who knows? – might actually result in their staying in power anyway.

#### **4.1.14 Forget climate stability; let's pay people to do nothing instead (2007-01-23 11:05)**

From [1]the Economist (subscription)

In recent weeks, a rush of climate-change bills has started circulating in America's new Congress. ... A national cap on emissions of carbon-dioxide, the main greenhouse gas, looks closer than ever. ... Part of the approach is likely to be a carbon-trading system, which companies prefer because it is more flexible than a carbon tax. The basic idea is that power plants and manufacturers will be allowed to emit a certain number of tons of carbon dioxide. If they exceed that amount, they must buy "credits" from companies that pollute less than their allowance.

I find this quite disturbing. A whole new bureaucracy will be set up to allocate CO2 credits to thousands of emitters. What will this achieve? A cap on the levels of CO2 that they emit. That's all.

This ludicrous administrative exercise is not designed to, and will not, achieve: a net reduction in CO2 levels emitted by the US, still less a net reduction in anthropogenic greenhouse gas emissions emitted by the US, still less a net reduction in greenhouse gas emissions by humans on this planet, still less a reduction in the proportion of greenhouse gases in the atmosphere. And if anybody does care at all about the health of the planet, as against setting up an elegant but futile trading system, *it will not bring about climate stability, because it is not designed to do so.*

Anonymous (2007-02-10 02:37:00)  
Any comments on Branson's gesture?

<http://www.washingtonpost.com/wp-dyn/content/article/2007/02/09/AR2007020900693.html>

Ronnie Horesh (2007-02-10 09:31:00)

Hi, and thanks for your query. I am pleased that the Virgin Earth Challenge is **not** about reducing anthropogenic greenhouse gas emissions a la Kyoto, but aims to encourage the: "removal of anthropogenic, atmospheric greenhouse gases so as to contribute materially to the stability of Earth's climate". The prize is handsome, the objective is clearly stated and meaningful, so I think this is a worthwhile gesture.

#### **4.1.15 Saving lives by capital punishment? (2007-01-26 09:45)**

Nearly 30 convicted killers released from jail over the past 10 years have gone on to kill again, according to Home Office figures released yesterday. [1]Convicted murderers who were set free to kill, [London] 'Daily Telegraph', 26 January

Along with most of my generation I have an instinctive horror of capital punishment. I wonder though just how rational is that visceral feeling? The process is undoubtedly distasteful, but much of my own disquiet centres on the possibility of a government executing an innocent person. This probably would happen (and has happened) but, as the article cited attests, no less real are the innocent people killed by people who would probably have faced capital punishment if it were applied. If one of our high-priority goals then is to save innocent lives, perhaps there is a case for restoring capital punishment for convicted murderers?

#### **4.1.16 Centralisation versus diversity and dynamism (2007-01-26 12:11)**

Referring to the UK's central Government the current 'Economist' says:

When the government is searching for new ideas it always has to look abroad (usually to less centralised places such as America), since councils in Britain have little freedom to experiment with new ways of doing things. [1]Trust the locals (subscription?), 25 January

One of the advantages, as I see it, of a Social Policy Bond regime is that, while there would be uniformity of desired social outcome, there need be no uniformity of approach. For most social and environmental problems, a mosaic of different, dynamic projects and initiatives will work best. There needs to be the freedom to experiment with new ideas, and for those ideas that fail to be terminated. It's also a matter of incentives: when government stipulates one approach, there is every incentive to follow it and to keep it going even when its failures are obvious. Too many interests become vested in its perpetuation - not least those of the programme administrators.

#### **4.1.17 Lessons from the gym (2007-01-28 13:11)**

If we're not careful we become obsessive about a single particular quantifiable measure - to the exclusion of things that really matter but that are less quantifiable. It could be the exchange rate for foreign currency, our weight, or the number of kilos we can bench press.

The effects can be pernicious: witness the large numbers of adolescents with eating disorders, or the athletes who [1]sacrifice their health to win.

Does this happen for the same reason that our minds are, by default, not in the here-and-now but are apparently [2]set to daydream? Perhaps our education is so totally verbal that we cannot handle the complexity of the present, but not being able to switch off, we focus on something simple, measurable that we can do something about.

Well, enough speculation about the why. The fact is, as individuals we do have this tendency, though it can be, thankfully, checked by our intuition, intelligence and insight.

I'm not so sure, though, about when that same focus on a single indicator bedevils the policymaking process. Government agencies, for instance, that focus on narrow numerical targets often miss seeing the wood for the trees. At the national level, the consequences can be dire. Generally there is no systematic use of indicators that reliably correlate with social wellbeing. But what fills the vacuum? Anecdotes, image, spin and inertia. Combined with the non-explicit targeting of, most usually, Gross Domestic Product, or GDP per capita – which is [3]terrible as an indicator of social welfare.

As I see it, there are two remedies.

- Downsize the policymaking remit. By which I mean, devolve policymaking as far as possible to a level at which normal people can tell what's going on without depending exclusively on quantifiable indicators. Or:
- Choose *broad* social and environmental indicators, that correlate accurately with social and environmental wellbeing; as against the Mickey Mouse micro-targets that characterise current policymaking. That is the principle underlying Social Policy Bonds, which apart from being more efficient at raising welfare than the current setup, would focus on outcomes. Which means that ordinary people could participate in defining them; an end in itself as well as bringing about more buy-in into social affairs.

[4]Jonathan Rowe puts our predicament well:

*The Atlantic* this month cites a recent study by economists that purports to show that the suburbs actually are bastions of social cohesion, based on membership in civic groups. It is a classic case of confusing available data with reality.

#### **4.1.18 Trust the locals (2007-01-30 12:38)**

The current 'Economist', in an article entitled [1]Trust the Locals (subscription), talks about the usual British response to being diagnosed as ill-governed: an 'endless cycle of restructuring followed by disappointment followed by more restructuring.' The journal proposes an alternative: 'the centre could be forced to do less and local government trusted a little more.'

I agree. Social problems, when reduced to single quantifiable indicators, such as 'unemployment', 'crime', or 'illiteracy' might have the illusion of being uniform across a country. The tendency, especially for remote policymakers, is to dream up solutions that are similarly monolithic. So the usual response is the bureaucratic one: something imposed from the top down, on a one-size-fits-all basis. Something cumbersome and unresponsive to events, and incapable of adapting to wildly varying circumstances across a diverse country. One result is that, in Britain, as the 'Economist' says:

[W]hen the government is searching for new ideas it always has to look abroad (usually to less centralised places such as America), since councils in Britain have little freedom to experiment with new ways of doing things.

I'd like to see Social Policy Bonds issued, because they would bring about still more devolution: from the public to the private sector. My reasons are not inspired by blind ideology, but because enlarging *and motivating* the pool of people interested in solving social problems would make their solution both more likely and more cost-effective. The benefits of this sort of contracting out would, I think, be incalculable.

## 4.2 February

### 4.2.1 The measurement tail wags the policy dog: family violence in New Zealand (2007-02-01 11:53)

A disturbing story from the BBC about [1]family violence in New Zealand:

The perception that New Zealand has one of the worst rates of domestic violence in the developed world is now common. But violence within families is by nature hard to quantify, and Mike Doolan, former Chief Social Worker and currently a researcher at Canterbury University [Christchurch, New Zealand], said the claim is "impossible to prove". New Zealand falls into a group of developed countries with "moderate to moderately-high" child homicide rates, he said. But international systems for recording other types of abuse vary, comparisons are unreliable and New Zealand may simply be better at monitoring the problem than other nations.

For me there are two main policy issues, both of which point to the need for some humility amongst policymakers. First, the difficulty of quantifying the size of the problem, alluded to in the excerpt above. Second, the question of what any government can or should do to address family violence.

The two are linked. Government routinely amasses a plethora of economic statistics, partly because it's easier to do so; partly because they can all be reduced to dollars and so compared readily with each other. The availability of financial data tends to make them a high priority for policymakers, whether explicitly or not. And the casualties of that sort of bias tend to be those things that cannot be easily monetised: including the physical environment and the social environment.

I offer no simple solutions to those problems, except to say that, under a Social Policy Bond regime, ordinary people would have more say over the outcomes they want to see targeted. If massive cuts in family violence became a policy priority, then the measurement problems referred to would become far less daunting. People would be motivated to solve them, and in doing that they would make the actual policy goal more feasible.

#### 4.2.3 Ideology trumps educational standards (2007-02-02 13:15)

The current 'Economist' in its survey of Britain (subscription):

But a passionate ideological debate about selection in English education (Scotland, Wales and Northern Ireland have their own systems) has got in the way. Politicians have been so intent either to defend or to oppose selection by academic ability that they have failed to set up a system of rigorous and useful qualifications for those whose interests are not academic. Standards have suffered in the name of inclusion, and vocational training has been chaotic. Meanwhile the great divide between public and private education has remained as important as ever. [1] *Clever Stuff*

, 'Economist', 1 February .

This is what happens when ideology drives policy. The policymakers and their hangers-on - well-intentioned, no doubt, and smart, certainly - lose sight of their original goal. They assume that they know best how to achieve their desired outcome. Eliminating selection was the supposed means to their end of equal opportunity for all, in the context of the English educational system. One outcome has been that grammar schools became fee-paying, and divisions widened. The ideologues didn't achieve their stated goal, but that was probably supplanted in their minds by the outcomes they did achieve: they strengthened their identity, reinforced their ideology, and bonded more closely with people who felt the same way. Oh, and the pupils suffering from their muddle-headed idealism? Who cares...who really cares?

#### 4.2.4 For pity's sake, target poverty outcomes (2007-02-04 10:14)

From an interesting and controversial essay in 'Sp!ked':

In re-describing poverty as 'vulnerability to climate change', the result appears to be a rejection of aspirations to modernise agriculture. Instead, there is the opposite emphasis: the design of plans that reinforce the social and economic marginalisation of many African people. Rather than development being safeguarded by the modernisation and transformation of African society, underdevelopment is subsidised through the provision of social support for subsistence farming and nomadic pastoralism. ...

The 'adaptation agenda' allows Western governments, international institutions and international NGOs to claim they are doing something positive to address the impact of global warming but the consequences for Africa could be disastrous. 'Learning from the poor', 'empowering the poor' and strategies to increase their 'resilience', end up patronising Africa's poor and supporting an anti-development agenda that would consign Africa to a future of poverty - and climate dependency. [1] *Forcing Africans to 'adapt' to poverty*

, Prof. David Chandler, 1 February

I have no expertise in development economics, but this argument, and others like it, seem to me to cry out in favour of the outcomes-based approach that I do advocate. Thousands of learned books and papers discuss the reasons for poverty in the poor countries. One decade it's institutions or governance that is seen as the problem; the next it's colonial history, or [2]evolutionary psychology. The assumption seems to be that once we locate the cause of poverty, we can set about tackling it. But who is trying to identify that cause? Essentially the professional priesthood of policymakers: government employees, academics and ideologically committed think-tankers. Many of them are well-intentioned, no doubt, and there are legions of heroes around the world, working for charities who eschew the theory and are actually trying to eradicate poverty. They are not helped, in my view, by the policy people, pre-occupied as they are with finding theories that validate their prejudices.

Here's my idea. Subordinate all approaches to the desired outcome: the eradication of poverty. Contract out the solution to the market. Then a larger group of *motivated* people will actually go about reducing poverty *without prejudice as to what causes it*. They may spend time trying to find the causes but under a Social Policy Bond regime they would do so only if that were to maximise the reduction in poverty per dollar spent in reducing it. Otherwise they will leave the identification of causes to the theoreticians and ideologues - where it belongs, along with their endless, futile, debates.

#### 4.2.5 Corporate welfare for casino operators (2007-02-05 13:54)

Thank you [1]Oligopoly Watch for highlighting [2]this story:

A few years after New Jersey legalized gambling and allowed casinos to open in Atlantic City in 1977, the state mandated that a portion of revenues to be set aside to improve "blighted areas," especially in run-down Atlantic City, a noble aim.

But according to a New York Times story ("Atlantic City Casinos Reap Anti-Blight Fund" 1/28/2007), over the past decade the moneys have been diverted to quite unintended target - the casinos themselves. According to the story, over \$400 million out of a total of \$1.8 billion since it was started) has been diverted from the state-run Casino Reinvestment Development Authority to projects that should have been paid for by the casinos themselves.

The pattern is a familiar one: government and large corporations engaging in mutual back-scratching at the expense of the social and physical environment. The corporations, grown rich on taxpayer-funded subsidies, can afford the very lobbying that perpetuates their subsidies. It's a vicious circle. When I talk about Social Policy Bonds I usually emphasise their efficiency. But they have another great advantage: transparency. Expressing policy in terms of targeted outcomes does mean that ordinary people can follow what's going on. Under a bond regime we might even choose to subsidise casinos or other large and wealthy corporations - but at least we'd be doing so with our eyes open. Under the current regime, there are legions of lawyers, politicians and bureaucrats who have every interest in obscuring the truth. As Ologopoly Watch continues:

Getting the tax dollars you pay in to be given right back in the form of subsidies is a great deal for the big companies. The ability to threaten to move, to play off one state against another, leads to tax breaks for companies that hardly need the money, while big social needs are unmet. Further more in this case, the casinos are directly responsible for some of the poverty and misery (drugs, prostitution, bankruptcy) that later cost the state in terms of law enforcement, hospitalization, and/or incarcerations.

#### 4.2.6 Global Subsidies Initiative (2007-02-07 11:44)

I've added a link to the [1]Global Subsidies Initiative in the blogroll (right-hand sidebar). As New Zealand taxpayer, I'm pleased that core funding for the GSI is provided by the Government of New Zealand – as well as the Swedish and Dutch Governments.

“In December 2005 the GSI was launched to put a spotlight on subsidies—transfers of public money to private interests—and how they undermine efforts to put the world economy on a path toward sustainable development. Subsidies are powerful instruments. They can play a legitimate role in securing public goods that would otherwise remain beyond reach. But they can also be easily subverted. The interests of lobbyists and the electoral ambitions of office-holders can hijack public policy. Therefore, the GSI starts from the premise that full transparency and public accountability for the stated aims of public expenditure must be the cornerstones of any subsidy program. But the case for scrutiny goes further.” [2]Read on...

#### 4.2.7 Subsidies for the rich in Chicago (2007-02-07 14:42)

Looking at the distribution of subsidies to state-granted economic development subsidies to the Chicago region, [1]Good Jobs First found, amongst other things, that:

[T]he ability of core-area workers to take advantage of the new employment opportunities in the collar counties is limited by the fact that the vast majority of subsidized workplaces in the newly developing suburban areas are not easily accessible by public transportation from the city. This means that for the many car-less workers in low-income, especially minority, communities, those jobs are effectively out of reach. [2]Gold Collar (pdf)

The '[3]collar counties' are more prosperous than Cook County, which forms central Chicago. This sort of thing is one reason why I much prefer the targeting of outcomes when it comes to spending taxpayer funds. If its goal is the economic development of poor areas, then that is what a government should explicitly target. Funds should be contingent on meeting that goal. It's just not good enough instead to set up institutions that have that goal as their stated objective. That's where a Social Policy Bond regime scores heavily over the current system: it rewards people only when targeted goals have been achieved. Government goals and those of investors in the bonds are congruent. Bondholders gain most when they achieve social and environmental goals, as articulated by government, most quickly and efficiently.

The contrast with the current system is stark. The story told in 'Gold Collar' applies to colossal quantities of government revenues, all over the world. It's one of waste, inefficiency, environmental destruction and corruption.

#### **4.2.8 Call of the private sector (2007-02-09 12:39)**

Paco Underhill's [1]*Call of the Mall* is an easy, entertaining description of America's shopping malls. What strikes me most is the quality and quantity of human ingenuity devoted to making shoppers buy more stuff. Why is it that it's the talented people in the private sector that reap massive rewards for achieving tasks that are essentially trivial? Why is that the public sector limps along attracting some dedicated, well-intentioned people, but failing to offer incentives to most of those who'd rather solve urgent social and environmental problems than head up the strategic planning unit of a single department store?

My contention is not only that such an asymmetry is wasteful, in that fewer resources are devoted to the tasks that would generate most payback, but that it's also a historical accident. There's no other reason for it.

Market forces have a terrible press, and in many instances, rightly so. There's been no restraint from those at the top of the private sector pyramid, with their grotesquely inflated 'compensation packages'. But the market's efficiencies and incentives can be made to serve social goals - if only we were to consider them with an open mind.

Social Policy Bonds are one way in which market forces can be channelled into the public good. They would reward people who achieve social and environmental goals at least cost to the public. These people might reap sumptuous rewards for so doing, but that's no reason to deny them their chance. In giving bondholders and their agents an opportunity to make large gains, a Social Policy Bond regime would both motivate those already working to achieve social goals, and attract a larger number of talented individuals into serving the public interest (as well as their own) rather than those of large corporations - like shopping mall operators.

#### **4.2.9 Eat food. Not too much. Mostly plants. (2007-02-10 11:29)**

From [1]Unhappy Meals, by Michael Pollan:

"The problem with nutrient-by-nutrient nutrition science," points out Marion Nestle, the New York University nutritionist, "is that it takes the nutrient out of the context of food, the food out of the context of diet and the diet out of the context of lifestyle." If nutritional scientists know this, why do they do it anyway? Because a nutrient bias is built into the way science is done: scientists need individual variables they can isolate. Yet even the simplest food is a hopelessly complex thing to study, a virtual wilderness of chemical compounds, many of which exist in complex and dynamic relation to one another, and all of which together are in the process of changing from one state to another. So if you're a nutritional scientist, you do the only thing you can do, given the tools at your disposal: break the thing down into its component parts and study those one by one, even if that means ignoring complex interactions and contexts, as well as the fact that the whole may be more than, or just different from, the sum of its parts. This is what we mean by reductionist science. 'New York Times', 28 January

Applying the same reductionism to policymaking can be just as problematic. The linkages between cause and effect in our increasingly complex world are ever more obscure. The number of variables, the interactions between them, and the time lags combine in such a way that successful policymaking is about as hit-and-miss as nutritional science. Mr Pollan ends his article with a list of ten recommendations for healthy eating. He begins it by simplifying those to just three: *Eat food. Not too much. Mostly plants.* Are there equivalent short but pithy maxims for policymakers? I believe so: *Target outcomes. Make sure the outcomes are transparent, and meaningful to real people. Don't be frightened of using markets.*

#### **4.2.10 As a last resort, try incentives (2007-02-10 14:08)**

From [1]Manchester Online:

Hospitals are to be given cash bonuses - for keeping people alive. Regional health bosses are planning to try out a US system of rewarding trusts [that] have low death rates, levels of infection and readmissions.

I haven't seen the details. It could be a step in the right direction; or, depending on the targets chosen, it could worsen matters, as has happened with the Mickey Mouse micro-targets used throughout the UK's National Health Service. (See [2]this blog, passim.) Expect opposition to any meaningful reform from the British trade unions.

#### 4.2.11 'You might as well smoke' (2007-02-12 14:26)

Compared to smoking cigarettes, use of Western smokeless tobacco (ST) products is associated with a very small risk of life-threatening disease .... This means that smokers can realize substantial health benefits by switching to ST, an obvious substitute. But consumers and policy makers have little chance of learning that ST is much less dangerous than smoking because popular information provided by experts and advocates overstates the health risks from ST relative to cigarettes. [1]Source

Carl Phillips and the other authors of *You might as well smoke; the misleading and harmful public message about smokeless tobacco* refer mainly to US health sources, including federally funded bodies. They do a thorough job of showing the biased information against smokeless tobacco but, understandably, they do not attempt to explain *why* it's biased. I think it's worth speculating on the reasons, because they apply to other policy areas, and I am thinking here of such varied, crucial issues such as broader health concerns, climate change, the use of market forces, and education.

In trying to promulgate the Social Policy Bond idea I frequently encounter opposition to the deployment of market forces to achieve social goals. In essence, my opponents are less interested in outcomes than in the motivations of people working to achieve these outcomes. Or perhaps they are trying to identify themselves as more compassionate or caring than the 'private sector' taken as a whole. I hasten to add that there are 'pro-market' people who oppose Social Policy Bonds for the opposite reason: that there's no need for government intervention of any kind to help achieve social or environmental objectives. For both groups, outcomes are deemed less important than ideology or process.

It's the same in other policy areas. Most of us aren't climate experts, and the arguments about climate change are now so politicized now that people will make their minds up based such irrelevant concerns as the stridency or smugness of one faction or another. The chances of getting coherent *effective* global action against climate change is in my view negligible. When our leaders choose make policy, the effect of that policy on the climate outcome comes very low on the list of the things they worry about.

There is an answer. A diverse society, with all sorts of information sources, will never agree about much, even if it could forget its ideological biases or prejudices. But if we target meaningful outcomes, and let the market decide how to achieve those outcomes, and how much achieving these outcomes will cost, then there is a chance of a coherent approach. That's why I advocate Social Policy Bonds. Under a Social Policy Bond regime, if an outcome such as climate stability is deemed worthwhile, then it will be the market that decides exactly

how many resources should be devoted to achieving it. Markets in Social Policy Bonds would be valuable not only because they allocate resources efficiently, but because of the enormous quantity of information they would generate about the cost of achieving targeted goals.

#### **4.2.12 Politics as priesthood (2007-02-15 11:45)**

Excerpts from [1]India, by Shashi Tharoor:

In modern India ...intellectuals remained aloof from the quotidian concerns of governmental policy.... Intellectuals were a deprived breed, shorn of that which made their elitist forebears respected - influence over the wielders of power. The spread of education had ended the Brahminical monopoly on intellectualism, but learning was now a means to an end, and the end that mattered was power. Anyone could be an intellectual, but only a few could exercise real authority. ...

Despite the prolific punditry, the only 'abstract' thinkers' whom [Indian] politicians bothered to consult were their astrologers.

I read this on the same day that a [2]UNICEF report was released showing that New Zealand's children and teenagers are more likely to die before their 19th birthday than those from any other developed country. Wellington's a small town but even here I think I detect not so much a disconnect between intellectuals and policymakers, but disconnects between (1) intellectuals and the people and (2) policymakers and the people. And learning does appear to be a means to certain ends; the ends becoming more and more about private goals, and less and less about benefiting wider society.

This is all subjective of course, but if true, what does it amount to? I think it does matter, because the specialisation of labour that works well in purely economic terms does not work when policymaking becomes a priesthood, removed from the concerns of ordinary people.

A few years ago New Zealand's Government [3]declared its economic objective: to return New Zealand's per capita income to the top half of the OECD and to maintain that standing. It's a concern to me that GDP per capita is put on such a pedestal. Its flaws as a measure of social wellbeing are [4]large and well known. A big national income can might be necessary to achieve certain ends, but it is not sufficient. Or perhaps the New Zealand Government's goals do not include the welfare of children. In this sense, our political class might be just as removed from those of ordinary people as India's. Then again, the UNICEF Report is [5]not entirely to be trusted.

#### **4.2.13 Entrenching welfare (2007-02-18 10:14)**

One in three households across Britain is now dependent on the state for at least half its income, it emerged today. Official government figures showed that more than seven million households are getting most of their income from government handouts. [1]Source

Sure government is generally inefficient and ineffective, but so are large corporations and almost any large organisation of any sort. And it's probably not healthy that so many households do depend on the welfare state for so much of their income. But worse in my view is that such dependence becomes entrenched. It is, in fact, dependence. Like a drug habit, welfare programmes are easy to start and very difficult to end. And I don't mean just the benefits that go to needy households, but also those far more sumptuous welfare payments - also known as subsidies, or import barriers - that flow into the coffers of large business corporates. It's very rare that their provisions contain effective sunset clauses. The payments help fund the lobbyists that oppose their removal. Other beneficiaries are the programme administrators: another effective resistance force against policy reform.

#### **4.2.14 Subsidising planetary destruction (2007-02-19 10:59)**

What does our political system do when an industry is systematically destroying its own resource base? Subsidise it of course. This is lunacy:

Most of the high seas catch from deeper waters is carried out by bottom trawling which involves dragging massive nets along the sea bed - a practice which can destroy deep-sea corals and sponge beds that have taken centuries or millennia to grow. [1]Source

This practice, environmentally disastrous as it is, is profitable only because of subsidies; half of which are fuel subsidies. From the same article:

“The unregulated catches by these roving bandits are utterly unsustainable. With globalised markets, the economic drivers of over-fishing are physically removed and so fishermen have no stake in the natural systems they affect. While it may be a good short-term business practice to fish out stocks and move on, we now see global declines of targeted species.”

The major villains in this particular madness are South Korea, Japan and Russia, but most rich countries continue to subsidise insanely destructive practices in agriculture, transport and energy.

#### **4.2.15 Centralized shop window policy (2007-02-20 11:43)**

Writing about the increasing uniformity of shop window displays in the US, Paco Underhill [1]writes:

[Owing] to the structure of retail chains, window displays are designed by specialists and contained in loose-leaf binders stored in a central office somewhere, intended to work equally well in every setting, meaning they don't work particularly well in any setting.

There's a striking similarity here with government; another large organisation trying to control everything from one centre. The consequences of failure though are more serious than a few lost sales when government is involved. They can be seen in schools that fail to educate, soaring crime rates, and worsening environmental problems. There is an extreme aversion to adaptive, diverse policies. Schools aren't allowed to fail; crime is seen as a problem solely of punishment and prisons; climate change must be tackled almost exclusively by reducing anthropogenic greenhouse gas emissions.

Life would be quite different under a Social Policy Bond regime. Yes, there would be uniformity – but of targeted outcomes, rather than the ways to achieve them. It would be up to the private sector to explore and implement the most cost-effective programmes. Investors in Social Policy Bonds would have built-in incentives to be efficient. Until then, though, social and environmental policy will suffer from being overly centralized, and as unappealing as an 'average' shop window display. Mr Underhill concluding his chapter on shop windows might

as well be writing about government policymaking:

There still are window dressers here and there – in Manhattan you’ll find them in the best stores, and everywhere else in America you’ll find them in the smallest ones. But in between those extremes, windows are now dressed long distance. They’re one-size-fits-all.

#### **4.2.17 The rise of therapeutic politics (2007-02-23 12:56)**

When looking at policymaking bodies, what is particularly striking is how unimportant outcomes are in determining both how policy is made, and who makes it.

...policies are often adopted on the basis of less careful analysis than their importance warrants, leaving wide room for mistakes and misperceptions. Forces of knowledge destruction are often stronger than those favoring knowledge creation. Hence states have an inherent tendency toward primitive thought, and the conduct of public affairs is often polluted by myth, misinformation, and flimsy analysis. Why states believe foolish ideas: non-self-evaluation by states and societies, Stephen Van Evera, MIT Political Science Department and Securities Studies Program, 10 January 2002, version 3.5.

In our complex economies, outcomes can be difficult to trace accurately to the events and people that generated them. Our extreme specialisation increases the length of the chain between producers and consumers and the time lags between cause and effect. Moreover, it increases people's alienation from each other, particularly between policymakers and stakeholders. The result is that appearances, personalities, and emotional appeal assume a great importance.

Therapeutic politics eschews matters of policy and principle and attempts to establish a point of contact in the domain of the emotion with an otherwise estranged electorate. .... The shift in rhetoric from standing up for what is 'right' to upholding what one feels good about signifies the incorporation of emotionalism into the heart of political decision-making. Therapy culture, Frank Furedi, Routledge, 2004 (Chapter 3, pp 60-61).

#### **4.2.18 Buy-in (2007-02-24 13:38)**

In my efforts to promulgate Social Policy Bonds I've usually emphasised their efficiency, which arises from a number of sources, including their harnessing of market forces, and their diversity and capacity to adapt to changing circumstances. I've also stressed their transparency: because the bonds target outcomes, people understand them more.

This, in turn, means another hugely important benefit: buy-in. If people understand what a policy is all about, they can participate more in its development, refinement and implementation. A Social Policy Bond regime would express its goals as outcomes that are meaningful to real people. Such outcomes would be more comprehensible to more people than the current unstated or unconsidered, vague, or platitudinous goals that characterise current policymaking. Discussion about outcomes, rather than the alleged means of achieving them, would be more accessible. If people have the chance of participating in such discussion, they will understand the limitations and trade-offs that are intrinsic to public policymaking. This means quite a few things, but to my mind the most important is buy-in: the reconnection of citizens with their policymakers; the sharing of responsibility and concern for policy initiatives.

This matters hugely when government has to rein in activities to which we have become accustomed, in the face of new threats. I am thinking of climate change specifically, where we need a coherent response to an unforeseen but urgent challenge. Of course buy-in would be desirable in other areas too. The current system discourages buy-in, partly because our societies are so complex, that virtually any effect - good or bad - can be plausibly traced

back to virtually any cause. And partly because political debate, centred as it is on arcane legal argument or stultifying discussion of institutional funding or structures, contributes so much to the widening gap between politicians and the people they are supposed to represent. Social Policy Bonds, because of their focus on outcomes, would help close that gap.

#### **4.2.19 Environmental stunts: do they help? (2007-02-26 14:06)**

Sometimes I wonder whether the environmental movement is so much posturing; an exercise in belonging, rather than an expression of concern for the environment.

Demonstrating against coal-fired power, nine Greenpeace protesters scaled a 150 metre high chimney stack at Huntly Power Station, in New Zealand's North Island yesterday. It appears the protestors did some minor damage to the stack.

I wonder what they are trying to prove with these puerile, illegal stunts. Their cause may be good, but their actions will do a lot to alienate much of the public from the entire environmental agenda - well, that's what I think. As the spokesman for the power company puts it:

There are 1.3 million people who get their power from this station in the upper North Island and if we cut this station off now there would be a lot of people who [will be] cold and in the dark this winter. [1]Source

It's all part of the politicization of the environment. We need to recognize that we are *all* beneficiaries of the damage that power plants and much other infrastructure do to the environment. We are all in this together. Sure, the protestors probably do have a smaller environmental 'footprint' than most of the rest of us. But they need us on their side if we are to improve environmental outcomes - as against the media profile of Greenpeace. Stunts like smack of sanctimony and smugness. They don't help.

Anonymous (2007-03-03 21:53:00)  
Hi Ronnie,

Over the last decades Greenpeace and other groups have raised a lot of awareness about environmental problems with their non-violent protests. I am not sure about the New Zealand public, but in Europe this is certainly the case.

A lot of environmentally destructive practices are used because the wider public is either not aware of

them or not aware of how damaging they are, as I am sure is the case with the Huntly power station. What alienates the people is the spin from the power company "if we cut this station off \_now\_", etc. Well, nobody demands the station to be shut off now. That's not what this protest action was about. Also I am suspicious of Genesis' claim that 1.3 million people (about a third of the total population) get their power of this one 1000MW station such that they depend on it to keep warm. I could not find figures to back this suspicion - or prove it wrong, other than the fact that Genesis Power generates about 14 % of New Zealand's power. Anyway, I think that "environmental stunts" are an important part of what groups like Greenpeace have done and still do.

Regards,  
Frank

Ronnie Horesh (2007-03-04 08:19:00)

Hi Frank and thanks for your comment. I share your suspicions about the self-serving claims of the power company. But I still think that actions such as this Greenpeace protest do much to alienate people from environmental concerns. Of course, my view is subjective and anecdotal. I have a couple of close friends who are socially aware and contribute a lot of time and energy to good causes, and who are quite repelled by stunts like this particular one, which are in their view unnecessary and provocative. In New Zealand we are lucky in that there are many ways of protesting and raising awareness that are perfectly legal. We have Green Members of Parliament. There are legitimate channels of protest that will not alienate anybody, and I am sure that the environmental movement - most of it - uses them - most of the time. In these fortunate circumstances illegal and destructive stunts, in my view, are unnecessarily provocative. They make it easier for most of us, who don't particularly want to change or to pay higher prices for power, to dismiss green concerns as those of a lunatic fringe. They smack of smugness and self-indulgence. They are an 'us versus them' statement and 'we' are the good guys. Well, that is how it looks to those of us who aren't involved and are now less likely to become so. In my view again, they are driven by the internal dynamic of the organisations involved, rather than wider environmental concerns. I almost wonder whether such stunts are sponsored by the power companies themselves, who can now depict themselves as victims and who are surely their largest beneficiaries. I just wish the media discussion were framed in terms of environmental outcomes and goals, rather than the antics of a few people at the margin and the reaction they provoke.

Perhaps we shall have to agree to disagree on this one, as we are mainly talking about attitudes and subjective matters, though I do think that in a genuinely democratic country, like New Zealand, protesting illegally and aggressively for any reason is a loss to us all. Whether it blights the prospects for the environment (my view) or not is more debatable and I thank you for your contribution to the debate.

#### **4.2.20 We're in this together (2007-02-28 11:37)**

Al Gore's mansion, located in the posh Belle Meade area of Nashville, consumes more electricity every month than the average American household uses in an entire year, according to the Nashville Electric Service. [1]Source

An informed discussion [2]here looks more closely at some of the details: Mr Gore buys carbon offsets, the number of people in his household is (probably) larger than average, *but* the costs of the offsets are tax deductible, and policymakers are couching the problem

of anthropogenic climate change 'in moral terms and by their own standard acting highly immorally.' And then, what is Mr Gore supposed to do? 'apparently the only way for him not to be a hypocrite is to move into a cave'. All these points are interesting, and seem quite valid to me. But they don't really address the issue: for whatever reason, we are all in this together.

It's easy to forget this, because we have left it all to government, and that has come up with a one-size-fits-all, top down, imposed pseudo-solution – Kyoto – with high up-front costs, and very little in the way of benefits. Most people, with justification, instinctively resent this sort of policy.

We desperately need people to buy in to solving the climate change problem. Kyoto doesn't do this. Kyoto has become politicized; so much so that anybody who questions it is assumed to be an environmental vandal. (This itself is indicative of Kyoto's limitations: people who are secure in their beliefs don't feel threatened when those beliefs are questioned.)

It is for all these reasons that I believe [3]Climate Stability Bonds would be an improvement over Kyoto. Climate Stability Bonds would be backed by the world's governments. They would be redeemable once a specified climate stability goal had been achieved and sustained. They would be freely tradable and their value would rise or fall as the targeted goal become more or less likely to be achieved. The goal could be specified as a combination of climate and other indicators. The bonds would not prejudge the best ways of achieving their goal. They would reward the achievement of climate stability, *however it is achieved*. Investors in the bonds would have incentives to respond quickly and appropriately to new knowledge about what is causing climate change and to new ways of dealing with it. Governments would be the ultimate source of finance for achieving climate stability, but the private sector would allocate society's scarce resources.

A Climate Stability Bond regime would express its aims in terms that people can understand. Its explicit goal would be climate stability. If people understand what a policy is all about, they can participate more in its development, refinement and implementation. This matters hugely when, as with climate change, we might have to rein in activities to which we have become accustomed.

## 4.3 March

### 4.3.1 Crazy (2007-03-02 10:24)

From the current issue of [1]The Ecologist:

A report from the European Environment Agency, to be released next week, highlights the role subsidies play in choices of transport. The report found €270bn-€290bn is spent annually in Europe in transport subsidies. Almost half goes to road transport, which the EEA said was "one of the least environmentally friendly" transport modes. Disentangling the web of transport subsidies is complex, and the EEA will next month release a study showing in more detail how taxpayers fund road transport systems.

It's perhaps a heroic assumption, but I do think that if there were transparency about where taxpayer and consumer funds go, I don't believe we'd be quite so keen to subsidise the destruction of our planet. Or that we'd want to transfer funds from the poor to the rich, which is what most transport subsidies do, along with most other [2]perverse subsidies - also known as [3]environmentally harmful subsidies. It's why I advocate, outcome-based policy, even if the full Social Policy Bond regimen is a bit too radical for today. We can't do a great deal about the complexity of our economies or society, and that is what allows these ludicrous, corrupt subsidies to persist, but we can try to subordinate policy to transparent, meaningful, outcomes. Our failure to do this is not only environmentally irresponsible, fiscally wasteful, and socially inequitable: it also widens the gap between policymakers and the people they are supposed to represent.

As Norman Myers [4]says: For every \$1 going into solar power or wind power, there are \$15 of government subsidy going into fossil fuels, which is crazy.

### 4.3.3 Don't lose sight of societal goals (2007-03-05 09:30)

Reviewing *The River of Lost Footsteps: Histories of Burma* by Thant Myint-U the current [1]*Economist* (subscription) says

There is much in [his] argument; and it is easy to share the exasperation he seems to feel with some exiled lobbyists. Some have so lost sight of the ends in pursuing the means that each new government sanction or consumer-boycott-induced withdrawal of a foreign investor is celebrated as a triumph in itself.

This confusion between means and ends is rife in the world today. Instead of societal goals, aspirations and values, ever more of our lives is determined by institutional goals, especially those of the larger organisations including government and its myriad agencies. It is all totally understandable, and quite rational given the incentives under which we currently operate. But it is also quite at odds with our broader purposes as a society. The exiled Burmese about whom Thant Myint-U writes would probably rationalise their support of a boycott of Burmese-made products as a way of further isolating the Burmese junta, and presumably hastening its end. This is questionable, but what is not up for debate is that the quality of life of the average Burmese suffers. As [2]Thant Myint-U puts it:

[I]magine for a moment that somehow, miraculously, extremely tight sanctions were possible – involving China, India and Thailand – and that these brought the government to its knees, without a dollar or renminbi left to pay for vital imports. While there is a possibility that reasonable heads would prevail, there is also a very good chance that the army leadership would stay in their *Führerbunker* until the bitter end, as the country collapsed into anarchy around them. Many of those who support sanctions hope that greater outside pressure would lead to disagreements within the army. Nothing could be more dangerous: the country could easily fall apart into dozens of competing military factions, insurgent armies and drug warlord militias. If that happened, all the troops in Iraq and Afghanistan wouldn't be enough to put Burma back together; it would be a disaster for Asia.

But then what are well-meaning supporters of the Burmese to do? In my view, they should define exactly what they want to achieve: presumably an end to the military dictatorship and some increase in the broadly-defined quality of life of the poorest and average Burmese. Then they could contract out the achievement of their targeted objective to whoever is best-placed to do the necessary work, perhaps by issuing 'Burma Democracy Bonds', on the Social Policy Bond principle. It would be up to the investors in these bonds to achieve this goal as efficiently as possible. They might try to achieve the goal in ways that a group of high-minded exiles cannot: they could bribe the most pliable of the current junta with one-way first-class tickets to the golfing resort of their choice for an indefinitely long holiday. They could finance the operation of a credible government-in-exile, with attendant media coverage. Whatever their course of action, it would never lose sight of its actual aims, because that would mean less financial reward for the investors. I realize that this sounds far-fetched, but the alternative has been tried for a long time, and it isn't working.

Burma is just one example. There are others, where the aims as expressed through actions of certain spokespeople - perhaps more cynical and less high-minded - are completely at odds with those of the people they are supposed to represent. The Palestinians spring to mind most readily, but such hijacking of the societal good by those who think or say they know how best to achieve it is unfortunately a common, and seemingly inevitable, aspect of current politics. I have blogged [3]below, about environmental organisations and how, in my view anyway, the naive actions of some of their membership are more likely to repel than attract potential supporters and so reduce the chances of actually helping bring about the environmental goals they say they wish to achieve. Especially in politics and the environment, we find that institutions - sometimes unconsciously, I am sure - come to see their own goals as more important than those of society.

My suggestion is that we try subordinating all our actions to agreed, explicit, transparent and meaningful outcomes. Contract out the achievement of our social and environmental goals to the private sector, without prejudice as to *how* they shall be achieved. Given the complexity of our society, with its distractions, its profusion of linkages and time lags that, I believe, is the only way we can be sure that our goals aren't corrupted and our energies aren't dissipated.

#### 4.3.4 "Carry on polluting" (2007-03-07 12:36)

Larry Lohmann, writing in the *New Scientist* is skeptical about carbon trading:

Arguably, the US sulphur dioxide trading programme of the 1990s helped business save money in meeting modest short-term reduction targets for a single substance. But global warming require a more radical solution: nothing less than a reorganisation of society and technology that will leave most remaining fossil fuels safely underground. Carbon trading...just encourages the industries most addicted to coal, oil and gas to carry on as before. [1]*Carry on polluting*

I broadly agree with Mr Lohmann in that carbon trading will not meet the challenge. And it seems that, in New Zealand anyway, there is a very large bureaucracy devoted to administering carbon trading, and a similarly large effort on the corporate side devoted to gaming the system. Carbon trading looks elegant, but its goals are modest and:

Only big firms can afford to hire carbon accountants, liaise with officials and pay the costs of getting projects registered with the UN. Yet these are often the companies that local people battle hardest against in defence of their livelihoods and health.

Carbon trading then seems likely to be a corporatist non-solution to the climate change problem. Something designed to keep economists busy, and to annoy and deceive the public with higher prices and the appearance that something's being done.

Well, regular readers of this blog will know that I favour [2]Climate Stability Bonds, which would prove as radical as necessary in meeting the challenge: their impact would be commensurate with the scale of the problem, rather than what is politically possible under the current - corrupt - system.

What's necessary? Mr Lohmann suggests: "Public investment, shifting subsidies away from fossil fuels and toward renewables, conventional regulation, support for the work of communities already following or pioneering low-carbon ways of life, requiring that businesses pay the costs their competitors incur in developing green technologies..." Climate Stability Bonds would probably encourage investors to develop all these, and more, initiatives, and they would do so without the laborious, energy-sapping, process-obsessed negotiating that after a lengthy gestation has given birth to... carbon trading.

#### **4.3.5 Targets and experiments (2007-03-10 10:41)**

Commenting on the educational ranking devised by the UK's Department for Education and Skills (DfES), the [London] [1]*Financial Times* points out that:

Secondary schools that encourage their pupils to sit non-traditional subjects such as leisure studies and performing arts are bolstering their league table position at the expense of leading schools that focus on core disciplines, a unique analysis of exam results has shown. ... Lancaster High School, a comprehensive ranked 478th by the DfES plummets more than a thousand places to 1,623 when "softer" subjects and vocational qualifications are excluded.

This is but one illustration of how the use of badly thought out numerical indicators and targets influence behaviour for the worse. They point to a genuine problem for well-meaning policymakers whose remit covers any but the smallest community: which numbers to use and how to use them? The Social Policy Bond approach relies totally on numerical targets and so, increasingly, does current policymaking, for better or worse.

It seems to me that useful indicators and targets should be inextricably correlated with  
306

wellbeing. And we should be targeting the wellbeing of ordinary people – not corporations or institutions, which have entirely different goals that can and often do conflict with those of the public. Importantly too, our chosen targets should also be expressed in broad terms, mainly so that objectives that can conflict with each other are targeted by a single policy – or issue of Social Policy Bonds. This is in order to minimise the chances that people will achieve one targeted goal at the expense of another, untargeted component of wellbeing. Broad objectives also maximise efficiency gains, as they give wider scope for the deployment and shifting of scarce resources.

The need for broad targets highlights one of the difficulties I experience when trying to raise interest in the Social Policy Bond concept: they function best over a large scale, making small-scale experiments difficult to devise. Ideal policy areas for Social Policy Bonds are those where a large range of approaches and projects need to be explored, adapted, tried and (if unsuccessful) terminated or (if successful) adopted widely. Climate change is one example. Others are eradicating poverty, raising literacy, reducing crime rates, over large regions or whole countries. It's difficult to devise experiments at that level, but an alternative might be a virtual experiment in a simulated world, such as at [2]<http://www.secondlife.com/>.

#### **4.3.6 Climate change: too important to be left to experts (2007-03-12 11:08)**

On 8 March the UK's Channel 4 tv station screened *The Great Global Warming Swindle*. It's discussed fairly favourably [1]here, and it's rebutted, to my satisfaction anyway, [2]here. I'm no expert, but it does seem as though the experts are in agreement that, at the very least, climate change is happening and that it's dangerous.

But one of the reasons I advocate [3]Climate Stability Bonds is that those who back them need not have a strong opinion one way or the other as to the seriousness of climate change. Assume that the governments of the world decide to issue Climate Stability Bonds, which would become redeemable for a large sum once climate stability had been achieved and sustained. If the consensus of the market for the bonds is that the climate is already stable, then the bonds would sell for a quite high price. The governments would not lose much by redeeming the bonds, as the bonds would not appreciate very much. If the buyers of the bonds were wrong, it would be *they, not the governments*, who would lose money.

If the market believes climate change is happening and that therefore climate stability will be difficult to achieve, it will attach a low value to the bonds when they are issued. Bond purchasers would stand to make large sums if they help bring about climate stability.

The crucial point is that under a Climate Stability Bond regime it would not be up to governments, the United Nations, or any panel of experts to make a one-time only assessment of the seriousness of climate change. Under a bond regime it would be *the market* that would be highly motivated to inform itself about all aspects of climate change, because it stands

to gain most if they get it right. And investors in the bonds would be so motivated *on a continuous basis*, as the market for the bonds would be constantly generating opportunities for gain to successful gatherers and interpreters of the flow of data about climate change.

A Climate Stability Bond regime would thereby bring onside the skeptics, or those who are just reluctant to pay large upfront costs for an uncertain gain. It would contract out not only the achievement of climate stability, but also the assessment of how serious a problem it is. The costs of a poor assessment would be borne by investors in the bonds, rather than taxpayers. Action to bring about climate stability – and I mean action, not empty, expensive gestures like Kyoto – would, I believe, therefore be more forthcoming.

#### **4.3.7 Simplify policy by targeting outcomes (2007-03-13 14:07)**

Perhaps the sophistication of modern financial structures means that the distribution of risks and the design of governance structures can be finely tuned to the needs of individual investors and the businesses they fund. Or perhaps there is a miasma of complexity and confusion in which everyone persuades themselves that the uncertainties of business have been landed on someone else. [1]John Kay, *Financial Times*, 13 March

Professor Kay is writing about private equity, but I am not sure his forebodings don't apply to policymaking and its impacts on the environment and society. If they do, then it would be for similar reasons. I suspect the complexities in the worlds of finance and policymaking *can* work in society's favour if behaviour is ethical and people trust each other. Economic complexity, based on the division of labour, works well under such circumstances. But it's not obviously better than stone age economics in complex economies, with their alienation, asymmetries of information and power, extreme interdependence, and widespread availability of highly destructive weapons. One becomes nostalgic for a simpler, more comprehensible world.

Can we have the benefits of complexity without its costs? Social Policy Bonds would recast politics, by starting out with broad, comprehensible and meaningful outcomes, to which all policy programmes would be subordinated. The world's complexities, manifold, ever-changing and hence unknowable to the elite caste of current policymakers, would be pored over by anyone with an interest in investing in the bonds. Efficiency, not status or chance, would determine how well people are rewarded for achieving social outcomes.

#### 4.3.8 Let's have spontaneous fun! (2007-03-15 11:20)

We live in a world of concepts, in a world of thought. We try to solve all our problems, from the most mechanical to psychological problems of the greatest depth, by means of thought. J Krishnamurti, *You are the World*, Harper and Row, 1972

What, then, of the [British] government's new, untried and dictatorially imposed new method of selecting junior doctors? It is part of its drive, conscious or unconscious, to destroy the independence first of the professions and then of citizens themselves. Its goal is a perfectly administered state (perfect, that is, in the sense that everything is administered and nothing is spontaneous or developed organically, not perfect in the sense that everything functions as well as possible). [1]Theodore Dalrymple, 8 March 2007.

Just as thinking has taken over from instinct, insight, intelligence or intuition in our individual lives, so is government control taking over many of the functions that as families, communities or societies we were used to doing for ourselves. I'm pessimistic about where the logical end point of this is: perhaps one of the better destinations would be a (relatively) benign police state like Singapore, where freedoms are restricted (by western standards), energies are almost entirely devoted to raising national income, punishments for stepping out of line are severe and the crime rate is low. Not the worst society, by any means, but the famous *Straits Times* headline hints at some of what's missing: "Let's have spontaneous fun - and here's how".

In Krishnamurti's view, continuous, unflinching, choiceless, self-observation is sufficient to put thought in its place. What would do the same to government? As it is, there is widespread dissatisfaction with government, but it's either diffuse, inarticulate, and expressed as disengagement from the political process; or it's ideologically driven, funded and beholden to corporate interests. There are well-meaning lobby groups who work through the political process but, when it comes to reinstating the societal intelligence that is being eroded by government, they are for the most part ineffectual. Perhaps we have reached the point where government is so dominant that any action to rein in government and restore societal autonomy has to work through government. Turkeys voting for Christmas?

I think that Social Policy Bonds, through their focus on outcomes, offer a way out of the predicament. Policy subordinated to outcomes - outcomes that are meaningful to natural persons, not corporations - would close the gap between people and their representatives in government. I suspect that specifying such outcomes would clarify what people think should be government's role in our society. Social Policy Bonds would also contract out the *achievement* of social and environmental goals to the private sector; again serving to rein in government control, and encourage diverse, more local, less monolithic, solutions to our social problems. It's likely that while government resources and articulation of our goals are necessary, withdrawal of governmental control over *how* goals shall be achieved would reinstate some of society's own skills and problem-solving abilities, many of which are being steadily undermined by government. That would be an end in itself, but would also, in my view, mean a more resilient, more resourceful and healthier society.

#### **4.3.9 CYA security (2007-03-17 13:29)**

Another form of CYA [Cover Your A\*\*] security is the overly specific countermeasures we see during big events like the Olympics and the Oscars, or in protecting small towns. In all those cases, those in charge of the specific security don't dare return the money with a message "use this for more effective general countermeasures." If they were wrong and something happened, they'd lose their jobs. [1]Bruce Schneier  
15 March

Mr Schneier hits the nail on the head. The real goal of so many bureaucratic activities comes not from being successful, nor even from avoiding failure, but from avoiding one's exposure as a failure. Tried, tested and failed methods will almost always win out over new and imaginative measures: if something hasn't been done before the penalties for failure are far higher than sticking to the script even if failure is thereby assured.

#### **4.3.10 "Our goal is to make houses unaffordable" (2007-03-18 13:04)**

Former Federal Reserve Chairman Alan Greenspan, speaking on 15 March:

If we could wave a wand and housing prices go up 10 percent, the subprime mortgage problem would disappear. [1]Source

Our policymakers have become so bewitched by the numbers that they fail to see what they represent. Sure, a rise in house prices would solve one problem; but one's person's increase in housing equity's is another's missed chance of home-ownership. In a conflict between competing groups of people, it seems that it's policymakers will favour those groups that

- have greater lobbying power
- are hit most visibly,
- are hit most suddenly.

Governments in the rich countries worldwide seem to be doing everything they can to keep property prices high, trying to postpone a crash at least until the next general election. High house prices have joined per capita Gross Domestic Product as a *de facto* government target. The sadness is that these numbers do not correlate with social wellbeing. The losers are not just the less powerful groups – would-be homeowners – but the natural and social environment as well. Targets such as house values and GDP per capita don't tell us anything about real social problems: homelessness, poverty, mental and physical health, or the state of the physical environment. Note to politicians: high house prices mean misery for large numbers of people. And a high GDP is at best a means to ends, not an end in itself.

#### **4.3.11 Pseudo-choices for dogs (2007-03-20 12:27)**

A hitherto obscure Canadian company, Menu Foods, has recalled some of its cat and dog food because it might be contaminated. But, as [1]Oligopoly Watch points out:

the interesting thing for us is the list of brands produced by Menu Foods. The company makes 42 different brands of cat food and 61 brands of dog food ... [and] each of the brands has a large number of flavor varieties. The list of brands is breathtaking. Some are store brands for all the US's major and minor supermarket chains. ... [O]thers are lesser-known general varieties.... Still others are so-called "nutritional" pet foods, premium high-cost brands....[2]Pseudo-variety describes the way in which a highly concentrated industry using similar methods can produce a dazzling array of [3]"choices" at every price point and quality level.

Oligopoly Watch reminds us how and how much, industries become concentrated. The relevance from my viewpoint is not so much that such concentration is necessarily a bad thing, but that it occurs because government is systematically biased in favour of big business, at the expense not only of small business but of ordinary people too. It is government that subsidises, whether directly indirectly by such means as import barriers or military contracts, its cronies in big business, and it is government that creates a regulatory environment that imposes higher costs on small than big firms. The petfood moguls might tell you that it's 'the market' that made them so successful; so too might other large agribusiness corporates, the oil companies, and the car manufacturers or aircraft makers. But that's misleading: the market they refer to is the market as mediated by government. And that's quite a different thing.

#### **4.3.12 Costing social goals (2007-03-22 11:20)**

From the summary of [1] *New Zealand's Spending Binge* (pdf, 365k):

- Core government spending is now almost NZ \$20 billion a year higher than it was in 2000, a 32 % increase in real terms.
- Total government spending now makes up 40 % of GDP, compared to 35 % in Australia.
- The available social indicators we have show negligible improvements since 2000. Life expectancy, infant mortality, hospital outputs, literacy, violent crime, suicide, poverty and income inequality have barely changed despite a massive increase in social spending.
- Around the world there is little relationship between higher public spending and better social outcomes.
- A major explanation for why this spending has been ineffectual is because of middle class welfare. A large proportion of government spending is simply recycled (or 'churned') straight back to those who paid the tax in the first place.

At first sight, the conclusions seem unarguable, and I'm not going to argue against them. What I would say is that they are not going to precipitate a radical improvement in the way we do things. You can imagine the counter-arguments: sure the indicators listed above haven't improved much, but there are others that have. Or: there are mitigating circumstances, such as a rise in oil prices, larger numbers of people on welfare, an aging population, a decline in our terms of trade etc. In short, there is a sense that we are not getting value for money from the taxpayer dollar, but there's little in the way of proof.

That itself, though, is grounds for concern. We have strong suspicions that government spending could be more efficient; that middle class (and corporate) welfare is wasteful and, if it were transparent, would be unpopular; that more broadly, the gap between government – even the government of a population of 4 million – is widening. But, as another of the report's conclusions says:

- The [New Zealand] government has little specific information on how effective [its] extra spending has been. We lack information on outputs and outcomes from the public sector, which makes it difficult to measure exactly what return taxpayers are receiving for their investment.

It's not just that we can't measure the return on the taxpayer dollar: it's that we cannot monitor whether particular policies, programmes, strategies or activities are better or worse than what we have at the moment.

A Social Policy Bond regime would be different: the targeted outcome would be costed by the market, under competitive bidding. The value of the bonds would rise and fall continuously, according to how remote the market thinks the outcome is to being achieved. Such information is invaluable to potential investors in the bonds, as well as policymakers. It tells them, and anyone else, which projects are likely to succeed. More compellingly, it tells us which projects should be terminated – something that happens all too rarely under the current system, where taxpayer-funded institutions and activities have their own momentum that keeps them going well after their 'best-before' date.

#### **4.3.13 Zoning (2007-03-23 15:46)**

An interesting comment from an Arizona contributor to a [1]discussion on organic farming:

The organic farmer gets a minuscule share of the price of a loaf of bread. The solution to this is for the organic farmer to become a producer of food, not just organic agricultural commodities. But the local zoning people tell me that if I grind my grain into flour and bake bread with the flour that these are "industrial processes" and that they will take whatever action it takes to stop me. ...

On the other hand, I have a friend in Bangkok whose next-door-neighbours house a small gem processing operation, which runs most of the night, at high volume.

Anonymous (2007-03-26 11:40:00)

The problem is indeed that sensible regulations are too often co-opted by particular interests. It used to be that the Norwegian electronics standards were just different enough from the Swedish ones to give our own washing machines an edge at home. Nowadays that's moved to EU level, but I'm sure it's still goes on, not just with respect to other nations, but between competitors as well.

It's not obvious to me how to prevent this.

Ronnie Horesh (2007-03-26 14:56:00)

I'm not sure either. But very often the regulatory environment, like import barriers and subsidies, is biased in favour of big business at the expense of small businesses and ordinary people. Outcome-based policy might help redress that balance.

#### **4.3.14 Subsidising ourselves to death (2007-03-25 23:17)**

It's not only the developed countries that subsidise rich motorists to pollute the planet. Iran does it as well. The current [1]*Economist* (subscription) mentions a petrol subsidy that amounts to four times what motorists pay at the pump. It costs the Iranian taxpayer billions of dollars a year. Raising the petrol price is politically difficult.

Of course, it's not just Iran, and it's not just petrol. It's most of the rich countries, many of the poor countries, and it's agriculture, energy and water. How do governments find themselves taking funds from poor people to give to the rich to help them destroy the environment? Often such subsidies start out as well intentioned. There's a food shortage? Subsidise farmers to produce more. But the subsidies mainly goes to the owners of the least elastically supplied input. In the case of agriculture, this is farmland. Wealthy landowners are the big gainers therefore, along with the agribusiness corporates that supply the increased volume of inputs and process the expanded volume of outputs. Cutting subsidies is far more difficult than starting them. Their beneficiaries have the means and the motivation to resist meaningful reform. Government is frightened of punishing its friends (and, very often, paymasters) in the business world, so takes the path of least resistance. It's ordinary people who suffer, as well as the environment.

Such nonsense is only possible where there is a disconnect between government and the people it's supposed to represent. And such a disconnect is guaranteed when policy is expressed in terms of vague, mutually conflicting, and uncosted goals. That happens when we trust government to do the right thing. But in our complex economies, neither government nor anyone else has much understanding of all the relationships between cause and effect. Obscenities like Iran's subsidies to motorists, or the European Union's subsidies to [2]wealthy aristocrats are the result.

Either we tolerate this insanity, until its financial, social and environmental costs destroy the planet completely, or we reduce our economic units to the size at which we can understand its linkages - probably something like the village level. The latter course has its attractions, but couldn't hope to sustain the population we already have. Or we introduce outcome-based government: something along the lines of Social Policy Bonds, where all policies, activities, and institutional goals are subordinated to social and environmental objectives that are chosen by, and meaningful to, ordinary people; as distinct from wealthy individuals or corporations.

#### 4.3.15 Government and big business versus everyone else: Putin's Russia (2007-03-27 13:56)

A couple of quotes from Michael Specter's chilling article in the *New Yorker* on Putin's Russia:

Propaganda has become more sophisticated and possibly more effective than it was during the Soviet years, when television was a tool used to sustain an ideology. The goal today is simpler: **to support the Kremlin and its corporate interests.**

Putin is proud of Russia's economic achievements.... "When I became President, our foreign-currency and gold reserves stood at twelve billion dollars, and now they have increased by eighty billion over the first half of this year alone, and currently come to a total of around two hundred and seventy billion," he said. "We have paid off our debts in full. ..." He added, "But none of this would mean anything if it did not bring change to people's lives," noting that incomes and pensions have risen nearly ten per cent each year since he became President. Nevertheless, **the country is literally dying.** When Boris Yeltsin took office, the Russian population stood at nearly a hundred and fifty million. By 2050, most official projections suggest, the number may fall below a hundred million. In describing the new Russia, neither Putin nor his loyalists mention the country's rapidly expanding AIDS epidemic, its endemic alcoholism, or the vast differences in incomes among its citizens. [1]Kremlin, Inc, 'New Yorker', 29 January (my emphases)

These quotes, and the entire article, show clearly that in Russia, as in other countries:

- Government and corporations have their own agenda, which often conflicts with that of ordinary citizens; and
- A high or rising Gross Domestic Product – which I believe is the de facto target of most governments – says very little about the wellbeing of a society.

#### 4.3.16 The Swiss model (2007-03-30 02:13)

A [1]letter by Stephen Morris, published in the current 'Economist', about the role of the British House of Lords:

In a parliamentary system so debased by conflicts of interest that Lord Hailsham once described it as “an elective dictatorship”, the Lords could well play a role in balancing the interests of the people against the ruling party and its rent-seeking clients. An even better alternative would be a system of direct democracy that allowed citizens to look after their own interests.

It's perhaps as understandable as it is regrettable that the Swiss model of 'direct democracy' is rarely proposed in other countries. Switzerland has a federal structure whose 26 cantons have use assorted instruments of “direct democracy”, notably “initiatives” to change the canton's constitution, and referendums to stop new laws, change existing ones, or prevent new public spending. Cantons vary in the ease with which these instruments can be used. Research by Bruno Frey and Alois Stutzer of the University of Zurich showed that, even after allowing for other variables, the more democratic the canton, the more people living there reported being happy. The effect is significant:

[T]he marginal effect of direct democracy on happiness [was found to be] nearly half as big as the effect of moving from the lowest monthly income band (SFr980-1,285, or \$660-865) to the highest (SFr4,501 and above). [2]Source

By looking at the reported happiness of foreigners living in the Swiss cantons, the researchers found that it wasn't just the effect of the decisions made by direct democracy that led to greater wellbeing. The participation in the process itself accounted for most of the increased happiness.

This is a position I have long advocated. A Social Policy Bond regime would specify outcomes to be targeted with public funds, but the language of outcomes is intrinsically more meaningful and more accessible to ordinary people. The current political system in most democracies rarely declares its goals in terms that mean anything to natural persons. Instead, its goals have more to do with gaining or retaining power, and usually mean favourable treatment to the most powerful lobbyists, especially government agencies and big business, largely at the expense of small businesses and ordinary citizens. The system gets away with this, because its goals are expressed vaguely and usually in the form of legalistic discussion about institutional structures and funding. Social Policy Bonds in contrast would subordinate all such processes to meaningful, explicit goals. This would draw more people into the political process. As the research into Swiss direct democracy shows, this is an end in itself, as well as a means to greater wellbeing.

### **4.3.17 The market? Don't make me laugh (2007-03-30 15:12)**

Stacy Mitchell's new book, *Big Box Swindle*, offers a compelling case for why uncontrolled proliferation of corporate chains undermines communities, competitive markets, and democracy. Mitchell provides a fine balance by detailing the big picture with extensive research while driving home the impact of problems with stories of real people, businesses and communities.

An especially interesting chapter is "Uncle Sam's Invisible Hand," which reveals how government policies have played an immense role in shaping the retail and other commercial development. Some of these policies, such as directly subsidizing politically-powerful corporations, may be familiar to our readers, but Mitchell unearths many cases of more subtle government favoritism or discrimination that make clear the growth of corporate chains has not resulted from market forces alone. [1]Source

I haven't read the book yet, but I'm glad it's been written. Businesses and government talk about 'the market' as though it's an accurate summation of individual's preference, weighted perhaps disproportionately in favour of the wealthy. But it's worse than that. The wealthiest of all are not individuals but large corporations, and they have many ways in which they can bias the market against small enterprises, the public, the natural environment and the social environment. In this, they and our governments, nominally democratic as they are, engage in mutual back-scratching. Governments help large corporates by, amongst other measures, imposing protectionist barriers to imports, and creating a regulatory environment that imposes disproportionately high costs on smaller businesses. Wal-Mart and other mega-retailers are not the only beneficiaries; agribusiness, military suppliers and the construction industry also leap to mind. But it's the big box sellers who most readily claim that their success is due to 'the market'. It's not, unless the market they are talking about is for policies, regulations and the souls of our representatives in government.

## **4.4 April**

### **4.4.1 Better than Kyoto (2007-04-02 14:02)**

Climate change is too important to be left to the bureaucrats. The latest manoeuvrings of the various interest groups: farmers, forest owners, car drivers, politicians and officials tell us all we need to know about where our ingenuity and inventiveness are going: into bickering,

lobbying in defence of vested interests, and competing with other interest groups for subsidies. Much serious brainpower will be spent on resisting change or extracting privileges from government.

It's a natural reaction to the same top-down approach that, at the global level, despite all the treaties and blandishments has led to nuclear proliferation and the frightening prospect of nuclear catastrophe. And it's that same approach, which at the national level in most developed countries, has generated soaring crime rates, failing educational and health systems, and the entrenchment of an underclass.

Leaving climate change to the government is just not good enough. And this not a criticism of government employees, who in my experience are almost all hard-working (sometimes to a fault), and undoubtedly well intentioned. The problem is that these employees are reacting perfectly rationally to the incentives on offer from the institutions that employ them. And these incentives are perverse. They have little to do with actually solving meaningful problems, and far more to do with the prime, over-arching goal of all institutions: that of self-perpetuation.

The outcome we should be targeting is some definition of climate stability, which should include indicators of plant, animal and human wellbeing as well as climatic variables and the rate of change of those variables. Targeting climate stability means that we don't prejudge the best way of achieving it. This is, in my view, Kyoto's most glaring flaw: it supposes that the best way of tackling climate change is to reduce anthropogenic greenhouse gas emissions. There is no evidence for this, even though the evidence that links such emissions to climate change appears convincing – with our current knowledge.

The point is that this knowledge is rapidly expanding. We are learning more and more about the links between greenhouse gas emissions and the climate, and about ways in which we can prevent or mitigate climate change. Kyoto is a single, one-size-fits-all, top down, fossilised, *supposed* solution to the climate change problem. But the climate change problem is so huge, and so urgent that we need instead a mosaic of approaches, that can adapt to our rapidly growing knowledge.

We also need to enlarge and *motivate* the pool of people prepared to do something to tackle climate change. Currently there is probably more human ingenuity devoted to marketing cans of dog food than there is to finding ways of preventing or mitigating climate change. The fact is that the rewards to a successful pet food campaign manager can be in the millions of dollars, while someone trying to generate new ideas for tackling climate change that don't fit in with Kyoto will have difficulty getting attention, let alone adequate funding. This points to the need to divert some private sector resources away from trivia and towards solving our most urgent environmental problem.

Recently the Virgin corporation has seen that gap, and [1]offered a reward for the best ideas to remove CO2 from the atmosphere. This is getting closer: we need to target a stable climate *however that goal is to be achieved*. We cannot afford to let the bureaucrats who run the Kyoto industry dictate the pattern of the world climate: we cannot afford the waste and inefficiency of brainpower that people will expend on gaming Kyoto.

There's more. We also need people to buy in to solving the climate change problem. Kyoto doesn't do this. Just the opposite in fact: most people instinctively resent imposed pseudo-solutions originating in remote bureaucracies. Kyoto has become politicized; so much so that anybody who questions it is assumed to be an environmental vandal. (This itself is indicative of Kyoto's limitations: people who are secure in their beliefs don't feel threatened when those beliefs are questioned.)

It is for all these reasons that I believe [2]Climate Stability Bonds would be an improvement over Kyoto. Climate Stability Bonds would be backed by the world's governments. They would be redeemable once a specified climate stability goal had been achieved and sustained. They would be freely tradable and their value would rise or fall as the targeted goal become more or less likely to be achieved. The goal could be specified as a combination of climate and other indicators. The bonds would not prejudge the best ways of achieving their goal. They would reward the achievement of climate stability, *however it is achieved*. Investors in the bonds would have incentives to respond quickly and appropriately to new knowledge about what is causing climate change and to new ways of dealing with it. Governments would be the ultimate source of finance for achieving climate stability, but the private sector would allocate society's scarce resources.

A Climate Stability Bond regime would express its aims in terms that people can understand. Its explicit goal would be climate stability. If people understand what a policy is all about, they can participate more in its development, refinement and implementation. This matters hugely when, as with climate change, government will probably have to rein in activities to which we have become accustomed. Kyoto discourages buy-in because it is focused entirely on one single policy: the cutting back of net anthropogenic greenhouse gas emissions which, at best, will do little to prevent climate change and despite being ineffectual will impose heavy, and up-front, financial costs.

Climate Stability Bonds, on the other hand, have a comprehensible, meaningful goal: the achievement of climate stability. They would channel the market's incentives and efficiencies into the solution of our most urgent environmental problem. But with their focus on a targeted outcome, rather than a supposed means of getting there, they would also encourage greater public participation and buy-in to the solutions they generate. We need a widely supported, coherent, and efficient response to climate change. Climate Stability Bonds have all those features. Kyoto has none.

#### 4.4.2 Subsidising planetary destruction: part 94 (2007-04-05 00:31)

A recent [1]report released by the European Environmental Agency has found that greenhouse emissions from transport vehicles remain a key obstacle to the European Union (EU) reaching its Kyoto climate change targets. While greenhouse gas emissions fell in most sectors in the EU15 between 1990 and 2004, they increased by 26 % in the transport sector. Road transport is by far the biggest polluter, emitting 93 % of the greenhouse gases put out by the transport sector, which accounts for 22 % of total EU15 emissions.

The report estimates that around 270-290 million Euros in *known* annual subsidies are being handed down to the transport sector in EEA countries, (which include the 27 EU Members and Turkey, Iceland, Liechtenstein, Norway and Switzerland). The effect of these subsidies is to reduce the costs of transport to users.

Apart from helping destroy the environment, such subsidies also represent a transfer from taxpayers to wealthier citizens, who use the transport infrastructure disproportionately more than the poor, as they have better access to transport and more time in which to use it. Meanwhile:

There is little prospect of slowing the growth in China's oil consumption, because **the government** is committed to a car-led policy of development. The World Bank's Mr Dollar has recently described this as "a very questionable development choice"—though it had earlier been conceived with the World Bank's backing. (My emphasis.)

#### 4.4.3 More versus better (2007-04-06 14:06)

[P]erhaps most surprisingly, *growth no longer makes us happier*. Given our current dogma, that's as bizarre an idea as proposing that gravity pushes apples skyward.  
Bill McKibben, [1]Reversal of Fortune, 'Mother Jones' March/April

In our individual lives we make choices for ourselves, and if we don't think more income or wealth is worthwhile, we trade more for a better quality of life. Things go awry when those decisions are taken out of our hands. Most western governments target growth above all else. Since they have around 40 per cent of national income to spend and the power to create statutes that heavily influence much of the rest of our lives, governments' goals play a big part in society's sacrifice of (in Mr McKibben's terms) *better* for *more*.

Of course, governments' goals should be close to those of the people they are supposed to represent. But, as with all big organisations, institutional goals tend to take over. Growth and complexity tend to go hand-in-hand, as does complexity and the gap between people and their government. So there is a self-reinforcing cycle that leads to the disengagement of people from politics, and the substitution of politicians' goals for those of ordinary people. They two sets of goals are quite distinct: and the choices of governments, given their huge economic and legal power, quite critical. One disastrous result is environmentally harmful subsidies, which mainly benefit large corporations at the expense of the physical and social environment, small businesses and ordinary citizens. Most of us would probably trade off some of the more measurable indicators of economic wellbeing for an enhanced quality of life. But the choice is largely out of our hands: it's made by our governments on our behalf and they have every interest in maintaining their symbiotic relationship with large corporations. So when it comes to a choice between *more* and *better*, it's *more* every time.

Social Policy Bonds are not just about efficiency: they're about subordinating government policy not to the wishes of large businesses, but to outcomes that are meaningful to, and chose with the participation of, ordinary people. Under a Social Policy Bond regime, government would articulate people's wishes and raise revenue for their achievement, but the actual goals, and the ways in which they would be achieved, would be decided by wider society. The benefits are not just greater public participation in choosing policy goals, but greater efficiency in achieving them.

#### **4.4.4 Immigration and buy-in (2007-04-09 11:29)**

A bleak picture of the corrosive effects of ethnic diversity has been revealed in research by Harvard University's Robert Putnam, one of the world's most influential political scientists. His research shows that the more diverse a community is, the less likely its inhabitants are to trust anyone – from their next-door neighbour to the mayor. [1] *Financial Times* , 8 October 2006

This is an oldish article, but the conclusions of the research cited are relevant. It's worthwhile asking whence the impetus in favour of immigration arises, and what are its long-term effects on the social fabric of the countries receiving and losing migrants? My own view is that our

governments have tended to regard our social environment very much as they have looked at the physical environment: something that can be run down for as long as an obvious emergency can be avoided, so that the financial figures look good.

Immigration is one subject on which buy-in is especially important. If people feel they haven't been consulted about who is allowed into the country they live in, then the result will be, as Professor Putnam's research indicates, negative. Consultation on such a sensitive subject could make a lot of difference: not necessarily to the immigration statistics, but to the far less quantifiable, but at least as crucial, matters of attitudes and trust.

We're fast losing the habit of such consultation. National policy is decided by professional politicians whose policies are mainly expressed in terms of institutional structures and funding, a proliferation of micro-targets, or arcane legalistic discussion. Absent from such policymaking are outcomes that are meaningful to citizens. Government instead is concerned mainly about the *means* of achieving its (very often) unexpressed or mis-expressed goals. To reconnect politicians with its electorate, I have long advocated Social Policy Bonds: not only because of their likely efficiency gains, but also because they start out with an explicit statement of a meaningful policy goal. By doing that, they encourage greater public participation in policymaking. When it comes to hosting migrants from many different cultures and backgrounds, such participation, and the buy-in it generates, are essential.

#### **4.4.5 Literacy in Pakistan (2007-04-11 12:32)**

From the current issue of the [1]*Economist*:

Officially, 53 % of Pakistanis are literate. Others say the figure is nearer 30 %. Literacy, often defined as no more than the ability to write one's name, is as low as 3 % among women in some rural areas.

The byline to the article sums it up: 'Pakistan's madrassas may be less of a problem than its mainstream schools'. With its population of 160 million, Pakistan's disastrous educational system is both distressing in itself, and a likely source of further misery. It's a problem that doesn't seem amenable to the current policy mix. Some years ago I proposed that private organisations and individuals take the lead and issue their own Female Literacy Bonds, based on the Social Policy Bond principle. My [2]handbook (pdf) for such entrepreneurs or philanthropists, explains how the bonds could be of interest to all:

•

If you are cash-rich but time-poor and know what you want, then you could get together with some cronies and do as suggested: set up an escrow account and issue your own bonds. If you are less wealthy you could swell the redemption funds by depositing your spare cash into escrow account set up by others.

•

If you have more energy than money you could buy some Female Literacy Bonds, and then work to raise female literacy in Pakistan. Your bonds would appreciate in value if literacy levels rose quickly. You could even borrow on the strength of the expected increase in capital value of your bonds, in order to finance literacy-raising projects. You could co-operate with other bondholders and finance those activities that you think will be most efficient in raising literacy.

•

If you are already involved in trying to raise literacy in Pakistan you could contact holders of Female Literacy Bonds and if they believe your activities are efficient in reducing conflict they will find it worthwhile to help finance your existing projects.

#### **4.4.6 Fight global warming by chopping down trees? (2007-04-13 01:55)**

From the current issue of the [1]Economist (subscription):

A climate model suggests that chopping down the Earth's trees would help fight global warming. ... The reason for this is that trees affect the world's temperature by means other than the carbon they sequester. For instance forests, being generally green and bristly things, remain quite a dark shade even after a blizzard.

The article is reporting on a study led by Govindasamy Bala, of the Lawrence Livermore National Laboratory, in California, and it doesn't mention many other ways in which trees might warm the climate. For me the implications are that, with our very limited knowledge of the causes of climate change, we ought to target not the ways in which we currently think we can stabilize the climate, but the goal of climate stability itself. We simply don't know enough

about the mechanisms underlying climate change to make policy today on *how* to stabilize the climate.

The scientific complexities of climate change are analogous to those of a social system, and our policymaking cannot cope with great complexity. It cannot reliably identify the cause and effect in complex systems, and it certainly cannot cope with rapidly expanding knowledge, nor with the diversity inherent in large geographical areas. It's too quick to identify a causal relationship, and then base policy on it. The Kyoto agreement is one such response to climate change. Whether Dr Bala's study is right or wrong on the question of trees and climate change, is not the point. What is crucial is that our policymakers have some degree of humility, and create policies that don't assume they know the entire truth.

Instead of promoting what are thought to be the means by which a goal is to be achieved, they should reward the society's desired *outcome*. When it comes to climate change, instead of rewarding the planting of trees, or whatever seems, with current science, to be ways of reducing our net emissions of greenhouse gases, it should [2]target climate stability, and let the market decide on the best ways of achieving that goal. These ways will not be obvious, and they will vary with time according to circumstances that we cannot anticipate. Rewarding successful *achievement* of society's goals, as under a Social Policy Bond regime, encourages a wide range of people to find diverse, adaptive and efficient ways of achieving social and environmental goals. Leaving such an exploratory process in the hands of politicians and bureaucrats just isn't going to work: society and the environmental challenges are now just too complex for an approach that was devised (and worked very well) in the late 19th century.

#### 4.4.7 Complexity exaggerates role of ideology (2007-04-15 12:22)

Commenting on Edmund Wilson's view of the American Civil War and the literature that resulted, and then about the current Iraq imbroglio, Inigo Thomas writes:

[N]ever before had Americans found themselves so articulate while also failing to convey any sense of what actually happened. ... The Iraq war, untidy and unkempt to say the least, has produced an even more stunning mass articulateness..... New books, magazine articles and blog entries go on endlessly about Bush and the neo-cons, how they skittled the war in Iraq because they were incompetent or because of their bad planning. If only the administration had listened to.... *First Puppet, Now Scapegoat*, 'London Review of Books', 30 November 2006

It's not Mr Thomas's main point, but one issue raised is: how can the experts get it so wrong? Well, Mr Thomas goes on to say that as far as the 'Bush, Cheney and their friends' were concerned: 'Whether democracy in the Middle East thrived or failed - that doesn't seem

to have mattered...' I'm not sure I agree with Mr Thomas on that, but regardless of what one thinks of this particular failure, there are plenty of other, less spectacular, but equally appalling policy disasters at a time of unprecedented articulateness. There are knowledgeable experts on virtually every subject. Sometimes their facts or interpretations appear to conflict, but more often, I believe, the increasing volume of available information fails to improve policymaking because either:

- the real drivers of policy are ideological (as seems to be the case with Bush et al), or
- the rising tide of information is rendered next-to-useless by the increasing complexity of our society and environment.

Perhaps the two are linked; in the face of so much complexity, the thinking is that we might as well just go with our prejudices. That's one reason I favour subordinating policy not to ideology, and not even to the latest readings of the masses of information available on any subject, whether it be climate change, how to stop wars and civil wars, or how to reduce crime levels. The information available to policymakers at any one time is almost as fixed as our prejudices: it's not always a solid basis for policy, especially for long-term goals. My previous post talked about climate change and new findings that in some parts of the world, more trees might accelerate global warming. This may or may not be true, but building long-term policy on fossilised science is not going to work: we need dynamic, adaptive strategies; and we need people other than policymakers to have incentives to investigate the most efficient solutions.

Social Policy Bonds do both: they target explicit, transparent goals, and they make rewards contingent on achieving those goals. By contracting out the achievement of social goals to the market, they maximise the efficient use of our scarce resources. There might still be failures: bringing peace and democracy to the Middle East is a lofty and probably an extremely remote goal. Under a bond regime, it might never be achieved, but what is certain is that US taxpayers would not then have to pay for the failure.

#### **4.4.8 Fraud (2007-04-16 12:50)**

George Monbiot explains why the British Government is extending the tax rebate for biofuels:

It used to be a matter of good intentions gone awry. Now it is plain fraud. ... The reason governments are so enthusiastic about biofuels is that they don't upset drivers. They appear to reduce the amount of carbon from our cars, without requiring new taxes. It's an illusion sustained by the fact that only the emissions produced at home count towards our national total. The forest clearance in Malaysia doesn't increase our official impact by a gram. [1] *If we want to save the planet, we need a five-year freeze on biofuels*, 'The Guardian', 27 March

I was inclined to think insanity, but Mr Monbiot is probably more accurate when he calls it fraud. He goes on to say that fuel suppliers in the UK have been ordered to ensure that 2.5 per cent of the fuel they sell is made from plants. If not, they must pay a penalty of 15p a litre. By 2050, the British Government wants 33 % of UK fuel to originate in crops, while President George Bush announced 'that he would quintuple the US target for biofuels: by 2017 they should be supplying 24 % of the nation's transport fuel.'

These ludicrous targets are government at its worst. They have nothing to do with any meaningful outcome for ordinary people, and everything to do with pandering to the wishes of large agribusiness corporates, and getting something in the media that appears to show concern.

#### 4.4.9 Cars: the insanity (2007-04-17 11:47)

The syntax is a bit odd, and it's now a month old, but I haven't seen this bit of news reported anywhere else. I think it's sad:

For the occasion of the closure day of the Geneva Motor Show, some 10 activists from different organizations were planning to do a small demo at the inside of the Geneva motor show, deploying a banner to point out the hypocrite discourse of the car manufacturers. As a **preventive measure**, Police Detectives of the Geneva Canton have taken the whole group of activists and the camera crews in their presence in custody, and kept them for more than 8 hours for questioning. Jeroen Verhoeven, Coordinator of the 4x4network and participating in the action, has been hand-cuffed and taken away to the police station for questioning. The activists have been charged of being "the alleged authors of threats alarming the public", **even if the action did not take place!** In order to avoid any dissident voice at the motor show, the activists have been **phone-tapped, hand-cuffed, strip searched, their DNA and fingerprints have been taken**, and video material, laptops and mobile phones have been seized by the Geneva Police." [1] UK Indymedia

(my emphases)

On a related note, I was pleased to see a fellow Wellington (New Zealand) blogger respond to a comment in the local paper about a "bus lane policy that will strip residents of their rights to park cars on busy thoroughfares".

Excuse me? When did it become a "right" to store one's private property on a public thoroughfare? [2] Tom Beard

This is no trivial question. Recent research seems scanty, but in 1992 the World Resources Institute (MacKenzie *et al* cited [3]here) estimated the value of this 'right', for the US alone, to be \$85 billion per annum, assuming an average value for a parking space of \$1000 per year. The authors argued that parking should be considered part of the normal costs of operating and owning a car and that the free supply of parking is effectively subsidizing the use of cars and trucks. (The same study concluded that road transport subsidies in the USA amounted to around \$174 billion in 1989 or 3 per cent of GDP with road users covering only about 20 per cent of public expenditures and costs.)

#### **4.4.10 Killing our citizens: no videos, no debate (2007-04-20 03:52)**

More than 100 people were killed violently yesterday in the US. More than 100 people are being killed today, and more than 100 will be killed tomorrow.

There will be no blaring headlines, no anguished hand-wringing, no serious debate about the costs and benefits of controlling the causes of these deaths by violence. That's for one simple reason: they were the result of road accidents. On average [1]119 people die every day on American roads. Worldwide, road deaths are [2]estimated to be 1.17 million per annum, with over 10 million crippled or injured.

What is it about road transport that makes us irrational? An infantile wish for high speeds? The erotic symbolism of entering an enclosed body and moving it along? I don't know, but figures show that even in the US car ownership is about 50 per cent, which means that at any one time much less than half the world's population has access to a car. But cities today are designed not for human beings, nor even for public transport, but for cars and their drivers. Our physical and social environment is being sacrificed for the car: well it looks that way. The irrationality of it all is more striking in developing countries, where the vast majority of people see very little return from the massive investment in road transport being undertaken by their governments. Their children are killed or injured, their air is poisoned, their climate is being altered irreversibly, their communities destroyed - for what? I know; it's not just for the sake of the wealthiest fraction of their population who can sit in air-conditioned comfort while they scoot around the cities. There are benefits for all from a complex market economy.

My concern is that most people have little real say in how their economy develops. The construction industry - and not just in the developing world - is a byword for corruption. My previous blog was about the subsidies implicit in allowing people to park their cars in a public space. But there are other perverse subsidies that benefit road transport: those that encourage oil extraction and consumption (thankfully these are [3]coming down in most countries). There is very heavy bias, more generally, in favour of the large and global as against the small and local. (Scroll down [4]this page for the excellent publication Small is beautiful, big is subsidised.)

Social Policy Bonds would re-orientate policy. Transport is a means to various ends, not an end in itself. People should choose the social and environmental outcomes they want to achieve with public funds. Politicians whose interests are largely dictated by corporate lobbyists, get away with road-building programmes because politics today is about image, spin, gesture and deceit. Political debate centres on arcane discussion about legal niceties, and institutional funding and structures. Give people access to policymaking, by centring the debate on outcomes, and public participation would be much higher.

To be sure, some of us might choose a transport system that is based on privately-run chunks of metal zipping around killing more people more than any number of gun massacres, that devastates our physical and social environment, and that requires the transfer of large amounts of funding to unstable and repressive regimes several thousand miles away. But let us make such choices explicitly, and with our eyes open.

#### 4.4.11 More gesture politics (2007-04-22 12:36)

Researchers at [1]Open Europe, an economics think tank in Britain, recently reported on the European Union's Emissions Trading Scheme. One of its many flaws is that it is inflexible. It covers only:

... CO2 emissions and only from certain plants in certain sectors of the economy. The scheme looks only at limiting emissions from a few industries, rather than looking at how to reduce net emissions from the whole economy at the lowest net cost.

[2] Source  
(pdf)

As well, and unlike even Kyoto, investment in CO2 'sinks' do not count. Of course, the theory might be flawed, but what about the practice? Open Europe's conclusion is that the ETS represents "botched central planning rather than a real market." Carbon trading has not resulted in an overall decline of the EU's carbon dioxide emissions. So even its own narrow terms, the ETS has failed.

This is typical. Projects like the ETS and Kyoto push all the right buttons. They make us feel good because it looks as though we're doing something. They give the illusion of success; they point the finger at countries that don't subscribe to them; they involve the creation of bureaucracies of (often) hard-working, well-meaning people; and they allow the rest of us to relax, because a lot of people are doing something positive. But they aren't. The agreements

continue, the organisations that administer them go from strength to strength; but the targeted outcome to which these organisations are allegedly supposed to be contributing? No impact whatsoever. The outcome has been hijacked by a political process that rewards activity above all else. And it will continue to be like this until we subordinate all such activity to the outcome that society - not government agencies nor other organisations, but real people - want to achieve.

-  
Policy as if outcomes mattered

#### **4.4.12 Role of current lobbyists in Social Policy Bond regime (2007-04-24 13:39)**

A reader in Australia has asked, amongst other things, about the role of existing lobby groups under a Social Policy Bond regime. Could they recognize the "threat" posed by the bonds (that is a redirection of government resources away from themselves) and lobby to ensure that the conditions attached to any Social Policy Bond issue favour them, or even worse, are impossible to complete? I am more sanguine. There would be some attempted manipulation, but as long as there were a strong performance incentive, the goals of these lobby groups would have to become much more congruent with society's. That is where the money would be. They would find it hard openly to come out and oppose targeted *outcomes*. For instance, they would find it difficult to say *we are against lower unemployment, or the eradication of illiteracy*. Under a bond regime, government's goals would be expressed in terms of such outcomes. Which means that the public will be able to follow the policymaking process, and the attempted hijacking of it, much more closely. And there is more consensus over outcomes than the alleged means of reaching them.

So my thought, or hope, is that the lobby groups who would be included to oppose Social Policy Bonds would see the writing on the wall. The bonds mean the democratisation of policymaking. Lobby groups who want to see Social Policy Bonds fail would suffer public opprobrium and, more to the point, they would be doing so very openly. Lobby groups could still influence policy, but not in secret.

-  
Policy as if outcomes mattered  
SocialGoals.com

---

Anonymous (2007-05-01 06:29:00)

I don't think that too many powerful lobby groups will try and oppose SPB directly (as you say who can argue against lowering unemployment), but that they will take a strong role in the drawing up of the SPB conditions. This process will be by its nature complex for most bonds as there is a need to carefully define the bond conditions so that the bond holders do not achieve the required outcome through undesirable approaches (eg employing every unemployed person for one hour a week so that they no longer count as unemployed). The complexity of the bond conditions will provide many opportunities to turn the condition towards a lobby groups own ends, or include conditions that make

the bond effectively impossible and worthless.

I don't know how this problem can be avoided - if the bond conditions are made simple (and hence visible to the public) then the bond holders will have many opportunities to collect on the bond via technicalities. If they are complex (ie all the requirements carefully defined), then existing lobby groups have lots of opportunity for condition manipulation.

An Australian Reader

Ronnie Horesh (2007-05-01 07:44:00)

Thanks for your comment. You are right, but I would say that whatever the difficulties with formulating optimum conditions for redemption of Social Policy Bonds, they would be less than under the current system. To be sure, there would be technical opportunities to evade the spirit of any particular Social Policy Bond issue, but so too would there be a larger group of people both concerned to see that the bonds really do achieve society's goal, and with the necessary expertise to do so - at least to the extent that technical manipulation of targeted outcomes will be more difficult than technical manipulation of the myriad obscure regulations, processes and structures that govern the current policymaking system. Another point of course, is that the bonds need not be issued by the public sector. Philanthropists, non-governmental organisations, and groups of interested individuals could all issue their own bonds. Such issues would not only be more resistant to manipulation, but could serve as templates for future issues of government-backed Social Policy Bonds.

#### **4.4.13 Total Information Awareness (2007-04-26 13:38)**

Nearly four years after [US] Congress pulled the plug on what critics assailed as an Orwellian scheme to spy on private citizens, Singapore is set to launch an even more ambitious incarnation of the Pentagon's controversial Total Information Awareness program - an effort to collect and mine data across all government agencies in the hopes of pinpointing threats to national security. [1] Wired

I've long suspected that as policymaking become more and more removed from people, the resulting social stresses will lead in one of two directions: either malign or benign dictatorship. One cause of the widening gap between politicians and the electorate is the perhaps inevitable targeting of numerical indicators by governments of more than several hundred people. Unfortunately the targeted indicators are often implicit; chosen because they are readily available rather than because they tell us anything about societal well-being.

The targeted indicator par excellence seems to be Gross Domestic Product per capita. Singapore is perhaps the most focused exemplar of this subordination of virtually everything to quantifiable economic indicators. I can't fault the logic of the Singaporean Government's interest in the TIA - given where it, and most of the rest of us, are now. As society becomes increasingly seen as an adjunct to an economic system, the loss of community and possibility of social collapse call for government - never slow to expand its role - to provide a solution. If that government is both benign and prescient, then something like the TIA becomes inevitable. Not the worst option by any means, but regrettable all the same.

#### **4.4.14 Stupidity (2007-04-27 12:40)**

In March EU leaders agreed to set a binding climate change target to make biofuel - energy sources made from plant material - account for 10 per cent of all Europe's transport fuels by 2020. But the European Commission has admitted that the objective, which aims to cut carbon dioxide emissions, may have the unintended consequence of speeding up the destruction of tropical rainforests and peatlands in South-East Asia - actually increasing, not reducing, global warming. [1]Source

This shows the stupidity of targeting irrelevant numerical indicators. Humanity is not interested in how much transport fuel comes from plants. What we *are* concerned about is climate change. So why don't our 'leaders' target something meaningful, like climate stability? Why not target a real outcome, instead of one of the supposed ways of reaching it? Several answers spring to mind: the need to maintain the revenues of agribusiness corporates; government's reluctance to relinquish control over means as well as ends; government's long history of thinking a handful of experts knows more than the entire population about how to achieve social and environmental goals. In this instance these answers are probably all valid. It's particularly depressing, though, that the result will be to accelerate the irreversible sacrifice of yet more of our precious heritage to the perceived interests of the road lobby.

#### **4.4.15 Africa (2007-04-30 10:22)**

From [1]the Economist (subscription):

How can the outside world help Africa? There is no easy answer. ... The latest aid-givers' consensus is to identify "good" countries, still quite a small bunch, and let them spend the cash as they see fit. Yet time and again, good guys—most recently, Ethiopia's Meles Zenawi and Uganda's Yoweri Museveni—slip back into old despotic ways, putting aid-givers into a quandary. By punishing governments, are they not hurting the innocent poor?

It seems to me that Africa is crying out for outcome-based policy. A Social Policy Bond regime would inextricably tie rewards to outcomes. In Africa that is an urgent need. Also important is that Africa's problems are so desperate that the continent's wellbeing can be accurately targeted by quantifiable indicators, such as literacy, infant mortality, longevity etc. (That's not

always true in the rich world.) We see in Africa (and North Korea ) governments' total cynicism: they are quite happy to bargain away their citizens' lives for a few more years in power. We need ways of mobilizing people to remove government corruption, or to bypass or, failing that, to undermine recalcitrant governments, in order to achieve basic human needs for their people. Social Policy Bonds, whether backed by concerned in the west, or by wealthy individuals or NGOs, would do generate incentives for such a mobilization. The current political system is failing. True, 'there's no easy answer', but motivating people to channel their ingenuity into finding answers has hardly yet been tried.

Anonymous (2007-05-01 06:41:00)

It is hardly surprising when African leaders act corruptly when there is no effective legal system to hold them to account for their actions.

One solution might be to create a corruption resistant legal system, one that was not funded and staffed by the corrupt government. Once leaders knew that they faced an independent legal system then they may be less likely to engage in corrupt activities. We (ie the donor countries) could tie any aid given to the establishment of such a legal system.

An Australian Reader

Ronnie Horesh (2007-05-01 07:12:00)

Thank you for your comment and interesting an idea. I fear though that to impose an independent legal system on corrupt governments (and it would have to be imposed) could play into the hands of those governments; much like Robert Mugabe or most of the Arab leaders could cynically claim that colonialists or Israel caused all their country's problems. Rallying support against outsiders in this way, though not justified, can be quite successful.

Harald Korneliussen (2007-05-02 10:07:00)

Hmm, I see a potential problem. Imagine that there are bonds targeted to some good indicators of human well-being, and that they are quite ambitious, requiring perhaps a 25 % improvement for payoff. The country in question is peaceful, but hopelessly corrupt. Then figure that the bondholders see two options:

1. They can work for gradual change. This will almost certainly work, but it will be very hard to reach the 25 % target. Perhaps only a 5-15 % increase is feasible in the best case.
2. They can get some trusted people in, stage a coup/revolution, and roll out vast plans of improvement if they succeed. If it succeeds, the 25 % goal will be met, but it only has a 10 % chance of succeeding. If it fails, the country will be thrown into bloody civil war and horrible misery.

To the bondholders, the second case may seem more desirable, and that's not nice.

It seems to me that all bonds based on threshold levels (such as I believe your suggestion for Afghan literacy bonds were?) are vulnerable to this, but it could perhaps be avoided if payoff was

linked to the indicators in such a way that the holders would be guaranteed some payoff, unless they completely botched it.

I do not think this is an academic question. It seems foreign aid specialists face similar questions all the time, in deciding if sacrificing the best for the good is worth it.

Ronnie Horesh (2007-05-03 01:20:00)

Thanks Harald, I think you are correct in that this is not just an academic question. Social Policy Bonds would be radically different from the current system, and such potential pitfalls would need to be anticipated as much as possible. Issuers I think, at least for the first bond issues, would need to have provisos that stipulate that certain other indicators (such as one for violent political conflict, your example) shall not rise or fall by a certain specified level if the bonds are to be redeemed. Another possibility is that at first relatively unambitious targets would be chosen, so that bond issuers could see how progress is going before targeting bigger goals.

As you say, foreign aid organizations have similar problems in today's regime; as do foreign governments that genuinely want to improve conditions for the world's poor or to overthrow oppressive regimes. Being explicit about goals is one way in which minds would then be concentrated on the tradeoffs that may or may not be involved.

Harald Korneliussen (2007-05-04 14:22:00)

"Issuers I think, at least for the first bond issues, would need to have provisos that stipulate that certain other indicators (such as one for violent political conflict, your example) shall not rise or fall by a certain specified level if the bonds are to be redeemed."

No, that wouldn't work. Violent conflict would only come if option 2 went bad, and then the bondholders would have lost anyway. My point is that bondholders could still want to take the chance at option 2, if there was a threshold level for payoff, rather than a proportional one.

Ronnie Horesh (2007-05-05 12:07:00)

(Revised) Thanks again for making me think about this. Actually the provisos would be embodied in the bonds, so that at the time of issue, potential investors would know that if violent political conflict were to occur (for any reason) the bond issue would be invalid.

The problems you foresee though could arise with negative-but-unanticipated actions. This reminds me of the incentives to fund managers to take big risks with their clients' capital in order to have a higher chance of coming top of the tables in terms of returns. In both cases, the costs of the downside do not fall on the risk-takers.

This concern does seem to point to the need for either smaller incremental increases in targets, or to proportional payouts (rather than thresholds), at least until the Social Policy Bond principle has been tried and refined, and at least for those goals where it cannot be assumed that bondholders would follow the spirit of the bond issuers, rather than the letter.

But perhaps Social Policy Bonds with ambitious goals in practice would turn out to generate proportional payouts. Very ambitious goals would mean a very low market value for the bonds. People buying the bonds therefore could multiply their investment simply by, for instance, raising literacy in Pakistan by 5 per cent, instead of (say) 50 per cent. I think this initial group of investors would probably be unwilling to jeopardise the chance of such a large gain for the much smaller chance of a spectacularly

large gain if they were to organize a coup along the lines you imagine. The same reasoning would apply all along the path to redemption, especially if bondholders are a loose and shifting coalition of interests.

## 4.5 May

### 4.5.1 Bangkok (2007-05-03 01:21)

I arrived late last night from a long flight. My first experience of the new airport, and perhaps even more impressive, the lavish road connections into the city. Impressive in a technical sense. Thailand has severe social and environmental problems, most of which would benefit from well-directed government largesse. But it's prestige projects like airports and multi-lane highways that seem to attract much of the available funding. Perhaps they are seen as necessary to the country's development, and perhaps the Thai Government is making wise, long-term, necessary decisions, that will benefit its people in ways that are less obvious than giving a higher priority to the disadvantaged or the physical environment. I can't prove anything one way or the other. It just doesn't feel right, that the rich - who are the main users of air and private road transport in Thailand - are so obviously well served *by public funds*.

### 4.5.2 Lateral Thinking and Dangerous Precedent (2007-05-05 01:37)

Look at Iraq. If the US said they were going to leave on a certain date, then for every week without any killings, the date would move forward, and for every week with a killing, the later and later the date would be delayed. This way those who killed would not be seen as heroes but those keeping the Americans in the country. [1]  
Source

I don't know whether this would work, but Edward de Bono is surely correct when he says that we "have to be open to possibilities and willing to explore". That would include politicians, or at least those whom they employ to formulate policy. Unfortunately, the incentives work against those trying to think laterally.

Francis Cornford put it this way, a century ago in [2]*Microcosmographia Academica*:

The Principle of the Dangerous Precedent is that you should not now do an admittedly right action for fear you, or your equally timid successors, should not have the courage to do right in some future case, which, *ex hypothesi*, is essentially different, but superficially resembles the present one. Every public action which is not customary, either is wrong, or, if it is right, is a dangerous precedent. It follows that nothing should ever be done for the first time.

### 4.5.3 Widening the gap... (2007-05-05 02:09)

...between politicians and people, still further. This from today's [UK] [1]*Daily Telegraph*:

The internal politics of both Scotland and Wales now resemble those of most Continental countries more than they resemble the English. The voters do not directly elect a government. They create circumstances in which the political parties negotiate to decide which of them will form the government.

Harald Korneliussen (2007-05-07 06:16:00)

Sounds good to me, if by government they mean the executive branch. There should be no more power in the executive branch than it needs to be to keep day-to-day affairs running.

I don't like the British/US idea that government works best when one party has absolute control. When the people is divided, it's a good thing that parties have to work together in the executive branch. What it usually means is that they have to compromise on their more controversial points, and we get a government that nobody likes (when did that ever happen anyway?) but most can at least stomach.

Did I mention that I don't like the Daily Telegraph, either? Well, Matt's pretty good. And the crossword, although the threshold is quite high for us non-native speakers!

Ronnie Horesh (2007-05-08 16:19:00)

I take your point, but I think it's unhealthy for people not to know what policies they are voting for. The tendency then is to disengage from politics completely, to be cynical about all politics, and to resent every policy as being imposed from above. I'd like, of course, to see people voting for outcomes, along Swiss lines. I like the *Telegraph* for its website (all free). I'll take look at the crossword now.

#### **4.5.4 Social Policy Bonds and government sub-contracts compared (2007-05-08 16:09)**

Discussion with friends makes me want to highlight one of the less obvious features of Social Policy Bonds: they function as a tradeable contract not to deliver a service, but *to achieve an outcome*. The distinction is an important one: the risk of bondholders' failure to perform is borne by the bondholders, not the government - or taxpayer. This is contrast to the usual sort of government sub-contracting.

The other difference between a tradeable contract to deliver a service, and a Social Policy Bond issue, would be that Social Policy Bonds could be bought and held by anybody, not just people already involved in carrying out the target-achieving projects, or well set up to do so. So the range of possible bidders would not be limited to a few likely operators, but would be open to all who are prepared to do, or to finance the doing of, projects that would help achieve the targeted objective. The fact that anybody could be involved in the bidding for bonds at any stage would discourage people from making excessive bids, so ensuring that social objectives would be achieved as cost-effectively as possible. Compared with tradeable contracts, this would make ownership of Social Policy Bonds more fluid, which would mean more market liquidity, more transparency and an enhanced ability for the government to fine tune its priorities after the outcome has been specified and the bonds issued.

If the Social Policy Bond concept were to generate more market activity, it would make more practical the targeting of remote objectives; ones that may take years or decades to achieve. Many businesses would be reluctant to take on these goals without the possibility that they could benefit in the shorter run. Social Policy Bonds would allow them to do what they could to achieve the target, then benefit from selling their bonds at a higher price, letting the new bondholders continue the advance toward the goal.

#### **4.5.5 Countless ordinary people (2007-05-10 07:26)**

I suspect Thailand has some similarities with Japanese society when it comes to a hierarchy that seems to be rapidly losing its influence. [1]Robert Locke, writing about Japanese society, argues persuasively that 'what people are pursuing in the workplace is not so much money as the respect of the people around them.... [The Japanese] have understood that a large part of what money-seeking individuals really want is just to spend that money on purchasing social respect, through status display or whatever, so it is far more efficient to allocate respect directly.'

Rather than offer financial rewards we could perhaps reward people who help achieve societal goals with higher social status. An honours system could go some way toward rewarding people who forgo financial fortune for the good of society. Indeed, many countries have honours systems that are - or were - intended to do this. People also gain status merely by being admitted to exclusive societies, by working for a reputable organisation, or are pleased simply to be recognised in their role by cognoscenti. And many social reformers are quite happy to toil away without needing their efforts validated by any external body. They might be happier

for knowing that they are helping to improve the society in which they live but, for a very large number, their reward lies simply in knowing that they are making a contribution.

But whether for good or ill, the context within which social status is barely correlated with financial status is rapidly disappearing from many rich countries: social status is becoming more and more congruent with high levels of wealth and income. The British honours system, for example, which used to compensate dedicated people for the financial sacrifices they made for the public good, is more and more following the trend, making awards to entertainers and sportspeople who, whatever their other troubles, are not financially impoverished. There are still fields of activity, in the academic and religious worlds, for instance, wherein social status and monetary reward do not always go hand-in-hand, but they are shrinking or indeed reward activities that most of us would see as anti-social. Re-instatement of a popular culture that confers high status on those who achieve social and environmental goals would be a difficult task in our highly mobile world. It would have to be an evolutionary process. But in the meantime, facing severe and urgent social and environmental challenges, what are we to do?

Rejig the incentives, so that people achieving social goals are rewarded in what is becoming the only way we know (currently) how: financially. That's where a Social Policy Bond regime comes in.

The world is being destroyed - no doubt about it - by the greed of the rich and powerful. It is also being destroyed by popular demand. There are not enough rich and powerful people to consume the whole world; for that, the rich and powerful need the help of countless ordinary people. Wendell Berry, *Conservation is good work*, The Amicus Journal, Winter 1992

Which is not to blame the countless ordinary people. We are, after all, reacting rationally to the incentives on offer. Change the incentives and we can save the planet.

#### **4.5.6 Kyoto was never serious (2007-05-11 14:59)**

In an article entitled [1]*Kyoto is dead*, William Pesek writes:

Yes, public awareness [of Kyoto] is rising and we're talking about the effects of greenhouse gases more than ever. Former U.S. Vice President Al Gore even won an Oscar for his film "An Inconvenient Truth." Massive pro-environment rock concerts also are being planned. The word, as they say, is out. Sadly, that hasn't provoked the torrent of policy changes needed to stabilize the environment. Leaders even point to the controversy over the treaty itself as the reason carbon emissions are still increasing exponentially, diverting blame from their own inaction.

I'm not sure about 'exponentially', but Mr Pesek is otherwise quite right, I believe. Kyoto will never work, and its failure is worse than doing nothing. He is also right to imply that our goal is - or should be - to 'stabilize the environment'. Not, please note, to reduce anthropogenic greenhouse gas emissions, nor even to stabilize or otherwise manage the composition of the atmosphere. We need to stabilize the climate, broadly defined to include indicators of the effects that a too-volatile climate has on human, animal and plant life. For myself, I'm quite pessimistic about the chances that anything meaningful will be done. The government-corporate interests that essentially determine policy are too locked in to existing systems to do much about them, and so big and powerful that they tend to crowd out or subvert any initiatives that could counterbalance their biases. For proof of this we need only read this prognosis about the chances of reforming US farm subsidies, entitled [2]*Insatiable*, from the current *Economist* (subscription):

So will politicians seize the chance? The proposals that Mr Bush's administration has put forward would do little more than tweak the system. .... In all ...the administration's plans would do little to disrupt the existing cosy arrangements for farmers.

There we have it, readers. Decades after it was shown conclusively that farm subsidies are an environmental disaster, fiscal nonsense and socially inequitable, nobody has quite found the political courage to end them. But... on the off-chance that anyone with any influence actually wants to do anything meaningful about climate change I will continue to try to promulgate [3]Climate Stability Bonds, which, rather than generate attempts to game the system (a la Kyoto) would generate incentives actually to bring about climate stability. That is, if anybody out there sees that as a worthwhile goal.

#### **4.5.7 What chance have we got? (2007-05-14 10:14)**

Is there anything positive to say about agricultural subsidies? OK, they are largely capitalized into the value of farmland, making farmers work the land much harder, so exerting more environmental stress on land and water systems; to be sure, they are wasteful and regressive, because poor people spend a larger proportion of their incomes on food than the rich and it is the rich - agribusiness corporates, as well as wealthy landowners - who are their largest beneficiaries. Oh, and they help destroy the living of would-be exporters in the food-rich developing countries, so reducing the chances of those countries ever getting prosperous. But surely, a devil's advocate might say, they subsidise production and so make food cheaper? Not so, because much of the subsidies take the form of import barriers that raise the price of food.

Now Michael Pollan, writing in the *New York Time Magazine*, [1]describes and explains the disastrous effects that farm subsidies in the US are having on that country's health. His

entire article is well worth reading, but here are some excerpts:

[H]ow is it that today the people with the least amount of money to spend on food are the ones most likely to be overweight? ... [T]he rules of the food game in America are organized in such a way that if you are eating on a budget, the most rational economic strategy is to eat badly — and get fat. ... This perverse state of affairs is not, as you might think, the inevitable result of the free market. Compared with a bunch of carrots, a package of Twinkies, to take one iconic processed foodlike substance as an example, is a highly complicated, high-tech piece of manufacture, involving no fewer than 39 ingredients, many themselves elaborately manufactured, as well as the packaging and a hefty marketing budget. So how can the supermarket possibly sell a pair of these synthetic cream-filled pseudocakes for less than a bunch of roots?

For the answer, you need look no farther than the farm bill. This resolutely unglamorous and head-hurtingly complicated piece of legislation, which comes around roughly every five years and is about to do so again, sets the rules for the American food system — indeed, to a considerable extent, for the world's food system. Among other things, it determines which crops will be subsidized and which will not, and in the case of the carrot and the Twinkie, the farm bill as currently written offers a lot more support to the cake than to the root. ...

The result? A food system awash in added sugars (derived from corn) and added fats (derived mainly from soy), as well as dirt-cheap meat and milk (derived from both). By comparison, the farm bill does almost nothing to support farmers growing fresh produce. A result of these policy choices is on stark display in your supermarket, where the real price of fruits and vegetables between 1985 and 2000 increased by nearly 40 percent while the real price of soft drinks (aka liquid corn) declined by 23 percent. The reason the least healthful calories in the supermarket are the cheapest is that those are the ones the farm bill encourages farmers to grow.

The evidence against US farm policy is damning, overwhelming, and has been around for several decades. Yet still it, and the European Union's equivalent, persist. There has been some tinkering with both policies, but essentially they are unchanged. Our politicians cannot summon the will to challenge the entrenched interests they represent. Nor are the sums involved trivial. Estimates put the total support to OECD countries at around US \$300 billion every year. It is the persistence of farm policy and other perverse subsidies, despite the weight of the accumulated evidence that they are without a single positive feature, that make it seem unlikely, to me, that our political system can ever convincingly address challenges such as climate change, which demand coherent, urgent and radical action.

#### 4.5.8 Social Policy Bonds: the third way (2007-05-15 15:04)

Writing about organochlorines, Paul Hawken says:

Because of the slow maturation of human beings, we have not had sufficient time...to understand the multi-generational health consequences of exposure...However, we do know that these compounds play havoc with human physiology, with effects that include cancer, infertility, immune suppression, birth defects and stillbirths. [1]  
*The Ecology of Commerce*

We didn't know about a lot of such things. We didn't know that emitting greenhouse gases could cause catastrophic climate instability. As I see it, there are three ways of responding to such imponderables. We can adopt a strong version of the precautionary principle, which says that if there is a strong suspicion that a certain activity may have environmentally harmful consequences, it is better to control that activity now rather than to wait for incontrovertible scientific evidence. There's much to be said for this when looking at new processes, but applying it to current technology would, I think, mean a drastic reduction in the quality and quantity of human life that we could support. Another response is the current one: ignore the problems created by technology until they become emergencies that affect photogenic animals, or people with whom we identify. Then try to bribe or coerce the vested interests into scaling down their operations.

But there is a third way, which acknowledges that we cannot know in advance the likely results of new scientific or industrial processes. That would be something like Social Policy Bonds, which would specify targeted outcomes for human, plant and animal health; probably in the form of indices, but with minima for each identified species or environmental indicator. The profit motive would both enlarge and motivate the pool of people interested in exploring the likely effects of new technology on the environment and in working towards reducing their impact. A handful of politicians or government-appointed experts cannot anticipate every such impact in advance of the application of new technology. But participants in a market for Social Policy Bonds that target environmental health would have *continuous* incentives to look for and deal with planetary depletions before they become intractable.

#### 4.5.9 Try all else (2007-05-17 04:15)

John Bolton 'who still has close links to the Bush administration':

And if all else fails, if the choice is between a nuclear-capable Iran and the use of force, then I think we need to look at the use of force. [1] Source

My suggestion: try 'all else'. Decide and define what we want to achieve - a bomb-free Iran? a reasonable regime in Tehran? - and contract out that achievement to the market. Issue 'Iran Peace Bonds' that would become valuable in the event of nuclear peace in the Middle East. Give people incentives to achieve such a peace. This may sound radical, but the war alternative on offer would inflict much misery without any guarantee of success. Importantly too, most in the west appear to be [2]opposed to it. Iran Peace Bonds, depending on who backed them and how much finance they put up, would merely countervail the existing incentives for arms manufacturers and certain government bureaucracies to make war.

#### 4.5.10 Free trade and 'free trade' (2007-05-18 08:52)

There's free trade, and then there's 'free trade' as espoused by large corporations and their friends in big government:

Generally, great powers are willing to enter into some limited degree of free trade when they're convinced that the economic interests under their protection are going to do well. That has been, and remains, a primary feature of the international order.

The ethanol boom fits the pattern. As discussed by agricultural economists C Ford Runge and Benjamin Senauer in the current issue of *Foreign Affairs*, "the biofuel industry has long been dominated not by market forces but by politics and the interests of a few large companies," in large part Archer Daniels Midland, the major ethanol producer. Ethanol production is feasible thanks to substantial state subsidies and very high tariffs to exclude much cheaper and more efficient sugar-based Brazilian ethanol. In March, during President Bush's trip to Latin America, the one heralded achievement was a deal with Brazil on joint production of ethanol. But Bush, while spouting free-trade rhetoric for others in the conventional manner, emphasized forcefully that the high tariff to protect US producers would remain, of course along with the many forms of government subsidy for the industry.

Despite the huge, taxpayer-supported agricultural subsidies, the prices of corn — and tortillas — have been climbing rapidly. One factor is that industrial users of imported US corn increasingly purchase cheaper Mexican varieties used for tortillas, raising prices. Noam Chomsky, [1]*Starving the poor*, 16 May

It's the self-entrenching and self-reinforcing nature of such distortions that is most problematic. "It does not matter who has property rights as long as they are clearly defined, says a prominent school of economists, citing an insight that won the Nobel Prize for Ronald Coase." But, as [2]John Kay goes on to say (in the context of present-day Russia and Argentina a century ago), "the wrong choice coloured politics and society for a very long time." Subsidies for agriculture,

in all their guises, have gone on for several decades already. They are probably seen by their beneficiaries as a property right. They not only impede any movement toward a rational farm policy; they also empower those opposed to any meaningful reform.

#### 4.5.11 Two welfare systems (2007-05-20 08:05)

"In reality we have not one but two welfare systems.", writes Paul Hawken in the [1]*Ecology of Commerce*, "The first is meager, consisting of aid to the unemployed, dependent children, the poor and helpless. It is seen as charity, a hand-out, a grudging acceptance of social responsibility, but it is almost always accompanied by judgment, adminishments of failure, and a high moral tone. The second welfare system is large, expansive, and expensive. It comes in the form of large government grants and programs for building highways, subsidies to the rich in the form of interest payment deductions on their houses, giveaways of timber and mining rights on government lands, government-financed research in universities, revolving-door policies between the dense industry and government resulting in expensive, poorly planned procurement policies and so on. The list of recipients of these handouts from the government is long, but they are not seen as recipients of welfare. However, the fact is that three times as much housing subsidy goes to the top fifth of the population as to the bottom 20 percent who need it most."

The other crucial difference between the two welfare systems is transparency. The first is quite open, with assistance rates (rightly) widely published and accessible to all. The other is largely hidden from public view. That's why the work done, for instance, by [2]farm-subsidy.org is especially valuable: it uses freedom of information law to force European governments to release detailed data on who gets what from Europe's €55 billion Common Agricultural Policy. And it puts this data online. Also interesting is the OECD's work on [3]environmentally harmful subsidies, and research done by [4]Good Jobs First (see [5]this about subsidies to Wal-Mart, the world's largest corporation).

Transparency is one of the big advantages of a Social Policy Bond regime: it is built in right from the start. Under a bond regime, you might get public support for large corporations, wealthy landowners, corrupt construction companies or the [6]organized criminals who benefit so much from complex regulations enacted by big government. You might even get generous public support, though I think it unlikely. But if that were the case, the people giving their tax dollars to the wealthy and corrupt would be doing so knowingly, not, as at present, because the hidden part of our current welfare system is based on deception.

#### **4.5.12 Subsidising fisheries destruction (2007-05-23 06:53)**

From today's *Bangkok Post*, and also appearing in the [1] *Daily Telegraph* :

Pierre Gagnaire, whose Michelin three-star restaurant in Paris regularly wins plaudits as one of the world's best, said that there were now too many restaurants like his own, ploughing their way through large quantities of certain raw materials considered as delicacies. ... "in the next five to 10 years there will be no wild fish, only farmed fish. That will have a huge impact on not only cooking techniques, but also flavours and the dishes we cook."

Mr Gagnaire's fatalism is unfortunate, but probably justifiable. As a species, we still haven't got round to stopping subsidies to fishing, which are [2]variously estimated at \$6.7 billion annually (by OECD), \$15 billion (by the WWF) or \$14-20 billion (by the World Bank, in 1998). Disciplines on subsidies are supposed to be considered in the stalled Doha Round of trade talks, but as the [3]Global Subsidies Initiative puts it "the probability that new, tighter international disciplines on fish subsidies will enter into force any time soon is low." Note that any such disciplines would be imposed for reasons of economic competition, rather than conservation; no bad thing, but still.... Meanwhile, and from the same source, "According to the FAO, around 75 % of the world's commercial fisheries are fully exploited, over-exploited or significantly depleted."

Policy as if outcomes mattered  
SocialGoals.com

#### **4.5.14 Any change would be an improvement (2007-05-25 15:10)**

Not too many surprises in the UK House of Commons [1]report, released on 16 May, on the UK Government's *Vision for the Common Agricultural Policy*, (which was launched in December 2005). It was, says the report, a 'disappointing lost opportunity'. The report concludes:

The only long-term justification for future expenditure of taxpayers' money in the agricultural sector is the provision of public benefits. Payments should represent the most efficient means by which society can purchase the public 'goods'—environmental, rural, social—it wishes to enjoy. For these payments to remain publicly acceptable, it is essential that they relate directly to the public goods provided and that, in turn, these public goods are measurable and capable of evaluation.

That would certainly be an improvement on the current nonsense, but how far would even that vision take us? It would probably take us into the realms of 'multifunctionality', whereby farmers and their lobbyists identify such nebulous by-products of agriculture as employment in rural areas, or the failure of farmers totally to destroy wildlife everywhere in Europe, and demand payment for supplying them. If this sounds cynical, it's not: agriculture's 'multifunctionality' is a means by which large quantities of taxpayers' and consumers' funds are already siphoned off to farmers and agribusiness in the European Union. As if agriculture alone is multifunctional! You might also cite the multifunctionality of violent crime or arson - they generate employment for health care personnel, construction workers, ambulance drivers and the rest. There's a case for looking at *net* positive multifunctional benefits, but it's a difficult and inescapably subjective one, especially if other sectors were to start demanding equal treatment.

There is another way: immediately announce the phasing out of all subsidies to farming to be completed in ten years. Use the taxpayer funds saved to alleviate genuine poverty, and allow consumers to benefit from lower food prices. One result would be a drop in the value of farmland. This would relieve stress on the environment and allow more people to take up farming. You would see a substitution of capital by labour, and quite possibly an increase in total production, though that would not be an explicit policy goal. Then would come the time to take on board some of the UK House of Commons report: identify any further goals, social or environmental, *that the public is willing to pay for*, and reward people, perhaps by issuing Social Policy Bonds, for achieving them.

-

Policy as if outcomes mattered  
SocialGoals.com

#### 4.5.15 The ways forward are not obvious (2007-05-27 13:09)

All is not as it seems with systems as complex as the environment. You'd think that encouraging people to walk rather than drive would reduce fossil fuel use or CO<sub>2</sub> emissions? Think again.

The grinding, milling, wetting, drying, and baking of a breakfast cereal requires about four calories of energy for every calorie of food energy it produces. A two-pound bag of breakfast cereal burns the energy of a half-gallon of gasoline in its making. All together the food-processing industry in the United States uses about ten calories of fossil-fuel energy for every calorie of food energy it produces. That number does not include the fuel used in transporting the food from the factory to a store near you, or the fuel used by millions of people driving to thousands of super discount stores on the edge of town.... Richard Manning, [1] *The oil we eat* .

What about US agriculture as a whole?

In 1994, David Pimentel and Mario Giampietro estimated [that for every] 0.7 Kilogram-Calories (kcal) of fossil energy consumed, U.S. agriculture produced 1 kcal of food. [2] Source

Similarly, you might assume that travelling by train is kinder to the environment than flying or going by car. But in June 2004, 'Modern Railways' published an article, *Rail loses the environmental advantage*, which pointed out that high-speed rail can consume more fuel per passenger than cars or even short-haul aircraft.

This happens when electricity for the rail network is generated by oil- (and presumably coal-) fired power stations, which convert fossil fuel into oil-equivalent at only 40 percent efficiency. As well, for supposed health and safety reasons in the UK, rail passengers cannot travel in the front third of the two vehicles that drive the fastest trains, and there have to be 'seat-free crumple zones' as well as toilets for the disabled (each occupying the space of eight seats). The result is that you end up with trains of 186 seats that weigh 227 tonnes, or a massive 1220kg per seat.

All this is to say only that it's not always obvious how to proceed when confronting environmental problems, and that our first instincts are likely to be wrong. Unfortunately, such are the disconnects in our complex societies and economies that our first instincts are likely to be expressed as government reaction, and that can entrench or aggravate problems rather than solve them.

With very complex systems, I suggest an outcomes-based approach: don't try to think of the best way of solving a problem, but define the desired outcome, and reward people for achieving it, however they do so. That's where Social Policy Bonds come in: they would be redeemable for a fixed, high, sum, once the specified social goal had been achieved, *however it is achieved, and whoever achieves it*. Under the current political system government bodies are set up, or regulations enacted that attempt to guess the most efficient

way of achieving goals - if these goals are made explicit, which doesn't always happen. Or some funding is diverted from taxpayers to various interest groups that have stated objectives that sometimes sound as if they are congruent with those of society. But the reality is that there are no strong *financial* incentives for government or private agencies actually to achieve social social goals. In many instances the incentives are perverse. What happens to the police force in an area where the crime rate plummets? The organizational objective above all others is self-perpetuation, and that often conflicts with its stated objective.

So if our goal is to reduce greenhouse gas emissions, target that. If it's to reduce traffic congestion target that. Let the market work out whether doing these things means putting people into cars or trains, or replacing highly processed cereals with locally grown vegetables. In short: start off with the targeted objective, subordinate everything else to its achievement, and contract out that achievement to the market.

Harald Korneliussen (2007-05-29 06:51:00)

Now as a genuine peak oil worryer, I don't want to belittle the importance of our dependence on oil, but I have to point out that these "oil calories" numbers are grossly inflated. They are artifacts of highly creative bookkeeping: yes, tractors use fuel, and transport uses fuel, but very little per unit of food. A simple investigation into how connected food prices are to oil prices should show the weakness of these arguments.

Unfortunately, I can't trust any study that says hybrid cars are more lifetime efficient than SUVs, or that trucks are more efficient than trains, or vice versa, because there is just too much wriggle room in how the environmental costs are accounted for.

Ronnie Horesh (2007-05-29 12:34:00)

Thanks Harald; I saw a wide range of estimates for the 'oil calories' embodied in food and chose the lowest (by a factor of 10), so of course you are right to be skeptical. Much depends on the boundaries we choose for the analysis: do we include the oil cost of mining the metal that goes into the manufacture of the tractor etc? However, I'm not sure about arguing this on the basis of the absence of a relationship between oil and food prices. My recollection of Economics lectures is that the sale price of something is completely independent of its cost of production - at least in the short run. Both agricultural and oil prices are a complete fiction anyway; largely set by government subsidies and regulation. Farming in the rich countries seems these days to be largely about making capital gains from land value appreciation. However, the broader point and the one you also make is that a handful of government bureaucrats today has no idea whether walking or driving, cars or planes, hybrids or SUVs, etc is better for the environment today; still less which will be better in the future. Which is why I would argue that we should subordinate our policy to outcomes: contract the job of finding out the efficiency or otherwise of all the options to an adaptive and motivated market. Regards

#### 4.5.16 We are all hikikomori now (2007-05-29 03:40)

Jonathan Freedland, reviewing *Nemesis* by Chalmers Johnson, in the '[1]New York Review of Books', dated 14 June 2007:

Johnson provides an anatomy of one particularly egregious example, the expansion into space weaponry represented by the so-called National Missile Defense program (NMD). Patiently he demonstrates why a system aimed at intercepting nuclear bombs before they can land on America does not and could not work. For one thing, no one has yet worked out how to identify a hostile launch and no interceptor has yet been designed that can tell the difference between an incoming warhead and a decoy. The result is that NMD is nothing more than a boondoggle in the sky, at last count pulling in \$130 billion of American taxpayers' money, a figure which on current plans would reach \$1.2 trillion by 2015.

But the NMD pork-in-space project is far from exceptional. Seeking fat contracts, the big defense companies give donations to those politicians who will pay them back by commissioning expensive defense projects; the contractors then reward the politicians by locating their firms in their districts; finally the voters, glad of the jobs, reward the politicians by reelecting them. Johnson offers dozens of examples, including Florida's Democratic senator Bill Nelson, a member of the Armed Services Committee, who in the 2006 federal budget "obtained \$916 million for defense projects, about two-thirds of which went to the Florida-based plants of Boeing, Honeywell, General Dynamics, Armor Holdings, and other munitions makers." Since 2003, Nelson has received \$108,750 in campaign contributions from thirteen companies for which he arranged contracts. It's **a cycle** perpetuated by everyone involved: contractors, politicians, voters. Everyone benefits from this untamed form of military Keynesianism—except the next generations of Americans who can be expected to drown in a debt that now measures \$9 trillion and grows daily. (My emphasis.)

This is classic *policy as if outcomes are irrelevant*. It's as if a broad body of taxpayers' money were meandering slowly across a dry plain, forming runnels and rivulets and making a pattern that was almost random to begin with, but over the years has deepened into channels and rivers within steep banks, ever more distinct from the surrounding parched landscape. The flow of spending creates its own interest groups who lobby to keep it going in the established grooves. What about the barren land in between the channels? As far as policymakers and the beneficiaries of their largesse are concerned it doesn't matter. The problem for the rest of us is that this way of allocating resources has gone beyond enriching a few at the expense of the many; gone beyond even entrenching an underclass and reducing the quality of vital public services such as policing, housing and education. Worse is that the favoured sectors are big and powerful enough to set the conditions for much of the rest of our economy and society as well. Look at agriculture where the history of government intervention and subsidy is one of the longest: what has been the result of decades of 'support for the family farm' in the US and Europe? A social and environmental catastrophe: intense specialization, an empty, barren, overcapitalized countryside, and a dangerous level of industry concentration. My previous post mentioned the dependence of industrial agriculture on oil. Another disastrous side-effect is that the very large companies that produce much food in most rich countries

have also become potential vectors for mass infection. A single lot of hamburger meat at one US processing plant was once found to contain parts from 443 different cows (*Cheap chow*, the 'Economist', 8 March 2003, pages 77-8).

The externalities resulting from the way in which government not only picks losers but backs them with gigantic quantities of taxpayer funds are catching up with us all. Subsidized agriculture, subsidized oil consumption and extraction, subsidized construction and maintenance of an infrastructure that consistently favours the large over the small, the global over the local: the externalities go beyond the environmental quagmire in which we find ourselves and beyond even the lunatic weapons programmes. They extend beyond even the social collapse that makes the centre of the pretty historical town in England, where I am shortly headed, a no-go area after 7pm even in the long summer evenings. Perhaps the most insidious externality of all is the widening gap between ordinary people and the political system that determines so much of our lives. Policymaking is remote and unresponsive to the needs of natural persons. We become justifiably skeptical about our ability to change the system. Why bother? What chance have we got? Policymaking is shaped mainly by the interests of big business and its friends in government. It has little to do with the individual and nothing to do with the individual that stands out against the system. We respond by withdrawing from it, into a world of blogs and distraction, emerging briefly, maybe, once every few years to put a cross on a piece of paper. When it comes to influencing policy, unless we are chief executives of large corporations or at the very top of the government machine, we are all [2]hikikomori now.

#### **4.5.17 Individuals make mistakes, but governments' are worse (2007-05-30 14:39)**

[1]Jonathan Rowe hits the nail on the head:

The supposed "rationality" of homo economicus is necessary for the computer models. But in terms of reality it's out to lunch. ... Th[e] ultimate metric is the Gross Domestic Product or GDP, which is more commonly known simply as "growth." But growth is just the sum total of all our buying, much of which is questionable even by the people who do it. Spend a fortune on cigarettes, develop lung cancer, spend another fortune on medical treatments - and voila, growth up the kazoo. ... That there is waste in government is obvious; but the question is compared to what? We individuals are wasteful too. Corporations are paragons of waste, as a glance at executive compensation packages would suggest, Without waste, this thing we call an "economy" would grind to a halt.

One difference, though is that, as I think Milton Friedman pointed out, individuals learn, governments don't. But the point about flawed nature of the GDP metric is well made. It's not

only a metric, it's a *de facto* target of governments the world over. Individuals have more of an excuse for their waste: it's their own money after all, and the consequences mainly fall on themselves. Government, with its teams of officials, advisors, committees and access to academic experts has less of an excuse, and its mistakes have impacts on all of us.

## 4.6 June

### 4.6.1 Subsidizing environmental destruction (continued) (2007-06-01 18:49)

The Global Subsidies Initiative reports on subsidies to coal mining in the European Union:

Current production aid helps producers cover operating losses. It is used in Bulgaria, Germany, Hungary, Romania and Spain, where the E[uropean] C[ommission] report says coal mining would not survive without aid. Notably, the Commission adds that these countries have had limited success re-structuring their coal industry, with production costs only slightly reduced and in some cases increased. [1] Global Subsidies Initiative

### 4.6.2 The failure of western aid (2007-06-03 20:15)

One of the problems of the conventional approach to policymaking is that the risks of government failure are usually borne by the taxpayer. And one of the virtues of the Social Policy Bond approach is that if a government issues bonds, it is the bondholders who lose if they fail to achieve the targeted outcome. I'm currently looking at applying the bond principle to the poorest countries in the developing world. My work is made easier by the well-defined [1] Human Development Index, which is a broadly-based measure of development as measured by literacy, school enrolment, life expectancy and income. Billions of dollars of western aid to the poor countries have done little to help. As author William Easterly observes in [2] *The White Man's Burden*, western aid hasn't even provided the cheap fixes that could save millions of lives. Medicine that would prevent half of all malaria deaths, for example, costs just 12 cents a dose. A bed net that would protect a child from getting malaria costs \$4.

The top-down approach to aid has mostly been a disaster, as Easterly describes. It's uncoordinated and unaccountable and channels billions to corrupt leaders who steal or squander the money. And it measures success by the volume of aid dollars pledged rather than the results they generate.

That's the key. The current measure of success is that of the accountant, rather than the human being. Now no single figure can encapsulate all the variables that make up human well-being, but at the low levels of social welfare prevailing in the developing countries there is a strong correlation between objectively measurable indicators such as those comprising the HDI, and well-being. Social Policy Bonds targeting the HDI of the poorest countries would generate incentives for people actually to raise well-being, rather than distribute government funds. The citizens of these countries should benefit, but so too would the taxpayer in the west who, if the bondholders failed as miserably as western governments have, would not lose a penny.

### 4.6.3 Black Swans (2007-06-04 15:16)

Nassim Taleb the author of [1]*The Black Swan: The Impact of the Highly Improbable*, defines a Black Swan as an event that is unexpected, has an extreme impact and is made to seem predictable by explanations concocted afterwards. The *Economist* [2]reviewing (subscription) the book, says:

[W]hen faced with a Black Swan we often grossly underestimate or overestimate its significance. Take technology. The founder of IBM predicted that the world would need no more than a handful of computers, and nobody saw that the laser would be used to mend retinas.

The 'we' in the first sentence is key. If decisions about black swans or any other risky or uncertain venture are made by just a few people, then yes, they will make poor decisions. If those people can do so, they will do everything they can to validate their poor decisions. If they are in government they can do this successfully, so blocking any attempt to investigate or explore new initiatives. It is not just about technology ([3]Concorde (scroll down) and the Soviet experience come to mind) where government has a prodigious record in picking losers. It's also about the range and type of approaches that government through its interventions, encourages or blocks.

A top-down, one-size-fits-all approach to policymaking, just cannot adapt to changing events, nor can it easily vary its approach for differing local circumstances. When a government dictates *how* problems shall be solved, that can spell disaster. We see this in the

failure of foreign aid (see my previous post), as well as the ludicrous perverse subsidies such as those to agribusiness, fisheries or the coal mining industry. Government, unfortunately, is not content to specify outcomes and contract out the achievement of those outcomes to the market (which would be the Social Policy Bond approach). For myself, I'm concerned that government's preferred solution to climate change - cut back anthropogenic greenhouse gas emissions - will not do the job; we could end up with worst of all worlds: rampant global warming, and very high upfront costs. My suggestion? [4]Climate Stability Bonds.

#### 4.6.4 How respectable are Social Policy Bonds? (2007-06-05 20:00)

When I first began talking about Social Policy Bonds, 18 years ago, I thought in my naivety that the idea would sell itself. Now, bombarded with information of all kinds, as we all are, I'm not so sure. Some sort of filtering mechanism is necessary to keep out the dross and to ration decision-makers' scarce time. There is such an onslaught of trivia and junk that, regrettable as it may be, approval by people higher up the hierarchy can at least be understood as a rationing device, though it's difficult sometimes to approve of that.

Anyway, against this criterion, and after 18 years, how do Social Policy Bonds stack up? How respectable are they? Some years ago [1]Robert Shiller, Professor of Economics at Yale, [2]wrote to me in support of the Social Policy Bond principle. His book *The New Financial Order* mentions Social Policy Bonds briefly, and the [3]website for that book refers to them. One essay and presentation about Social Policy Bonds won an award by the UK-based Institute of Social Inventions - now the [4]Global Ideas Bank; another was a finalist at the inaugural [5]St Andrews Prize for the environment. I have given presentations about the bonds at the Organization for Economic Cooperation and Development in Paris, at Cambridge University, and at think-tanks in London and Melbourne. More about the record of Social Policy Bonds can be found [6]here and [7]here.

In recent years, progress appears to have faltered. The occasional flurry of enthusiasm for varied applications, which tends to die down after the initial burst of enthusiasm. The odd newspaper article published, the odd comment received on this blog site (for which I am grateful) and the odd mention in a published article (example [8]here). But the concept remains at the margin. Until it has been tried, discussed and refined, it's unlikely to take off, but until it finds a champion who sees it through, it's unlikely to be tried. I believe now that government in any form is unlikely to be the first to apply the bond concept. I have drafted a [9]handbook (pdf) to help guide private issuers of Social Policy Bonds should they be interested. As far as I know, nobody has actually taken up the challenge.

### 4.6.5 Destroying the countryside (2007-06-07 13:55)

From today's London [1]*Daily Telegraph*:

The catastrophic decline of farmland birds in Britain due to intensive farming methods is being mirrored across Europe, a new survey reveals. The red-backed shrike has become extinct as a nesting bird in the UK. Europe's farmland birds have declined by almost half in the past 25 years as a direct consequence of the Common Agricultural Policy, it is claimed.

What is disturbing is not so much the damage that the CAP is doing to the environment, nor its economic wastefulness, nor even its social inequity - it taxes the poor to [2]subsidise the rich. Rather it is the *persistence* of all these disastrous flaws, in the face of evidence accumulated over decades.

-

### 4.6.6 G8 and the protestors (2007-06-08 16:54)

The current *Economist*, [1]discussing the G8 Summit:

The main message of the protestors was rejection of policy-making that kow-tows to "global capitalism". As helicopters roared overhead, and water cannon readied for action, they pleaded for more debt forgiveness for the world's poorest countries.... Non-governmental organisations said the G8 pledges fell short. Oxfam, an aid group, argued that the \$60 billion proffered to combat disease added only \$3 billion a year to what had already been promised up to 2010. Greenpeace, an environmental group, said that despite the inclusion of America in work to reduce emissions, the Bush administration was "as far away as ever" from agreeing such reductions itself.

I have some sympathy for the protestors. I am skeptical about debt forgiveness: presumably the protestors would like the majority of people in the poorest countries to have a much improved standard of living. So would I, but I don't think debt forgiveness is a particularly useful way of achieving that; nor do I think that the sums disbursed to combat disease, whatever the total, will be allocated with any great efficiency. I'd prefer to see direct targeting of important goals by something like [2]Women's Literacy Bonds, rather than a prejudgement that the best way of getting there is to let (mostly) corrupt or incompetent governments off the hook. I am just as skeptical about top-down government-mandated efforts to reduce greenhouse gas emissions. Again, I think targeting [3]climate change itself has advantages over Kyoto. Nevertheless, I sympathise with the protestors, because I think they feel disenfranchised by a political system that has too many distortions and is too remote to take on board what most people actually want. Perverse subsidies (for [4]agriculture or [5]oil, to give two examples), against which I have railed in [6]previous posts, are the most obvious sign of this. Nuclear proliferation is another.

From the preface to [7]*Failed States*, by Noam Chomsky:

[S]ome of the primary characteristics of failed states can be identified. [One] is their tendency to regard themselves as beyond the reach of domestic or international law, and hence free to carry out aggression and violence. And if they have democratic forms, they suffer from a serious "democratic deficit" that deprives their formal democratic institutions of real substance.

One of the virtues of a Social Policy Bond regime, as I see it, is that by targeting outcomes it would bring concerned people and organizations back into the fold. It could reconnect ordinary people with their political system, which at the moment feels remote and unresponsive to their needs. There's nothing inevitable about this growing gap between natural persons and their policymakers. It's largely a result of a bias in favour of big business; a self-reinforcing favoritism that a reformulation of political goals in terms of outcomes could do much to correct. Whatever one thinks of the protestors against 'global capitalism', it's difficult to argue that their voices would be heard under the current regime if they took up conventional politics.

#### 4.6.7 Britons - hypochondria or non-participation? (2007-06-11 14:40)

The current [1]*Economist* (subscription) muses upon the British unhappiness with its current condition - which, to remind ourselves, is the envy of probably 98 percent of the world's

population:

Though the British have always been hypochondriacs, earlier bouts of intense self-deprecation—after the war, when bread was rationed and the empire fell apart, or the discontented late 1970s—have coincided with real hardship. By any sane measure, the current grouching doesn't. ... But these inklings [of British good fortune] tend to be submerged in the mud of disgruntlement: the same public is convinced that, in general, the NHS is a wreck. What explains this disconnect?

The *Economist* attributes the grouching and disgruntlement to hypochondria, but I am not so sure. I believe that if the British had achieved exactly the same conditions - in their health service, cultural makeup, educational achievement, and the rest - with more participation in the governance that brought them about, they'd be happier. Participation in defining and creating society's goals is an end in itself. Comparing the different Swiss cantons,

Messrs Frey and Stutzer [found] that a one-point increase in this democracy index, after stripping out the effects of the other variables, increases the share of people who say they are very happy by 2.7 percentage points. What this means is that the marginal effect of direct democracy on happiness is nearly half as big as the effect of moving from the lowest monthly income band to the highest [2] Source (subscription, possibly).

In Britain government is extremely centralised (see [3]here and [4]here, for instance) - at least in absolute terms - and has become more so since the early 1980s. And Britain itself has pooled sovereignty with the European Union. A memorable example occurred in 1996 when, despite its best instincts and against overwhelming economic and humanitarian logic, European Union foreign ministers, against British protests and pleas from Nelson Mandela's South Africa refused to allow free-trade negotiations between the EU and South Africa to begin, because that would have upset French farmers. Is it any wonder that Britons feel disenfranchised, and that this takes the form of unhappiness despite, what on any objective criteria, are enviable living conditions? It's not enough to give people the things you think they want. It's as important to let them make their own decisions. One way of allowing that to happen would be to formulate social goals in terms outcomes that are meaningful to real people, rather than have decisions made by remote government and big business in a mutual back-scratching exercise, as at present. (More about Professor Frey and links to his interesting work can be found [5]here.)

---

Harald Korneliussen (2007-06-15 13:59:00)

This idea the economist has, that people ought to be happy when the rest of the world is so much worse off, is just foolish. They know perfectly well that people are unhappy when they feel that they ought to have had it better.

So, you see people who enjoy a much more luxurious lifestyle than yourself, who definitively don't deserve it (I'm thinking of various sport, pop and movie stars, which Britain has plenty of). You feel less safe than you felt twenty years ago (bother that it may be more or less true, depending). You see that social mobility is abysmal, what you can attain is mostly determined by your parents. You see the PM going off to war even though a large majority is opposed - but Britons, unlike most in those multitudes of are worse off than them in absolute numbers, know that it wasn't supposed to be that way.

#### **4.6.8 Who cares about the grassroots? (2007-06-12 13:53)**

Commenting on the imminent closure of Waltham Forest public swimming pool, in London, 'the biggest and best swimming pool, the one used by club swimmers and triathletes and talented teenagers with dreams of competing for Great Britain in 2012', [1]Martin Samuel writes in today's London *Times*:

In the end, it is about priorities. An Olympic logo that could have been designed for nothing by the students in art colleges around Britain came in at roughly £400,000. The same sum would cover the year-on-year losses on the pool at Waltham Forest College until 2012 and beyond, yet we have no money to do that. ... To make the Olympic budget work, £2.2 billion has been taken from lottery funding. That is the reality of the London games. Big-ticket items constructed at the expense of grassroots sport.

This is the story the world over: the small and local sacrificed to feed the appetite of the large and global. Our political system is like our economic system. Things that really matter to people are given away, because they cannot be quantified and, especially, cannot be converted into monetary terms. It's happening to the environment and it's happening to social cohesion. It's not just Britain and it's not just sport. There is something very wrong with our decision-making mechanism when the aggregated wishes of large numbers of ordinary people are routinely under-weighted, while the financial demands of large corporations - including government agencies - assume over-riding dimensions.

Ordinary people in the current system find it difficult to articulate our concerns. One reason is that we have to make guesses as to how to achieve our goals. We might all want, say, better sports facilities for our children, and we might be prepared to give up the chance of hosting the Olympics for that goal. But to bring that about, how would the ordinary person make those wishes apparent to policymakers? Find people who believe the same thing, perhaps get a petition going, find sympathetic politicians to articulate your case.... But all this takes time, and in that time the the corporates - advertizers, property developers, broadcasters, and the rest - will have already made their case to government, and made it very slickly and persuasively too.

An alternative approach would be for policy to be subordinated to the goals of natural persons, rather than corporates. Broad health and social goals would subsume grassroots

sports objectives. Britain might still get to host the Olympic Games, but only if that were thought by the market to be the best way of achieving those goals.

#### **4.6.9 Failed States (2007-06-13 21:58)**

Writing about the United States Government's perceived need to 'reframe pretexts not only for [military] intervention but also for militarized state capitalism at home', Noam Chomsky writes:

It is sometimes argued that concealing the development of high tech industry under the cover of "defense" has been a valuable contribution to society. Those who do not share that contempt for democracy might ask what decisions the population would have made if they had been informed of the real options and allowed to choose among them. Perhaps they might have preferred more social spending for health, education, decent housing, a sustainable environment for future generations...as polls regularly show. [1] Failed States

(page 127)

Quite. If people want to subsidize at vast expense, high technology, non-stick saucepans, or the replacement of wildlife by oil-burning heavy machinery let us at least make those decisions for ourselves. Given the sums involved and the destruction and conflict such subsidies can create, they are hardly trivial. Any half-sensible outcome-based policymaking system, such as a Social Policy Bond regime, would give a high priority to the polls that Prof Chomsky refers to, rather than the short-term interests of corporate or 'defence' lobbyists.

#### **4.6.10 Government failure imposes large costs (2007-06-16 16:16)**

[1]Newt Gingrich in some recent spoken comments contributes the title of this post, and:

How many of you have ever gone online to check the location of a package at UPS or FedEx? In a room this sophisticated, it's virtually universal. ... The market has

led to the capital investment and the information technology and a corporate culture which is that productive. It can track millions of packages simultaneously in virtually real time. This is a fact. You experience it in your own life. Over here is, for example, the federal government, which cannot find between 11 and 13 million undocumented workers. Look at these two information systems. I've argued as a public policy matter... that if we simply allocated \$200 million to send a package to each person who's here illegally, that within 48 to 72 hours UPS and FedEx would have found them, we'd know where they are. It is so grotesque, it's funny, right? And yet in this city and frankly in most of the public administration and public policy and government courses in the country, you cannot get them out of the world that failed.

He and Noam Chomsky should get together - see my previous post. Government is so big and remote that it doesn't do things the voters want it to do; it *does* do things the voters *don't* want it to do; *and* when it does do things that voters want, it does them so badly as to be worse than ineffectual. A final quote:

[I]f you do want to have a system that has, for example, less carbon-loading of the atmosphere, I will guarantee you that an incentive-based and prize-based marketplace is going to get to solutions radically faster than a litigation and regulation-based model.

I agree.

#### **4.6.11 Government and monoculture (2007-06-19 19:16)**

Schools are now legally required to teach pupils to read using phonics, which involves blending letter sounds to form words. This method was already part of the [British] government's literacy strategy, but teachers had been previously encouraged to use a variety of methods. However, the [Jim] Rose review, which sought to address concerns about literacy standards among young children, concluded that phonics was crucial to raising standards. [1] The Guardian

Government influence on health, education and housing, to take just a few huge policy areas, is now so big that when it gets things wrong, the consequences can be calamitous. That has certainly been the case with its perverse subsidies, such as those to agriculture, which have devastated the physical environment, transferred wealth from the poor to [2]the rich, and led to the massive overcapitalization of farms in the west, rural depopulation and industry concentration. When government gets involved in something it is often well meaning; but it also imposes a uniform, top-down approach; it is incapable of adaptation and reluctant to terminate failed experiments. In agriculture the visual result is mile after mile of denuded

landscape devoted to highly specialized production - or non-production - of canola, wheat or whatever government bureaucracy favours in that particular part of the world. A series of monocultures, in short.

But monocultures, in agriculture or anywhere else, are inherently vulnerable. When things go wrong, they go wrong in a big way. So the news item excerpted above worries me. The capacity to respond and adapt to changing circumstances or new research findings or new techniques is essential. That is why I advocate policy subordinated to outcomes. If Social Policy Bonds targeting literacy were issued, they would have the capacity to adapt to every type of changing event: ideology, fashion or fad - which have so often bedevilled education - would be disregarded in favour of the targeted outcome. In education, literacy as in agriculture and the environment, diversity is essential. For a short paper about Social Policy Bonds aimed at raising women's literacy in the third world click [3]here. For a longer pdf text encouraging the private issue of bonds targeting literacy in a third world country (Pakistan), click [4]here.

#### **4.6.12 Wider motorways, wider motorways, and wider motorways (2007-06-21 10:08)**

It's probably a good idea for a government to build a basic road infrastructure, but whether taxpayers should fund much beyond that is questionable:

The [British] government's Highways Agency is offering £1.6bn to a private consortium to widen around 60 miles of the M25 to four lanes in each direction. It will take five years to build, will swallow tens of thousands of acres of greenbelt land, encourage yet more people to travel by car - and it will end up costing the taxpayer more than £5bn. [1] Source

Also in the UK, it is costing £21 million per mile to widen the M1 motorway. The cost of the total M1 widening project has risen from £3.7 billion to £5.1 billion. Interestingly, for the cost of widening 1.2 miles of the M1, the Scottish Executive will be able to [2]cut class sizes in Scotland to 18 pupils in the first three years of primary school by employing more than 500 new teachers.

Ok, it is not self-evident that allocating scarce resources to wider roads rather than better primary education is wrong. The question though, is does it reflect society's wishes? Who is making these decisions, and on what basis? As the disconnect between politicians and the people they are supposed to represent becomes ever wider, perhaps the most direct route for concerned people who want to make a difference is to [3]become a celebrity:

As serious public and political life has withered, so celebrity culture has expanded to fill the gap, often with the encouragement of political leaders desperate for some celebrity cover.

#### 4.6.13 Policymaking is over-specialised (2007-06-23 08:49)

One day during the 1919 Paris Peace Conference Lloyd George, the British Prime Minister was thinking aloud:

Mesopotamia...yes...oil...irrigation...we must have Mesopotamia; Palestine...yes...the Holy Land... Zionism...we must have Palestine; Syria...h'm...what is there in Syria? Let the French have that. Arnold Toynbee, quoted in [1]Paris 1919, by Margaret MacMillan

Throughout this fascinating book it's hard not to sympathise with the conference delegates. Whatever they decided was doomed from the start. They came as representatives of their countries or people - and by virtue of that, I think, they were bound to generate serious problems. Their success or failure was measured not by what they did for the wellbeing of their people or its individual members, nor even by the overall wellbeing of their people, but by a few not-always-meaningful indicators that become important mainly because they are shared by other interest groups. Let me try to clarify: in the case of the Paris Peace Conference, areas of control, political power, and reparations from Germany were the main things on the agenda. The remit of Lloyd George *et al* was not to maximise the total long-term wellbeing of their population: that's a difficult thing to quantify and difficult to explain to an opposition back home. Instead, a few, short-term and symbolic indicators were implicitly chosen as the ways in which the delegates' performance would be measured.

It's implicit in the form. The politicians of that time, as nowadays, are highly specialised; the result of a large gap between real people, and their alleged representatives. That gap was shrinking in the west, partly as a result of the social disruption caused by the Second World War (though there are ominous signs that it's widening). The politics of interest groups is quite distinct from the concerns of the individual. It is a specialised form, and its goals are specialised too. But when interest groups increase their power, as they tend to do, a vicious circle is set up. It is not always in ordinary people's long-term interest to classify themselves as 'British', or 'Muslims', or 'trade unionists' or whatever, to the exclusion of more human, rounded forms, but those are the labels that people in power will want to put on us. As with the Paris 1919 delegates, they are just as much victims of this misperception as the rest of us.

A world of warring factions, whether they be empires, nation-states, religions, social classes or whatever, seems to be the inevitable result.

One solution could be to do away altogether with the specialised group of power-wielders, or at least to curtail their powers drastically. A Social Policy Bond regime would do that in two ways. First, by taking away the (often exclusive) powers of government (and its corporate friends) to supply health, education and welfare services. Second, it would devolve decision-making about what society should and should not target away from a specialised caste of policymakers back to ordinary people.

---

#### **4.6.14 Librarians: corrupted by power? (2007-06-24 13:05)**

A quote from an interesting article by Tim Coates about UK Libraries in the current [1]*Reader's Digest* (pdf):

So high have expenses become—and so low is the attraction of the book collections—that the average book loan costs nearly £4...

Of course, libraries do many other things: they answer enquiries from the public, archive local history collections and, increasingly, lend DVDs, CDs and computer games. But still, £4 per book seems a lot, and I haven't seen that figure refuted on the web. Mr Coates hints at the likely explanation:

In one London borough with nine libraries, there are nine tiers of "managers" between the counter staff and the local councillor who is responsible for libraries. The Library Manager, who handles admin; the Librarian, who chooses the books; the Area Manager; a Library Management Team; a Senior Management Team; the Chief Librarian; the Head of Cultural Services; the Education Director and, finally, the Council Librarian. Recently I talked to a chief librarian who said that when she started in Glasgow 30 years ago, the library service had a City Librarian and he was the only person not based in a library.

The default setting for any group in a position of power seems to be to expand the numbers of that group and thereby expand its power. Sooner or later, the founding objectives of the group cease to be its animating force. Instead, self-perpetuation becomes its guiding principle, and control - over people, resources, whatever - becomes an end in itself. Trade unions, universities, schools, religious bodies, and large corporations: they are all subject to the same

corrupting influences. Most often, their power is circumscribed at some point by opposing power groups, and it is the results of the collision of these groups that gives us our current political and social system. Big problems arise, though, where the groups have interests in common that are in conflict with those of ordinary people. The UK Library System is a *relatively* benign example, but it still appears on the basis of Mr Coates' article, to represent a waste of resources that could certainly be deployed more usefully in Britain.

My suggestion is that we subordinate the existence and functions of social and environmental organisations to their goals. A Social Policy Bond regime would do this by inextricably linking investors' rewards to the bonds' stated objectives. Without achievement of those objectives, which would be written into the redemption terms of the bonds, holders would not be rewarded. For more about Social Policy Bonds, please click on the links in the right hand column.

#### **4.6.15 Things that do move (2007-06-27 15:53)**

Daniel Finkelstein, writing in today's London [1]*Times*, talks about Nassim Taleb's new book [2]*Black Swans*:

[Taleb] identifies fields in which experts are useful – livestock judges, test pilots, brain surgeons, accountants – and those where, as he puts it “experts tend not to be expert” – stockbrokers, personnel selectors, intelligence analysts. Simply, he argues that “things that move”, requiring anticipation and prediction, do not usually have experts, while “things that don't move” seem to have some experts. Politics is very definitely in the former category.

This confirms my thinking that, when it comes to finding solutions to problems in a fast-changing, diverse society, the market is going to do better than any panel of bureaucrats or experts. We need adaptive, diverse responses to our social and environmental problems, rather than top-down, one-size-fits-all government-mandated pseudo-solutions. Politicians do have their uses of course. Social and environmental *goals* don't change very frequently, and politicians can represent us quite well in articulating these goals, and helping make us aware of necessary trade-offs. Politicians are also good at raising the necessary public funds to help achieve these goals. These are "things that don't move", and politicians and their attendant officials do them well enough.

A Social Policy Bond regime would split up the required processes quite neatly. Whoever issues the bonds, whether government or a private organization, would specify the targeted social or environmental goal and allocate funds for the ultimate redemption of the bonds. But they would then contract out the achievement of the goal to the private sector,

a field in which "things move" and in which their expertise would count for little against the pluralist adaptability of highly-motivated investors in the bonds.

#### 4.6.16 Forecasts by scientists versus scientific forecasts (2007-06-29 18:31)

One of the virtues of the Social Policy Bond approach is that we can insure against things that may or may not be happening. Take climate change: if the market believes the climate is *not* becoming more unstable, then [1]Climate Stability Bonds targeting the current level of stability, would be valued at something close to their redemption value when floated. So the bonds' backers (most probably taxpayers) would lose very little. For this reason I'm in the happy position - intellectually - of not needing to have an opinion about what is happening to the world's climate. Climate Stability Bonds would be the most cost-efficient way of dealing with climate change whether we accept the scientific consensus or not. Correction: whether we accept the consensus of scientists or not. There is a difference, as the recent paper [2]*Global Warming: Forecasts by Scientists Versus Scientific Forecasts* (pdf) by J Scott Armstrong and Kesten C Green makes clear:

The forecasts in the [Intergovernmental Panel on Climate Change's Working Group One] Report [2007] were not the outcome of scientific procedures. In effect, they present the opinions of scientists transformed by mathematics and obscured by complex writing. We found no references to the primary sources of information on forecasting despite the fact these are easily available in books, articles, and websites. We conducted an audit of Chapter 8 of the Report. We found enough information to make judgments on 89 out of the total of 140 principles. The forecasting procedures that were used violated 72 principles. Many of the violations were, by themselves, critical. We have been unable to identify any scientific forecasts to support global warming. Claims that the Earth will get warmer have no more credence than saying that it will get colder. ...

Prior to conducting an audit, one might ask policy makers to say what information would be sufficient to change their opinions. People who are able to specify such evidence are often able to change their opinions. When we have used this question among academic researchers and students, we find that many of them are willing to specify such information. Disturbingly, however, many others are unable to even imagine that any information could possibly change their minds.

This paper could be seen as reassuring or threatening, depending on your viewpoint. Regardless, though, it is, as the authors say in the quote above, disturbing that basic scientific forecasting principles appear to have been violated. (See [3]here for an article inspired by the

paper.)

Anonymous (2007-07-02 07:28:00)

Hi Ronnie,

It's funny, I came across Armstrong's article a few days ago.

I haven't read it entirely, so I can't really discuss it. What put me off is that he (as so many others) claims to use scientific principles whereas others do not. In the chapter "On the value of forecasts by experts" he then quotes -what he calls- forecasts which turned out to be wrong. Does he really compare those to the climate predictions the IPCC is based on. Also he argues that Watt's statement from 1970 was a (wrong) forecast about temperature changes, when in fact Watt just said what would happen "[i]f present trends continue".

He is also cherry picking his references and grossly mis-interprets statements, e.g. says that Jim Renwick's statement about seasonal forecasting is a statement about global climate models in general.

Note that I do not want to make a judgement as to whether his conclusion is wrong or right, but his methods do not strike me as particularly scientific.

I have the **impression** that he is just frustrated because the scientific community ignores his "forecasting principles".

Cheers,  
Frank

Ronnie Horesh (2007-07-02 20:34:00)

Thanks Frank for your comment. I emailed Gavin at the excellent [1]RealClimate website, asking for his views on the Armstrong and Green paper. I'm sure he won't mind my publishing the gist of his response here:

"We saw this, but it's very badly done. The authors' ignorance about how modelling is done or what is actually being forecast is evident. For instance, they only looked at one chapter of the IPCC report when scattered throughout the three volumes are all the issues that they felt were ignored. 'Out of sample' tests? There are hundreds, but Armstrong et al gave it a -2 rating - that can only be because they don't know what the 'sample' is or how climate models are built and tested.

"Given the low level of diligence, plus the parroting of some of the least well supported contrarian literature (Carter et al? please!), one gets the sense that the biggest point of contention is that IPCC didn't cite Armstrong's book."

It seems you were right to be skeptical. Regards

1. <http://www.realclimate.org/>

Harald Korneliussen (2007-07-03 21:13:00)

If a social policy bonds regime came into action, and climate think tanks started investigating actions against climate change... well, one thing is certain, I wouldn't be investing in your climate think tank!

On climate science, it seems to me you still have a bit of that "sell the shovels, buy ditch digged bonds instead!" attitude.

Ronnie Horesh (2007-07-03 22:10:00)

Thanks Harald. I don't think I'd set up a climate change think-tank. Your choice would be whether to invest in the bonds or not. Any organization that results from the bonds would have as its objective that of achieving climate stability. Running a think-tank of any sort, if it were to happen at all, would be a byproduct of that goal.

But your main point is valid: I am more concerned about setting up policies that would encourage people to dig ditches, rather than to dig ditches myself. I could - and would try to - do both of course, but my comparative advantage is in policy, rather than climate change science. Actually I don't see the two activities as mutually exclusive alternatives. I think setting up systems that reward the achievement of climate stability will motivate, and enlarge the pool of, the people interested in actually achieving it. Regards

## 4.7 July

### 4.7.1 More mess (2007-07-01 16:16)

More from Daniel Finkelstein:

The best way of making good collective judgments is to aggregate many independent points of view. But tidy politics works on the opposite principle. it is organised as a conspiracy in which everyone defends everyone else's mistakes. [1]*Advice from a chimp (1) No experts (2) More mess, 'The Times', 27 June*

Unity, in other words, is more important to our politics, than outcomes. That's not so surprising. Political parties are only institutions, and like all large organizations their goals are not necessarily those of the individuals within them, let alone those non-members they purport to represent. Large corporate organizations do adapt - or they go under. So do political organizations, even including the largest, most secure of them all: ruling governments. The tragedy is that their death throes can be protracted and drag many thousands of people with

them. It's little comfort to know that the most reviled and hated regimes will one day come to an end; or even that corrupt, insane political programmes - step forward, Common Agricultural Policy! - are unsustainable in the long run. The long run can be very long, and the damage done to people and the environment by, say, the Soviet Union or the CAP, is largely irreversible.

Perhaps we need to look at a [2]new type of institution. One whose structure and activities are a byproduct of the outcome it targets, rather than the other way round.

#### 4.7.2 Nappies: latest news (2007-07-03 16:47)

The latest on cloth versus paper nappies (diapers):

[A] four-year research project ... found that the impact of burying disposable nappies in landfill sites was matched by the energy consumed and greenhouse gases generated by washing reusables or transporting them to laundries. [1]Thisislondon.co.uk

Environmental impact is a difficult concept to measure. How is one to weight the environmental impact of (say) washing cloth nappies in water heated to 100 degrees Celsius, against that of the harvest, transport and disposal in landfill of their paper substitute? At great cost (the study referred to in the quote above cost £30 million and took four years) you could probably compare the impact in terms of any one environmental indicator, such as water use, landfill volume, or even carbon footprint (assuming resolution of boundary issues). But even assuming a complete and accurate Life Cycle Analysis, there is no objective way of weighting the different impacts.

Social Policy Bonds applied to environmental issues have huge informational advantages over some conventional policies, particularly on a large scale. For instance, rather than try to evaluate the diverse impacts of the vast and ever-changing panoply of consumer goods and services, a bond regime would take a few broad indicators - regional landfill volume, air quality, climate stability - express its goals in terms of thresholds that must not be breached, then reward the achievement of those goals. Just how those goals are to be achieved is left up to investors in the bonds, competing with other would-be investors to find the most cost-effective ways of doing so. For more about Social Policy Bonds applied to environmental problems, click [2]here.

### 4.7.3 Subsidies to the rich (2007-07-04 22:14)

It's not just the UK that the transfers funds from the poor to the rich via farm subsidies. It's painful reading but you can read [1]here about how the US fails to look after the members of its military who suffer Post Traumatic Stress Syndrome:

The PTSD label is not only stigmatizing, but its symptoms are often mistaken for personality disorders and are blamed for behavioral problems like insubordination and substance abuse, resulting in a one-way ticket out of the military with no retirement pay or benefits.

And [2]here, about Maurice Wilder, "newly crowned king of the subsidies":

He received \$2.5 million in farm handouts from 2003 to 2005 ...making him the single biggest single recipient. Even the Bush administration is becoming embarrassed by the welfare state created for farmers. The president is thinking of limiting handouts to farmers to an adjusted \$200,000 per household.

---

Harald Korneliussen (2007-07-05 11:50:00)

That the military fails to look after their people who acquire mental illnesses, is unfortunately nothing new. Quite a few shell-shocked soldiers in WW1 were accused of merely being cowards.

### 4.7.4 I like this (2007-07-05 19:42)

From the UK [1]*Guardian*:

Voters [in the UK] will be given powers to decide how ten of millions of pounds should be spent in their neighbourhood under radical plans being unveiled today. In a potentially dramatic extension of direct democracy, councils will have to hold ballots before deciding where money should be targeted. It would mean that, for the first time, people could direct cash to areas that concern them most, such as parks, curbing antisocial behaviour, targeting drug trouble spots or cleaning up litter.

I think this is a good idea. It's part way toward a Social Policy Bond approach. Ideally the funding would be directed at specified outcomes, and there would be competition to achieve these outcomes. But even so, if this initiative takes off I think it would represent a big improvement over the current system. Voters are better educated and have access to more information

than they ever did when the current form of elections was set up. Direct democracy would encourage people to participate in the decisions that affect their lives - and [2]end in itself (may need subscription) as well as a means to further ends.

#### **4.7.5 (2007-07-08 16:12)**

'The Ideology of Development'

William Easterly writes:

Like all ideologies, Development promises a comprehensive final answer to all of society's problems, from poverty and illiteracy to violence and despotic rulers. It shares the common ideological characteristic of suggesting there is only one correct answer, and it tolerates little dissent. It deduces this unique answer for everyone from a general theory that purports to apply to everyone, everywhere. [1]Foreign Policy

Exactly. I'm bemused when commentators blame politicians for not having a coherent ideology or not being true to their party's principles. Ideological rigidity is a curse. It does nothing to achieve outcomes that are of interest to ordinary people, as distinct from ideologues and party hacks. We need adaptive, diverse strategies, not top-down, one-size-fits-all belief systems; they've been tried and and they have failed; they failed not because 'they were never fully adopted' but because ideology implies ... well, let Professor Easterly explain:

The ideology of Development is not only about having experts design your free market for you; it is about having the experts design a comprehensive, technical plan to solve all the problems of the poor. These experts see poverty as a purely technological problem, to be solved by engineering and the natural sciences, ignoring messy social sciences such as economics, politics, and sociology. [Jeffrey] Sachs, Columbia University's celebrity economist, is one of its main proprietors. He is now recycling his theories of overnight shock therapy, which failed so miserably in Russia, into promises of overnight global poverty reduction. "Africa's problems," he has said, "are ... solvable with practical and proven technologies." His own plan features hundreds of expert interventions to solve every last problem of the poor—from green manure, breast-feeding education, and bicycles to solar-energy systems, school uniforms for aids orphans, and windmills. Not to mention such critical interventions as "counseling and information services for men to address their reproductive health needs." All this will be done, Sachs says, by "a united and effective United Nations country team, which coordinates in one place the work of

the U.N. specialized agencies, the IMF, and the World Bank.”

So the admirable concern of rich countries for the tragedies of world poverty is thus channeled into fattening the international aid bureaucracy, the self-appointed priesthood of Development. Like other ideologies, this thinking favors collective goals such as national poverty reduction, national economic growth, and the global Millennium Development Goals, over the aspirations of individuals.

Actually I think national poverty reduction a laudable goal, though I share Professor Easterly’s doubts about aid bureaucracy’s other objectives.

The Social Policy Bond approach is different. It subordinates ideology to targeted outcomes. Any organization that comes in to being as a result of Social Policy Bonds will have goals that are exactly congruent with those specified in the bonds themselves. Its structure and motivation would be those that are most efficient at achieving those goals, which would be society’s targeted social and environmental objectives.

#### **4.7.6 The role of GDP (2007-07-11 19:13)**

Questioning the supplanting of Gross Domestic Product by an array of alternative indicators, [1]Daniel Ben-Ami writes:

The first point to note is that the attack on GDP is generally based on a caricature. Countless commentators have made the point, often as if it is their original insight, that GDP is not a perfect measure of human wellbeing. However, it would be hard to find anyone who would have made such a claim for GDP in the first place. No one – except perhaps the most hardcore economics geeks – cares about GDP numbers for their own sake.

I disagree. Perhaps nobody will *admit* to caring about GDP for its own sake, but it does seem to have become a *de facto* target for governments that either have no clear objective beyond staying in power, or an array of meaningless micro-targets that have little to do with well-being or can anyway be easily manipulated, at great deadweight cost to society. I also disagree with the author when he casts aspersions on the Millennium Development Goals.

These commit world leaders to such targets as eradicating extreme poverty and hunger, achieving universal primary education and reducing child mortality.

The first two of these I see as unquestionably valid goals; the last needs some qualification.

Nevertheless Mr Ben-Ami is, I think, correct to talk about the unpriced *positive* externalities arising from economic growth. I don't see much of this in the literature - though I have [2]posted about it, and it's reassuring to see it mentioned by someone else.

...if anything, GDP statistics underestimate the human benefits of economic growth. Having a larger economy itself has important benefits.

#### **4.7.7 Rail and the environment (2007-07-13 13:23)**

From the London [1]Times:

[S]ome trains on rural lines, such as the diesel Sprinter, are less efficient than 4x4s because they are often almost empty. Douglas Alexander, when he was Transport Secretary, said last year: "If ten or fewer people travel in a Sprinter, it would be less environmentally damaging to give them each a Land Rover Freelander and tell them to drive."

The better environmental choice between alternatives is not always obvious, and a lot of damage can be done by people in powerful positions prejudging *how* environmental objectives are to be achieved. They would do better to help specify these goals, and allocate funds for their achievement, but to contract out the actual achievement to people who will be motivated to do so efficiently and quickly. A Social Policy Bond regime would encourage the exploration and

application of the best ways of achieving the specified goals, and it would do so impartially. It would not assume, for instance, that rail, because it has apparently been the sounder environmental alternative in the past, will always continue to be so, under all circumstances. No handful of politicians or experts, however eminent or well meaning, can hope to keep track of the multifarious changing facts in the way that markets do. The information and the motivation are just not there.

#### **4.7.8 The limits of scholarly focus; or give greed a chance (2007-07-15 19:17)**

From Chapter 1 of [1]*Another Blood Century: Future Warfare*, by Colin Gray:

If an apparently convincing general solution to the problem of war were achievable, it is probable that someone would have discovered it by now. The fact that none such has yet been promoted suggests that the scholarly campaign against war may have been thoroughly misconceived. ... [War] is simply too rich a subject to be captured, let alone prospectively controlled, by the conclusions of general theory.

In this, writes Professor Gray, war is similar to disease: individual maladies can be treated and even cured but 'disease per se does not lend itself to direct scientific assault'.

I agree with this, as far as it goes, but I am more optimistic. Poverty has been reduced not because people have deliberately set out to do so, but largely as the byproduct - or positive externality - of people and corporations maximising their wellbeing in the market. Yes, government intervention and private philanthropy have played a large role in distributing some of this wealth to the poor and into the provision of public services, but the ultimate source of the funding for this was mainly the private sector. In the west the effects of disease as a whole *have*, in fact, been drastically reduced, though as Professor Gray says, this is not because scholars or intellectuals decided to focus attention on all disease and target it for reduction.

Scholars aren't going to bring about world peace. I don't know whether greater wealth is more or less likely to reduce the level of violent political conflict in the world. Perhaps the trickle-down effect of higher incomes and reduced poverty will make war less likely. Or perhaps by raising the stakes, and the availability and destructive power of weapons, it will have the opposite effect. But I think we can do more than simply be passive observers of the effects of globalised wealth generation on the incidence of war.

A Social Policy Bond regime would target *all* violent political conflict, including wars within and between states. It would not directly generate solutions to the problem of war, but it would give incentives to those who are currently engaged in conflict reduction and conflict resolution. It would also enlarge the numbers of people willing and able to work toward those ends. We

don't need systems, ideologies, more government intervention or more scholarship. Neither should we sit back and hope that war will be reduced or eradicated as a spin-off from world development. What we do need are adaptive, diverse solutions to the problems of potential or actual armed conflict in all its myriad manifestations. To see how the Social Policy Bond principle could be applied to one particular field of conflict (the Middle East), read [2]*Peace Bonds: Give Greed a Chance*.

#### 4.7.9 Japanese bureaucracy (2007-07-18 16:25)

Reading [1]*Dogs and Demons: the Fall of Modern Japan*, one is struck by how resistant the Japanese administrative class is to change, despite the disastrous effects its failings are having on the country, including the destruction of its natural environment. Here the author, Alex Kerr, contrasts the theoretical love of the Japanese people for nature, with what is actually going on:

It is impossible to get through a single day in Japan without seeing some reference - in paper, plastic, chrome, celluloid, or neon - to autumn foliage, spring blossoms, flowing rivers, and seaside pines. Yet it is very possible to go for months or even years without seeing the real thing in its unspoiled form. Camouflaged by propaganda and symbols, supported by a complacent public, and directed by a bureaucracy on autopilot, the line of tanks moves on: laying concrete over rivers and seashores, reforesting the hills [with a cedar monoculture], and dumping industrial waste.

Bureaucracy the world over is not subject to the checks and balances of the private sector. This can work to everyone's benefit, as when it does things that only governments can do, and does them well. A military victory, for instance, or successful economic planning - as in post-war Japan. But there's no self-limiting humility, little adaptivity to a changing world, certainly no internal pressure to change. Any such pressure has to come from the outside. But if government becomes too large, too monolithic, too powerful or too closed, it can resist such change, at the expense of its population, for decades. The worry is that the governments of the western countries are becoming like that of Japan, and the USSR: willing to use their powers, and the cynicism of an increasingly disengaged electorate, to resist change, and so enhance their capacity to enlarge their role - and ensure when inevitable change does come, that it will be painful, while in the meantime overseeing the destruction of the social and physical environment.

Against that, is the shrinking planet; people travel more and have greater access to information. They can, then, become more aware of the failings of their bureaucracy at home. Governments can resist that only by blocking travel and information flows, which is more and more difficult to do. But acting in the other direction are:

- migration; whereby the most ambitious and energetic of the mis-governed countries are more inclined to migrate than to improve things at home; and
- the growth of the centralised superstate, along European lines, whereby a single bureaucracy encompasses an enlarged area, making it more difficult for people to compare its performance with other bureaucracies.

Indeed, the impression one gets reading [2]Chomsky is of the use of power of the world's dominant bureaucracy - that of the the US - to subdue the independence of others. From many points of view, this is a bad thing, though possibly not the worst alternative. But it's bad in particular from the risk management point of view. Diversity of bureaucracies and the ability of people to compare them is one way, perhaps the most effective *benign* way, of getting them to represent their people's interests rather than their own.

The *methods* of the Japanese bureaucracy in the post-war decades were largely successful in achieving its aims, which were in turn largely compatible with those of the Japanese population. Those linkages may have broken in Japan and be fraying in much of the rest of the world, but a Social Policy Bond regime could bring them together again. Goals would be explicit, broad and agreed with greater public participation. Bureaucracy would articulate these goals, and raise the finance for their achievement. It would not direct funds directly to its cronies, but contract out the achievement of society's goals to the private sector, via competitive bidding. Amongst many other benefits, large-scale corruption of the sort that has destroyed so much of Japan's environment, would be a thing of the past.

#### **4.7.10 Japanese bureaucracy, continued (2007-07-20 22:10)**

How did it come about that the Japanese ceded so much power to the bureaucrats (see my previous post)? More from: [1]*Dogs and Demons: the Fall of Modern Japan*:

Before World War II, the bureaucrats had already consolidated power but had to share it with the armed forces and the big *zaibatsu* business cartels. After the war, with the army and the *zaibatsu* discredited, politicians, the press, and the public consigned their fate to bureaucrats, allowing them near-dictatorial powers and asking no questions. For a while, the system worked reasonably well....

Alex Kerr gives a full account of the damage that the bureaucrats are now doing, but the Japanese bureaucrats seem to have entrenched their power so deeply and pervasively that any change will occur only very late in the day, and is likely to be very stressful. The worry is that it is not just Japan; that the influence of government and big business, acting together as

they generally do, is becoming as self-entrenching in the west as in Japan. That may sound far-fetched but a single mad policy, the Common Agricultural Policy, has already done much to devastate the physical and social environment of the European Union's rural sector. It is still, decades after its faults were clearly identified, transferring wealth from the poor to the rich, and wasting billions of taxpayer and consumer dollars.

In that instance at least, there is nothing intrinsically self-limiting in bureaucrats' powers. Perhaps it's the comparatively small size of agriculture in Europe that allows it to continue to be subsidised in this corrupt, insane manner. While the CAP costs billions of dollars, it still represents only a small proportion of the EU's Gross Domestic Product. But it, and other perverse subsidies - or rather, their persistence in the face of widespread knowledge of their perversity - should be a warning. We need mechanisms that terminate failed policies rather than entrench them.

My suggestion, Social Policy Bonds, would do that by subordinating activities and funding to explicit, targeted, verifiable outcomes, rather than vaguely expressed declarations of intent that can easily be ignored.

#### **4.7.11 Chomsky on the Middle East (2007-07-21 20:25)**

Professor Noam Chomsky, in an [1]essay that encompasses a lot more, puts it accurately and eloquently:

The most extreme protectionism was during the Reagan years—accompanied, as usual, by eloquent odes to liberalism, for others. Reagan virtually doubled protective barriers, and also turned to the usual device, the Pentagon, to overcome management failures and “reindustrialize America,” the slogan of the business press. Furthermore, high levels of protectionism are built into the so-called “free trade agreements,” designed to protect the powerful and privileged, in the traditional manner. Imminent Crises: Threats and Opportunities

It's a long essay, and one that points to the huge gap between ordinary people, in rich and poor countries, and the governments that are supposed to represent them.

#### **4.7.12 Post 399 (2007-07-24 19:49)**

It's my 399th post on this blog, and maybe time to take stock. In the past couple of years there have been the odd flurries of interest in the Social Policy Bond concept, including at political levels maybe one degree of separation away from the very highest, but to my knowledge nothing has so far come of any of them. There seems to be a bit more interest in judging the performance of some agencies by outcomes, but I'm not aware of anything like the contracting out of outcomes (as against outputs) to the private sector, and especially not via anything like Social Policy Bonds, which would facilitate a fluid, protean structure subordinated entirely to the targeted social goal. My own work in Social Policy Bonds is therefore something of a holding operation. I write about one or two essays a year for the occasional competition. I maintain this blog, but after years of trying I rarely seek the interest of politicians, the media, and (especially) philanthropic organisations and publishers. I'm most disappointed by the philanthropists. My dozens of emails to anyone connected with established philanthropic bodies are, without a single exception, ignored.

For these reasons I'm particularly glad to read comments on this blog. To a degree, having made the work available is an end in itself. And I take some comfort from reading the lives of people like [1]Thomas Bayes, whose contribution to probability theory was discovered only after his death.

#### **4.7.13 Adaptability versus bureaucracy (2007-07-26 18:02)**

One of the features of Social Policy Bonds is that they encourage adaptive solutions to our social and environmental problems. The most significant determinants of our way of living were largely unanticipated. Corporations and their activities have led to great benefits (as well as costs) that have little to do with the personal gain of the entrepreneurs who set them up. These side-effects of individual self-interest (positive and negative externalities, as economists call them), in contrast to the plans of the private sector management, were unplanned. With the help of government intervention, they have led to a huge increase in the quality and quantity of life in the rich countries.

Until they grow big enough to influence government, most private sector companies adapt or go under. But their negative externalities of their activities are largely the responsibility of government, a monopoly. Government responds to social and environmental problems in ways that often do not adapt. Hugely wasteful, corrupt and malignant policies, such as farm subsidy programmes and other perverse subsidies, persist partly because they are too small in relation to the overall economies that support them.

Diversity helps: when people from democratic countries travel overseas, see the advantages of doing some things differently, and return home, that puts pressure on their governments to adapt. But what happens when government becomes so big that people cannot do this? Then there would be just one approved way of bringing about, say, climate stability and if that

didn't work, then there would be little pressure chance of alternative approaches, *despite the evident failure of the policy*.

We may well need governments that have very large geographical remits: even a form of global government. And there probably are universal values that need protecting by such bodies. But such values are outcomes, not ways of achieving them. We can have universal values and goals, such as the eradication of world poverty, 100 % literacy and numeracy, but we need diversity in the ways of achieving them. Then failed experiments will be terminated, and succesful ones widely adopted. A Social Policy Bond would be consistent with such an approach. It would target outcomes, not the ways of achieving them. Under a bond regime, those agencies, be they public or private sector, would survive and prosper only if they were efficient at achieving society's targeted goals.

-

Policy as if outcomes mattered  
SocialGoals.com

---

#### **4.7.14 Explicit goals (2007-07-27 19:12)**

Commenting on an [1]article about Henry Kissinger's role in US foreign policy, a Darian Diachock writes:

The pedestrian character of how these foreign policy wonks think fascinates me. You think ... PhD in some humanities field, experience in international trade, complex issues matrices, and so on. But no, it's "We need to humiliate them," or "We need to kick around some crappy little country to show we need business." Makes you realize that it's not brilliance but connections that results in high-level appointments. Certainly, the quality of thought isn't "high-level".

I would argue that any single mind, however brilliant, will be deficient when it comes to deciding what society's goals are and how to go about achieving them. When I write about Social Policy Bonds I tend to stress their efficiency as compared with current policymaking. But perhaps as important as any of those attributes is that they would change the way in which the very goals of policy are decided. The goals themselves would drive policy; under a bond regime a government would have to state its goals explicitly and transparently. Going to war for the petty reasons to which Mr Diachock refers, would be a hard sell. The goals of such an undertaking would have to be clearly stated. To attract investors they'd also have to be feasible and objectively verifiable. And, critically, they'd also have to be costed, in the sense that the *maximum* cost to taxpayers would be stipulated in advance.

The goals of many of our most costly policies are rarely specified very accurately. Governments are more comfortable with inputs (spending) decisions than with defining broad outcomes and rewarding those who achieve them, whoever they may be. It's partly for historical reasons and partly also because nobody likes to give up power. A Social Policy Bond regime would limit the power of government to specify how its goals shall be achieved, and

who is to be charged with achieving them. But government could still articulate society's goals, and would still be responsible for raising the finance to reward the achievers. These are things it could do quite well; more so when it has to convince a skeptical market about the validity and feasibility of its goals rather than appeal to a few highly-placed ideologues with their own agendas.

#### **4.7.15 Starting a drug habit (2007-07-30 18:37)**

It's a tragedy that even developing countries like Brazil are [1]subsidising the biofuels industry. As if they have no more pressing problems than expensive fuel. This policy is environmentally questionable, socially inequitable and will be financial nonsense as well. Like other perverse subsidies it is a short-term, televisual response to a set of long-term, global problems. How do such policies get made? Their stated objective sounds reasonable, at first hearing: to encourage local industry while giving a push to something green. But the real objective is to make life easier for agribusiness. Lobbyists for agribusiness the world over know this. They are the real beneficiaries of the farm policies that have done so much to depopulate the rural areas of the rich countries, to denude their countryside, to transfer wealth from food consumers to landowners and large corporates, and to hobble the food-rich developing countries on their path to prosperity. Brazil and the other Latin American countries should have learned from the west's mistakes.

Under a Social Policy Bond regime such corrupt policies would probably fall at the first hurdle. Few governments would get much support if they had openly to admit that their expensive subsidy programmes have one objective: to enrich the large agribusiness corporates. Instead, policy goals would be expressed in terms of outcomes for real people. A useful discipline, but one that evidently does not have to be followed by the Brazilian Government.

## **4.8 August**

### **4.8.1 Tools for an informed democracy (2007-08-04 12:50)**

Commenting on democracy's flaws, Nicholas Kristof, writing in Tuesday's *International Herald Tribune*, says:

[W]e should be able to respond to evidence of democracy's failings with something more than Churchillian resignation. So why not address the problem in [the US] education system, by teaching basic economics and statistics in high schools? Students usually now encounter statistics, if at all, in college. But simple statistics could easily be taught along with algebra in high school. Likewise, principles of economics could be taught in social studies classes.

Mr Kristof makes a strong case. With the current and widening gap between ordinary people and their supposed representatives, more, and *more informed*, public participation in policy-making would be [1]an end in itself, as well as means towards the worthwhile end of better outcomes for average citizens, rather than corporations and government agencies. That it's easy to fool people with no statistics can be seen (if you have broadband) in this fascinating [2]talk by Peter Donnelly.

Harald Korneliussen (2007-08-14 11:56:00)

I started reading some public choice literature today ("Collective decisions and voting" by Nicolaus Tideman), inspired by what I've read about voting systems.

We always talk about statistics, but I think it's even more worrying that people don't see the problems with getting accurate information out of an election.

#### **4.8.2 Policy goals are more stable than the means of reaching them (2007-08-05 14:45)**

One of the reasons that the [1]*Economist* (subscription, probably) gives for European companies not taking much interest in the carbon emissions market is that:

...in a business driven by government regulation, there is always the risk that fickle politicians might change the rules of the game, with unpredictable consequences.

Latvia is currently suing the European Commission for an increase in its allocation of allowances. There are another five such cases, and if any of them succeeds 'it could contribute to another glut in allowances and another slide in the [emissions] price'.

I don't see emissions trading as very wondrous. It might succeed in cutting emissions,

but it will do so less efficiently than a carbon tax which itself, in my view, is far inferior to a [2]Climate Stability Bond regime, which would reward people for actually stabilizing the climate, rather than inflict grievous upfront costs on the basis that cutting anthropogenic, according to 1990s science, is the most efficient way of reducing climate change. The argument in the *Economist* points to similar reason why, I believe, a Climate Stability Bond regime would be preferable: he the stated policy goal - a more stable climate - is less variable than the alleged means of getting there. It is not just our rapidly expanding knowledge of the magnitude, causes and consequences of climate change that threaten to invalidate Kyoto as a policy, but the vulnerability of Kyoto to political meddling - of which the *Economist* gives but two examples.

Not only that, but it would be much easier to achieve public participation and support for policy goals than for the alleged means of reaching them. Everybody wants to see climate stability and I am sure there would be more support for Kyoto if it could be shown that cutting anthropogenic greenhouse gas emissions were the most efficient means of achieving it. A Climate Stability Bond regime would contract out the achievement of climate stability to investors, who would have powerful incentives to explore and implement the most efficient solutions to climate change. It would be up to those investors to adapt their efforts and while they would have to react to new information, they would not have to allow for changing views of politicians as to the value or otherwise of the targeted climate stability objective.

### 4.8.3 Insurance against media hype (2007-08-08 14:05)

Amongst other points well made, Edward Luttwak says:

[H]umanitarians should note that the dead from Jewish-Palestinian fighting since 1921 amount to fewer than 100,000—about as many as are killed in a season of conflict in Darfur. [1]The middle of nowhere

Media attention distorts many of our priorities. It means we are far less concerned about Darfur than the Middle East. If we were indifferent between war-induced deaths in either region, we'd focus a larger share of our scarce peace-making resources on Darfur. Even if policymakers are genuinely so indifferent, the clamour arising from unequal media coverage means their resolve to do the rational thing quickly crumbles.

A Social Policy Bond regime would be different. Its goals would be stable over time. Say a consortium of peace-makers, in conjunction perhaps with the United Nations, aimed to reduce global deaths arising from violent political conflict. Investors in the [2]Conflict

Reduction Bonds that such a body might issue would concentrate their efforts *impartially* on those regions where they could maximize the number of lives saved per dollar. Importantly, they would not be swayed from that goal by ephemeral events, such as the availability of film footage from the Middle East, and the absence of reporting from Darfur.

#### **4.8.4 Great share prices; shame about the calamity (2007-08-11 13:16)**

In the absence of systematic targeting of numerical indicators, there is a risk that governments will implicitly, and perhaps unintentionally, target indicators that do a poor job of measuring societal wellbeing. Gross Domestic Product is one such indicator. It fails on many counts: most notably it does not measure environmental or social health; nor does not take into account leisure time. Another dangerous target is the value of leading shares. The Ludwig von Mises Institute brings us [1]this story, from the catastrophe that is Mugabe's Zimbabwe:

Zimbabwe is in the middle of an economic disintegration, with GDP declining for the seventh consecutive year, half what it was in 2000. Ever since President Mugabe's disastrous land-reform campaign (an entire article in itself), the country's farming, tourism, and gold sectors have collapsed. Unemployment is said to be near 80 %.

But something odd is happening.

The Zimbabwe Stock Exchange is the best performing stock exchange in the world, the key Zimbabwe Industrials Index up some 595 % since the beginning of the year and 12,000 % over twelve months. This jump in share prices is far in excess of increases in consumer prices. While the country is crumbling, the Zimbabwean share speculator is keeping up much better than the typical Zimbabwean on the street.

The authors of this report attribute this to the rise in the money supply - and wonder how much of last 25 years' growth in western share markets is a result of similar increases in the rich world, and how much is due to wealth creation. My concern, though, is with the unsystematic use of indicators, that might lead those in government to regard the health of (say) the sharemarket or even 'the economy' (as measured by GDP for example) as accurate measures of society's welfare. In large societies some sort of numerical aggregates are going to have to be measured and targeted: I'd like such indicators to be measured explicitly, and to be inextricably linked to social and environmental wellbeing. In other words: government should aim to achieve outcomes that are *meaningful to real people* - as distinct from corporations.

#### **4.8.5 How many minutes to midnight? (2007-08-14 12:53)**

Writing about the [1]Middle East's nuclear surge in the *International Herald Tribune*, the authors, after discussing Iran's ambitions, say that:

...[the] countries that control over one-fourth of the world's oil supplies are investing in nuclear power programs. This is not about energy; it is a nuclear hedge against Iran. ... Egypt and Turkey, two of Iran's main rivals, are in the lead. Both have...announced ambitious plans for the construction of new power reactors. ... Not to be outdone, Saudi Arabia and the five other members of the Gulf Cooperation Council (Bahrain, Kuwait, Oman, Qatar, and the United Arab Emirates) at the end of 2006 "commissioned a joint study on the use of nuclear technology for peaceful purposes." Algeria and Russia quickly signed an agreement on nuclear development in January 2007, with France, South Korea, China, and the United States also jockeying for nuclear sales to this oil state. Jordan announced that it, too, wants nuclear power.

There's a real mismatch between the incentives on offer. The short-term financial gains to western suppliers of nuclear technology have far more leverage, currently, than those of us who are concerned both that nuclear proliferation is a problem in itself (if it discourages actions against oppressive states) and a precursor of catastrophe. But the payoff from an exchange of nuclear weapons though large, is diffuse and of uncertain magnitude and timing. The opportunity costs of not selling nuclear technology to the Middle East outweigh, at least in the minds of those making the decision, such nebulous gains.

A Social Policy Bond regime that rewarded nuclear peace - defined as the absence of the explosion of a nuclear weapon - would rebalance the incentives. Currently those who would oppose such an explosion are (presumably) in a massive numerical majority, but have few means of expressing their wishes in a way that is likely to forestall nuclear proliferation. Neither do we know how best to bring sustain nuclear peace. The tendency therefore is to assume that governments will sort it out, with the support of hard-working, well-intentioned non-governmental organizations. But all the evidence points the other way. We need to make the incentives to maintain nuclear peace at least as convincing as those working to undermine it. We might not know exactly how to reduce the chances of a nuclear exchange, but we have no excuse for not encouraging people to find out. We could issue Nuclear Peace Bonds ourselves, or encourage our governments to do so collectively. See [2]here, for a short paper on Conflict Reduction Bonds, which outlines the principles involved.

#### **4.8.6 Meaningless environmental targets (2007-08-16 12:08)**

It seems EU leaders [1]agreed at their summit in March that there should be a 10 percent target for biofuel use. There is also [2]a 20 % target for the proportion of EU energy from renewable sources by 2020.

This is exactly the sort of political gesture that gets us into trouble. Targets like these are not valid ends in themselves. They are a means to uncertain, unspecified, vague environmental objectives. So why not specify exactly the objectives we want to achieve and target them directly? Politicians would actually be quite good at that: one thing they do well is to articulate society's goals and raise the revenue necessary to achieve them. Where they fail is in specifying *how* our goals shall be achieved. Biofuel use is contentious on many grounds, and renewable energy is not necessarily better for the environment than, for example, energy conservation. When it comes to deciding how to achieve objectives politicians' record of failure is abysmal.

Thankfully these particular follies are being widely challenged before they can create and enrich interest groups whose *raison d'être* will be to oppose them. A contrast to agricultural support programmes and other perverse subsidies, which do so much to waste billions of dollars, transfer wealth from the poor to the rich, and devastate the rural sector's physical and social environment, and which persist decades after their failings became known.

#### **4.8.7 Supermarkets and farmers (2007-08-19 12:31)**

'Farmers complain of ruthless buyers', says the [1]*Sunday Telegraph*. Farmers are complaining about the buying power of the big supermarkets in the UK. It's difficult to feel sympathy for the farmers, most of whom are essentially recipients of government welfare, though, perhaps because it's much [2]higher than normal welfare for disadvantaged people, it's goes by the names of subsidy and protection. (You can find out how much individual farmers in the EU receive [3]here.)

Yet there is a case to be made against the supermarkets. They are not exactly the subsidy-free market-driven businesses they would have you believe. They benefit from a government-financed transport infrastructure that systematically benefits the large and global at the expense of the small and local: roads, ports, airports. Much of the subsidies supposedly directed at farmers in fact ends up with large agribusiness corporates. (One

measure of this is farmers in Europe pay much more for things like veterinary products than do their counterparts in subsidy-free New Zealand.) Industry concentration is a result, and the supermarkets benefit from this too. They also can manipulate and benefit from a regulatory environment that tends to favour large businesses at the expense of small.

#### **4.8.8 Scary (2007-08-20 09:40)**

Not directly related to Social Policy Bonds, but fascinating all the same. A [1]letter from Raimondo Salomonem of New York, published in today's *International Herald Tribune*:

The problem with nuclear weapons is that there is never room for even the slightest error. If any nation, or a non-state actor launches a missile, the consequences would be catastrophic. There has been more than one very close call in the past. In 1988, in the mud-caked woods of West Germany, I was stationed on the front lines of the Cold War. I was a member of a Pershing II nuclear missile-launch team. Our missiles were aimed at Moscow and were capable of zeroing in on a trash pail in Red Square. One rainy night, during a field expedition, a sergeant accidentally allowed the tail end of a 40-foot long launch trailer to slide off the road into a ditch. This forced the missile on the trailer's bed to point its nose up to the sky.

Years later, I read a book written by a Soviet defense official who recounted how they locked on that missile - the reports they received said the missile had been erected in what was considered an extremely hostile offensive maneuver. Until we managed many hours later to tow the trailer out of the ditch, the Soviets had been on a heightened state of alert. It was only until they saw us secure the missile in a hangar that they stood down. A sad fact, among many potentially sad facts in this incident, was that the missile in question was a dummy, used only for training. This was a very close call that brought us perilously close to the type of flash point that would send the world into destruction. Forget treaties. Future leaders should hold summit meetings, not fishing trips. When the subject of global warming comes up in conversation, I silently hope to myself that we will be around long enough to see if it happens.

#### 4.8.9 Evolution or incentives? (2007-08-22 07:56)

From an [1]article about Gregory Clark's *A Farewell to Alms*:

Historians used to accept changes in people's behavior as an explanation for economic events, like Max Weber's thesis linking the rise of capitalism with Protestantism. But most have now swung to the economists' view that all people are alike and will respond in the same way to the same incentives. Hence they seek to explain events like the Industrial Revolution in terms of changes in institutions, not people.

Dr Clark, though, argues that institutions and incentives have been much the same all along and explain very little, which is why there is so little agreement on the causes of the Industrial Revolution. He believes natural selection - genetic transmission of capitalist values - is the answer. To me this sounds far-fetched and unnecessary, though I haven't read the evidence that Dr Clark has compiled. I don't often find myself in the position of agreeing with "the economists' view", but I do think incentives are critical. Looking at the failure of certain countries to develop, I can't point to any lack of resourcefulness on the part of their citizens. More compelling to me is how this simple question would be answered: "if people work hard, what is the chance that they will be allowed to keep most of their earnings?" For most societies in the past, and for many today in the poor world, that probability has been too low to make capitalism worthwhile.

1. <http://www.enw1.net.ru/?q=node/2472>

---

Harald Korneliussen (2007-08-27 12:11:00)

This author takes the "economist's position" that people are equally capable of responding to incentives, to turn it on its head and recycle the old arguments of racial superiority.

But he's trying to answer a question that has already been answered far more plausibly by Jared Diamond in "Guns, Germs and Steel" - fully from the "economist's position", that there are no significant differences in inherent ability to respond to incentives.

The economist is arguing for biological explanations, and the biologist for economical ones...

I came across [1]this article which tells about the historical tension between economists and racists, and it probably did more to better my impression of your profession than anything else I can think of. I would read that as background to Clark's claims.

Unfortunately, many modern econ-bloggers seem to be flirting with the zombie of scientific racism.

1. <http://www.econlib.org/LIBRARY/Columns/LevyPeartdismal.html>

Ronnie Horesh (2007-08-29 07:37:00)

Thanks Harald for your comment, and the link to the fascinating Levy and Peart article.

#### 4.8.10 Orangutans v biofuels (2007-08-24 08:17)

An interesting [1]discussion at *Grist* where Peter Madden asks whether those concerned about the environment are too obsessed with climate change?

There certainly are trade-offs between tackling different environmental issues. And with a limited pot of money, other important areas can suffer. Policies can be in conflict, too. Remember the catalytic converter in the 1980s: good for tackling pollution, but bad for fuel efficiency. And bad for biofuels today, which may be good news for tackling climate change; but if poorly sourced, is very bad news for orangutans.

How should we go about sorting our environmental priorities? The problem is one of weighting entirely different environmental impacts. We'd all like to see climate change reduced *and* pollution fall *and* more orangutans, and, for that matter, better healthcare, lower crime rates and all the rest.

In the absence of systematic weighting, or explicit consultation, these decisions are made (or fall out of) the political process. Unfortunately, rationality and the society's wishes or even our best interests are poorly served. More potent as policy drivers appear to be lobby groups on behalf of vested corporate and bureaucratic interests, and events for which there is video footage that can be shown on television.

There are genuine difficulties with weighting the diverse, competing demands for society's scarce resources, but a large part of the problem is that we have little idea of how much solutions to our diverse problems will cost.

Social Policy Bonds could be the answer. They have an advantage over most other instruments in that the cost of achieving the targeted outcome is minimised and capped. And it is the market that decides on how much the solution to a targeted problem will cost. Bonds aiming to increase climate stability, for example, would convey extremely valuable information to the public and policymakers about the actual cost not only of achieving the targeted degree of stability, but about how much extra increase in stability will cost. The market for the bonds is elegantly efficient in conveying information about the cost of achieving objectives and, crucially for policymakers, how this cost varies with time and circumstances. This information is immediate, upfront, and available to all. It is determined not by a handful of so-called experts, but by competitive bidders who have incentives to get it right.

Immediately, then, half of the policy conundrum is resolved: we have best estimates of the costs of, say, protecting orangutans and increasing climate stability. We could say that raising climate stability by 1 percent will cost \$x, while maintaining current numbers of orangutans will cost

\$y. We could say that raising literacy rates by x percent will cost the same as reducing air pollution by y percent. (My post [2]here discusses information markets, which, as far as I can tell, generate the same sort of information as Social Policy Bonds but do not seek to modify behaviour.)

#### **4.8.11 Fisheries (2007-08-27 12:53)**

Of the fish caught by English and Welsh commercial fishing vessels in the English Channel, Western Approaches, Celtic and Irish Seas between 2002 and 2005:

63 per cent ...weighing 24,500 tons, were thrown back over the side. Few if any of these fish would survive because trawling ruptures their swim bladders. [1] Fishermen 'discard two-thirds of catch'

*Daily Telegraph*

It would be exhausting as well as upsetting to explain the tragedy of the world's fisheries. The root causes are probably similar to the parallel fiasco of industrial agriculture: highly visible, noisy and utterly self-interested lobbyists; a focus on yields per dollar to the exclusion of anything else; lack of political courage.... Policy instruments to address the environmental calamity have been useless, focusing mainly on ineffective and inefficient input controls. Farmers in the west seem to accept a downgrading of their role as food producers in favour of glorified landscape gardeners, working for the government and subject to monitoring and surveillance - in return for handsome subsidies from taxpayers and consumers. But it's difficult to see the world's fisheries people, whose identity is bound up with pursuit of a wild resource, in that role.

Perhaps then the state of the world's oceans would be suitable for application of the Social Policy Bond principle? The goal - biological health, expressed as some index of the world's marine plant and animal species - would be shared by almost everyone; it's the means of achieving it that are proving elusive. And, in contrast to perhaps to agriculture, there seems to be no amount of government-backed monitoring that will stop people degrading the environment for their own short-term purposes.

Where the goal can be reliably quantified and agreed by all; where existing policies are failing; and where there seem to be no other solutions on the horizon: those are criteria that, to me, cry out for a Social Policy Bond approach: in other words, one where people are rewarded for achieving a specified outcome.

-

SocialGoals.com

1. <http://www.telegraph.co.uk/earth/main.jhtml;jsessionid=LYBYPPASNGPOVQFIQMGSFFOAVCBQWIV0?xml=/earth/2007/08/27/eadiscards127.xml>

#### 4.8.12 Climate change and land management (2007-08-29 08:06)

Freeman Dyson [1]writes:

To stop the carbon in the atmosphere from increasing, we only need to grow the biomass in the soil by a hundredth of an inch per year. Good topsoil contains about ten percent biomass ... so a hundredth of an inch of biomass growth means about a tenth of an inch of topsoil. Changes in farming practices such as no-till farming, avoiding the use of the plow, cause biomass to grow at least as fast as this. If we plant crops without plowing the soil, more of the biomass goes into roots which stay in the soil, and less returns to the atmosphere. If we use genetic engineering to put more biomass into roots, we can probably achieve much more rapid growth of topsoil. I conclude from this calculation that the problem of carbon dioxide in the atmosphere is a problem of land management, not a problem of meteorology.

It sounds plausible to me. The point, though, is that we need to supply incentives to people who prevent climate change *without prejudging how they do so*. Unfortunately Kyoto fails in this regards. It is entirely focused on reducing net anthropogenic greenhouse gas emissions. [2]Climate Stability Bonds would be different: if Professor Dyson is right in that climate stability could be achieved by more widespread application of no-till farming methods, then a bond regime would reward research and diffusion of those methods - but Kyoto would not.

Policy as if outcomes mattered  
SocialGoals.com

1. [http://www.edge.org/3rd\\_culture/dysonf07/dysonf07\\_index.html](http://www.edge.org/3rd_culture/dysonf07/dysonf07_index.html)

2. <http://socialgoals.com/ieakytotext.html>

---

Harald Korneliussen (2007-08-30 16:35:00)

Yes, it sounds plausible, and since it comes from a respectable scientist (even one on "our" side in politics, if you count that he's an advocate of nuclear disarmament and international cooperation) it's all the more serious that he has chosen to speak out on an issue far away from his fields of expertise.

By all *other* accounts, growing or regrowing topsoil is awfully difficult. Many serious environmentalists (such as Jared Diamond in "Collapse", if I don't remember very wrong) see topsoil as so difficult to replenish that it for all practical purposes is a nonrenewable resource.

Yes, no-till agriculture reduces erosion, and that is a very good thing, but it does not replenish topsoil. No matter how kind your agricultural practices, you have to put back the nutrients you take out somehow, through some forms of fertilizer or nitrogen-binding crops. While there are promising advances (I'm keeping an eye on the biochar/agrichar technique), agronomists have been looking for such technologies for a long time anyway, so we can't expect miracles to just turn up and save us.

In the even that they do anyway, it probably won't be insurmountable to amend Kyoto to accept topsoil as a "carbon sink" on par with forests.

Ronnie Horesh (2007-08-31 11:05:00)

Thanks as always Harald. I think it was Professor Dyson's phrase "much more rapid growth of topsoil" that led me to believe he is referring not to the creation of more soil, but to the conversion of the

deeper layers of soil into topsoil. Could that be right? If so, I think Dyson's optimism could be justified.

Yes, I guess Kyoto could conceptually be modified to take into account growth of topsoil. I suppose it's only slightly less realistic than monitoring forests in a meaningful way.

#### **4.8.13 Politician speaks the truth! (2007-08-31 19:39)**

Barrack Obama, in Wednesday's *Financial Times*, about the implosion of the US subprime lending industry:

Over the past several years, while predatory lenders were driving low-income families into financial ruin, 10 of the [United States'] largest lenders were spending more than \$185 million lobbying Washington to let them get away with it. So if we really want to make sure this never happens again, we need to end the lobbyist-driven politics that made it possible.

(I think he means "make it possible".) On the strength of this, Mr Obama would get my vote.

## **4.9 September**

### **4.9.1 Cheese-based dogfood versus WMD (2007-09-04 09:40)**

Ending the chapter on Weapons of Mass Destruction in his book, [1]*Another Bloody Century*, Colin Gray writes:

War, allegedly, can hardly be an instrument of policy if it would entail mass slaughter, especially reciprocal mass slaughter. Alas, that all too reasonable point of view is not correct. Nuclear strategy is not an oxymoron.... [The] persisting lore of war applies no less to WMD than to all other kinds of weapons.

Professor Gray's pessimism is probably justified. The proliferation and use of WMDs seems to be another of those social problems that everybody wants to solve, but for which we are bereft of solutions. With WMD, any solution needs a long lead time. If more and more people begin to see their use as thinkable, then stopping their use become more and more difficult.

There's no clear solution. We need to mobilize the ingenuity of people who, if they weren't busy trying to maximize sales of [2]cheddar-based dogfood, would just as happily devote their talents to reducing the risk of nuclear war. It comes down to incentives. There are excellent people working for a more peaceful world. But we need more of them, and we need them to have more resources at their disposal. Many of our social and environmental problems are

currently solved as a byproduct of the private sector and its income- and wealth- generating activities. Others are the responsibility of the public sector which, for whatever reasons, functions by rewarding activities rather than outcomes. This can work, if we know in advance those activities that will ensure the desired outcome. But for seemingly intractable problems, like war, we don't, and that's why [3]Conflict Reduction Bonds could be helpful. Conflict Reduction Bonds would reward people for bringing about peace, *however they do so*.

There are no easily specified solutions to nuclear proliferation, or the use of WMD, but that's no reason not to encourage people to find them. We need diverse, adaptive programmes - the sort that government or supra-governmental bodies like the United Nations, find hard to support, but that a Conflict Reduction Bond regime would stimulate.

#### 4.9.2 Scandalous (2007-09-05 10:49)

From the [1]Global Subsidies Initiative:

The United States Government Accountability Office (GOA) has found that the U.S. Department of Agriculture (USDA) is paying millions of dollars in farms subsidies to thousands of deceased individuals. ...

"The USDA ... does not have the management controls to verify that it is not making payments to deceased individuals." ...

[D]uring the 1999-2005 period, some \$1.1 billion in farms subsidies were paid in the names of 172, 801 deceased individuals, some of whom had been dead for seven years or more. The USDA relies on the farm subsidy recipients to notify them of any changes, including a death, which may change an estates' eligibility to receive subsidies.

#### 4.9.3 Helping people, not activities (2007-09-07 12:14)

If you put a rat with a two-degree fever into a very hot room, the rat activates its cooling mechanisms to keep its body temperature two degrees above normal. If you put it into a cooler room, it activates heat-conservation mechanisms to maintain that two-degree fever. Body temperature is carefully regulated even during fever; the thermostat is just set a bit higher. [1]Why we get sick (page 27)

Fever, in other words, is not the problem, but the body's attempt to defend against infection, and medications that block fever 'interfere with the normal mechanisms that regulate the body's response to infection, with results that may be fatal.' This sort of adaptive behaviour can apply to our social and environmental problems. Sometimes, not always, government intervention can accentuate and entrench the problem. Farm subsidies (this blog, *passim*) are a classic example, but thankfully we are becoming a little more cautious about rushing in to address the presenting problem whenever there's a crisis.

So the current [2]*Economist* (subscription) recognises that markets can regulate more effectively than government when dealing with the subprime lending turmoil:

Shares of the most egregious mortgage lenders have plunged and dozens have gone bust. Loan-underwriting standards are tighter. The riskiest subprime securities have almost no takers. These spasms are how the market cleans up its mistakes and learns not to repeat them. That sounds cold-hearted, but pain is a necessary part of this correction. When politicians seek to deaden that pain and supplant those lessons with hasty fixes of their own, they almost always blunder.

If there's a general approach to such interventions, I would opt to aim for broad, objectively verifiable outcomes that are meaningful to natural persons, as distinct from corporations. Faced with, say, a plunge in agricultural product prices, the efficient approach would be to help farmers *in their capacity as human beings* rather than as farmers. Let the market decide on how people deploy their land, labour and capital. It does it more efficiently, because more adaptively, than government ever can. A government's duty is not to bail out inefficient industries, nor to maintain abstract economic growth figures, but to help its citizens.

#### 4.9.4 Private schools for the poor (2007-09-09 12:42)

[1]James Tooley, Professor of Education at the University of Newcastle-On-Tyne, has [2]researched private schools for the very poor in developing countries. Typically these are small, shabby operations, sometimes occupying a single classroom, staffed in some cases by just the teacher-proprietor and an assistant. Fees can be less than ten US cents per day. Despite the fears of some aid organizations, these schools:

...everywhere were outperforming the government schools in the key curriculum subjects – even after controlling for background variables.

Even when the per pupil teacher cost was calculated "private schools came out less expensive: In the government schools in Lagos State, for instance, per pupil teacher costs were nearly two and a half times higher in government than in private schools."

For me, these results point to the need to solutions beyond the control of the public sector. It is not, or doesn't have to be, a case of government versus private sector, though that is unfortunately how research like this is often interpreted. Rather it indicates the need to abandon ideology when targeting broad social goals, such as universal literacy for a developing country.

#### **4.9.5 Money politics (2007-09-11 09:53)**

Al Gore writes:

After a long and detailed review of all the polling information and careful testing of potential TV commercials, the anticipated response from my opponent's campaign and the planned response to the response, my campaign advisers made a recommendation and prediction that surprised me with its specificity: "If you run this ad at this many 'points' [a measure of the size of the advertising buy], and if Ashe responds as we anticipate, and then we purchase this many points to air our response to his response, the net result after three weeks will be an increase of 8.5 percent in your lead in the polls."

I authorized the plan and was astonished when three weeks later my lead had increased by exactly 8.5 percent. Though pleased, of course, for my own campaign, I had a sense of foreboding for what this revealed about our democracy. Clearly, at least to some degree, the "consent of the governed" was becoming a commodity to be purchased by the highest bidder. [1] *The Assault on Reason* quoted in the *NYRB* by [2] Michael Tomasky

Gore was writing about his first Senate race, in 1984. I suspect his, and our, cynicism will have grown since then. The growing gap between politician and ordinary person is self-enlarging. Our non-involvement in politics enhances the role of the Public Relations people and lobbyists, which creates yet more voter apathy.

One of the advantages of a Social Policy Bond regime is that it would express its goals in terms of outcomes that are meaningful to real people, as distinct from corporations and their agents. Transparency - consulting with voters about their goals - would be built into the system from the start.

#### 4.9.6 Is war inevitable? (2007-09-13 12:32)

More from Professor Colin Gray:

War is a part of the human condition, it is not a problem that can be solved. However, it is a condition some of the worst features of which can be alleviated by law, custom, norms and plain self-interest. [1] *Another Bloody Century* (page 379)

I am a little more optimistic. I think that if war's negative impacts can be satisfactorily defined, then targeted for reduction and sufficient incentives can be put in place, then wars can be reduced in number and scale. As Gray explains elsewhere (page 385), "Warfare is social and cultural, as well as political and strategic, behaviour. As such it must reflect the characteristics of the communities that wage it." These characteristics are deep-seated and pervasive, which means that solution need to be long term in nature. Diverse, adaptive and focused approaches will be required. Gray's pessimism is justifiable if we confine ourselves to thinking about government-implemented measures. But a [2]Conflict Reduction Bond regime could work, in ways that we cannot necessarily foresee. The main difficulty, it seems to me, is in defining exactly what we want to achieve: terrible though war is, some types of 'peace' are even worse.

#### 4.9.7 The Political Class (2007-09-16 08:42)

Writing about the Political Class in Britain, [1]Peter Osborne says:

Unlike the old Establishment, the Political Class depends directly or indirectly on the state for its special privileges, career structure and increasingly for its financial support. This visceral connection distinguishes it from all previous British governing elites, which were connected much more closely to civil society and were frequently hostile or indifferent to central government. Until recent times members of British ruling elites owed their status to the position they occupied outside Westminster. Today, in an important reversal, it is the position they occupy in Westminster that grants them their status in civil society. The Political Class is distinguished from earlier governing elites by a lack of experience of and connection with other ways of life.

A complex economy and the division of labour explain much of this disconnect between politicians and the citizens they are supposed to represent. Is there any way of closing the gap? One way might be to adopt one of the principles of a Social Policy Bond regime: debate policy in terms of targeted, explicit outcomes. Currently when our politicians talk to us it's often about funding arrangements, institutional structures, or the activities of government

agencies. And what they talk to us *about* is often equally peripheral: people or events for which there is compelling tv footage; anecdotes and images that support an agenda that isn't always clear to us, the public.

A Social Policy Bond regime would recast political debate. Social and environmental outcomes would be the starting point of politics. Politicians would have to choose between such outcomes but in doing so they would consult ordinary people, who could participate in policymaking because they understand its terms. Compromises and trade-offs would still have to be made; there would still be pressure on resources and there would still be disagreements about priorities. But policy outcomes - unlike the arcana of current politics - are things that ordinary people can understand. Their participation in policymaking could help close the ever-widening divide between government and the people.

#### **4.9.8 Interesting (2007-09-18 11:25)**

From Harper's Index:

Percentage of American adults held in either prisons or mental institutions in 1953 and today, respectively: 0.67, 0.68

Percentage of these adults in 1953 who were in mental institutions: 75

Percentage today who are in prisons: 97

Source: *Harper's Magazine*, April 2007 (page 17)

Those figures might go a long way toward explaining the rise in crime rates over the past five decades. Currently, despite talk of 'joined-up government', mental health and crime are seen in the west as two almost wholly distinct policy remits. It's certainly convenient, administratively, to do so. But in doing so do we optimize social welfare? I don't know what projects a Social Policy Bond regime aiming to reduce crime would stimulate, but investors would at least have incentives to explore the linkages and answer such questions.

#### **4.9.9 Charisma-driven politics (2007-09-21 10:16)**

Discussing British politics, the Bagehot column in the current [1]*Economist* (subscription, probably) hits the nail on the head:

[P]olicy is a decreasingly important factor in politics generally—certainly compared with the genuinely ideological clashes of the 1980s. Part of the explanation for that trend is that Labour and the Tories now agree about so much, even if they conceal their similarity by narcissistically inflating small differences. [Prime Minister] Brown's omnivorous pilfering of everyone else's best ideas is blurring the distinction more than ever (which hurts the Lib Dems, since this coalescence has made grumpy Labour and Tory voters readier to switch straight to the other big party). Part of it is the influence of digital media on how political opinions are formed. That has made having a charismatic and ideally photogenic leader vital....

It's no bad thing, in my view, that ideology's influence is lessening. I'd prefer though that policy were instead driven by outcomes rather than visual imagery.

#### **4.9.10 Trumping ideology (2007-09-22 13:46)**

Reviewing [1]*Super Crunchers*, by Ian Ayres, the *Economist* (dated 13 September) says:

The sheer quantity of data and the computer power now available make it possible for automated processes to surpass human experts in fields as diverse as rating wines, writing film dialogue and choosing titles for books.

Even the occasional government is accepting that properly analysed data trump ideological conviction. Mr Ayres sings the praises of Mexico's Progres/Oportunidades programme, which gave assistance to poor people only if their children attended health clinics and schools. It was tried out on 506 randomly selected villages. The results were so convincing that the programme was expanded 100-fold despite a change of government.

The merit, it seems to me of such a policy approach is that unsuccessful experiments will be terminated: it's genuinely Policy as if Outcomes Mattered.

#### **4.9.11 Regulation and big business (2007-09-25 11:02)**

One of the ways in which big business and its pals in government conspire against small businesses and ordinary people is by manipulating the regulatory environment.

[1]Oligopoly Watch asks why large corporations in the US are asking the Government for more regulation. Part of the answer is that:

[w]hat big corporations want is for the federal government to set standards that will overrule even tougher state standards. There has been a rise in regulation from a growing number of states, led by California, to make up for the gaps in regulation presided over the Bush administration, which has systematically weakened rules and defunded regulatory agencies.

As well, though, regulations can be used as unfair, non-tariff barriers to trade:

[W]hy is Altria (Philip Morris) calling for the regulations of cigarettes and General Electric and Phillips joining to push for more regulation of light bulbs? Pure self-interest, a new strategy in an old war, one of getting the government to help big companies maintain market share. All of the new regulations will be used to set a barrier to entry for smaller (usually Chinese) companies into the market. In these cases, it is easier for the established players to conform to a higher level of regulation....

When I worked in the agricultural policy area I saw a lot of this. In one memorable [2]example involving European Union legislation in the UK:

A snail farmer was told to tile his packing room, which was classed as an abattoir, up to the ceiling to catch the blood. BBC 1 TV *Country File* 8 February 1998

This sort of thing happens not only because government and big business are inevitably biased against smaller concerns, but also because the government is more comfortable, and sees a larger role for itself, in regulating processes and activities, rather than outcomes. Ordinary people are the losers.

#### **4.9.12 Tax breaks for the rich (2007-09-26 09:34)**

I've long been suspicious and wary of the way in which most western countries subsidise home ownership. Partly because the subsidies are paid out in ways that divert funds from more productive investment; partly because they make it difficult for even hard-working ordinary people who aren't lucky enough to inherit property, to own a house; and partly because the wider economy begins to rely on unrealistically appreciating house values - so much so that government has a vested interest in continuing to prop them up.

Writing about the US, [1]David Morris says:

For all but the very rich, houses represent the single largest source of lifetime financial savings. A low rate of home ownership, and the resulting low rate of savings, is particularly high among blacks and Hispanics. In 2005, government provided \$150 billion to homeowners in tax subsidies. But the way the subsidies were structured did little to raise home ownership among these groups. Why not replace the housing tax deductions with a level refundable tax credit? .... Economists Richard Green ... and Kerry Vandell ... have examined such a system and predicted that it could increase overall home ownership by 3 to 5 percentage points. Even more impressive, a housing tax credit could increase home ownership by up to 8 percentage points among the lowest-income households.

Robert Brenner, in [2]*the Guardian* writes that, following the crash and recession of 2000-01:

central banks turned again to the inflation of asset prices. By reducing real short-term interest rates to zero for three years, they facilitated an explosion of household borrowing that contributed to, and fed on, rocketing house prices. Inflated household wealth enabled increased consumer spending that, in turn, drove the expansion. Personal consumption plus residential investment accounted for 90-100 % of the growth of GDP in the first five years of the current cycle. However, the housing sector alone was responsible for raising the growth of GDP by more than 40 %, obscuring just how weak the recovery was. The rise in demand revived the economy.

Unfortunately, it's difficult to see how this merry-go-round can stop. Like a drug habit, or other poorly-thought out subsidies, these tax breaks become very difficult to end, even when the evidence of their woeful economic and social impacts has become obvious to all.

#### **4.9.13 Markets and 'markets', continued (2007-09-29 08:24)**

Dean Baker writes:

The key flaw in the stance that most progressives have taken on economic issues is that they have accepted a framing whereby conservatives are assumed to support market outcomes, while progressives want to rely on the government. This framing leads progressives to futilely lash out against markets, rather than examining the factors that lead to undesirable market outcomes. The market is just a tool, and in fact a very useful one. It makes no more sense to lash out against markets than to lash out against the wheel. The reality is that conservatives have been quite actively using the power of the government to shape market outcomes in ways that redistribute income upward.

This is from the preface to *The Conservative Nanny State* published last year and available as a [1]free download. I'm not sure I'd go along with all Mr Baker's suggestions, but the book is well worth reading.

## 4.10 October

### 4.10.1 Climate change: how to decide who pays (2007-10-01 11:19)

Cass Sunstein [1]points out that:

[i]t is increasingly clear that the world would be better off with an international agreement to control greenhouse gas emissions. What remains poorly understood is that the likely costs and benefits of emissions controls are highly variable across nations.

The US and China, large emitters of greenhouse gases, are not likely to be the leading victims of climate change. Indeed, and with all the usual caveats, Russia is expected to gain. The biggest projected losers from climate change are India and Africa. The mismatch between the large emitters and those most at risk contributes to the current policy stalemate. Adding to the complexity, a country like China could point to cumulative emissions as a basis on which to allocate blame and so responsibility for cutting emissions: Sunstein gives a table showing that the US emitted 29 % of the total (anthropogenic) carbon dioxide from 1850-2002; China 7.6 %. Or perhaps per capita emissions should be the criterion? On that basis, the US emitting 19.7 tonnes of CO<sub>2</sub> (in 2002) is far more culpable than China (3.7 tonnes).

Sunstein concludes that:

Because of its wealth, its high per capita emissions rate, and its past contributions, the moral obligations of the United States are especially insistent. What remains clear is that the United States cannot do much about the problem without the participation of developing countries, above all China. For this reason, it is appropriate for the United States to take active steps, perhaps including unilateral action, in order to increase the likelihood that such countries will be willing to participate in the future.

Agreed, appropriate yes, but also unlikely. Sunstein's discussion is compelling, but I'd still prefer to see an outcome-based approach, such as [2]Climate Stability Bonds that would rely on upfront cash incentives, instead of the vagaries of moral suasion. The two are need not be in conflict of course. but I'd rather back a regime that rewards self interest. At the highly aggregated level of countries, that seems to me more likely to work, and that, after all, is what really matters.

#### 4.10.2 Complexity demands an outcome-based approach (2007-10-03 11:18)

Government thinks in terms of institutions, and that can create problems. For instance, it's not at all clear that the best way of raising literacy is to increase funds for schools. Or that to reduce crime, the best use of our scarce resources is to fund more police. The linkages are too complex for any single body to grasp; especially ones like government agencies, which typically operate top-down programmes that however badly they fail, are never terminated. No complex policymaking environment is immune:

From [1]*the Gospel of Food* by Barry Glassner (quoting research, and words, of Ichiro Kawachi):

[R]esearch shows that death and sickness rates from cancer, heart disease, and other major illnesses in the US are higher in states where participation in civic life is low, racial prejudice is high, or a large gap exists between the incomes of the rich and poor and of women and men. 'Policies **that appear to have little to do with health**, like macroeconomic policies to reduce the level of income inequality, can have a major impact on driving down the rates of illness in society.' (page 30) (My emphasis.)

Diverse, adaptive approaches are needed, but they must be subordinated to outcomes: if they do not help achieve the targeted outcome, they should not continue to be funded. Only markets give investors the incentive to explore and experiment with diverse approaches to complex social and environmental problems - and to terminate failing projects. The contrast with government when dealing with complex problems is stark.

#### 4.10.3 Let the voters decide (2007-10-07 11:16)

Why not have referendums on free trade? Costa Rica is doing, though as Mark Weisbrot [1]writes, voters can be blackmailed into coming up with the 'right' answer. A leaked government memo suggested that mayors of Costa Rican cities be told that they would "not get a penny from the government for the next three years" if they did not deliver a majority of voters for the Central America Free Trade Agreement.

#### 4.10.4 Subsidising fisheries destruction (continued) (2007-10-08 14:42)

The European Commission recently released a list of fishing vessels that have received EU fisheries subsidies between 2000 and the beginning of 2007, reports [1]Global Subsidies Initiative:

The top ten vessels received some €30 million [between them]. The top two vessels were Spanish boats *Albatun Dos* and *Albatun Tres*; each receiving €4 318 440 for their construction. Notably, a number of subsidy recipients identified in the EC list have been cited with illegal, unreported and unregulated (IUU) fishing. Infractions included using illegal nets, misreporting catches in logbooks, and falsifying sales records. However, a full accounting of subsidy recipients who have been cited with IUU fishing is currently impossible, given that there is no public record of vessels that have been issued citations. "It is outrageous that taxpayers' money has financed criminals who destroy the marine environment and undermine legal fishing activities," said Markus Knigge, European Marine Programme Officer with the WWF.

If people were allowed to vote on whether their taxes should be used to fund environmental destruction, and voted 'yes', then I'd find it difficult to argue against them. But we are not given such an opportunity. This subsidised, permanent, destruction of a scarce, living resource, for the benefit of the short-term prospects of a few giftless politicians is despicable.

#### 4.10.5 Social Policy Bonds: do they have a future? (2007-10-10 07:26)

Social Policy Bonds haven't made much progress in policymaking circles in the last few years. I'm not even sure that policymakers think any more in terms of outcomes than they used to. But I am still optimistic that Social Policy Bonds, or something like them, will play some role in the future. Why?

First, because of a combination of an increasingly complex world, and the growing gap between policymakers and the people they are supposed to represent. Politicians and their officials have inherited a decision-making system that is, essentially, about rewarding interest groups, be they corporations, government agencies, organized labour, or lobbyists for environmental, ethnic, sexual or religious bodies. What's missing from this is buy-in from ordinary people, *in our capacity as ordinary people*, rather than members of an interest group. Without buy-in, the current political system will become increasingly vulnerable.

But our economy, society and environment are becoming ever more complex, which means that the wishes of most citizens cannot be satisfied either by submitting to the interests of sectoral groups, nor by centralized, top-down decisions about funding, activities,

or institutional structures. I think therefore that the decisions that government makes will increasingly have to be expressed and subordinated to outcomes that are meaningful to real people. Social Policy Bonds are one way of doing that: policymakers reward the achievement of social goals, regardless of how they are achieved. They relinquish their control over the 'how', because that is something that they don't do very well.

Underpinning this scenario is the increasing transparency about policy failures. Our political class knows less about how to achieve certain goals, but the public knows more about their failure to do so.

I see nothing to interrupt any of these trends. For that reason I think that somewhere down the track Social Policy Bonds may become a significant policy instrument.

-

#### **4.10.6 The losers aren't being compensated (2007-10-12 04:13)**

Mark Weisbrot [1]writes:

Free-trade advocates...always make distorted statements such as "the average household has gained \$10,000 from free trade." Now, if a hedge-fund manager makes an extra billion dollars, it can raise the average income in his town or suburb quite a bit. But it doesn't do much for others in the area; and in fact it is likely to be at the rest of the public's expense.

Quite so. Free trade can benefit everybody, but only if the losers are compensated. Otherwise it's only the abstract concepts 'the economy' or 'the country' that benefit. There's very little compensation going on, as far as I can see.

-  
Policy as if outcomes mattered  
SocialGoals.com

#### **4.10.7 Who cares? (2007-10-12 13:44)**

In Wellington's *Dominion Post*, Susannah Bailey of Greenpeace, points out some of the flaws in the New Zealand Government's greenhouse gas emissions trading scheme. Some of her views are [1]here, but in the newspaper article she writes that the scheme:

isn't coupled with an overall emissions reduction target.... Officials have conceded that the main goal of the scheme is to meet our Kyoto liability at least cost rather than to achieve emission reductions. 11 October, page B7

Exactly: New Zealand might or might not reduce its greenhouse gas emissions; which might or might not do anything to prevent climate change. Who really cares? The sole certainty is that the trading scheme will require a whole new bureaucracy to administer, whose costs will be borne, upfront, by taxpayers. Some of us may be successfully deluded into thinking that something is actually being done about climate change. The Government can then pass on to other issues, like the [2]145 violent crimes being committed in New Zealand every day. Perhaps it can set up a free telephone hotline and attribute any further increase to 'improved reporting'.

#### **4.10.8 Climate change and geoengineering (2007-10-14 09:36)**

Could geo-engineering prevent climate change? James Woudhuysen [1]believes that:

[E]nvironmentalists tend to dismiss geo-engineering because, at root, they are not interested in halting climate change. For many today, both green activists and leading politicians, climate change is a moral and political issue rather than simply a practical problem. They see the 'issue of climate change' as a means to changing people's behaviour and expectations, rather than simply as a byproduct of industrialisation that ought to be tackled by technological know-how. They are resistant to geo-engineering solutions because putting an end to climate change would rob them of their *raison d'être*.

I really don't know about that, but I do wonder whether there are more efficient or politically realistic ways of preventing climate change than the current approach, which relies exclusively on cutting our greenhouse gas emissions. What's disturbing is not so much *why* alternative solutions aren't being seriously considered, but simply the fact that they aren't. Probably the answer lies in the nature of the possible side-effects. They might be difficult to anticipate and disastrous. But so too might the effects of climate change or, indeed, those of emission cutbacks.

I see geo-engineering approaches as a subset of a large array of possible (partial) solutions. A [2]Climate Stability Bond regime would encourage people to explore and enlarge this array, and to pursue only the most promising projects. The mix of projects would be diverse and adaptive. Possible negative effects of, for instance, geo-engineering - or, for that matter, cutbacks of greenhouse gas emissions - could be avoided by stipulating that Climate Stability Bonds shall not be redeemed if these effects are too large.

#### **4.10.9 British Government favours UHT milk (2007-10-16 07:38)**

The London *Times* [1]reports that:

Officials at the [UK] Department for Environment, Food and Rural Affairs have made a serious proposal that consumers switch to UHT (Ultra-High Temperature or Ultra-Heat Treated) milk to reduce greenhouse gas emissions. It is part of a government strategy to ensure that some 90 per cent of milk on sale will not require refrigeration by 2020.

For all I know, this strategy might be justified. What concerns me is how it's arrived at. Refrigeration in supermarkets is a visible consumer of electricity and I suspect that's why the officials at DEFRA have picked on it. Have they compared it with other ways of reducing greenhouse gas emissions that may yield far more benefit? Why 90 per cent, rather than 80 or 95 per cent? Is a government agency the best placed to try to determine the trade-offs that consumers should make?

I think that if a government wants to reduce greenhouse gas emissions, then it should give consumers the option of how best to do so. I'd rather see government tackle target climate change itself rather than greenhouse gas emissions, but if it insists on targeting the latter, it should set broad targets and let the market decide on how they are to be met.

#### 4.10.11 We are the ADD Generation (2007-10-19 09:36)

Rather than the 'Me Generation', or 'Generation X', I've often thought that we are really the 'ADD Generation', where ADD stands for Attention Deficit Disorder. Our politics is, essentially, media driven, and the mass media have a short attention span with little time for subtlety, or for events that cannot entertain when shown on television.

So there's very little sense of perspective. Dean Baker [1] writes that Robert Novak...

...[t]he Washington Post columnist, dedicated his column today to a \$1 million earmark (0.3 cents per person) for a museum dedicated to Woodstock. This may well be a waste of taxpayers' money, but it is wrong to imply that such waste amounts to a big factor in the budget or budget deficit. (For another comparison, the \$1 million is approximately equal to what we'll spend in 3 minutes on the Iraq War.)

Indeed. Another case in point: the current issue of [2] *the Economist* (subscription) talks about the cost of eradicating malaria:

A back-of-the-envelope estimate suggests it would cost about \$9 billion a year for two or three decades to make and distribute the necessary vaccines, drugs and equipment.

This sounds like a lot, but take a look at this excerpt from [3] *A Subsidy Primer*, by Ron Steenblik:

Recently, for example, the Environmental Working Group, an American non-profit organization, counted up all the direct payments made by the U.S. Government to farmers between 1994 and 2005 and found that ten percent of subsidy recipients collected 73 percent of all subsidies, amounting to \$120.5 billion.

#### 4.10.12 Corporates (2007-10-22 09:31)

It's not enough to rail (as I frequently do) against the corporate influence on politics. While politicians and big business generally go hand-in-hand, there are nuances, as [1] Paul Krugman points out:

The truth is that while the administration has lavished favors on some powerful, established corporations, the biggest scandals have involved companies that were small or didn't exist at all until they started getting huge contracts thanks to their political connections. Thus, Blackwater USA was a tiny business until it somehow became the leading supplier of mercenaries for the War on Terror (TM) .

This sort of thing subverts democracy, but appears to be systemic. One benefit of a Social Policy Bond regime is that politicians would be allocating funds to outcomes, rather than favoured lobby groups. Those outcomes, being meaningful and comprehensible to natural persons, would be decided openly, with full public participation.

#### **4.10.13 Social Policy Bonds (almost) applied! (2007-10-22 12:39)**

Well, ok, not Social Policy Bonds, but rather the bond principle, of financially rewarding people who do things that lead to better outcomes for ordinary people:

Joaquim Chissano, a former President of Mozambique who led his country to peace after more than a decade of civil war killed a million of his citizens, became the first ever winner of a new £2.4 million ( \$5m) prize for achievement in Africa today. Mr Chissano, who was in power between 1986 and 2005, was awarded the Mo Ibrahim award for achievement in London by Kofi Annan, a former United Nations Secretary General. ...The \$5 million prize was established by the Mo Ibrahim Foundation which was launched last year to boost governance in Africa. Dr Ibrahim, the founder of the African telecommunications company Celtel International, is one of Africa's most successful business leaders. [1] The Times

#### **4.10.15 Microfinance (2007-10-25 11:04)**

[1]Jimmyjangles draws my attention to a newspaper [2]article about Microplace (launched by eBay) which will allow:

ordinary investors to buy securities aimed at improving conditions in the world's poorest countries. MicroPlace, located at [3]<http://www.microplace.com/>, will allow people to invest as little as \$100 to support development in impoverished areas.

Microfinance is the supply of loans, savings, insurance and other basic financial services to low-income households and businesses, typically without collateral.

Microfinance is at work in more than 100 countries, and is generally provided by financial institutions or wealthier investors. It gained wider renown last October when Bangladeshi economist Muhammad Yunus, who pioneered it in 1976, and the Grameen Bank he founded won the Nobel Peace Prize. "Capital markets are just waking up to this asset class," Tracey Pettengill Turner, the founder and general manager of MicroPlace, said. "This is different because it is the first Web-based service for the everyday investor to invest in microfinance, and earn an investment return while addressing global poverty."

I like this idea. Once people invest capital in a region, then they take a wider interest in it. Political reform, improved governance, and development meaningful to ordinary people: all these are more likely to follow if there are outsiders concerned about how their investment is doing. This sort of development, arising from the bottom up, is infinitely better than [4]the alternative.

#### **4.10.16 Second Life (2007-10-29 10:10)**

Calling for a new paradigm to deal with climate change, Ted Nordhaus and Michael Shellenberger advocate:

a new military-industrial-academic complex around clean-energy sciences, similar to the one we [the US] created around computer science in the 1950s and '60s. ...The goal would not be to subsidize clean energy in perpetuity, but rather to make the kinds of investments that ultimately bring the real price of clean energy down to the price of dirty-energy sources like coal in places like China. Doing all this will require a more optimistic narrative [than] Gore's *An Inconvenient Truth*. ... Cautionary tales ...tend to provoke fatalism, conservatism and survivalism ...not the rational embrace of environmental policies. *Second Life: a manifesto for a new environmentalism*, 'The New Republic', 24 September

I would add 'resignation, cynicism and despair'. [1]Climate Stability Bonds as a way of dealing with climate change could be that different paradigm: under a Climate Stability Bond regime, people would be rewarded for stabilising the climate, however they do so. Kyoto conforms to the miserabilist paradigm that has spectacularly failed to address the problem. It punishes, people for doing something that (probably) does contribute to climate change. The costs are upfront, complex, administratively expensive. Any benefits are almost certainly going to be negligible and will take decades to appear. A Climate Stability Bonds regime would encourage people or governments to invest in exactly the ways that Nordhaus and Shellenberger advocate. It would focus on the outcome we all want to see: a stable climate; rather than the means of reaching it. Or the *supposed* means, for as James Lovelock puts it:

A rapid cutback in greenhouse gas emissions could speed up global warming, the veteran environmental maverick James Lovelock will warn in a lecture today. ' [2] Daily Telegraph

## 4.11 November

### 4.11.1 Biofuels (2007-11-02 09:56)

I have a lot of sympathy for [1]Oxfam as reported by the [2]BBC, in their concern about proposals to extract transport fuel from plants. There are all sorts of problems: most obviously the unclear net fossil fuel cost of such fuel. As well, the alacrity with which western politicians are keen to jump on this bandwagon should itself be grounds for suspicion. Here in the west we sacrifice our cities, our air quality, hundreds of thousands of our citizens annually, our communities, and significant proportions of our animal and plant life to road transport, so I suppose in that accounting that the fate of several million poor people in other parts of the world, who will now have to compete with biofuel corporates, is of minor concern. It's another example of government as if outcomes are irrelevant. Transport is a means to various ends; not an end in

itself. Government should be concerned about ends, not means. The risk that our fossil fuels will run out should be borne by fossil fuel users, not taxpayers or third world farmers.

#### 4.11.2 Context and complexity in social systems (2007-11-04 03:54)

One of the benefits of expressing policy goals in terms of outcomes is that it contracts out the identification of complex relationships to a wider pool of people than does the conventional policy approach. With something like climate change, such complexity is largely about the scientific relationships between cause and effect. The Kyoto process assumes the primacy of anthropogenic greenhouse gas emissions, not only as the cause of climate change but as the best way of dealing with the problem.

But complexity manifests itself in social systems as well, and again the Social Policy Bond approach, which subordinates process to targeted outcomes, could be preferable. In an excellent article about the US educational system, Peter Schrag writing about America's apparently poor performance despite higher spending and smaller class sizes:

In fact, a lot of such international comparisons lack context and are therefore debatable, because of the relative paucity of social services in this country - as opposed to the universal preschool, health care, and similar generous children's services provided in other developed nations - our schools are forced to serve as a fallback social-service system for millions of American children. [1] *Schoolhouse Crock*

(subscription), 'Harper's Magazine', September 2007

It's difficult to see how the current policy approach can address the inherent complexities. Instead of targeting educational outcomes explicitly, it is more inclined to increase funding for schools. The answer might lie in (say) better pre-school or healthcare or counselling for single parents or whatever, *but the current system offers no incentives to explore these possibilities*. And the individuals embedded in the system - teachers, bureaucrats - are almost certain to see more funding for their particular element of the system as the solution.

A Social Policy Bond regime would be different. It would target the outcomes and, essentially, contract out the achievement of these outcomes to the market: a much wider, more motivated pool of people, who need not be afraid of offending existing interest groups or terminating failed experiments in their search for answers. My most recent essay about applying the Social Policy Bond approach to education, in this case to raising the literacy rate in Bangladesh, can be found [2]here (pdf). Others can be found via the [3]SocialGoals.com website.

#### 4.11.3 Growth and poverty (2007-11-05 10:17)

It's widely assumed that economic growth will help eradicate poverty. The *new economics foundation* questions this in its publication [1]*Growth Isn't Working*, published in January 2006. "Either we are told that a rising tide lifts all boats, or that, rather than sharing the cake more evenly, it is better to bake a larger one" (page 25). We assume that growth, and in western countries anyway, our redistributive policies, will alleviate poverty. But nef's skepticism is, I think, justified. In the west many government interventions help make the rich richer, at the expense of poorer people and, often, the environment. High food prices, as [2]Oxfam (pdf) found, mean that wealthy landowners like the Dukes of Westminster, Marlborough and Bedford, Lords Illife and de Ramsey and the Earl of Leicester can *each* receive subsidies from the public of up to £370 000 a year for growing their cereal crops.

For myself, I think that if we are serious about eradicating poverty, then we should reward people for eradicating poverty. Simple, yes? Much simpler and less prone to corruption or breakdown than the current system, which regards the ending of poverty as an inevitable byproduct of economic growth and state intervention. Recently I have been working on an essay about applying the Social Policy Bond principle to poverty in the developing world. The issuing of bonds that would appreciate in value with the reduction of poverty is made much simpler by work already done to calculate the [3]Human Development Index. This measure, though limited, could be refined not solely as a measure of poverty, but to be a target in a bond regime that would indicate where in the world our limited resources for poverty alleviation would do most good.

#### 4.11.4 I don't mind... (2007-11-08 13:55)

...when failed policy experiments are terminated. In this context, I disagree with Matthew Paris:

Before he became Prime Minister I devoted a page in *The Times* to the detailed story of just one of Gordon Brown's barking mad ideas. Small in itself, it provided ...a useful vignette on what is wrong with his brain. Mr Brown had proposed and forced through a plan for troublemaking teenagers to be paid — in vouchers usable at municipal leisure centres — £20 for every week in which they didn't make trouble. Of course you or I can see at once that this one's a turkey too; but a pilot scheme was

duly required, and duly failed, and the whole thing **was called off**. *Gobble, gobble! Another turkey from Farmer Brown*, Matthew Paris, 'The Times', 8 November [My emphasis]

It's the failed policies that *aren't* stopped that are the problem. I think, we need to encourage *more* potential turkeys, provided people have incentives to terminate them when they don't work.

Policy as if outcomes mattered  
SocialGoals.com

---

#### **4.11.5 Solving disputes (2007-11-10 12:23)**

The current *Economist* summarises one conclusion of [1]*Civil Paths to Peace: Report of the Commonwealth Commission on Respect and Understanding*:

The existence of lots of competing affiliations which pull people in different ways is the best hope of silencing gloomy talk of a "clash of civilisations" (with religion, and Islam in particular, often seen as the defining characteristic for giant global blocks). Such thinking is "deeply flawed on a conceptual level and deeply divisive in practice," the report says. [2] *Don't dare put me in a box* , 'The Economist', 8 November (subscription, probably)

There is a lot in this. The putting in boxes can be a self-reinforcing process, a vicious circle. Some fanatics of (say) a religious or ethnic group pull some sort of stunt that alienates everybody else. The people in the group begin to feel shunned or victimized. That reinforces their sense of identity and, not coincidentally, the power of their fanatical leaders. One can see this happening, perhaps almost as disastrously, with environmental groups. Debate about matters such as climate change is almost as politicized and polarized as is discussion about the Middle East. One result is the democracies' identity politics or gesture politics. Meaningful solutions to complex social and environmental problems is often postponed until either attitudes have hardened irreparably, or it's too late to do much about the underlying issues anyway.

A Social Policy Bond regime that targeted conflict (by, for instance, issuing [3]World Peace Bonds) would probably defuse tensions between groups before they arise. Investors probably wouldn't even take the identities of these groups as a given. They might decide that the most efficient way of reducing violent political conflict would be to subsidize intermarriage between people of different race or religion, or perhaps to encourage mixed schooling, exchange visits between schoolchildren of different culture.

The authors, continues the *Economist*, say that:

At a minimum...the authorities who are trying to keep inter-communal peace should not empower people whose authority depends on keeping divisions sharp.

Exactly. One thing is certain: currently there are too few incentives for people who want to tackle such issues, and too many to those who foment violent conflict. World Peace Bonds could do something to redress the balance.

#### **4.11.6 Political parties (2007-11-12 00:25)**

Reacting to an article by Simon Jenkins in the London Review of Books, correspondent Neil Forster [1]writes:

One can but admire the energy that Simon Jenkins displays rowing strongly as he does when deciding on the treatment best calculated to cure our ailing democracy ([2]LRB, 20 September). But that energy rather goes to waste once you appreciate just how regressive Jenkins's basic proposal is: that the political parties in this country set about 're-engaging with the public'. How they're to do this he doesn't so far as I can see tell us. More important, why on earth should they want to re-engage with the public when they are doing very nicely thank you without making any such noble attempt?

The discussion is about how political parties (in the UK) should be funded at a time when party memberships are vanishingly low. I'm not an enthusiastic supporter of political parties, or any institution that selects on the basis of ideology. Society is too complex and fast-changing for ideologues to keep up, and that's one reason for the universally acknowledged widening gap between politicians and the people they are supposed to represent. Perhaps [3]new sorts of political organisation are needed.

Mr Forster continues:

'A party in receipt of state money loses its incentive to build its base,' according to Jenkins. Unable as I am to perceive any such incentive as existing in our current

circumstances, we might as well cut our losses and accept that state funding would be a whole lot more predictable and transparent than the haphazard system we at present live under, with all its murky opportunities for corruption.

His suggestion does sound like an improvement over the current system. But the 're-engagement with the public' that Mr Jenkins talks about could actually occur if political parties, as I suggest, orientate their ideas, language and manifestos towards outcomes, rather than sell their image, make meaningless gestures, or discuss structures, activities or funding arrangements.

#### **4.11.7 Subsidies to the rich, continued (2007-11-14 08:49)**

The European Court of Auditors submits its annual [1]report on EU expenditure. As has been the case for more than 10 years it refuses to approve it:

The Court again gives an adverse opinion on the legality and regularity of the majority of EU expenditure: primarily the part of agricultural spending not covered by IACS, structural policies, internal policies and a significant proportion of external actions. In these areas there is still a material level of errors found in the payments to final beneficiaries, albeit to different levels. Source: [2] farmsubsidy.org

In the chapter on farm subsidies, the report says:

the Single Payment Scheme has led to a substantial increase in the number of hectares in respect of which direct aid is paid and beneficiaries. The Court has also noted among them railway companies (England), horse riding/breeding clubs (Germany and Sweden) and golf/leisure clubs and city councils (Denmark and England).

As farmsubsidy.org says:

Little of this is any surprise to the farmsubsidy.org network, whose members have been finding unexpected recipients of farm subsidies alongside the many royal recipients (Queen Elizabeth, Prince Albert of Monaco, the Duchess of Alba etc) and corporate beneficiaries Arla, Campina, Nestle, Philip Morris, Tate and Lyle etc). Who would have thought that Lufthansa and Gate Gourmet are getting six figure payouts in farm aid every year? This has been hidden from the public for decades, but transparency is finally bringing it all out into the open.

#### 4.11.8 The limits of a free market (2007-11-19 08:42)

More from Clive James (in a chapter written about the British General election of 2001):

The New Britain is philistine to the core. It is one of the cruellist paradoxes of my time in Britain that its once fruitful broadcasting system now reinforces the stupidities it was brought into being to ameliorate. ... [W]hen Margaret Thatcher removed the quality requirement from the ITV [Independent TV] franchise bids, she blew the whistle for the rush to triviality. It was a crime bred from the capital error of thinking that an ideology can be a view of life. The free market has an unrivalled capacity to harness brains. But the free market does not have a mind, and its bastard child, managerialism, is not a thing of the spirit: just a toy for the untalented. [1] *The Meaning of Recognition*

(page 169)

I agree with Mr James here. The key, I think, is to harness the brains not solely to the performance of corporations, but to the social good. That is the Social Policy Bond principle: to channel the free market's incentives and efficiencies into achieving social and environmental goals.

#### 4.11.9 Disaster capitalism (2007-11-21 04:36)

From [1]Harper's Index, October:

- Average grade for US infrastructure given by the American Society of Civil Engineers in 2005: D
- Percentage change since 1990 in the average size of an American Master bathroom: +50

This seems to me to typify a trend seen in most of the western countries: a degradation of the commons at a time of rising private affluence. This theme is explored in more depth in the same issue of Harper's, in an article by Naomi Klein: [2]Disaster Capitalism (subscription):

[D]isasters have become the preferred moments for advancing a vision of a ruthlessly divided world, one in which the very idea of a public sphere has no place at all. ... [Katrina] was created and deepened by public infrastructure that was on its last legs; in the years since, the disaster itself has been used as an excuse to finish the job. ... Not so long ago, disasters were periods of social leveling, rare moments when atomized communities put divisions aside and pulled together. Today they are moments when we are hurled further apart, when we lurch into a radically segregated future where some of us will fall off the map and others will ascend to a parallel privatized state, one equipped with well paved highways and skyways, safe bridges, boutique charter schools ....

Importantly, if Ms Klein's thesis is accurate, there's no self-correcting mechanism, as she is well aware:

The disaster-capitalism complex does not deliberately scheme to create the cataclysms on which it fees...but there is plenty of evidence that its component industries work very hard indeed to make sure that current disastrous trends continue unchallenged. Large oil companies have bankrolled the climate-change-denial movement for years....

My impression is that something similar seems to be happening in both the UK and New Zealand. Whether this is a product of right-wing think tanks, [3]ethnic diversity (or rapidly changing ethnic diversity), the welfare state, or the discredited economics of socialist alternatives, I don't know and in a sense it doesn't matter. If there's widely agreed to be a problem, then the Social Policy Bond principle is about motivating people to solve it, rather than channelling resources into identifying its cause.

By its nature, the commons is a difficult thing to define and quantify. For instance, random crimes of violence might rise, but that could deter people from exposing themselves to them; they stay at home or drive everywhere, and crime rates fall. But we can try to get a handle on the non-subjective aspects and we can try to encourage the people who generate solutions. A thriving economy does generate more material wealth, but governments that are beholden to large corporations are unlikely to do a good job of alleviating our social and environmental problems. The sort of questions that a Social Policy Bond regime would stimulate - along the lines of: what do we want as a society? - could go a long way to avoiding the disaster capitalism that Ms Klein writes about.

#### **4.11.10 Why we have green leaves and Kyoto (2007-11-23 09:30)**

From a letter by Raymond Firestone to the New York Review of Books:

[N]atural selection proceeds via a narrow point-to-point pathway, not a wide all-encompassing one. In solving any given problem it can make use of only what happens to be available at that particular time.

Black leaves might be superior to green, but no new structure will appear...

unless it is immediately adaptive.... Thus green leaves dominate because they happen to have come along before black ones, and also because chance uncovered no route from green to black that was adaptive at every new step. NYRB, 11 October, page 49

Is there something analogous to our societies here? Perhaps so. I don't think we can assume, for instance, that left to their own devices our vast number of decision-making bodies, including not only corporations, individuals, interest groups and non-governmental organizations but government agencies as well, will somehow generate solutions to such universally recognised problems as climate change, famine or war.

What's missing, in my view, is the focus in both evolution and society, on the immediate. Bodies like the United Nations reflect our own limitations: they do genuinely want to see an end to (say) climate change, but as an institution its focus is on the immediate: it looks at *what it thinks* is the next step forward. But the direction of such a step is limited by its imagination, which means that policy evolution will be overly based on what is current. Rather than stipulate a desirable end point (climate stability, for instance), our decision-makers are prepared to delegate only the next step of policy implementation to the wider population. So we get a huge political and financial effort directed at reducing anthropogenic emissions of greenhouse gases. (And even this will be done at [1]less than maximum efficiency.) There will, as a result be incremental change - better fuel efficiency here, more expensive power there - but larger adaptations, which might be dramatically more efficient, are not envisaged nor encouraged by our current political process.

The Social Policy Bond principle is different. It contracts out the achievement of broad social and environmental goals, like climate stability or world peace, to entire populations of would-be investors. So a broader, more highly motivated coalition would decide on the direction and magnitude of the most efficient ways of achieving society's goals. I think that would be an improvement.

#### **4.11.11 Privatizing libraries (2007-11-25 09:06)**

There may be no more eloquent statement about the erosion of our [ie, the United States'] civic connectedness than the news that public libraries around the country are starting to outsource their daily operations. Yes, public libraries are being privatized. This should not be entirely surprising, given how jails, highways and even military operations are being privatized these days. Yet it does raise the distressing

question - If libraries are vulnerable, where will this momentum for dismantling our civic institutions end? [1] David Bollier

I can't add much to Mr Bollier's piece. I do recommend you read his and other posts that appear in [2]OnTheCommons. Privatized libraries are one aspect of the deterioration of our commons. If asked, I am sure most of us would decry environmental pollution, unsafe streets, and other symptoms of an eroding public life. There are trade-offs of course: less pollution means (often) a lower material standard of living; lower crime can mean a more intrusive police force, and privatized libraries could mean lower property taxes. These trade-offs are made via the political process. The problem is that this process is weighted heavily in favour of sectoral interests, which tend to favour big business at the expense of small businesses and individuals, and numbers (as in GDP per capita) at the expense of things that cannot easily be quantified, like the state of the commons. The process, in short, is unrepresentative.

The sort of outcomes that Social Policy Bonds would best target - broad social and environmental goals - would most probably not directly mention the ownership of libraries. But a bond regime would, because it does target outcomes, draw more people into the policymaking process. Once involved, people would be more aware of the trade-offs and more concerned about our deteriorating commons. We might make choices that result in the commons' continued erosion - though I doubt that - but at least we'd be doing so with our eyes open.

#### **4.11.12 Nobody really knows (2007-11-27 08:48)**

In today's London *Times* Gerald Baker [1]describes some of the bad things happening to the US economy. For instance: the US dollar has fallen by 40 percent in the past 5½ years:

If you had asked the average gloomy economist back then what would be the implications of such a steep fall in the dollar, the answer would have included a good deal of pessimistic conventional wisdom. Such a sharp drop in the value of the currency would, it was generally assumed, spell real trouble for the value of US assets. Demand for US Treasury bonds would surely fall sharply. In fact, the decline in the dollar's value would be both cause and effect of a flight from dollar-denominated assets. Interest rates, which move inversely to bond prices, would, therefore, surge, presumably prompting a serious retrenchment. Foreigners would surely offload many of their US equities, too, and Americans would not be far behind them.

Then there would be an inflationary surge. A 40 per cent decline in the dollar's value, would, other things being equal, push up import prices by a similar amount and the feed-through to the broader economy would be swift and painful.  
*The Times*, 27 November

But what has actually happened? Mr Baker continues:

In the past 5½ years, US Treasury prices actually have soared. In early 2002 the yield on the benchmark ten-year Treasury was about 5.5 per cent. It is now about 4 per cent. Equities, on a broad measure, are up by about 50 per cent in the past five years. Inflation? It has gone up, but hardly enough to notice. In December 2002, the core consumer price index ...was up 1.9 per cent from a year earlier. Last month it was up to 2.2 per cent.

Now there are lots of specific reasons that explain these unexpectedly benign outcomes: foreign central banks still buying US Treasuries; global savings keeping demand strong for all US assets; prices held low by international competition. And it is still true that we face serious challenges. But when you think of all the factors that could have produced disaster in the past five years – not just a dollar collapse but soaring oil prices and an overextended housing market – you have to conclude that something quite fundamental has changed. The US and global economies continue to demonstrate a remarkable structural resilience and flexibility unseen in modern history.

Remarkable, yes, and unforeseen, even by the experts. It reminds me of work done by [2]Eban Goodstein, which shows that not only interest groups, but disinterested commenatators routinely overstate the costs of pollution control. The link doesn't seem to be working right now, but here is one example Goodstein gives:

Asbestos. When the Occupational Safety and Health Administration (OSHA) instituted regulations covering exposure to asbestos in the early 1970s, they hired a consulting firm to estimate the cost of compliance. Two later studies found that the original prediction for the cost of compliance was more than double the actual cost, because of overly static assumptions.

The common factor between the poor performance of experts at prediction is probably complexity rather than self-interest. From the point of view of a Social Policy Bond advocate, the implication is that subordinating policies to outcomes can work: if there are sufficient incentives, then large numbers of motivated people can defy the doomsters. Costs of implementing valuable social and environmental policies cannot be predicted by experts, so why not target desirable outcomes – however seemingly unrealistic or [3]idealistic – and let the market worry about the cost? We may well be pleasantly surprised.

#### **4.11.13 Saturated fat and climate change (2007-11-30 00:08)**

A story in the November issue of *Men's Health*, [1]What if bad fat is actually good for you? by Nina Teicholz tells us that, after numerous studies, there is no convincing evidence that

saturated fats are bad for you. But the far-reaching implications of this fact have been widely ignored. Of wider interest are the difficulty of getting work published that contradicts accepted dogma, and the disconnect between scientific fact and policymaking. Medical research is bedeviled by many of the problems that afflict analysis of social and environmental problems, especially extreme complexity and the difficulty of performing controlled experiments. So it seems quite plausible that beliefs and policies accepted by the broad establishment can diverge from reality in medicine just as much as in social welfare or environmental policy. Vested interests form and co-operate with each other to resist change. Very low priority is given to the essential (but admittedly complex and unexciting) task of monitoring policies for their effectiveness. It can take a crisis to force policy to adapt to reality.

One way of resolving this problem would be for policymakers to stay out of complex areas. The difficulty with this is that government has already moved in to such a degree that it has crowded out society's other ways of dealing with problems. We can actually see this process happening today when government, for reasons that appear compelling, becomes involved in such issues as disciplining children. Nothing necessarily wrong with this sort of encroachment but the danger is that they substitute for society's own coping mechanisms, which then disappear permanently - and that these evolved customs and taboos might have been more efficient than the policies that replaced them. We begin to depend on government intervention, even when such intervention defies all commonsense: take a look at the long and lamentable history of farm support policies for the best-documented example.

If withdrawal of government is no help, might not the answer lie in the replacement of a handful of experts by a diverse, adaptive group of motivated people? Very often, in matters of complex policy like, say, heart disease or climate change, we know exactly what we want: longer, healthier lives or climate stability. But we have no clear idea of how to get there, and probably the best approaches vary unforeseeably with time, geographical area and a host of other variables. By targeting our desired outcomes, and rewarding people for achieving it, we could replicate, accelerate and even improve on the evolution of sensible, diverse, adaptive approaches that in natural societies, as in the individual organism, make for long-term well-being in ways that are socially and environmentally sustainable. This is the essence of the Social Policy Bond approach.

## 4.12 December

### 4.12.1 Sacrifices (2007-12-03 09:40)

David Foster Wallace writes:

What if we chose to regard the 2,973 innocents killed in the atrocities of 9/11 not as victims but as democratic martyrs?... In other words, what if we chose to accept

the fact that every few years, despite all reasonable precautions, some hundreds or thousands of us may die in the sort of ghastly terrorist attack that a democratic republic cannot 100-percent protect itself from without subverting the very principles that make it worth protecting? ... Would it be monstrous to refer to the 40,000-plus domestic highway deaths [in the US] we accept each year because the mobility and autonomy of the car are evidently worth that high price? [1] *The Atlantic*

, (subscription) November 2007

Mr Wallace, rightly in my view, laments the lack of a serious national conversation about the relevant tradeoffs. The discussion is about 'The American Idea', and Mr Wallace goes on to ask:

What are the effects on the American idea of Guantanamo, Abu Ghraib, PATRIOT Acts I and II, warrantless surveillance...etc?

Even if they have made Americans safer 'are they worth it?'

Where and when was the public debate on whether they're worth it? Was there no such debate because we're not capable of having or demanding one? Why not?

All good questions. I wonder whether their answer is largely a technical one. Of course, people with power rarely relinquish it voluntarily. And there are highly effective lobby groups who will do a lot to prevent meaningful debates about policy priorities. But the real reason may be less sinister: it's that we are more consumed by process, gesture, symbol, media interest and activity when we are making policy, rather than outcomes. Nobody has strong incentives to monitor policies for their effectiveness, so that gets a very low priority. Trade-offs, such as that between road transport and alternatives, have to be painstakingly guessed at, long after policies are implemented and entrenched.

The Social Policy Bond principle, by obliging us consider the outcomes we want, would encourage discussion of trade-offs. It would not end the debate about sacrifices between, for example, safety and freedom that Mr Foster Wallace raises, but it would bring to the forefront the notion of such tradeoffs. By making them explicit, an Social Policy Bond regime could both make debate possible and bring about more public participation in it.

#### **4.12.2 Energy efficiency is not a goal (2007-12-05 09:55)**

From [1]Planet Ark:

American consumers are driving bigger gas-guzzling cars and buying more air conditioners and refrigerators as the overall energy efficiency of such products

improves.... In what the study calls "the efficiency paradox," consumers have taken money saved from greater energy efficiency and spent it on more and bigger appliances and vehicles, consuming even more energy in the process.

"While seemingly perverse, improvements in energy efficiency result in more of the good being consumed – not less," said Jeff Rubin, chief economist and chief strategist at CIBC World Markets, which conducted the study. The study concludes that stricter energy efficiency regulations aren't the answer to concerns over climate change and the depletion of oil supplies.

Exactly. Efficiency is not an end in itself; it's a means to an end, and governments would do better to target such ends rather than what they think is the best way of achieving them. This confusion bedevils government policy in many other areas: rather than target literacy, they target class sizes; rather than target unemployment, they introduce corrupt and wasteful import barriers; they rather than target global peace they pile up ever more weapons... the list goes on. "The problem is, energy efficiency is not the final objective," Rubin said. Indeed. Martin Wolf, of the Financial Times [2]agrees. Discussing climate change he says:

Yes, we have a moral obligation to consider both the poor and future generations. Yes, the fact that the changes in the composition of the atmosphere are, to all intents and purposes, irreversible makes early and effective action essential. But acceptance of these points will not be sufficient to obtain meaningful action, instead of pious aspirations and much pretence. A good example of the latter is the proposition that it is enough to lower the carbon intensity of output. Alas, it is not, unless the reduction is very large indeed.

#### **4.12.4 Subsidizing planetary destruction, continued (2007-12-08 11:05)**

I haven't read the entire report [1]*Fishy Farms* (pdf), by non-profit consumer organization Food and Water Watch, which describes the problems created by open ocean aquaculture in the US, but here are some of its conclusions:

- Each pound of fish sold by the University of New Hampshire's demonstration project costs about \$3,000 in our taxpayer dollars to produce.
- Aquaculture will not reduce pressure on wild fish populations. The industry is already the world's largest user of fishmeal and fish oil, consuming 80 percent of the world's fish oil and half the fishmeal each year.
- It can take two to six pounds of wild fish to produce one pound of some types of farmed fish.

Thankfully the subsidized research still seems to be at the experimental phase. Costs to US taxpayers have so far been limited to \$25 million - not much compared the billions that routinely get spent on equally damaging agricultural subsidies. *Fishy Farms* is summarized [2]here.

#### **4.12.5 Image versus reality (2007-12-11 11:04)**

Bill McKibben's book, [1]*The Age of Missing Information*, was written 15 years ago, but it is still pertinent. Commenting on the sheer volume of television that we watch (25 or 30 hours per week) and the difficulty we have in hearing subtle but critical messages against it, McKibben says:

If God decided to deliver the Ten Commandments on the *Today* show, it's true he'd have an enormous audience. But the minute he was finished, or maybe after he'd gotten through six or seven, it would be time for a commercial and then a discussion with a pet psychiatrist about how to introduce your dog to your new baby (page 216).

Our politicians pander to this. Slow-moving stories without televisual appeal are ignored; campaigns that sound far-reaching and momentous are announced in response to headline news, They're usually ineffectual or destined to be forgotten as media attention moves onto something else. See, for instance, this [2]story on the Bush Administration's response to the sub-prime lending problems in the US. This is government by manipulation: image is the over-riding priority. Appearing to be busy is crucial. Spend money, form committees, restructure: anything, anything at all, except *agree on a meaningful outcome and subordinate policy to that.*

#### **4.12.6 Celebrity policing (2007-12-13 11:53)**

Explicit, verifiable outcomes can function like a compass to policymakers. In their absence, there's no real measure of how well or badly our governments are doing. No real measure - but plenty of false ones, including the amount of funding a particular body receives or, increasingly nowadays, the media attention given to one's actions. The police aren't paid for performance: increased crime figures are routinely attributed to more comprehensive reporting... so how does a police force prove that it's effective? Not by reducing crime; not these days, but by appearing in a favourable light in the mass media. Writing about the UK, [1]Mick Hume says:

[I]the day-to-day reality of policing, there is a discernible tendency to prioritise high-profile cases that might bring exposure and kudos rather than mere convictions. ... The police now seem to chase celebrities around almost as hard as the paparazzi do, often with farcical results....All of this is the flipside of the crisis of traditional authority that the police, like every other state institution, have suffered in recent years. They have attempted to rebrand the police as a 'service' rather than a 'force', indulged in very public self-flagellation over being 'institutionally racist', and done everything possible to distance themselves from the old image of 'the heavy mob'. But the loss of a clear sense of mission has often left the police appearing paralysed, a crisis of self-confidence well illustrated after the successful prosecution of the Met on health and safety grounds over the shooting of Jean Charles de Menezes. Uncertain of how to regain authority and fearful of the results of doing anything decisive, the police have often been reduced to staging the sort of high-profile PR stunts discussed here, to give the appearance of being in command.

There are genuine problems in measuring how well police perform: it is not just crime that unravels the fabric of society but also fear of crime, which is inescapably subjective. Even so, some research into objectively verifiable measures would I am sure generate more relevant performance indicators than the number of high-profile media appearances by top policemen, which is what appears now to be one of our police force's main goals.

#### **4.12.7 Climate change and discount rates (2007-12-14 13:01)**

A not-too-technical discussion on the discount rate to be applied to the damage caused by climate change is [1]here. As I say in my comment there, I can't help thinking that the cost-benefit method, in being applied to climate change has little relevance or meaning. For one thing, it's being applied to the so-called costs of mitigation, but the uncertainties extend to the relationship between gas emissions and climate change. I'd prefer to see climate change tackled directly and in fact targeting climate stability, rather than gas emissions, and subordinating policy to that would make life much easier. I [2]suggest agreeing on a target for climate stability, and contracting out the achievement of a stable climate to the market. This means no prejudging of how best to achieve the goal: mitigation might be necessary, but there will other, possibly more efficient solutions, as yet unthought of by those who would commit us to gas reductions and *only* gas reductions.

#### **4.12.8 Targeting longevity (2007-12-16 10:08)**

If ever Social Policy Bonds were to be issued, they may well make use of existing sources of data that can be used, with some massaging. Though climate stability doesn't seem to be explicitly targeted, for example, there are large and increasing volumes of data on the world's climate and its variations over time and space. Now I [1]read that Goldman Sachs is to compile publish a mortality index, tracking a "monthly a pool of 46,290 anonymous U.S. citizens over age 65". The rationale has nothing, unfortunately, to do with Social Policy Bonds, but this is the sort of information that would be helpful in targeting longevity, or some refinement of it, perhaps in countries where it is a reliable indicator of wellbeing. Note that, if the financial benefit that could be accrued by manipulating mortality rates downwards were sufficiently high, the index could indeed stimulate longevity-reducing initiatives.

#### **4.12.9 Ideology and AIDS in Africa (2007-12-17 12:08)**

The history of the response to African AIDS can be divided into two phases: (1) fiddling while Rome burns, and then (2) trying to use the fiddles to put out the fire.

So [1]writes William Easterly in the *New York Review of Books*. The World Bank and aid organizations were slow to act.

Western scientists flew into Africa, collected blood samples, and flew out, seemingly much more interested in getting recognition in the Western press than in communicating useful and sensitive knowledge to African leaders and the public.

Western scientists were tactless; western media played up to this:

[B]eing accused of promiscuity and having Africans labeled as the equivalents of Typhoid Mary did not make their leaders or the general population all that receptive to messages from Western scientists on how to confront the epidemic. Many Africans reacted with a mixture of denial and conspiracy theories. Maybe the CIA had targeted Africans during the cold war with a scientifically engineered virus....

Helen Epstein in *The Invisible Cure*, the book that Mr Easterly is reviewing, understands that the AIDS crisis in Africa is caused by 'concurrent relationships'. As Easterly puts it:

To oversimplify a little, Africa's AIDS tragedy is that it combines greater Western-style sexual equality for women with social norms that permit simultaneous long-term sexual relationships for both partners.

Infection rates in Uganda fell, largely because of its crucial 'Be Faithful' message. Tragically, this message has been ignored by ideologues of both the left (who favoured condom use) and the right (who favoured abstinence). A huge share of the current western effort:

has been concentrated on getting antiretrovirals [ARVs] to those in Africa with full-blown AIDS. There is nothing wrong with the urge to treat the sick, but in practice it has crowded out nearly every other response to the epidemic. ARVs are now reaching only a tiny minority of those in need and it will never be feasible to treat everyone. .... The "Be Faithful" message was neglected because it was not of interest to the bureaucracy concerned with AIDS. As Epstein muses acidly: "Zero Grazing" had "no multimillion-dollar bureaucracy to support it."

This appears to be another distressing case of well-meaning, hard-working people being hampered by their own ideology in their genuine efforts to alleviate a human disaster. I think this is a clear case where a Social Policy Bond approach that rewarded people for reducing AIDS infection rates, *however they do so*, would be far superior. Aid organizations, and others, would direct funds *impartially* to where they would generate the greatest return per dollar outlay. Ideologues would go somewhere else: Social Policy Bonds would enlarge and motivate the pool of people who are solely concerned to reduce the incidence of AIDS, rather than validating their worldview.

#### 4.12.10 Outcomes versus emotions as policy drivers (2007-12-21 10:31)

What should drive policy? Not ideology, I don't think, because it essentially faith based; the faith being that approaches that succeeded in the past will succeed today. (Paul Krugman has a [1]column today on how conservative ideology has done much to precipitate the mortgage disaster in the US.) Not spending, because pumping money into activities or institutions is no guarantee efficiency in delivering outcomes will be maintained or improved. I'm also suspicious of top-down restructuring having worked in an organization that was restructured eight times in my 17-year career there. The immediate result was a loss of morale, losses of well-qualified employees, and waste of resources. There were short-term accountancy-type gains, but the main discernible goal seemed to be to enhance the curriculum vitae of those who planned the restructures. It's not only me who is skeptical of these sorts of policy driver. But there are worse, and one such is emotion.

A recent [2]article on *Science Daily* is titled "The Effect of 'In-Your-Face' Political Television on Democracy". It reports on research showing that:

[T]he incivility and close-up camera angles that characterize much of today's "in your face" televised political debate also causes audiences to react more emotionally and think of opposing views as less legitimate.

I think this finding is important. Television is vastly influential in politics. TV corporations have their own imperatives, and these have everything to do with audience figures (and subscription and advertizing revenue) and very little to do with fostering the mutual respect of opposing sides in political debates. Arguments are polarized, attitudes become extreme on all sides. In the US the influence of emotion as a policy driver seems to me to show in the attitudes towards, amongst others, smoking, guns, abortion and capital punishment. To this outsider there seems very little mutual respect on either side of those arguments, and the disease seems to be spreading within the US to immigration and welfare. And outside the US? I don't really know what television is like in other countries except perhaps New Zealand, where there also seems to be a descent into incivility.

It seems that emotion is supplanting other policy drivers. It's not too much of a surprise, because society is growing ever more complex as are the relationships between cause and effect in social and environmental policy. Emotion is easier to communicate and to exploit. But as a policy driver it has obvious faults. It's far too easy to manipulate for mercenary and more sinister ends. I'd much prefer to see meaningful outcomes drive policy. These could bypass the complexities of our economy and society, so they would be easy to understand. It's far simpler, say, to target violent crime, or climate change, than it is to make a case for (say) subsidizing leisure centres for youths or urging poor countries to stop building coal-fired power stations. These actions might be necessary and efficient, but it should be up to the market to make the case for carrying them out, rather than remote, cumbersome and monolithic central

government. But that's not the only advantage of targeting outcomes: the other is that it would be direct and accessible to ordinary people. It would appeal to people's rationality, make us aware of trade-offs, encourage public participation and buy-in, and engender mutual respect amongst people with different views - in stark contrast to appealing to people's emotions.

#### **4.12.11 Politics as an Enterprise System (2007-12-23 11:55)**

In a [1]review of *The Social Life of Information* by [2]John Seely Brown and [3]Paul Duguid, Simon Head describes:

"enterprise systems," or ES, which bring together computer hardware and software to standardize and then monitor the entire range of tasks being done by a company's workforce.

It is ES that Wal-Mart has applied to the retail economy, to the great benefit of its shareholders.

Among manufacturers, wholesalers, and retailers like Wal-Mart, ES offers obvious economic advantages. It relies on electronic tags, sensors, and "smart" chips to identify goods and components at different stages of the production and distribution chain, a practice that has brought enormous gains in productivity. Such innovations allow managers to find out immediately not only that production and distribution are falling behind schedule, but also why.

But increasingly ES is being applied to bureaucracies, white-collar business, and universities. ES technologies reduce complex human activities to a series of processes that can be mapped out and programmed by a computer. Writing about the US, Mr Head continues:

Nowhere have these technologies been more rigorously applied to the white-collar workplace than in the health care industry. The practices of managed care organizations (MCOs) have provided a chilling demonstration of how enterprise systems can affect the work of even the most skilled professionals, in this case the physician. The goal is to standardize and speed up medical care so that insurance companies can benefit from the efficiencies of mass production: faster treatment of patients at reduced cost, with increased profits earned on increased market share.

This seems to work only from the very narrow perspective of the MCOs' accounts. Patients experience similar frustrations (and worse) to those that all of us feel when ringing a call-centre - where ES is also widely used.

And what about the workers? Mr Head mentions also [4]*The Culture of the New Capitalism*, in which Richard Sennett

describes how the widespread use of enterprise systems has given top managers much greater latitude to direct and control corporate workforces, while at the same time making the jobs of everyday workers and professionals more rigid and bleak. The call centers of the "customer service" industry, where up to six million Americans work, provide an egregious example of how these workplace rigidities can make life miserable for employees. At call center companies such as AmTech and TeleTech, call center companies to whom many corporations outsource their "customer relations management," agents must follow a script displayed on their computer screens, spelling out the exact conversation, word for word, they must follow in their dealings with customers. Monitoring devices track every facet of their work: minutes spent per call, minutes spent between calls, minutes spent going to the bathroom. ...

The most powerful passages in Sennett's book describe how these unnerving changes are destroying aspects of white-collar employment that he believes are essential to the well-being of workers, whether they are nurses, call center agents, bank officers, or mid-level managers at Con Edison. He describes how the spread of ES has resulted in a declining emphasis on creativity and ingenuity of workers, and the destruction of a sense of community in the workplace by the ceaseless reengineering of the way businesses operate. The concept of a career has become increasingly meaningless in a setting in which employees have neither skills of which they might be proud nor an audience of independently minded fellow workers that might recognize their value.

This is bad enough, but what happens when bureaucracy and politicians adapt ES for their own purposes? In New Zealand and Australia it [5]appears that the independence of public servants and their ability to offer impartial and objective advice to politicians is diminishing. Policymaking becomes a top-down, hierarchical process, designed to maximise the popularity - as measured, with ever less credibility by general elections - of the ruling political party. Officials become subject to the ennui that Sennett describes. Flair and originality are discouraged, process is king. We are all Wal-Mart employees now!

All this serves to widen the already big gap between politicians and ordinary people. Slipping through the cracks are such vital but difficult-to-measure concerns as the wellbeing of society. A Social Policy Bond regime could close this gap. The key is to target outcomes that are meaningful to ordinary people. Such outcomes would be inextricably linked to people's wellbeing. Goals would originate from the public, who would be motivated to participate in politics because their views would count. Such an approach requires that politicians relinquish some of their power. Frankly, and mainly for that reason, it will be a while before it happens. But the alternative of an ever-widening gap between politicians and the people they represent and the continuing alienation of people in government service at any level from meaningful employment is too dreadful to contemplate.

#### 4.12.12 Ludicrous (2007-12-24 09:17)

The Accident and Emergency (A &E) departments in English hospitals have to ensure that 98 percent of patients transferred or discharged within four hours. If they fail, they are subject to financial penalties. One result is that, since these targets were imposed, more patients are transferred to hospital wards 'just in case'. This is costly in resource terms, but it benefits hospitals who receive as much as £1000 per admission, compared with about £100 for a patient treated in A &E. And, as [1]*The Times* puts it:

The increase in admission through A &E could have another explanation, apart from the four-hour target. To admit more patients is greatly in the financial interests of hospitals because under payment by results they get paid much more. Using the system in this way is called "gaming" within the NHS and is frowned upon.

This the sort of nonsense that happens when a government imposes Mickey Mouse micro-targets. The letter of the intent is strictly adhered to; the spirit is ignored. I do agree that we need some sort of target for government funds, but such targets must be broad and *meaningful to ordinary people*. A &E throughput rates are irrelevant to the health of the population; if government is concerned about health then it should target health. Of course, defining health and measuring it is more difficult than measuring the length of stays in A &E departments, but with sufficient ingenuity - of the sort that is currently applied to gaming the system - it can and should be done.

#### **4.12.14 Incentives to engage (2007-12-27 09:43)**

According to Jim Giles, writing in the [1]*New Scientist*(subscription), New York this year became the first city in a rich country to try to alleviate poverty by offering cash incentives to improve people's engagement in areas such as education, health and employment. Mexico was the pioneer. Top-down projects, such as subsidies for staple foods and healthcare were mostly unsuccessful. So the government gave cash payments to low-income families to be spent however they wanted, provided they behaved in approved ways. For example, a family could earn about \$20 a month by enrolling a child in primary school and ensuring that s/he attended regularly. Similar payments were made if children had regular health check-ups.

In the rich countries it is mainly the US that uses such incentives, and there only in a few isolated drug-treatment programmes. Whether they succeed in stopping drug abuse in the long term is uncertain.

It's a controversial approach, but one of which I approve. I'd prefer governments not to make the payments directly, but rather to set broad health, education and employment targets, and let the private sector work on achieving them. But accepting that reducing substance abuse (for instance) is an end in itself, I'd encourage the disconcertingly rare approach of setting a target and doing whatever is necessary to achieve it. The chosen methods may seem controversial, counterintuitive or as in this case, a subsidy to the undeserving or the dissolute, but so long as they are ethical and legal I think it would be irresponsible to rule them out.

#### **4.12.15 Marjane Satrapi (2007-12-29 11:16)**

Graphic novelist Marjane Strapi was interviewed in April 2005 for [1]Salon Magazine (gated, but the full text is [2]here). She says:

If I have one message to give to the...American people, it's that the world is not divided into countries. The world is not divided between East and West. You are American, I am Iranian. We don't know each other, but we talk together and we

understand each other perfectly. The difference between you and your government is much bigger than the difference between you and me. And the difference between me and my government is much bigger than the difference between me and you. And our governments are very much the same.

This is a compelling insight. It's especially poignant ("We, the people....") that Ms Satrapi can accurately point to the gap between the American government and American citizens. Big government need not necessarily be a problem in itself, but it tends to come with remote government - which, I believe, is. What's more, big government is self-entrenching. It is comfortable dealing with (and accepting campaign funding from) big corporations. Big business of all sorts enjoys explicit subsidies, as well as a favourable regulatory environment, and the implicit subsidies of a government-funded infrastructure and (often) economic protection. Governments confuse the fortunes of big business with those of the wider economy, and those of the wider economy with those of society. One result is that the individual citizen in most democratic western countries feels as remote from decision making as does the average Iranian citizen.

Anonymous (2012-02-13 14:26:49)  
Honestly?

America is not perfect. But can you really say that Iran and the Western governments are the same? Marjane lives in France, perhaps she was talking about France and the USA? She certainly can't be talking about the country she described in Persepolis.

Ronnie Horesh (2012-02-13 14:45:10)

Hi Anonymous; I don't say that Iran and western governments are the same; only that people 'feel' that the gap between them and their government is similar. The five years since this post and your comment have, I think, seen this gap between people and government widen still further in the west; and perhaps in Iran too?

#### **4.12.16 Risk communication (2007-12-30 09:10)**

Discussing asymptomatic women aged 40-50 who have participated in mammography, [1]Gerd Gigerenzer writes in his excellent book [2]*Calculated Risks* (pp41-3) :

The probability that one of these women has breast cancer is 0.8 percent. If a woman has breast cancer, the probability is 90 percent that she will have a positive mammogram. If a woman does *not* have breast cancer, the probability is 7 percent that she will still have a positive mammogram. Imagine a woman who has a positive mammogram. What is the probability that she actually has breast cancer?

Of 24 physicians who were given this information only two gave the correct answer - which is 9 percent. Probabilities are difficult for most of us to get a handle on. Gigerenzer is a persuasive advocate for instead using natural frequencies:

Eight out of every 1000 women have breast cancer. Of these 8 women with breast cancer, 7 will have a positive mammogram. Of the remaining 992 women who don't have breast cancer, some 70 will still have a positive mammogram. Imagine a sample of women who have positive mammograms in screening. How many of these women actually have breast cancer.

It's much easier to see from this that only 7 of the 77 women who test positive actually have breast cancer, and indeed most of 24 (different) physicians given the information in this form, estimated correctly. Gigerenzer also discusses AIDS testing and the often tragic reaction of people who test positive when they, their testers and their counsellors know nothing about how frequently such positives are false:

Since the first AIDS cases were described in 1981, more manpower and money have been poured into researching HIV than any other disease in history. Little, in contrast, has been done to educate the general public about what an HIV test result means. (p139-40)

Ignorance about risk bedevils the law courts as well:

Many students who spent much of their life avoiding statistics and psychology become lawyers. Out of some 175 accredited law schools in the United States, only one requires a course in basic statistics or research methods.... [S]tudents who excelled in critical thinking could not evaluate whether a conclusion drawn from statistical evidence was correct or incorrect. (p159)

I think the lessons from this are important for policymaking, and not just because many of our policymakers used to be lawyers. One lesson is that it's quite possible for even well-meaning professionals to have no idea about statistics and risk. As our economies and societies grow ever bigger and more complex, policymakers will rely more and more on statistics. Inferences drawn from them need to be robust. My feeling is that the ignorance that Gigerenzer documents thrives in the compartmentalized, specialized policy environment we have today. Doctors, lawyers and politicians don't know very much about risk and neither does most of the public. There's very little monitoring of policies for effectiveness and there's very little incentive to get policies right. You can't (easily) legislate for effective risk communication and understanding, but what you can do is throw the achievement of social goals open to the market - by using Social Policy Bonds for example - so that errors of the sort that Gigerenzer documents do not persist and entrench themselves.

# 2008

## 5.1 January

### 5.1.1 We're all Aztecs now (2008-01-01 10:18)

Cars have done much to destroy life, not only directly but also indirectly by taking over our cities, poisoning our air, destroying communities... and the list goes on. Here's yet another angle, from the *New York Times* via [1]Grist:

Motorized outdoor enthusiasts are converging in increasing numbers on Western public lands [in the United States] - not only in areas marked for such outdoor enthusiasm, but in wilderness areas where rules against off-roading are nearly impossible to enforce. Registration of all-terrain vehicles and motorbikes in four Western [US] states tripled from 1998 to 2006. The surge is traceable to the booming outdoor-recreation industry, as well as the culture of sprawl: In some places, houses have been pushed out so far that federally owned land is just a big backyard - albeit a public backyard where no individual has to take the specific blame for vehicle-aggravated erosion and water pollution. Off-roaders deny criticism that they're out to defile untouched nature, arguing that public land is there for public use. "[Groups lobbying for wilderness designations] think it has to be kept in this pristine state," says one motorcycle-shop owner. "These people don't even use it." Which is, of course, the point.

Regarding the header of this post:

Michael Harner, in his 1997 article *The Enigma of Aztec Sacrifice*, estimates the number of persons sacrificed in central Mexico in the 15th century as high as 250,000 per year. [2] Source

That's towards the higher end of the range of estimates. Worldwide, about [3]1.2 million are killed on the roads annually.

### 5.1.2 The unimportance of being responsible (2008-01-04 11:59)

John Kay [1]writes:

In politics, business and finance, as on the seas, the hero is the person who tackles a problem, rather than the person whose actions prevent the problem arising. ...If Margaret Thatcher had acted to deter Argentina from invading the Falklands, rather than ordering a taskforce to remove the occupying forces after they had landed, she would probably have been remembered as an unsuccessful one-term prime minister.

He's right: being remembered and winning elections are not as helpful as preventing problems arising in the first place but unfortunately they constitute success in our current policymaking system. As a society we'd do better to reward those of us who anticipate and avoid social and environmental problems before they become emergencies. A Social Policy Bond regime that rewarded the maintenance of the best aspects of the status quo could do this: bonds could target, for example, the absence of large-scale wars, or use of nuclear weapons; or the absence of catastrophic climatic events or large-scale disease epidemics.

Many of our social and environmental problems need long-term, unglamorous, patient, adaptive and diverse approaches to their solution. Such approaches seldom cover their practitioners with glory or even recognition - still less do they win elections. There are many well-meaning people and organizations in these areas and many of them do superb, heroic jobs with few resources. A Social Policy Bond regime could both enlarge this pool of effective problem-anticipators and divert more resources their way. Incentives do matter and it would be a good idea, I think, if the people currently devising ingenious advertising [2]campaigns for dogfood were instead given the chance to provide decently for their children by working to deter nuclear warfare or mass environmental disasters.

### 5.1.3 Avoiding catastrophic climate change (2008-01-05 23:52)

How do you put a value on extreme events when doing cost-benefit calculations? Extreme environmental events will become more common if the climate changes radically. They might have a low probability of occurring, but they could be catastrophic. Jim Giles in the [1]*New Scientist* says that economists have generally ignored extreme events when doing cost-benefit calculations about climate change: they are so unlikely and lie so far in the future that it is not cost-effective to try to prevent them. "But environmental groups argue that the risk of extreme events justifies large investment now..."

Martin Weitzman of Harvard University has developed the first thorough method for including unlikely but extreme events, such as widespread crop failures, in cost-benefit analyses. When you take into account extreme temperature rises of more

than around 6 °C, he says, they dominate all other options and effectively demand that investment aimed at stopping them be made now. "This tells us that we should take the problem much more seriously than normal cost-benefit analyses suggest," says Weitzman.... It "probably means we should spend more money now, but it doesn't tell us how much."

Exactly. The scientific uncertainties are huge and so is the range of plausible expenditures. So too is the urgency of the problem and any policy debate under the current system is quite simply going to take too long. The usual international initiatives demand a degree of scientific and economic certainty that is higher than we are ever likely to achieve until the problem has become too late to do much about. The current system is fundamentally flawed: it insists on too high a degree of proof before action can be taken. It does so because *our governments are the ones that bear all the risk of making a wrong decision*. Governments have to find the (considerable) resources to spend now on a problem that may or may not materialize years or decades in the future. Naturally they will be reluctant to do so until the evidence becomes impossible to ignore - by which time it will be too late to avert a calamity.

[2]Climate Stability Bonds would solve that problem by transferring the risks of getting it wrong to those willing to bear it - *voluntarily* and with a continuing incentive to get the cost-benefit calculations correct. Globally-backed Climate Stability Bonds would contract out the achievement of climate stability to the most efficient operators. If they fail to perform, then it is they who would lose out, not taxpayers the world over. It would be in their interests to do the calculations correctly, and to continuously refine them in line with our rapidly expanding knowledge and technology. They would have incentives to spend resources immediately on the most effective climate-stabilising projects, while bearing all the risk of failure. They certainly wouldn't delay doing anything until catastrophe becomes imminent and obvious to recalcitrant taxpayers...by which time it's also likely to be inevitable.

#### **5.1.4 Corporate goals are not societal goals (2008-01-08 11:57)**

Susan Pagan's 9-year-old daughter recently made the honor roll, but when the Florida mom saw the report card, she was appalled. There on the envelope was a cartoon of Ronald McDonald along with a potential "food prize" for elementary school students who had good grades, behavior or attendance.

"Reward yourself with a Happy Meal!" the report card jacket urged. And to further associate fast food with praise, approval and success in the minds of young consumers, the offer also stipulated that the "report card must be presented at the time of ordering." [1] Julie Deardoff

16 December 2007

This sort of thing happens when we assume that corporate objectives are necessarily congruent with society's. They aren't. Neither does a strong economy, as measured by such flawed indicators as Gross Domestic Product, mean a successful society. Unfortunately, in the absence of clear, broad goals for the education - and nutrition - of our children, the corporations feel they can move in. And they're not mistaken:

The saddest part about this whole story? [Susan] Pagan was told that she was the only parent who thought it was inappropriate to put fast-food ads on the report card jackets and that the district would consider her complaint next year.

### **5.1.5 Unnecessary surgery (2008-01-10 00:51)**

An article in *Men's Health* about unnecessary surgery in the US shows how far we are from outcome-based health policy:

[In November 2006] at the American Heart Association's annual scientific sessions in Chicago, a tremor rumbled through through the McCormick Place convention center. Turns out the cause of the quake (which only cardiologists could feel) was a major new study on angioplasty, that near-miracle procedure in which a balloon-tipped catheter is used to unblock an artery. The seismic finding? Only that angioplasty is no more effective than medication for a large segment of heart-attack victims. Or, to put it in stark statistical terms, heart doctors have been performing as many as 50,000 unnecessary operations every year. Frightening, yes, but nowhere near as scary as the broader implications. When the air was suddenly let out of the angioplasty balloon, there was at least one cardiologist present in the convention center who recognized the researchers' conclusion as just another symptom of a condition he'd seen before: doctors cutting first and asking questions later. [1] Is Your Surgeon Scamming You?

, John Brant

It's disappointing that cash incentives trump ethics in such circumstances, but we could at least have policies that bias the incentives in favour of long-term positive health outcomes, rather than a profusion of invasive, often-dangerous, procedures that do nothing to benefit the average patient. Unfortunately governments tend to focus on meaningless targets whose only virtue is that they are easy to measure, such as throughput in emergency wards, ambulance response times etc. Targets like these are easily gamed, and while they are quantities that can be measured and compared, they are costly to gather and have nothing to do with the welfare of patients. Of course there would be difficulties in subordinating health policy to meaningful measures of wellbeing (such as [2]Quality Adjusted Life Years) but if carefully designed it would I think lead to a far more successful healthcare system.

### 5.1.6 Anecdote is not proof (2008-01-14 00:27)

It's almost a given that government spending is inefficient. But it is not sufficient to show high absolute and relative government expenditures coexist with social and environmental problems, as they do in the rich countries. The facts are, though, suggestive.

- Government spending in the rich countries typically amounts to at least a third of national income.
- Many social indicators have shown negligible improvements in recent years. Life expectancy, infant mortality, hospital outputs, literacy, violent crime, suicide, poverty and income inequality have barely changed despite a massive increase in social spending.
- Around the world there is little relationship between higher public spending and better social outcomes.

At first sight, the conclusion that government is inefficient seems unarguable, but in fact there are counter-arguments: sure the indicators listed above haven't improved much, but there are others that have. Or: there are mitigating circumstances, such oil price rises, larger numbers of people on welfare, aging populations, etc. So while there is widespread perception that we are not getting value for money from the taxpayer dollar, there's little in the way of proof.

More convincing than anecdote, to me anyway, is the persistence of perverse subsidies: those policies, like agricultural support programmes, that transfer funds from the poor to the rich, that environmental depredation, and that are financially disastrous. They were set up with good intentions, but they have helped finance the creation of lobby groups whose *raison d'être* is resistance to their withdrawal. Their persistence, in the face of decades of evidence as to their failure, points to a more dangerous truth: that mechanisms that correct disastrous programmes can fail. Indeed, one result of poor policymaking is that it widens the gap between policymakers and ordinary people - a problem in itself and one that is likely to generate more problems further down the road.

-

Policy as if outcomes mattered  
SocialGoals.com

### 5.1.7 Policy and rationality (2008-01-15 09:33)

From [1]*Bad Food Britain*, by Joanna Blythman:

Rarely a week goes by on British television screens without a programme detailing, in disturbing detail, the unsavoury underbelly of industrial food production, or the effect that cheap, overprocessed junk food has on the nation's health. A minority ...is so affected by that knowledge that it changes its shopping habits instantly, boycotting this or that, and forking out more for an alternative. But within a few days after the headlines die down, it is business as usual for most British shoppers. page 133

So too in the world of policy. Attention spans are short, and what we don't really want to know, we can easily bury under the blizzard of new information. Slow-moving, unglamorous and inconvenient facts - and I don't just mean about climate change - are demoted in our minds. Politicians react to crises or events for which there is compelling tv footage. They are not always the ones to which we'd give highest priority if we were being rational. One solution would be to specify policy in terms of the outcomes it's supposed to achieve. Such outcomes will be less responsive to ephemeral events or distractions or the goals of corporate bodies or other lobby groups. On the same theme, that of rationality in policy, here is [2]another idea, and US citizens could follow it up. You could sign this petition to be sent to Congress:

I am not afraid of terrorism, and I want you to stop being afraid on my behalf. Please start scaling back the official government war on terror. Please replace it with a smaller, more focused anti-terrorist police effort in keeping with the rule of law. Please stop overreacting. I understand that it will not be possible to stop all terrorist acts. I am not afraid.

### 5.1.8 Too many doctors? (2008-01-16 12:35)

What would be the typical government reaction to a health care crisis? More doctors, of course. Shannon Brownlee questions this, at least for the US. Unlike the number of car dealers, for instance,

which depends on the number of people who want cars and can afford them ...how much health care patients want or need has far less influence over the supply of physicians. That's because for the most part it's your doctor and not you, the consumer, who determines how much care you receive. When your doctor says you need a CT scan, you get one. When your doctor says you should go to the hospital, you go. Doctors, in effect, generate some of the demand for their services, so that even when there are large numbers of them per capita, they can keep their appointment books full. [1] Source

There's also the possibility that fewer doctors could lead to better care:

More tests and procedures always entail more risk, and for care that's unnecessary, the ratio of benefit to risk is zero. What's more, where numerous doctors, particularly specialists, are routinely involved in a patient's case, the potential for miscommunication and confusion multiplies. Modern medicine should be a team sport, but it is often practiced as if everybody is running a different play. Different doctors order duplicative tests, prescribe drugs that interact poorly with what the patient is already taking, and assume another physician will attend to a critical aspect of a patient's care. A cardiologist can be a virtuoso at slipping a stent into the coronary artery of a patient in the throes of a heart attack, but if she leaves it to another physician to prescribe aspirin to her patient – one of the most effective treatments for preventing a second heart attack – that prescription might fall through the cracks.

This is what appears to be happening in many hospitals, where the ratio of specialists to primary-care physicians is especially high. In one recent study, two Harvard economists ... examined how the quality of care in different states varied as the proportion of specialists rose. They found that measures of quality, like the percentage of heart-attack patients who received a prescription for aspirin, tended to fall in direct proportion to a rising ratio of specialists. The point ... "is not that the specialist is inferior, but that the system is not accounting for the 'coordination cost' specialists are imposing."

This is worrying because the likely policy response is going to create more such problems. How could a politician, even one convinced by solid research proving Ms Brownlee's points, cut back training programmes for doctors? How would it look to his or her political opponents, or to the media, when a medical mistake occurs at a hospital that would have had more doctors but for our politician's cutbacks? It's not just health care. In every policy area the penalties for doing something likely to succeed but different far outweigh the benefits for doing something that has been tried before and shown to fail. Rising crime? Spend more on police or CCTV cameras. Traffic congestion? Build more roads. Not enough fish being landed? Subsidize more powerful fishing boats. The incentives are to placate lobby groups and vested interests, not to achieve society's goals.

### **5.1.9 Procedure is king (2008-01-17 07:35)**

More from [1]Bad Food Britain:

'Hazard Analysis Critical Control Point' (HACCP) ... focuses on identifying the 'critical points' in a process where food safety problems - hazards - could arise... What

HACCP boils down to is a system of checklists, form filling and record keeping. ... This system creates a paper trail so that in the event of a problem, the companies or producers implicated can demonstrate that they did their bit and walk away blameless, plausibly denying responsibility. ... A supermarket that poisoned customers by selling contaminated chicken... could use HACCP to show that its suppliers followed correct procedures so it was not at fault.

The overriding objective - the one that permeates the entire system - has little to do with food safety and everything to do with protecting oneself from disciplinary proceedings or lawsuits. There's a similar confusion in other policy areas. Here is [2]Bruce Schneier on airport security:

Surprising nobody, a new study concludes that airport security isn't helping: "A team at the Harvard School of Public Health could not find any studies showing whether the time-consuming process of X-raying carry-on luggage prevents hijackings or attacks. They also found no evidence to suggest that making passengers take off their shoes and confiscating small items prevented any incidents."

And: "The researchers said it would be interesting to apply medical standards to airport security. Screening programs for illnesses like cancer are usually not broadly instituted unless they have been shown to work."

Note the defense by the TSA: "'Even without clear evidence of the accuracy of testing, the Transportation Security Administration defended its measures by reporting that more than 13 million prohibited items were intercepted in one year,' the researchers added. "Most of these illegal items were lighters."

This is where the TSA has it completely backwards. The goal isn't to confiscate prohibited items. The goal is to prevent terrorism on airplanes. When the TSA confiscates millions of lighters from innocent people, that's a security failure. The TSA is reacting to non-threats. The TSA is reacting to false alarms. Now you can argue that this level of failures is necessary to make people safer, but it's certainly not evidence that people *are* safer.

Again, rational policy is subordinated to procedure. It can't work: we need diverse approaches that can adapt to changing circumstances. Such pluralism are anathema to centralized policy-making. But what government policymakers can do is specify target objectives, and contract out *their achievement* to the market. Actions should serve outcomes - not procedures. A Social Policy Bond regime would ensure that all actions would aimed at achieving the social and environmental goals set for it by government. Being freely marketable, they would encourage the adaptive, diverse solutions that big, complex social and environmental problems demand.

### 5.1.10 Irrationality as a policy driver (2008-01-20 11:23)

US Presidential candidate Barack Obama speaks:

We have been operating under a politics of fear: fear of terrorists, fear of immigrants, fear of people of different religious beliefs, fears of gays that they might get married and that somehow that would affect us. We have to break that fever of fear ... Unfortunately what I've been seeing from the Republican debates is that they are going to perpetuate this fearmongering ...It's absolutely true there are 30,000, 40,000 hard-core jihadists who would be happy to strap on a bomb right now, walk in here and blow us all up. You can't negotiate with those folks. All we can do is capture them, kill them, imprison them. And that is one of my pre-eminent jobs as president of the United States. [1] Newsweek

Not all fears are irrational of course, and of course there are some things we ought to fear more than we do and make policy accordingly (species extinction springs to (my) mind). All the same, as Sharon Begley continues:

The fact that a candidate whose campaign is built on optimism and a positive message is not above evoking terrifying images of suicide bombers and nuclear bombs—and doing so two breaths after he denounces fearmongering—reveals the power of fear to sway voters. Half a century of research has shown that fear is one of the most politically powerful emotions a candidate can tap, especially when the fears have a basis in reality; jihadists, of course, are indeed bent on suicide bombings. ... "In politics, the emotions that really sway voters are hate, hope and fear or anxiety," says political psychologist Drew Westen of Emory University, author of the recent book *The Political Brain: The Role of Emotion in Deciding the Fate of the Nation*. "But the skillful use of fear is unmatched in leading to enthusiasm for one candidate and causing voters to turn away from another."

Fear can easily over-ride our rationality. For instance, we fear plane crashes more than we ought, and don't fear car crashes enough, and unfortunately policymakers react accordingly. Social Policy Bonds, which would target broad outcomes - accidental deaths, in this instance - would lead to more rational policy than that likely to follow a spectacular plane crash - especially one for which copious visual footage is available.

### 5.1.11 Education is not schooling (2008-01-22 05:18)

Short excerpts cannot do justice to Jay Griffiths' [1]*Wild: An Elemental Journey*, but this is a blog about policymaking , rather than a book review. Here (page 140) she is writing about the Inuit in Canada :

School is not a synonym for education . You might, if you're lucky, get a bit of an education at school, but for Inuit children , the land was their education . White lawmakers forced Inuit children to go to school, insisting that their parents settle in communities.... One result is that people are dependent on store-bought food, and if they have no cash they go hungry. ... a stark physical example of the effects of not knowing the land. But the psychological effects are everywhere. Without knowledge, you cannot be out on the land. without survival skills, you can barely set foot beyond the perimeter of the community. Young people are effectively imprisoned by this ignorance into the small and claustrophobic communities where they go stir-crazy.

The policymaking mentality hasn't changed much: government isn't content merely to raise and allocate funds for the (laudable) goal of educating children. It has a single, astonishingly limited vision as to what the form and substance of that education shall take. Naturally it's biased

in favour of its own educational experience: the sort that leads to careers in lawmaking. It's the same in other fields: government views crime as something to be tackled by the police and justice system. Health is something for a Ministry of Health to deal with. Mental health is about more psychiatrists, counselling and drugs. The policies are all neat and compartmentalised, just like the bureaucracies and the state of mind that generates them. The real world, though, is too messy - wild - for that. Effective policies need to stimulate people's imagination; to cope with society's as different from our own as the Inuit; and to deal with rapidly changing knowledge and circumstances. Broad goals are stable over time: the most effective ways of achieving them are not.

Social Policy Bonds would allow governments to do what they are good at: articulating society's goals and raising the revenue to achieve them. But the actual achievement of these goals would be far more efficiently done by the market. Currently the markets' formidable incentives serve the private goals of shareholders and business operators. A Social Policy Bond regime, in contrast, would channel the market's efficiencies into the service of public goals.

### **5.1.12 Exporting environmental damage (2008-01-24 12:58)**

I've often wondered how much of the undeniable success of western economies depends on exporting our problems to the rest of the world. I've known about the effects of our insane agricultural support policies on developing countries for some time: the closing our our markets; the catastrophic effects of exports of subsidised overproduction on farmers; the export of price instability for farm products - see [1]this (pdf) for an extreme statement. Now [2]here is a report about our environmental impact on the third world:

The environmental damage caused by rich nations disproportionately impacts poor nations and costs them more than their combined foreign debt, according to a first-ever global accounting of the dollar costs of countries' ecological footprints. The

study, led by former University of California, Berkeley, research fellow Thara Srinivasan, assessed the impacts of agricultural intensification and expansion, deforestation, overfishing, loss of mangrove swamps and forests, ozone depletion and climate change during a 40-year period, from 1961 to 2000. In the case of climate change and ozone depletion, the researchers also estimated the impacts that may be felt through the end of this century. "At least to some extent, the rich nations have developed at the expense of the poor and, in effect, there is a debt to the poor...."

What this implies for the development path of the poor countries should be obvious. Unfortunately policymakers in those countries, for the most part, persist in targeting aggregated economic goals - principally GDP and growth of GDP - which, apart have little to do with the wellbeing of ordinary people, threaten to replicate the environmental depredations of the west. Far better would be to target meaningful human (as distinct from economic or corporate) goals, such as those incorporated in the [3]Human Development Index: life expectancy, standard of living, education, literacy. We need to remind ourselves of what we already know: economic growth is not an end in itself.

### 5.1.13 Hunger and aid (2008-01-27 09:45)

From the current '[1]Economist' (subscription):

[D]ealing with hunger hardly requires a doctorate in the biochemistry of the human body. Breast-feeding advice, food supplements and better hygiene all make a big difference. Most countries know what to do and run pilot programmes that work. But they rarely find the money for full-scale national efforts; the international outfits that might help are ... fragmented and dysfunctional. ... [M]oney for improving nutrition would be the most effective sort of aid around. At the moment, roughly \$300m of aid goes to basic nutrition each year, less than \$2 for each child below two in the 20 worst affected countries. In contrast, HIV/AIDS, which causes fewer deaths than child malnutrition, received \$2.2 billion— \$67 per person with HIV in all countries (including rich ones).

On what basis are aid funds allocated? Availability of tv footage? The caprice of celebrity donors? Political correctness? All probably play a part. The one criterion that doesn't seem relevant is efficiency. Of course, it's not quite that simple: many of the obstacles to rational resource allocation are probably third world governments that have little interest in looking after their populations, and every interest in syphoning off aid funds or otherwise obstructing, for their own narrow purposes, aid workers. That probably diverts resources away from some of the areas in most desperate need. A Social Policy Bond regime targeting basic health indicators in the developing world could go a long way toward redressing these perverse incentives, perhaps by persuading recalcitrant governments to take long golfing holidays.

Meanwhile it's worth comparing the £300 million that the rich world gives to alleviate hunger in the poor countries to the amount it lavishes on its own farmers: in 2006 that amounted to \$268 billion according to the [2] OECD . Yes, you read that right: billion. To put it another way: taxpayers in the rich world give 89 times as much to their own agriculture sector as they do to starving people in the third world. In return we get: a devastated rural environment, the destruction of wildlife and bloated oligopolistic agribusiness corporates, and thousands of highly skilled lobbyists adept at maintaining the status quo.

#### 5.1.14 Catastrophe bonds versus Social Policy Bonds (2008-01-29 10:55)

Catastrophe bonds are typically issued by insurers. The investors who buy them are paid a high rate of interest. If a defined catastrophe ( eg a hurricane or pandemic) does not occur, then the investors will make a healthy return on their bond purchase. But if the catastrophe does occur, then the principal initially paid by the investors is forgiven, and is instead used by the insurer to pay its claims to policyholders. ([1]Source) Cat bonds can be quite [2]profitable to investors.

They bear some similarity to Social Policy Bonds. A government could issue Social Policy Bonds that would reward people if, say, a disastrous hurricane did not occur. Holders of the bonds would then be in a similar position to holders of catastrophe bonds: they win if there is no catastrophe. However, Social Policy Bonds would be defined differently. Their objective is to encourage people to do what they can to prevent the catastrophe occurring. So rather than target forces of nature like hurricanes, they might target the numbers of people killed or made homeless by such an event. Unlike holders of cat bonds, investors in Social Policy Bonds would have incentives to reduce the probability and scale of the defined risk.

All is not lost - yet - in Kenya, but the news is grim:

A month after its disputed presidential election, Kenya remains deeply divided and unstable. Politically motivated killings, hackings and gang rapes continue in the towns and in volatile country districts. The economy is faltering. ....What has happened is not a genocide, nor is Kenya anywhere close to being a failed state. But the killings and clearances have been grisly and wretched. When the dead rotting in the maize fields or pulled apart in the wilds by hyenas are eventually counted, over 1,000 Kenyans are likely to have been killed since the election. More than 250,000 have been displaced. [3] The Economist

(subscription)

The question that leaps to mind is: why isn't anyone with financial clout interested in insuring against or preventing this sort of catastrophe? The answer's just as clear: there aren't any significant financial investments at stake, as there are when a hurricane strikes the shoreline of a rich country. But that's where the people (or institutions) who could issue Social Policy Bonds come in: they wouldn't know how to avoid a catastrophe like Kenya, but they put up the funds that *would* motivate investors to do whatever they can to avoid one. The catastrophe bond concept works in practice. So too could Social Policy Bonds, and the potential beneficiaries could include the world's poorest, most vulnerable populations.

### 5.1.15 The Victory Project (2008-01-30 11:51)

From [1]Arnold Kling:

A web site called [2]The Victory Project proposes billion-dollar prizes

" To the first person(s) that solves any of these Problems:

1. Develop a cure for breast cancer.
2. Develop a cure for diabetes.
3. Reduce greenhouse emissions from petroleum powered automobiles by 95 % without increasing the cost of a normal car more than 5 %.
4. Achieve 150 miles per gallon of gasoline in a 3,000 lb. car, using EPA standards; without increasing the cost of a normal car more than 10 %."

I added my own comment saying that, while I like the basic principle, I think the goals need to be thought through a bit more. They should be broader: rather than reward cures for breast cancer and diabetes they should target something along the lines of increased longevity and wellbeing of, say, the US population, perhaps as measured by Quality Adjusted Life Years. Otherwise the prize might divert scarce research resources away from areas where they can achieve a much better return per dollar. Similarly with 3: total environmental damage is the problem, not just greenhouse gas emissions. Number 4 looks better but, again, the problem is total environmental damage: lots of cheap-to-run vehicles could raise net petrol consumption as well as total environmental damage.

## 5.2 February

### 5.2.1 Society is not chess (2008-02-02 10:20)

Looking to chess for lessons about economics, [1]John Kay writes:

Planned regimes have often succeeded when they have ploughed resources into the achievement of narrowly defined objectives. We smile when we read of the All Union Chess Section, under the Supreme Council for Physical Education. Its director, filled with bile and Marxist rhetoric, proposed shock brigades to spearhead five-year plans for chess. But it worked. Most of the world's best chess players became so as a result of the endeavours of the Supreme Council. If chess was the battleground between free enterprise and state planning, state planning won. But the real battlefield was not chess but consumer goods and military hardware. Although the Soviet Union produced great chess players by directing resources to the game, the cars and computers it produced were inferior and few. Planned economies were unable to cope with the diversity of consumer needs and the constantly changing requirements of modern technology. 'Financial Times', 29 January

The battlefield, I believe, moved since then, a little distance away from consumer needs and towards the needs of society and the environment. Society's needs might be less diverse than consumer needs, and less rapidly evolving, but our knowledge about the best ways of achieving them are nevertheless rapidly changing. For big social and environmental problems, like war or climate change, central planning isn't going to work any more than it did for the Soviet Union's wider economy. Such problems are more like the provision of consumer goods than chess: they need diverse, adaptive and imaginative approaches for their solution.

Unfortunately, so far at least, those charged with solving our major social problems still think in terms of central planning. If they ever do acknowledge the need for pluralist and responsive solutions, they could do worse than consider Social Policy Bonds, which would allow them still to define society's broader goals and raise the revenue for their achievement. Our politicians and bureaucrats would have to relinquish their control over how these revenues are spent; so they would lose some powers, yes. But society and the environment could benefit greatly.

### 5.2.2 Philanthropy and profitability can go hand-in-hand (2008-02-04 14:13)

Reviewing [1]*The Power of Unreasonable People: How Social Entrepreneurs Create Markets That Change the World* by John Elkington and Pamela Hartigan, the [2]Economist (subscription) says:

If you are setting out to save the world rather than to make a profit, it is perhaps not surprising that financial institutions are less likely to give you money than your friends and family, or trusts and foundations. .... If the business plan does not set profitability as a goal, then investors are likely to see it as philanthropy, not investment.

It's a shame that the attainment of important social and environmental goals is either assumed to arise from a growing economy, or given over to bodies - mostly government agencies - that, for nebulous historical reasons, do not reward employees according to how well they achieve their stated objectives. The result is that the goals go largely unachieved - and wealthy corporations and individuals become even more wealthy, often at some cost to society as a whole and the environment.

Social Policy Bonds change all that. They would channel the market's incentives and efficiencies into the solution of social problems. These are the same incentives that have generated enormous wealth in the private sector, lifted millions out of poverty, but at the same time worsened other social and environmental problems. Social Policy Bonds would mean that profitability and philanthropy could go hand-in-hand. If any philanthropist or anybody connected to any philanthropic organization would like to know more, please contact me directly. For reasons that I can well understand, no single such organization has ever replied to a single one of my emails.

### **5.2.3 I don't know what the policy is, but we need to change it (2008-02-07 10:58)**

One of the benefits of the Social Policy Bond approach is that it clarifies what politics and politicians are for. It's policy as if outcomes matter, yes, and politics as if there's a purpose to it, other than being a politician. We haven't got there yet. Commenting on the two US Democratic Party front runners, [1]Mick Hume sums it up:

The argument between them has thus become one of how to bring change about, what style to pursue it with, rather than anything substantive about what exactly that change might entail. For all the weeks of debate, not one clear political division between the rival Democrat candidates of 'change' has emerged, beyond the posturing about what they did or didn't say about the Iraq war five years ago. Apparently the plan is just to 'change' first, then decide what to do later.

Policy as if outcomes mattered  
SocialGoals.com

1. <http://www.spiked-online.com/index.php?/site/article/4479/>

#### 5.2.4 Subsidising planetary destruction: biofuels (2008-02-08 09:49)

What is it about driving cars that makes us irrational? Clearing natural land to grow biofuels is clearly madness:

The clearance of grassland releases 93 times the amount of greenhouse gas that would be saved by the fuel made annually on that land, said Joseph Fargione, lead author of [one study], and a scientist at the [1]Nature Conservancy. "So for the next 93 years you're making climate change, just at the time when we need to be bringing down carbon emissions." [2] Studies deem biofuels a greenhouse threat  
, Elizabeth Rosenthal, 'New York Times', 8 February

The decisions about how to prevent climate change are being taken by a handful of politicians on the basis of what...a hunch? Whatever best suits motorists? Least political resistance? The short-term interests of agribusiness combines? Whatever the basis, it's got very little to do with preventing climate change and verges on the insane. A Climate Stability Bond regime would be different. Decisions about how best to prevent climate change would be made by a large group of people who would be highly motivated to bring about climate stability as efficiently as possible. It's the size of the group, their diversity and their motivation that make all the difference. The current system is certain to be unnecessarily expensive, politically divisive and have ghastly consequences for the land. Now the latest science shows it's going to nothing to prevent climate change. Madness.

#### 5.2.5 Bureaucrats versus policymaking (2008-02-11 04:25)

Reviewing [1]The Trouble with Physics, by Lee Smolin, Mike Alder writes:

The gradual corruption of enterprises by bureaucracy appears to be inevitable. Once any enterprise becomes successful, it is doomed to be taken over by those for whom power and prestige are the central aspects of their lives. The forms are preserved, but the content is lost. Rituals replicate endlessly. This would seem to be a constant of human nature; the trick is to recognize when it has happened and not be fooled by the rhetoric. And if it can happen to Christianity it can happen to anything. Including Science. [2] Bureaucrats versus science  
(apparently unavailable right now), 'Quadrant', December 2007

It's certainly happened to universities and research. Lamenting the failure of theoretical physicists to come up with radical innovations or dramatic shifts in our thinking, Alder continues, summarising Smolin:

Financial managers need to defend expenditures on the basis of maximising their expected return.... That inevitably means that the currently favoured paradigm gets almost all the money. ... So everyone goes for the best bet, and if it happens to be wrong, we all go bust. .... Philosophers who are good are beyond price, but the mediocre are useless. Scientists tend to be technicians more than philosophers, but the system of rewards doled out by the bureaucrats in charge of the universities these days favours the technicians. It is so much easier to measure their output.

The same is happening in the world of policymaking. You don't get penalised if you advocate a tried, tested and failed policy. But try something different, and if it's not a success in a roarily obvious way, you will suffer the consequences. Better to play safe and do the conventional thing. And if you want to be creative, go into advertising. Bureaucracy stifles creative policymaking just as surely as it has oppressed religion and theoretical physics.

We need a system that encourages innovation, and Social Policy Bonds may be the answer. Under a bond regime successful policies would be rewarded, however unfashionable or outlandish they might seem; while failed policies would be terminated - in the interests of everybody: bondholders, society and the environment alike. As well, the bonds would encourage diverse approaches, and ones that adapt over time - again, unlike the monoculture that prevails increasingly not only in politics, but in our rural environment, our urban environment, religion and science.

## 5.2.6 Social Policy Bonds and prediction markets (2008-02-13 00:01)

I haven't thought much about prediction markets, which are:

...speculative markets created for the purpose of making predictions. Assets are created whose final cash value is tied to a particular event (e.g., will the next US president be a Republican) or parameter (e.g., total sales next quarter). The current market prices can then be interpreted as predictions of the probability of the event or the expected value of the parameter. Prediction markets are thus structured as betting exchanges, without any risk for the bookmaker. [1] Wikipedia

There appears to be some evidence that they are better than pundits at forecasting election results or share prices. I've tended to ignore them because their focus is on speculation or (possibly) hedging against possible events, rather than generating incentives to modify behaviour and bring about positive changes. But they are, in principle, not very different from Social Policy Bonds. An organization could enter a prediction market and place a bet *against*, say, literacy in Pakistan rising to 99%. If the bet were big enough, that would create an incentive for people not only to take the bet and wait passively for literacy to rise, but actively to help the process along, perhaps by initiating new projects or financing existing literacy-raising schemes on the expectation of winning their bet.

It strikes me that we could start with smaller objectives, using one of the current prediction market platforms. Does anyone have a pet project they want to see carried out? If you have suggestions or would like to discuss this possibility, please email me directly.

### **5.2.7 No security without privacy (2008-02-15 13:04)**

Some clear thinking from [1]Bruce Schneier. He quotes a colleague of US Director of National Intelligence Michael McConnell, about a proposed plan to monitor all internet communications for security purposes, as saying 'privacy and security are a zero-sum game.' Schneier comments:

I'm sure they have that saying in their business. And it's precisely why, when people in their business are in charge of government, it becomes a police state. If privacy and security really were a zero-sum game, we would have seen mass immigration into the former East Germany and modern-day China. While it's true that police states like those have less street crime, no one argues that their citizens are fundamentally more secure. We've been told we have to trade off security and privacy so often - in debates on security versus privacy, writing contests, polls, reasoned essays and political rhetoric - that most of us don't even question the fundamental dichotomy. But it's a false one.

The debate, Schneier points out, 'isn't security versus privacy. It's liberty versus control.' Exactly. The familiar saying 'if all you've got is a hammer, you're going to see every problem as a nail' comes to mind. Control is something governments can do. It is, in fact, a large part of their *raison d'être*, and justifiably: there are some things that only government can do, and one of them is creating statutes and maintaining order. But control isn't the only way of bringing about security, just as cutting anthropogenic greenhouse gas emissions isn't the only way of stabilising the climate. Government should do what it is good at: articulating our security needs and raising the revenue required to achieve them. But it should leave open just how those needs are to be met. Rather than impose questionable new controls, government could let the private sector devise the most efficient means of enhancing our security within the existing statutory framework.

## 5.2.8 How to create a lobby group (2008-02-16 09:19)

Describing the insane EU milk production quota scheme, the [1]Economist (subscription) hits the nail smartly on the head:

It is an EU rule that unintended consequences, left for a few years, fossilise into special interests.

Smaller businesses' stupidity is for the most part self-terminating. If they don't succeed they go out of business. But larger corporations and governments are too big to fail, and their stupidity doesn't just linger: can be self-reinforcing. EU agricultural production subsidies were quickly capitalised into land values, and milk quotas in the Netherlands have taken the form of transferable, expensive, lump sum welfare entitlements. The *Economist* continues:

Older Dutch dairy farmers may hold quotas worth €1m, which they can sell when they retire. The financial impact on these folk would make it politically hard to scrap quotas overnight, say Dutch farm officials, even if it would help younger farmers, for whom quotas are a big disincentive. "The quota system was never meant to be a retirement scheme, but it has worked out that way," says an official.

## 5.2.9 Living on traffic islands (2008-02-18 09:36)

Discussing the life and novels of J G Ballard, [1]Theodore Dalrymple points out, en passant, that

...it is the architects, with their modernist dreams of making the world anew according to implacably abstract principles, who have created the wasteland [in which one of the protagonists finds himself] in the first place. Ballard captures the socially isolating nature of modern architecture—and the modern way of life associated with it—with great symbolic force.

The architects, yes ... and the town planners too. As in so many other social and environmental aspects, government and big business have brought about a monoculture; a top-down, one-size-fits-all approach that might very well optimize some abstract economic indicators, but which leaves does very little for our psychological wellbeing. Subsidies to the energy and construction sectors play their part, as does an infrastructure that relentlessly favours the large and global at the expense of the small and local. The impact of the top-down approach to policy isn't always negative - sometimes it's desirable, sometimes necessary. The point is that, manifestly in architecture and town planning, the outcomes it mainly serves are of little interest to ordinary people - as against the large corporates and government agencies for whom administrative tidiness and consistency are ends in themselves.

We need instead a system that is responsive to genuine outcomes; not the academic economic figures that so bewitch our policymakers. A system that, because it subordinates activity to meaningful outcomes, will not stifle diverse approaches to reaching those outcomes. Social Policy Bonds are one way in which we can bring an end to the dreary, dangerous monoculture that threatens our physical and social wellbeing just as surely as it has stripped our agricultural land of wildlife and cloned our cities.

### **5.2.10 Farm subsidies, continuing (unfortunately) (2008-02-21 10:52)**

[1]Guy Fawkes shows how easily politicians can be corrupted, even those on the left of the political spectrum; even those who once spoke out against the Common Agricultural Policy. Not much is black or white in politics and policymaking, but as P J O'Rourke put it *seventeen years ago* (in [2]Parliament of Whores):

I spent two and a half years examining the American political process. All that time I was looking for a straight forward issue. But everything I investigated - election campaigns, the budget, lawmaking, the court system, bureaucracy, social policy - turned out to be more complicated than I had thought. There were always angles I hadn't considered, aspects I hadn't weighed, complexities I'd never dreamed of. Until I got to agriculture. Here at last is a simple problem with a simple solution. Drag the omnibus farm bill behind the barn, and kill it with an ax.

### **5.2.11 Nuclear peace or exotic cat food? It's up to us. (2008-02-23 23:54)**

So what progress are we making with avoiding a nuclear conflict? In addition to the dangerous fragility of nuclear Pakistan, Joseph Cirincione tells us that the US (and the rest of the world) now face:

(1) a nuclear-armed North Korea; (2) the possibility of a Middle East with several nuclear states, Egypt, Turkey, and Saudi Arabia among them; (3) the increasing danger of weapons from other countries falling into the hands of terrorist groups, while American-led programs to secure nuclear bomb materials around the world are being neglected; (4) an upsurge in the pursuit of civilian nuclear power by many countries

that could put them within reach of nuclear weapons capacity; and (5) the possibility that flaws in US and other command and control systems—including those exposed last August by the unauthorized flight from North Dakota to Louisiana of a B-52 bomber armed with six nuclear bombs—could result in the accidental or unauthorized use of nuclear weapons. [1]*The greatest threat to us all*, ' New York Review of Books' , 6 March 2008

I think this crisis is caused by the absence of any clear means of dealing with it. Nuclear proliferation demands a multiplicity of approaches. It cannot command the imagination of, for instance, climate change which, policymakers are convinced, can be addressed by cutting back on our greenhouse gas emissions. That may or may not work, but it is a coherent policy; one that thousands of government officials can work on, and one that all of us can understand whether or not we agree that it's worthwhile. Nuclear proliferation is different. It's probably at least as great a threat to our survival as climate change, but there's no single, over-arching way of dealing with it. Government is especially bad at dealing with issues like this, where solutions are unlikely to come from the limited repertoire of command and control bureaucracy. Unless Government identifies solutions *that it can implement*, it's discouraged and tends not to follow through. It lacks the imagination to conceive of non-bureaucratic solutions, and it's not keen on relinquishing control. The result is our current perilous position.

But government could deal with the problem. It could recognise that, while it doesn't have all the answers, it can at least mobilise the private sector to come up with solutions. The ingenuity and resources that go into pet food advertising campaigns, for instance, is phenomenal. (See here for [2] cat food 'inspired by the tastes of Tuscany'.) To divert some of them into reducing the probability of a nuclear conflict would surely be a worthwhile initiative. Government could do this by issuing something along the lines of [3]Conflict Resolution Bonds. It would define a set of nuclear peace targets, and back the bonds with rewards to be paid after specified periods during which a nuclear exchange does not occur. Bondholders would be motivated to bring about nuclear peace by whatever means they see as being efficient. They would not be limited to the solutions or activities that only government can implement. With a decent monetary incentive they could bring in our undoubted, boundless ingenuity to remove what is probably one of the greatest threats to our survival.

## 5.2.12 Military blunders and policy (2008-02-25 22:41)

[1]Victor Davis Hanson, writing for the Claremont Institute, takes us on a quick canter through some American military blunders, both tactical and strategic and right up to present-day Iraq. Intelligence failures, huge battlefield miscalculations, inferior materiel, poor leadership: all have been features of US military campaigns throughout history. Just one example:

We often read of the tragedy of the September 1944 Arnhem campaign. Impossible logistics, bad weather, lousy intelligence, tactical imbecility, and much more doomed the "Market Garden" operation and led to the infamous "A Bridge Too Far" catastrophe. Thousands of Anglo-American troops were needlessly killed or wounded—after the Allies had recently crushed an entire German army group in the west (though they let 100,000 Wehrmacht troops escape at Falaise). The foolery of Market Garden also ate up scarce resources, manpower, and gasoline at precisely the time the American Third Army was nearing the Rhine without much major opposition. Once Allied armies stalled for want of supplies, they would be unable to cross the border of the Reich for another half year. The Germans used the breathing space after their victory in Holland to rush defenders to the so-called Siegfried Line, which had been theretofore mostly undefended.

The picture is not entirely bleak. We 'live and learn, learn and live'. At least until Vietnam, there was 'a sort of tragic acceptance of military error as inherent in war.' Mistakes are bound to occur 'in the context of human imperfection, emotion, and fear.'

Though Presidents Lincoln and Truman were both reviled, Americans still felt that ultimately the American system of transparency and self-criticism would correct wartime mistakes.

And there lies the hope. Transparency about what is happening and freedom to criticise. But also the capacity to adapt to fast-changing circumstances. Mechanisms that terminate failed ventures. I'm sometimes disturbed by the every increasing level of aggregation at which decisions are made. Big business and government between them determine to an increasing extent, how we live (see [2]here and [3]here, for examples). This is not only a matter of the large corporates' growing dominance over the world's economic activity; it's also about governments' effects on our behaviour, through regulation and intrusion, and their tight links with big business. Big government tends to mean remote and unwieldy government. It best understands and does deals with big business, and tends to favour the big and global at the expense of the small and local.

But perhaps most dangerous is the tendency of big government - or any large monopolistic organization - to continue doing things with diminishing attention given to whether they are effective and efficient. The military blunders that Mr Hanson describes could not be allowed to run their course indefinitely. The costs of allowing failed approaches to continue were huge and obvious. Most of our social and environmental problems are slower-moving and not as immediately compelling. Nuclear proliferation, for example (the subject of my [4]previous post), or climate change, or loss of social cohesion: decisions are made at such high levels of aggregation that there is little room for alternative approaches, and little incentive for people to try them.

Social Policy Bonds could possibly turn that disadvantage into a plus. Instead of dictating that the way we shall deal with climate change, for example, is to cut back on greenhouse gas emissions, a collection of world governments could define a global climate stability target, and reward those who who successfully achieve it, however they do so. The size of the targeting body serves to define the problem, and raise revenue for its achievement; things that a large authoritative body can do very well. But such a body cannot adapt to changing events or expanding knowledge rapidly enough, and that's where the multitude of holders of

[5]Climate Stability Bonds could help: they would have powerful incentives to terminate failed ventures, and choose only the most efficient solutions to the climate change problem.

### 5.2.13 The Martindale approach to policy (2008-02-27 09:39)

Monoculture in agriculture is like the [1]Martindale system in roulette: your near-certain, small, steady gains are balanced by the tiny chance of disaster. In agriculture the disaster could take the form of a pest against which an entire region's single variety crop has no resistance. In policy it could take the form of high oil prices, which threaten the road transport system. In both cases government played its part in favouring uniform, global models at the expense of diversity. Most of the ludicrously high levels of subsidy paid to agriculture in the rich countries (US \$268 billion in 2006) end up with the largest landowners and large agribusiness corporates. They bid up farmland values, making it necessary to maximise yields per hectare, encouraging the use (and raising the price) of purchased inputs. The result is the dreary and fragile monoculture of field after field planted with oilseed rape or (coming soon) biofuel-yielding crops, in response to the current consensus of Brussels bureaucrats. As the level at which critical decisions gets higher and higher, it's not only the distance between the decision-makers and those affected that increases: it's also the seriousness of the disaster that could strike if the decision-makers get it wrong.

I'm thinking also of policies like Kyoto, which put much of the world's environmentalist resources into one supposed climate-stabilising idea: cutting back anthropogenic greenhouse gas emissions. If that turns out not to be a viable way of solving the problem, then the consequences for all of us could be catastrophic. The Social Policy Bond principle understands that governments can have good, popular intentions, and are often the only bodies that can pay for their achievement. Something like climate change demands action at the very highest level. But a uniform and static approach to a social problem is rarely optimal.

## 5.3 March

### 5.3.1 Broad indicators are essential (2008-03-01 09:05)

Focusing on narrow indicators is easy, but rarely of great value. I've blogged [1]before about the Mickey Mouse micro-targets (the length of hospital waiting lists for example). Similarly, if a government were to target accidents to cyclists, the evidence appears to be that risk compensation would occur:

In one experiment, a British psychologist, Ian Walker of Bath University, simply got on his bicycle and monitored the behaviour of 2,300 vehicles that overtook him. When he wore a helmet, drivers were much more likely to zoom past him with little room to spare; when he was bare-headed (and indeed when he wore a female wig) the amount of space that motorists left would increase. [2]*A hazardous comparison* , The Economist, 28 February

But even targeting road deaths in general wouldn't necessarily improve things:

An experiment in Munich found that the drivers of taxicabs fitted with anti-lock braking systems were involved in no fewer accidents than those without. That is because the former used those superior brakes not to practise prudence but to drive more aggressively. ... John Adams, a transport expert at University College London, has compiled data from all over the world to show that laws making drivers wear seatbelts do not make roads safer; they move deaths from inside cars to outside them because they encourage bad driving.

What about aiming to reduce the number of children killed on the roads? John Adams points out that this:

has fallen in recent years ... but mainly because they are rarely allowed out alone, so today's teenagers have less skill at navigating hazardous roads; and as a result, the number of teenagers killed in car accidents has jumped.

Sometimes the difficulty of picking appropriate indicators for targeting under a Social Policy Bond regime is pointed out to me. But exactly *the same problems apply to policymaking under the current regime* - except that there is rarely any transparency about what is being targeted. And that leaves the way open for expensive (and mostly [3]futile) responses to the relatively small number of deaths caused by terrorism, while an estimated 1.2 million people are killed on the world's roads every year.

### 5.3.2 Growth at all costs (2008-03-03 08:43)

James Fallows, discussing the Chinese economy and in particular its high savings rate:

Better schools, more-abundant parks, better health care, cleaner air and water, better sewers in the cities - you name it, and it isn't in some way connected to the factory-export economy, China hasn't got it, or not enough. ... [S]aying that China has a high savings rate describes the situation without explaining it. Why should the Communist Party of China countenance a policy that takes so much wealth from the world's poor, in their own country, and gives it to the United States? [1]*The \$1.4 trillion question* , 'The Atlantic', January/February

Growth at all costs seems to be the answer, in the hope that more jobs will reduce China's social tensions and generate jobs for the rural poor. It's hard to blame the Chinese government for this. Economic growth is the de facto target for most governments and, arguably, it tracks increases in wellbeing more accurately in China than in richer countries. But that's not to say very much. In China and the densely populated industrial countries the downsides of economic growth - environmental pollution and loss of social cohesion, for instance - may be uncertain, difficult to quantify but they are also very large. They might well outweigh the similarly incalculable positive-but-unmeasured effects of economic growth; including the alleviation of poverty. There's no way of knowing, and the results of governments' getting it wrong could be disastrous.

Another way might be to recognize that economic growth - even if it could be measured accurately - is not an end in itself. It's a means to various ends, many of them private, and best decided by individuals and households. Encouraging, and subsidising mothers to join the work force and send their children to childcare centres might boost GDP figures, but it should hardly be a matter for government policy. Perhaps government can best intervene by specifying public goals in terms of minimum levels: of poverty, pollution, health, educational achievement, employment, etc, and then to let people make their own decisions as to the necessary trade-offs. Social Policy Bonds lend themselves to this: government could issue bonds that would reward people only if minimum levels of (say) literacy or physical health were maintained.

In such a regime, government would be doing what it does best: articulating and paying for the supply of legitimate, measurable, public goods and services that correlate well with social wellbeing. Beyond those minima, people would make their own decisions about whether, for example, to subsidise profligate US consumers or [2]big-box retailers.

2. [http://reclaimdemocracy.org/independent\\_business/review\\_big\\_box\\_swindle.php](http://reclaimdemocracy.org/independent_business/review_big_box_swindle.php)

### 5.3.3 Motoring ourselves to death (2008-03-04 23:14)

Policy is often made without realising its implications. The result can be disastrous. Governments, realising that building roads was necessary at first, have gone overboard, subsidising

road transport, oil extraction, storage of cars on public highways (parking). The massive social costs rarely enter the calculus. The 1.2 million deaths from road accidents every year are obvious and visible, but there is more:

Noise from rail and road transport is linked to 50,000 fatal heart attacks every year and 200,000 cases of cardio-vascular disease in the EU according to the new research published today by T &E. .... "[T]he lack of decent regulation combined with increased traffic and a trend towards bigger, more powerful and noisier vehicles is literally proving to be a lethal combination for Europeans. Unlike air pollution, which most major European cities are now starting to tackle, noise has been ignored for decades as the problem has worsened and the negative impacts on society have increased" ....

The World Health Organisation's threshold for 'serious annoyance' and onset of negative health effects from environmental noise is 55 decibels. The study found that around 210 million citizens of the European Union are regularly exposed to 55 decibels or more of road noise.... [1]50,000 heart deaths a year caused by traffic noise , T &E, 28 February

Conventional policymaking can't handle such adverse side-effects (negative externalities, in economists' jargon). It's difficult to measure the effects of noise on physical and mental wellbeing, but it's easy to measure the benefits of a new road in terms of time saved, and to put a monetary value on that time by multiplying it by road users' earning rates. The bias, which we see in so many other policy areas, is against crucial but unquantifiable components of our wellbeing and in favour of those impacts that can be quantified, monetised, and aggregated into something that sounds good, like economic growth. Memo to policymakers: a magnificent transport infrastructure is not an end in itself: it's a means to certain ends. You would do us all a favour if you targeted those ends directly rather than poured taxpayer funds into those schemes that you (and your buddies in big business) think are the best ways of achieving them.

### 5.3.4 Post 500 (2008-03-06 11:56)

My 500th post on this blog and time for a free and frank appraisal of where Social Policy Bonds are going. The honest verdict has to be: not very far. At least not that I'm aware of. I don't know of anyone other than me who's working on them, nor any organizations that are thinking about issuing them. I get very few comments on this blog, which together with the main [1]Social Policy Bonds web site get about 15 views daily (excluding RSS feeds and perhaps other views that my hitcounter doesn't register).

There is increasing interest in the value of markets for generating information in prediction markets, or information markets. More [2]catastrophe bonds are being issued. But all these markets differ from Social Policy Bonds in that, while making use the dynamic information of markets to anticipate or insure against events, they don't attempt to modify

behaviour. Participants in these markets are active only in the sense that they invest in them. Social Policy Bonds are in contrast designed to reward people for helping achieve society's goals.

The lack of interest is disheartening, but I am currently working on another book about Social Policy Bonds, and hope to have a first draft done in about three months. I intend to continue posting on this blog and maintaining the Social Policy Bonds website.

### **5.3.5 Subsidising environmental destruction in India (2008-03-07 04:33)**

Writing about the debate over the Nano, the Rupees 1 lakh (approximately US \$ 2500) car launched by the Tata Motor Company, Sunita Narain says:

There is no doubt that any car that is small is better than a big car in terms of fuel economy and emissions. There is also no doubt that affordable cars are better than expensive ones. But the question is in what direction is Nano leading us. The issue is not small, cheap cars or big, expensive cars, but all cars. The issue is whether it is helping mobility and at what price.

Let's take the 'affordability' question first. The fact is that cars — small or big — are heavily subsidized. The problem is that when economists (including those who run the government) fret and fume about mounting subsidy bills, they think of farmers — fertilizer, electricity and food — not our cars. But subsidy is what they unquestionably get.

The subsidy begins with the manufacture of cars. When we read about the Singur farmers' struggle to stop government from acquiring their land for the Tata car factory we don't join the dots. We don't see this as the first big subsidy to motorization. The fact is, in Singur the manufacturer got cheap land, interest-free capital and perhaps other concessions — the Left Front government in West Bengal never made public full details of its attractive package. This brought down the cost of production and allowed the manufacturer to price the Nano at Rs 1 lakh. But this is not only about Tata or Singur. The fact is that, to compete, every manufacturer needs the same, if not better, package of benefits. The fact also is that every state government is competing to offer sweeter deals. We know that in the now contested special economic zones of Goa, the government had agreed to give industry all this and 15 years of electricity free of cost. We also know if West Bengal did not bend to please, Uttarakhand was waiting to entice the Tatas. In other words, we are certainly not paying the cost of manufacture of our cars, not to mention the full cost of running or parking them.

The car owner (and I am one as well) pays a one-time road tax, which is between 0.5-5 percent of the cost of the vehicle in most states. The bus pays an annual road tax and it also pays a passenger tax based on the number of people it carries — call it a penalty for efficiency as it moves more people, takes less road space and so emits less and consumes less fuel per passenger.

But this is only one part of the subsidies to car owners. There is also the cost of regulating traffic; of installing traffic signals; the cost of building flyovers, over-bridges and subways; the cost of pollution control measures; the cost of pollution to our health. Since cars take up over 75 percent of the road space, even though they move less than 20 percent of the people, it is obvious whom this expenditure benefits the most. ...

The subsidy bill does not end here. There is also the cost of parking, which we refuse to pay any or full cost for, and which the government refuses to impose. But we forget or do not see that in our cities the largest number of people take the bus or cycle or walk to work or shop. The bus has not been replaced by the car, it has only been marginalized. In simple terms, this means that buses have no space to move — in all cities they crawl, commuters cannot reach destinations in time, and accidents keep getting worse as space constraints grow.

The question is should we discount the price of motorization so that some (and maybe a few more) can drive a car or a two-wheeler? Or should we pay the real cost of our commute so that the government can invest in mobility for all? The fact is that the government cannot afford to subsidize cars for all. Nor can it afford to invest in both cars and buses. Ultimately, it is not about economics. It is about politics and the imagination needed to build cities in which mobility does not mean cars. Flyovers can be built, but only if we know where they will lead. [1] Source

My thoughts exactly.

### 5.3.6 Follow the money (2008-03-09 10:38)

A useful site for keeping track of US political donations is [1]<http://www.opensecrets.org/>, maintained by the Centre for Responsive Politics. Eric Janszen argues that the bubble that looks about to burst in the financial markets has been inflated by a 'credit-financed, asset-price-inflation machine organized around one tenet: that the value of one's assets...now goes in only one direction, up....' The US finance, insurance and real estate industries are the lead players. are the culprits. Government oversight has been weak and, as Mr Janszen puts it, these sectors, according to opensecrets.org:

gave \$146 million in political donations for the 2008 election cycle alone, and since 1990 more than \$1.9 billion - nearly double what lawyers and lobbyists have donated,

and more than triple the donations from organized labor. [2]Harper's February (subscription), summary [3]here

### 5.3.7 Torture and the unimportance of outcomes (2008-03-11 08:31)

It shouldn't surprise me by now, but it does, that outcomes have so little bearing on policy. Crucial policy decisions are made for reasons ranging from media attention to ideology or the vested interests of campaign donors, but results hardly seem to feature. The decision makers go ahead anyway. You might think that ethically questionable policies are subject to more scrutiny than routine budgetary appropriations, but you'd be wrong:

President Bush has ...promised to veto a bill that would bar the CIA from using techniques such as sensory deprivation, water-boarding and temperature extremes, arguing they are needed to gain information that protects the public from terrorists. Such an 'end justifies the means' argument might sound persuasive to some, but it is worthless unless such techniques actually work. A report on this subject was released [in 2007] by the Intelligence Science Board.... The message it repeated over and over was that there is virtually *no evidence to show the effectiveness of any of the interrogation techniques used by the US*. The authors expressed 'surprise and concern over the lack of rigorous scientific examination....' (my emphasis) *Modern barbarity*, 'New Scientist', 23 February

This is policy as the rationalisation of what people feel like doing, and it's no basis for an efficient bureaucracy, still less an ethical one. I shouldn't be surprised of course. I have quoted before from [1]*Why states believe foolish ideas* by Steven van Evera :

[G]overnment bureaucracies non-self-evaluate. At a minimum, agencies with evaluative responsibilities are not invited to evaluate - they are kept out of the loop, their opinions unsought. At a maximum, government agencies actively suppress their own internal evaluative units and are discouraged from evaluating the beliefs and policies of other agencies.

Whatever you might think about Social Policy Bonds, it's surely time to look at subordinating policy to transparent, meaningful outcomes, rather than continuing to have critical decisions made for us on the basis of no evidence whatsoever.

-  
Policy as if outcomes mattered  
SocialGoals.com

### 5.3.8 Targeting broad outcomes (2008-03-13 09:32)

One of the advantages of a Social Policy Bond regime is that it allows backers of the bonds, be they private or public sector, to target things that are beyond or beneath the radar of policymakers. Things like war and violence, in general rather than in particular, or a nuclear exchange, or the spread of infectious diseases. More broadly, Social Policy Bonds could reward maintenance of the sorts of stability that we value: a stable physical climate, the absence of man-made or adverse impacts of natural catastrophes. For the most part, these problems are dealt with piecemeal, as they arise, and with a lot of guesswork about uncertain and ever-changing relationships. For instance, a huge task for governments around the world would be to agree that climate change is a problem worth spending resources to solve, but governments are supposed to articulate society's concerns and to produce legislation, and raise the funds necessary to achieve them. But for governments to go further and say they know how best to solve the problem is, in my view a mistake. With climate change they have focused on a single remedy - restraining anthropogenic emissions of greenhouse gases. But governments have no expertise in this matter; their scientific advice is necessarily fossilised and their approach necessarily top-down, one-size-fits-all and unresponsive to different and changing circumstances and our rapidly expanding scientific knowledge.

Far better to reward the achievement of a stable climate by issuing [1]Climate Stability Bonds of sufficient value to motivate people to bring about the goal in ways they think will be most efficient. I don't think it's too far-fetched that governments will eventually target very broad goals for which their current approaches are manifestly inadequate. But, I have to admit, it doesn't seem to be happening right now.

### 5.3.9 Free-riding (2008-03-15 12:33)

People, especially economists, often mention the danger of free-riding when I talk about Social Policy Bonds. Free-riders would be the bonds hoping to benefit from any increase in the bond price without actually participating in any objective-achieving projects.

However, I think markets would work to limit the benefits from free-riding. To see this, assume that most of a particular issue of bonds were held by would-be free-riders. Then very little, if anything, would be done to help achieve the targeted objective. As the objective became more remote, the value of all the bonds would fall. And as the bonds lost value, they would make a more attractive purchase for people who were prepared actively to help achieve the targeted objective. So free-riders would be tempted to sell, even at a loss, rather than see the value of their bonds continue to fall. Some history of falling bond prices would tend to make free riding on Social Policy Bonds less appealing with future issues. Free-riding then would become a self-cancelling activity. There are other reasons why bondholding would be unattractive to potential free-riders:

Individual free-riders would have no incentive to collude with other free-riders, because

the more they did so, the more remote the targeted objective would become, and the further would the value of their bonds fall. This would act so as to limit any free-riding activity to small players.

As with other financial instruments, small players would have to pay higher transaction costs than the bigger institutions — the ones that would be most likely to initiate objective-achieving projects.

Small players also would not have access to the research that would enable big players to value the bonds accurately. Therefore they would be at a disadvantage in the market.

Note also that even if free-riders were to gain from holding Social Policy Bonds, they would do be doing so only because their bonds had risen in value as a result of a targeted objective becoming closer to being achievement. As well, attempted free-riding would have positive effects: it would add liquidity to the bond market.

All this is speculation of course, and I may be wrong. We'll see, if somebody actually issues Social Policy Bonds.

### **5.3.10 Sacrificing the environment (2008-03-17 11:56)**

A quote from the current 'Economist's' report on China's quest for resources:

Pan Yue, a deputy minister at the State Environmental Protection Administration (SEPA), China's paramount environmental regulator, estimates the annual cost of environmental damage at 8-13 % of GDP—much the same as the overall economic growth rate. If it continues like this, he expects levels of pollution to double over the next 15 years. [1] *A large black cloud*

(subscription)

There must be some subjectivity in Mr Pan's estimates, but even so, the comparison is alarming, and quite plausible.

### **5.3.11 Social Policy Bonds as insurance (2008-03-19 07:59)**

In an ever more complex, interlinked world more and more things that could be ignored or used to be handled informally now have to be managed by government. This applies to many

aspects of the commons and particularly the environment. Given the record of government, this is quite scary. Government policymaking can succeed when it's well meaning, has sufficient resources and the problems it has to solve are easily identified and do not conflict too much with powerful interests. Unfortunately, many of the new problems arising from globalisation are difficult to anticipate and isolate from a myriad of possible causes. What's raised this concern in my mind is my reading of the [1]methane clathrate gun hypothesis, but there are any number of other possible ways in which the lives of millions of humans could be endangered: other environmental disasters, nuclear proliferation, pandemics, asteroid impacts, etc. How should governments deal with such threats?

The UK government is the first to set up a National Security Forum as a result of its work on a [2]National Security strategy. Terrorism seems to be given greater attention than perhaps is necessary, but the limitations of such an exercise are more serious, I think, than a bias towards highly visible shocks.

One way forward might be to issue Social Policy Bonds as insurance against large-scale disasters. The cause of the the disaster need not be specified: the bonds would function in a similar way to increasingly popular [3]catastrophe bonds, except that they would have the purpose - and the backing- of making it worthwhile for investors to *prevent disasters happening*. A national government could issue Social Policy Bonds that would reward investors if an event killing more than, say 10000 of its citizens in any one 48-hour period, does not occur before a specified date. The bonds would encourage investors to investigate all sources of potential disaster, *impartially*; that is, without favouring those that have a high media profile, for example, or those that are the remit of existing public or private sector bodies.

Globally, the concept could be scaled up: a collection of governments under the auspices of the United Nations or non-governmental organizations could issue similar bonds, aimed at preventing even larger-scale disasters.

In both cases, the particular merit of the Social Policy Bond approach is that there is no need for a handful of experts to try to anticipate the causes of future disasters and to allocate funds according to their views and today's knowledge. Investors in Social Policy Bonds would do this work themselves, *without bias and during the entire lifetime of their bonds*.

### **5.3.13 Getting rich by doing the right thing (2008-03-22 04:15)**

The big advantages of Social Policy Bonds are their efficiency, transparency and stability of policy goals. But a less obvious benefit, pertinent at a time when the rich are being taxpayer funds are being used to bail out [1]shareholders of banks that pursued disastrous policies but are deemed too big to fail, is that they are means of accumulating wealth by performing public service. Social Policy Bonds, when issued by government bodies, would express society's goals: investors would gain by performing functions that are inextricably linked to public benefit. Working successfully to achieve universally desired social and environmental goals would be seen as a laudable way of becoming rich. There are likely to be all sorts of intangible and unforeseeable benefits from having people or institutions become rich in this way. People may see corporations' non-Social Policy Bond activities relatively less socially desirable. They may be more prepared to rein in the less attractive of such activities given that Social Policy Bonds provide a socially beneficial way of becoming rich.

Anonymous (2008-03-27 11:44:00)

In Spain you can get rich with very different ways, you can get all the money from the city hall, build with their permissions and do what you want, what do you think about that? regards

Ronnie Horesh (2008-03-27 12:42:00)

This confirms my view that the construction industry in many countries is a byword for corruption. Transparency is important, especially for projects that are going to determine how people live for decades to come. Social Policy Bonds provide that transparency. They also provide a way in which ambitious, energetic and financially motivated people can get rich by performing public services, rather than building appalling, low-quality housing and infrastructure.

### **5.3.14 Crime and incentives (2008-03-23 12:19)**

Irwin Stelzer writing about politics and life in the UK:

Crime has significant psychic costs - ready for a nice relaxed evening walk on a deserted street in a major city, the sort of thing that was a routine pleasure a decade ago? Probably not, which is why 60 percent of those surveyed say Britain is a worse place in which to live than it was five years ago.... *The economic consequences of Mr Brown*, 'The Spectator', 19 January

I'm pleased that somebody else feels the same way as me, but otherwise there's little to cheer about. The contrast with the private sector is compelling. No single corporation has all the answers to many of the problems they try to solve: how to market dogfood; how to maximize sales of laundry products, etc. But collectively they do a great job of satisfying our material needs. It's a Darwinian process to be sure: with many, many failed enterprises along the way. Now the UK has had decades of academic research into crime; countless strategies, initiatives, reorganisations, reports by government bodies and consultants and the rest. Why haven't they been translated into safe streets?

Part of the answer must be that the incentives aren't there. A police force that is too successful in reducing crime will see its funding cut. Neither are individual members of police forces paid in ways that are correlated to reductions in crime rates. It sounds very simplistic, but how else is one to explain the ingenuity that dramatically satisfies our needs as paying consumers and fails to satisfy our needs the 'psychic' human need to walk around in safety?

### **5.3.15 Housing monoculture (2008-03-25 08:48)**

Commenting on the mismatch between the US housing stock and people's wish to live in walkable urban environments, Christopher Leinberger writes:

[a third of people surveyed] wanted to live in mixed-use, walkable urban areas - but most had no way to do so at an affordable price. [1] *The next slum*  
, 'Atlantic Monthly', March

Suburban housing is largely a product of central planning and government subsidies. Zoning requirements have done a lot to separate people from work, shops and entertainment, along with the subsidies for roading and the extraction and consumption of oil. The disaster has not only been to the physical environment. Suburban alienation and dependence on cheap, available oil are other results of this lifestyle choice made not by ordinary people but by the planners and technocrats in government and their friends (and paymasters) in gigantic construction corporates. The decision makers are now so remote from us, so beholden to large corporations and operating at such a high level of aggregation and abstraction that they can impose a monoculture, whose potentially catastrophic vulnerabilities are like those of its agricultural equivalent.

Social Policy Bonds are not just about efficiency, but about efficiency in achieving social and environmental goals that are meaningful to natural persons - as distinct from public sector macroeconomists and large corporations. They are about closing the gap between policymakers and the people they are supposed to represent. Policy under a Social Policy Bond regime means targeting agreed outcomes, and the subordination of all activities and institutions to those outcomes. If people want to live kilometres away from their work, friends, shops and other distractions that's fine, but there's no need for taxpayers to subsidise such lifestyle choices, still less to impose it on people who'd make different choices in an undistorted market.

---

investments Vietnam (2010-06-02 07:22:01)

Maybe this is also the reason why people could easily adapt to a lifestyle they want to have.

### **5.3.16 Ends, means and the financial sector (2008-03-26 09:23)**

John Kay writes:

Since financial stability is unattainable, the more important objective is to insulate the real economy from the consequences of financial instability. Government should protect small depositors and ensure that the payment system for households and businesses continues to function. There should be the same powers to take control of essential services in the event of corporate failure that exist for other public utilities. The deposit protection scheme should also have preferential creditor status to restrict the use of retail deposits as collateral for speculative activities. [1]*More regulation will not prevent next crisis* , 'Financial Times', 26 March

I agree, and think the same principle should be extended into other policy areas. Financial stability is not an end in itself, while looking after small depositors is a legitimate government function. Government should concern itself with such goals, without trying to prejudge how they shall be achieved. With the ever increasing complexity of our society and economy, identifying cause and effect is often near impossible. It's simpler for government to target goals than the supposed means of reaching them.

It's also more transparent and - crucially - enables greater public participation and hence buy in. Cutting back anthropogenic greenhouse gas emissions - which is [2]not actually happening despite government hand wringing - is never going to be a popular or meaningful goal. But climate stability is a worthwhile goal, one that ordinary people can understand and buy into. Similarly with one of the other great dangers we face: the technical details of nuclear weapons limitation are arcane and irrelevant to most people. But we would enthusiastically support the drastic curtailment of the risk of a nuclear exchange. That is what governments should aim for, and that is what they should target. *How* to get there...that should be left to an enlarged pool of motivated people. That's where Social Policy Bonds come in.

### 5.3.17 Nothing new here (2008-03-28 10:14)

Talking about the latest US Farm Bill, the [1]*Economist* (subscription) says, accurately:

The recipients [of government largesse] are hardly the most deserving: farm households make a third more than others, and the richest of them, which get most of the subsidies, bring in three times what the average non-farm household does. Instead of saving the family farm, the policy is destroying it, encouraging agricultural land consolidation and raising barriers to entry. And then there are the deleterious effects America's price-distorting payments have on foreign farmers and so on trade negotiations.

There's nothing new about this. What is striking about these policies are not their disastrous social and environmental impacts; rather it is their persistence, in the face of decades of evidence of their failure to meet stated goals.

Social Policy Bonds are radical; they would entail government relinquishing control of some of its policy instruments. They are untested and have not been refined or widely discussed. But when you get policies like the corrupt, profligate agricultural support policies of most western countries, you realize that the proper standard of comparison should not be not some ideal, wasteless, super-efficient policy paradigm, but the current system whose failings are not just severe and well documented, but persistent in the face of all rationality.

## 5.4 April

### 5.4.1 Zimbabwe (2008-04-01 11:00)

In the face of the catastrophe that is Zimbabwe today, the west appears impotent. Our governments and large corporations stand aloof, unconcerned, or convinced that whatever they do will be futile or counter-productive. Only the non-governmental organizations on the ground do what they can to mitigate economic and social collapse. One of the virtues of outcome-based policy like Social Policy Bonds is that it could channel people's compassion and resources into solving problems previously thought to be beyond our control. No-one knows how best to help Zimbabweans, but then no western government has yet actually specified that as a goal and rewarded people for achieving it. But the long-term welfare of Zimbabweans could be the specified target of Social Policy Bond issue backed by western governments or philanthropic organisations. With the right incentives, some of the ingenuity and resources now devoted to enriching corporations and individuals would flow into projects and programmes *that we cannot yet specify*, into improving the wellbeing of the Zimbabwean. Just because we don't know what best mix of projects will be doesn't mean we should stand by and do nothing.

Another advantage of Social Policy Bonds is that they enlarge the range of large-scale projects that can be considered. Western government intervention in Africa in general, and Zimbabwe in particular, is open to (deliberate) misinterpretation and the charge of neo-colonialism. For instance, the long-term prospects for peaceful development in Zimbabwe, or elsewhere, might best be enhanced by reducing inter-communal strife, which might conceivably be minimised by the encouragement of intermarriage between different communities. Western governments could not themselves sponsor such intermarriages: that would be political dynamite. But holders of Social Policy Bonds that have as their explicit objective the long-term improvement of the welfare of African citizens, would probably find fewer barriers in the way of that sort of project: it would be clear to everyone that their motivation is entirely mercenary, rather than anything more sinister.

#### **5.4.2 Social Policy Bonds: I'm convinced anyway (2008-04-03 12:00)**

I'm convinced, despite the current lack of interest, that Social Policy Bonds' their time will come. Or at least, that there will be a move towards specifying desired outcomes and rewarding people for achieving them - the heart of the Social Policy Bond method. Why? Because of the rising world population and the increasing complexity of our social organisation. As well technology is changing at a faster rate. These factors all make it near-impossible for conventional policymakers to identify the most important future problems and, even more, the relationships between those problems and their causes. Reading about climate change you realize how close we are to a catastrophe that few could have anticipated while the trail of gunpowder was being laid (and how little we are doing even now to avoid it). But climate change has had a long lead time and there were people, decades ago, who suspected it might happen. There are now so many potential catastrophes without even those portents that the organizations we hope will help us anticipate and avoid them - government agencies, mainly - can't realistically be expected to do so.

Some government bodies currently issue [1]catastrophe bonds, but most are issued by insurers, and all appear to protect against losses arising from specified perils (such as hurricanes). I envisage that more government bodies will begin to issue them against unspecified disasters that lead to large-scale loss of life. I actually think it would be irresponsible of government *not* to manage risk in this way. With large enough sums at stake, bondholders will realize that they could benefit by working to identify the most likely disasters and doing what they can to minimise their impact. That would essentially be Social Policy Bonds, in principle. Issuers will then start to issue bonds specifically to encourage such behaviour: Social Policy Bonds in practice.

-

Policy as if outcomes mattered  
SocialGoals.com

1. [http://en.wikipedia.org/wiki/Catastrophe\\_bond](http://en.wikipedia.org/wiki/Catastrophe_bond)

### 5.4.3 Beyond monopoly: the coming globopoly (2008-04-06 06:52)

Raphel

Sagarin studies the impact of climate change and human activity on marine life, and is based at Duke University, Durham, North Carolina. He thinks living things can show us how to keep society safer. Asked by [1]*New Scientist* (subscription) whether there are any successful examples of the kind of security approach he is advocating he replied:

The one I often cite is of DARPA , an arm of the US Department of Defense that develops forward-thinking technologies. It had a grand challenge: to create autonomous robotic vehicles. Rather than contract this out to a single organization, it went out to university groups and offered a million-dollar prize. DARPA had remarkable success, as all these individual groups tried to solve the problem.

This is a slightly less refined version of Social Policy Bonds, but even so it was more successful than the default setting of the current system. As government becomes more and more dominant in our economy, society and environment, it will tend to crowd out diverse approaches with its own one-size-fits-all, top-down, way of doing things. Its approach is essentially that of central planning. My chief worry is that globalised central planning will not be subject to the decades-long attrition that led to the breakdown of the Soviet Union, which was fearsomely monopolistic in its own domain, but eventually had to face competition from the more prosperous, less uniform, western economies. This global monopoly ( globopoly ?) will dictate not only what should be done, but *how* things shall be done. It's that approach that has led to Kyoto, and the single focus on reducing anthropogenic greenhouse gas emissions as the only approved way of tackling climate change - and it's unlikely to do any better for the world environment than central planning was for that of the USSR.

### 5.4.4 Monoculture (2008-04-08 09:46)

An ex-colleague has introduced me to the work of [1] Vanadana Shiva, a scientist and activist. One phrase from an interview [2]here strikes me:

When India and Pakistan were competing with nuclear tests, and India called its nuclear bomb the Hindu bomb, while Pakistan called its bomb the Islamic bomb, I said: this is the perfect example of diverse men for monoculture.

Monoculture does seem to be the result of big, remote government and its tendency to centralise. It takes physical form in the increasing uniformity of our cities, where so much diversity and vitality is sacrificed to the interests of the road lobby and construction industry. The monoculture of our countryside is better documented, and just as environmentally destructive.

The Social Policy Bond principle recognises that big government can mean well and see

that things are done that only big government can do; and that some of these things are extremely worthwhile; and that government should continue to encourage and reward them. But when big government goes beyond its remit and actually insists on doing things its way, then the dismal result is monoculture, with all its life-sapping uniformity and potential for calamity. That's because government agencies have their own objectives (primarily self-perpetuation) and their own way of doing things (top-down, one-size-fits-all). We need government to articulate our best interests and raise funds to reward their achievement , but we need the diverse, adaptive approach that Social Policy Bonds offer to actually achieve them.

#### **5.4.5 Madness (2008-04-08 11:55)**

A quick quote from Paul Krugman, explaining the rise in world food prices:

And meanwhile, land used to grow biofuel feedstock is land not available to grow food, so subsidies to biofuels are a major factor in the food crisis. You might put it this way: people are starving in Africa so that American politicians can court votes in farm states. [1]*Grains gone wild*

I will say it again: we're not just destroying our planet; we're not just destroying it with our eyes wide open; we're subsidising its destruction with our taxes.

SocialGoals.com

1. [http://www.nytimes.com/2008/04/07/opinion/07krugman.html?\\_r=1&oref=slogin](http://www.nytimes.com/2008/04/07/opinion/07krugman.html?_r=1&oref=slogin)

---

#### **5.4.6 Re-greening the Sahel (2008-04-11 09:05)**

From an interview in 'New Scientist' with Chris Reij , African agricultural expert:

[D]uring later colonial times, the farmers [in Niger] were told to grow peanuts , and experts instructed them to remove all the trees from their fields: modern agriculture was about cultivating a single crop on a bare field. ...the other thing is that trees were considered state property - as they are in many African countries - so when nobody was looking the farmers just chopped them down and sold them as firewood.

But in fact the news is good: the Sahel has been re-greened. People have planted very large numbers of trees, which have now been incorporated into their farming system. So what changed?

All across Africa, people look after the things they own but ignore or destroy what is controlled by the state. The World Bank says good governance is essential for development but in this case the weakening of the state created opportunities for farmers.

This chimes with one or two of my previous posts: government as monopoly can stifle development if it doesn't know what it's doing; and that's supposing it's well meaning in the first place. I don't think this danger is in any way restricted to developing countries. By dictating how things shall be done, instead of the broad goals we need to achieve, government can inhibit the exploration and application of diverse, adaptive initiatives.

-  
Policy as if outcomes mattered  
SocialGoals.com

---

#### **5.4.7 Same old story (2008-04-13 06:12)**

The US Government Accountability Office (GAO) reports that the billions of dollars spent on research and development into alternative fuels by the Department of Energy (DOE) has done little to lessen the country's dependence on fossil fuels:

Some US \$ 60 billion has been invested in R &D on so-called advanced energy technologies by the U.S. DOE over the last 30 years, but consumption from traditional fuels has remained relatively stable: today fossil fuels supply 85 percent of U.S. energy consumption compared with 93 percent in 1973. The growth of nuclear power in the 1970s and 80s accounts for most of the difference, according to the GAO. [1]  
Source

It's a familiar story; the only unusual feature is that there was an official attempt to monitor performance - and that it became public knowledge. On a similar theme, a cartoon in Friday's *International Herald Tribune*, (which I cannot find on the web) amidst a discussion of rising world food prices shows a couple of starving wretches about to approach a stocky American filling the tank of his capacious car from a pump with a biofuel sticker. 'Sorry guys', he says 'I'm busy saving the planet.'

#### **5.4.9 Happiness (2008-04-17 12:05)**

Back in 1974 Richard Easterlin of the University of Pennsylvania published a study that seemed to show that economic growth didn't necessarily lead to more happiness; especially at higher levels of income. Now two economists, Betsey Stevenson and Justin Wolfers argue that money does tend to bring happiness, even at higher income levels. (See [1]here for a *New York Times* summary of the issue.) There are all sorts of ideological positions taken about what has become known as 'happiness research'. It's something I think about when wondering what should be targeted under a Social Policy Bond regime. My inclination is to stick to objectively verifiable measures of wellbeing ; but there are grey areas. It's hard to measure crime rates, for example, and much easier to measure fear of crime. Evidence suggests that in the UK in recent years, the two have actually diverged, with increasing fear of crime coinciding with falling crime rates. That's quite plausible, if people are afraid of exposing themselves to crime, say, by staying indoors after dark.

Under a Social Policy Bond regime I've always thought it would be best to concentrate on targeting for improvement the lower levels of education, health, housing etc, on the basis that (1) there is less ambiguity about such improvements leading to wellbeing ; and (2) at the lower levels, more can be done with fewer resources. Also, at higher levels of income and wealth, people generally have more varied goals, and more time and information with which to make informed decisions about how to reach them.

I still hold to that view, and I'm not sure I find the Stevenson and Wolfers work convincing. Others also [2]have their doubts.

#### **5.4.10 Urban monoculture (2008-04-20 01:15)**

One thing governments and big business can't deal with is diversity. After decades of government intervention, 'industry concentration' - the degree to which a few large firms dominate,

is very high in the the input and processing agribusinesses; that might have happened anyway, but the trend has been amplified by government. Its subsidies go overwhelmingly to the biggest landowners, input suppliers and processing companies; it creates a regulatory environment that imposes disproportionate compliance costs on small, local, businesses (the irony being that its the activities of the larger companies that generate the need for regulations at all); and it identifies economic success with the fortunes of bigger companies. Apart from the environmental depredations and unappealing aesthetics, the resulting monoculture in the countryside leaves us open to potentially disastrous pest or disease invasions.

Now the same looks like happening in the cities. Government and its cronies in the construction business have imposed a road-based infrastructure on of the world's cities. As with industrial agriculture, it penalises small, local businesse and ordinary people. And as with agriculture too, it is absolutely dependent on oil. What government failed to factor in is how vulnerable this leaves us when the oil runs out. We might find our urban monoculture just as fragile as our agricultural monoculture

#### **5.4.11 Big government = remote government (2008-04-22 00:34)**

Whether or not the UK's '[1]special liquidity scheme' is actually a taxpayer-funded bailout, it's clear that big organisations can afford to be out of touch in ways that small businesses and ordinary people cannot. Big companies can influence government in all sorts of ways. They often receive subsidies, or protection from imports. They can manipulate the regulatory environment in such a way as to impose disproportionately higher compliance costs on smaller enterprises. And if they are banks, they are deemed 'too big to fail' and governments fall over themselves to rescue them with funds from taxpayers. Smaller businesses have to respond to the market. Big business distorts the market.

But what happens when the big organisation is in fact the government? Now that government increasingly dominates our economic, social and environmental sectors, we can look forward to a whole new set of problems. Big government is remote, out-of-touch government. It works in the same way as a big corporation. If it can't sell its policies it can impose them. Its size insulates it from day-to-day reality. Bureaucratic logic has a momentum of its own, and dreadful policies have a powerful interest group in the people who get to administer them. Big government is cumbersome, monolithic and, ultimately, contemptuous of the people its supposed to serve. All this is not to say that people working for government bodies are the same. It's the system that is at fault, not the individuals caught up in it.

When organisations are big they have underlying objectives other than their stated ones. The over-arching organisational objective is self-perpetuation. Smaller companies survive and prosper by meeting market demands. Big government issues streams of targets that sound worthwhile but are essentially about reinforcing and expanding the role of government. There's hardly a single example of governments holding themselves responsible for achieving a meaningful, worthwhile outcome of value to ordinary people. Instead we get Mickey Mouse

micro-objectives, like compliance with the Kyoto Protocol, or smaller waiting lists for hospitals, that have nothing to do with real people, and everything to do with control.

#### **5.4.12 Dodgy donors, etc (2008-04-24 12:09)**

An interesting story [1]here about the costs to the public of political parties in the UK. On this issue I think I'm with the participants of the 'eighteen months of cross-party talks' which 'stalled in October, amid failure to agree on a raft of recommendations....'. Given the current system, in other words, I don't have an opinion on where funding for political parties should come from. I do think it should be more transparent, but I'm more inclined to think in terms of outcomes rather than political parties. The current system is quite odd really. Corporations or wealthy individuals give funds to political parties, openly or in secret, on the basis that these parties will (probably) enact certain measures that (possibly) will lead to the outcomes they want to see. Why not finance outcomes directly? Under a Social Policy Bond regime that would be feasible. It might not be a bad idea for people other than wealthy donors to think in terms of outcomes rather than political parties and the ideologies or interest groups they represent; and again, a Social Policy Bond regime would encourage that. In fact, the bonds would mandate outcome-based policymaking. I think that would be a big improvement over the current system, which is anachronistic and opaque.

#### **5.4.13 Politics without policy (2008-04-29 01:43)**

Even by the standards of recent years, this year's US election campaign is unusually devoid of discussion about policy. The would-be presidents' age, race, gender, and friends seem to be the issues that matter. To some extent this is understandable: politics under the current system fails to hold the attention. There's little relationship between what candidates promise and what they deliver. Real issues do come up: whether or not to go to war, or whether to favour the very rich at the expense of everyone else, but rarely in any of the democracies are candidates' positions explicit. Once the election is over, public opinion is something to be ignored or manipulated.

It's easy for politicians to get away with that because current policymaking systems are opaque. Where they are not secret they are simply too boring for anybody other than experts or academics to capture people's imagination. Policymaking centres around arcane, technical issues: legislative, regulatory or fiscal matters that the average politician doesn't fully understand, let alone normal members of the public. Corporations with powerful vested interests

do understand the system - or can afford to bankroll those who do - and revel in it. Politicians and bureaucrats, work hard, take their index-linked pensions and genuinely believe they are doing a great job. The larger, slow-moving problems go unsolved: the degradation of our commons at the hands of government and the large corporations; the alienation of people not only from the political process but, divided by a car-crazy infrastructure, from their neighbours.

Re-engagement is possible, I think, by expressing political goals as outcomes that are meaningful to ordinary people. Instead of proposing this or that reorganisation of health care systems, for example, target real-life health goals: longevity, quality-adjusted life years, infant mortality etc. More broadly, instead of sacrificing quality of life to economic growth, target social and environmental goals and subordinate the economy to those. People can understand such goals. We don't, really, care about the race of politicians, and we don't have the time to compete with corporations and specialists when it comes to arguing over policy. But we do understand and care about social and environmental outcomes.

## 5.5 May

### 5.5.1 Transcending government structures (2008-05-02 00:55)

In the early days of government intervention it was quite clear what needed to be done. Society would benefit unambiguously by increased health, education and infrastructure spending. This still holds for much of the developing world. But in the rich countries things are now much more complicated. At higher levels of development the correlation between government spending and social and environmental wellbeing breaks down. The boundaries between the remits of governmental agencies become hazy: society has become too complex, and too interlinked to fit into self-contained administrative boxes. Education is no more just about schooling. It's influenced by policy on the arts, broadcasting, health and even taxation (if tax policy encourages women to work, for instance, that will affect, in non-straightforward ways, the way in which children learn). Health is no longer just about supplying clean water, sewers, and legislating against food adulteration. Crime and fear of crime are about more than policing.

Unfortunately, we lack ways of dealing with these complexities. Identifying the relationship between cause and effect is no trivial task, with all the obscure relationships and time lags. Eventually, I think we will come round to targeting outcomes, as Social Policy Bonds do. Government will specify an outcome, and reward people for achieving it, however they do so. Who is rewarded, by how much, will be left to the market. Currently these questions pre-occupy government agents to such a degree that they inhibit action. Organizational objectives supersede those of society and the result is a sort of policy paralysis. Bickering between government agents and the hijacking of policy goals by government employees are the result. This is particularly important when confronting those challenges for which there is little precedent: we'd pay a lot to insure against a nuclear exchange anywhere in the world, for instance, but our current system has few ways of channeling resources into that goal.

Under a Social Policy Bond regime, targeting such goals would be more feasible. There's no need to specify which government department shall be charged with achieving them. So not only would that achievement become more efficient, but we could think about targeting goals that do not fall into the traditional bureaucratic structures. I'd like to see nuclear proliferation and the risks of catastrophic environmental disasters (natural or man-made) targeted in this way, but there are plenty of other pressing issues that cannot get a proper hearing within the current institutional framework. And until we move to an outcome-based policymaking structure - it need not necessarily involve Social Policy Bonds - they're not likely to.

## 5.5.2 The superclass and its world (2008-05-05 03:29)

Listening to a talk by David Rothkopf about the subject of his book [1]*Superclass* I'm struck by the degree to which the interests of those in the superclass not only differ from those of everyone else but are diverging. Who are the members of is the superclass? Leaders in international business, finance and the armaments industry, mainly: and that is another important point; nation states and their governments play a subordinate role to the interests of the world's largest corporations. Government and bigness do seem to go hand-in-hand, and a sustained period of heavy government involvement in industry does seem to lead to a high degree of 'industry concentration', in which a few very large corporations dominate. This is demonstrably true of agriculture, construction and the armaments ('defence') industries, but as government regulatory powers expand is becoming a reality in other sectors.

I think is worrisome for several reasons. First, we - that is ordinary people - are ending up with more bigness than we want. That's a problem in its own right. Second, the curse of bigness is that it doesn't respond readily and appropriately to urgent challenges. Likewise, it imposes a uniform way of doing things - a monoculture - which has all the vulnerability to shocks of its agricultural counterpart. The large scale of corporate and government activities has both heightened our vulnerability to shocks and reduced our capacity to respond to them. It's difficult to do much about this: in many ways we are so locked in to the ways of doing things that the corporatist-government complex has favoured. For instance, our urban lifestyle and our farming systems are now entirely dependent on low-cost fossil fuel; more so than they would have been had market forces been undistorted by the big players.

It is sad to reflect that the superclass has so organised society that in our chaotic, perilous world, the US Presidential campaign may well be won and lost over who promises to knock a few cents off the price of gasoline for the summer season.

### 5.5.3 Biofools (2008-05-09 03:22)

What's interesting about biofuels is how we're marching towards the financial, human and environmental disaster they represent with our wallets *and* our eyes open. We know that the rush to biofuels is accelerating the destruction of Amazon rainforest. We know they are a nonsense in that they offer little, if any net reduction in fossil fuel use or greenhouse gas emissions. We suspect that they are helping drive up the price of food. And we can see very clearly that we are transferring taxpayer funds to subsidise the stuff:

[M]uch of the biodiesel produced in the United States from soybeans and corn (and subsidised by American taxpayers to the tune of \$1 a gallon) winds up in Europe, where it benefits from still further subsidies. That's great for farmers in the Midwest, but offers little consolation to motorists across America. [1] Source

I used to think that the corrupt, deranged agricultural policies of the US and Europe could only be implemented because they were devised behind closed doors and the real beneficiaries - wealthy landowners, large agricultural corporates and the legions of bureaucratic policy administrators - concealed their true purpose from a naive, distracted public. But now I'm not so sure. We cannot plead lack of information any more. Perhaps it's the opposite: too much information?

### 5.5.4 Social Policy Bonds could formalise rational behaviour (2008-05-11 01:29)

In the cold light of day we'd probably be indifferent between, say, war deaths in the middle east and war deaths in Africa. We'd allocate our scarce conflict-reduction resources to where they could do most good. But our actual policy priorities don't reflect rationality; they are largely a function of where the media happen to be able to film footage for television. So the middle east commands our attention while Africa languishes. It's too early to say what the response to the cyclone in Burma will be: it does seem to be a case where a comparatively small aid effort now could save many lives.

A Social Policy Bond regime could formalise our rationality and give it more scope. A global body such as the United Nations, or a group of philanthropists could issue Social Policy Bonds that target world deaths from large natural disasters over, say, five years. 'Large' could mean any disaster that kills more than 500 people, regardless of where it happens. Say that the number of people killed in these disasters averages 50000 a year. The 'Disaster Relief Bonds' could pay up if the number falls below 30000. In the first instance, this would generate incentives for investors to prevent loss of life by, for example, installing warning systems or supplying emergency information. The key point is that bondholders would look rationally at where they could expect to save the largest number of lives per dollar spent.

Bondholders could also intervene after a disaster has struck. Again, they would allocate resources rationally and impartially, and independently of the type of media footage.

### **5.5.5 Social Policy Bonds and the Polluter Pays Principle (2008-05-13 12:41)**

There are some quite elegant economic solutions to social and environmental problems. Take the example of a lake polluted by the run-off of nearby farms. Where the lake is grossly polluted and the farmers are wealthy, the political process would probably demand that the farmers pay to clean it up or have their polluting activities legally restrained or taxed. But where the lake is already healthy, though not quite healthy enough to attract fee-paying fishers, then the beneficiaries of a clean-up - would-be tourist operators around the lake, perhaps - could reasonably be asked to pay for it to be cleaned up, or to compensate farmers for reducing their polluting activities. Note that in this instances, which is in microcosm that of many larger environmental issues, the debate about who pays generally precedes the cleanup.

Now simply assume that the lake is polluted and either a local authority or a group of nearby residents on their own initiative, decide to issue their own Social Policy Bonds: 'Lake Health Bonds'. These would be redeemable for a fixed sum only when the lake's water quality had reached a target level for a sustained period. The local authority or the residents could contribute to the redemption funds used to redeem the bonds. Bondholders could then begin the cleanup operation immediately. Part of the cleanup could entail lobbying one or other tier of government to impose taxes on the polluters or the beneficiaries - whichever is most cost-effective. In other words, the issue of who *pays would be secondary to that of the cleanup.*

Social Policy Bonds are therefore quite compatible with the use of the Polluter Pays Principle, or indeed pollution taxes or the principle that beneficiaries pay. Such instruments, and others such as straight regulation, should be seen merely as tools to reach society's environmental goals. Social Policy Bonds, rather than being merely another economic instrument, are a means by which the most efficient economic instruments, or combination thereof, will be deployed.

### **5.5.6 Closing the gap, with outcome-based policy (2008-05-17 13:02)**

Our chief problem with policymaking , as I see it, arises because it is only incrementally adaptive. That is, it's driven by short-term concerns, and proceeds along lines laid down decades ago. That's one reason why failed policies - such as subsidies to rich farmers and agribusiness corporates - are so difficult to get rid of. Now, if policymaking evolved in the Darwinian way, such policies would be terminated because they are maladaptive. But within

countries, and increasingly, between countries as well, there is a policy monoculture. National governments and corporations have similar interests, so there is little policy diversity even at a global level.

Of course, there are differences between, say, Chinese and US capitalism but the vested interests are so deeply entrenched, the global challenges so urgent, the level of aggregation at which problems need to be solved is so high, and the world is so much smaller, that the Darwinian method of allowing optimal solutions to emerge from what is a reasonably wide a range of possibilities will probably not work. There is too little time to wait for incremental adaptation to address, say, climate change or nuclear proliferation. And we have only one planet; the result of a successful policy mutation may not only be too late, but can be swamped too readily by the wrong choices.

This is the end point of the urban monoculture - dominated by government and the big corporations - in which we live. We still have the possibility of adapting, but more and more it is brought into the service of these organizations, and the objectives of those organizations are, at best, different from those of ordinary persons and, at worst, in conflict with them.

Disenchantment with, and disengagement from, politics seems to be the response. And who can blame the voters? Politics seems to be run by the corporations, for the corporations, with some ideology thrown into the mix. One way of reconnecting people with government, I think, is for government to start expressing goals in terms of outcomes that are meaningful to real people. Rather than propose, say, to increase spending on health services or education, government should target, explicitly, life expectancy or literacy. This, of course, is the Social Policy Bond approach.

-

Policy as if outcomes mattered  
SocialGoals.com

---

### **5.5.7 Political triage (2008-05-21 13:21)**

Social Policy Bonds would, I believe, minimise the cost of achieving goals, and they would cap the maximum cost of achieving them, but they don't tell us what we should target. Not directly. Right now, the prioritising of social and environmental goals seems to take place at a not fully conscious level, driven by concerns other than maximising returns on spending: media appeal, vested interests etc. Perhaps too, we are reluctant to acknowledge that resources are limited and we cannot solve all the world's problems. One organization that does look at such 'political triage' is [1]Copenhagen Consensus. It does good work in questioning existing political the priorities, on the basis that though we'd like to solve all the world's problems, resources are limited and we have to prioritise. For instance, it estimates the existing cost of the Kyoto Protocol \$180 billion a year and says it will make a minuscule difference to the world's climate, 'delaying temperature rises by just seven days by 2100'. But it calculates that

A tenth of the annual cost of the Kyoto Protocol - or a tenth of the US budget this year for the wars in Iraq and Afghanistan - would prevent nearly 30 million new infections

of HIV/AIDS. The same sum could similarly be used to help the four million people who will die from malnutrition this year, the 2.5 million killed by indoor and outdoor air pollution, the two million who will die because they lack micronutrients (iron, zinc, and vitamin A), or the two million whose deaths will be caused by a lack of clean drinking water. [2] A time for clarity

Assuming the figures are correct, it would seem clear that we ought to divert funds away from Kyoto towards AIDS and malnutrition prevention but that is to some extent a subjective view, because we are comparing the supposed week's delay with human lives saved. Taking the same quote, though, assume that the decision lies between saving the lives of the four million who would otherwise die of malnutrition this year or the 2.5 million killed by air pollution. Then, we'd be comparing like with like, and the choice should lie with saving the four million. There are a lot of assumptions necessary, but that is how an impartial reckoning at a global level, would go. The problem is that, even with all the caveats, such easily compared, objective criteria are rarely to hand.

Cost benefit analysis can help a bit, but the weighting problems are huge. How much, for instance, is biodiversity worth and, as we asked earlier, how can say, the interests of wildlife and biodiversity be weighed against people's wish for biofuels?

Social Policy Bonds may be an improvement on one-off cost-benefit analyses or the other ways in which costs are estimated. The market prices of the bonds at flotation and thereafter generate estimates of the total and marginal costs of achieving targeted goals. The total cost estimates would probably be better estimates than those calculated from cost-benefit analysis, while the marginal costs derived from bond prices would represent a big improvement over the information currently available to decision makers once they have decided which projects to support. But those decisions, ultimately, will have to be made on a political basis. The bonds would make it easier, I think, for people to participate in making them by generate better cost estimates but they will not remove the need to take difficult decisions about the relative weighting of different goals.

All very interesting stuff. I've seen similar views on [www.climatechangetriage.net](http://www.climatechangetriage.net). It seems there are a number of folks talking in this way. Sounds like a good idea to me

Ronnie Horesh (2008-08-23 19:30:00)

Thanks Chris.

### **5.5.8 Free riders? (2008-05-27 02:58)**

One of the questions I get asked about Social Policy Bonds is about the free rider effect. The bonds most probably will rely on holders collaborating after in objective-achieving projects. Those holding large numbers would do best to co-ordinate their activities with each other.

But why then would they not collude before the bonds are floated, in the bond market itself, holding off their purchases so that they pay less for the bonds than they would in a competitive market? This can certainly be a problem under the current system where contracts to supply services are put out to tender. But existing corporations are structured around the sale of goods or the provision of services – not the achievement of outcomes. Social Policy Bonds are best applied to broad policy areas where the question of how best to achieve a specific social goal cannot be easily answered at the time the bonds are issued. For example, take a broad objective like reducing air pollution in a region. There will be a wide range of ways in which the bonds can increase in value. These can involve: lobbying for higher tax on petrol, subsidising the sales of catalytic converters to cars-owners, subsidising buses and bikes, pedestrianising streets and a wide range of other possibilities. Most probably, the optimal approach will be a combination of many diverse activities, and this combination itself will be changing over time, in response to new events and expanding knowledge. There will be a kaleidoscopic continuum of optimal approaches, which will vary markedly according to the value of the bonds. So, for example a bond that can be redeemed for \$100 may be floated. The optimal combination of possible bond-price raising measures when the bonds are priced at \$50 will be quite different from when the bonds are priced at \$48, and *so will the range of corporations interested in buying the bonds*. Remember too, that bondholders can profit without holding the bonds till redemption. There will be a range of potential purchasers all with different time periods in mind. Some will have little interest in holding the bonds for a long time, adding to the competitiveness of the bond market.

The likelihood then is that there will be intense competition for the bonds before they are floated, but collaboration between the large holders - tacit or not - afterwards. Of course, we can't know for certain what would happen, until Social Policy Bonds are actually issued.

-

Policy as if outcomes mattered  
SocialGoals.com

---

### **5.5.9 More madness (2008-05-31 11:50)**

How does it happen that we not only allow the destruction of the planet, but subsidise it? Even the poor countries are at it. A story in the current issue of the [1]*Economist*(subscription) tells us that India subsidises diesel consumption at a cost of between 2-3 percent of GDP. The same story tells us that an IMF study of five emerging economies found that the richest 20 percent of households received 42 percent of total fuel subsidies; the bottom 20 percent less than 10 percent.

One of the arguments underpinning my advocacy of Social Policy Bonds is that there is no systemic way that compels governments to terminate their failed policies. Indeed, the pressure acts in the opposite direction: you subsidise people or corporations, make them richer, and so give them both the means and motivation to resist removing the subsidies. In the developing countries the victims as ever are the poor.

Social Policy Bonds could end that cycle. All activities, all spending, are subordinated to the goal of targeted social or environmental objective. We could still subsidise the destruction

of the environment to allow the rich to drive their cars if we wanted - but we'd have to be upfront about it. Somehow, I don't see that happening.

## 5.6 June

### 5.6.1 Seen at passport control (2008-06-05 12:53)

Queuing at passport control on entry to the UK you see two signs: one saying that if you try to assault a member of the Immigration or Customs staff you will be liable to arrest and punishment. A second goes something like this 'Please remove your passport from its holder. This will save time at the counter.' To me this is quite sad. It reflects the low expectations that the British governing class has for the public, the contempt the public has for the government (and the justice system), and the wide gap between the two.

Society is too complex for most ordinary people to have anything much to say about how particular social and environmental goals should be achieved. But where we can contribute is in coming to agreement on the outcomes that we want to see. If we had policy whose goals were expressed in terms of meaningful outcomes then public participation in formulating it would be greater. We could all be part of the policymaking process. The actual achievement of our goals would, under a Social Policy Bond regime, be contracted out to the market. But there would be buy-in to public policy, and a closing of the gap between government and the people.

### 5.6.2 Social Policy Bonds for counterintuitive solutions (2008-06-08 16:50)

It's the  
counterintuitive

nature of solutions to complex problems that makes me think Social Policy Bonds have a lot to offer. A [1]US study found that transportation accounted for only 11 percent of the total greenhouse gas emissions generated as a result of a typical household's food consumption. Growing and harvesting the food accounted for 83 percent of the total. Focusing on 'food miles' can therefore give a misleading impression of a food's environmental impact. So often, our first impressions of how to solve social and environmental problems go awry. These

problems are often not amenable to the top-down, centralised, one-size-fits-all approach that government follows. Preventing climate change may not be most efficiently done by restricting food imports, or even by cutting back on greenhouse gas emissions. Reducing crime rates may mean a lot more than increasing funding for the police, or putting up more CCTV cameras. Increased expenditure for health services or schooling might not be the best way of improving wealth or education....

A Social Policy Bond regime would reward people for achieving our social and environmental goals, however they do so. Bondholders have incentives to seek optimal solutions - which might not be the obvious ones. Typically, for complex problems, the best approach will be a mosaic of different, adaptive projects, initiatives and policies. No single, centralised body can follow that approach, and especially not one steeped in a bureaucratic culture. Social Policy Bonds for complex, long-term problems, will probably lead to the creation of a new type of organisation: one whose every activity is subordinated to the solution of the targeted problem. Such organisations might well perform some of the same activities as government nowadays - but it would have incentives to do so efficiently, and to pursue other activities whether they are 'obvious' or not, so long as they are also efficient.

### **5.6.4 Diverse approaches are essential (2008-06-12 19:03)**

Perhaps the most alarming sentence in Mark Lynas' article in the (UK) Guardian is this:

[C]onventional wisdom from governments and environmental groups alike insists that "Kyoto is the only game in town", and that proposing any alternative is dangerous heresy. [1]Climate chaos is inevitable

One of the advantages of a Social Policy Bond regime is that it allows multiple approaches. The stakes could hardly be higher than with climate change, yet we are attempting to deal with it with a single approach; one which is a product of 1990s science and all sorts of political compromises. Kyoto is divisive, and imposes upfront costs for a very uncertain, remote return. No wonder then that it lacks any real support except from those who are so involved in process that they see it as an end in itself. At OECD, when talking about environmental applications of the Social Policy Bond principle several years ago, I encountered similar opposition from employees of OECD governments who were committed to Kyoto.

[2]Climate Stability Bonds are compatible with cutting greenhouse gas emissions, Kyoto style. But they would also encourage other policies and projects, provided they were more efficient. They would also make application of the Kyoto approach more efficient, by rewarding people commensurately with their efficiency, rather than for the degree to which they comply with the Kyoto process. Sadly, I think there's a chance that we're too late even to avert the oblivion to which Mr Lynas occurs; if so, our single-minded focus on Kyoto should bear much of the blame.

### **5.6.5 Government is not the solution - or the problem (2008-06-16 13:32)**

It's unfortunate that so much of politics takes the form of arguing about the size of government. For me, it's not that government is big that is the problem; it's that big government tends to be remote government - but that is an observation rather than an inevitability. We owe a lot to big government:

[W]e prefer to take our chance of cholera and the rest than be bullied into health...

So the [London] *Times* said, in an editorial protest against government-imposed basic sanitation schemes aimed at reducing cholera levels in London. The date: 1 August 1854. In those days identifying solutions was relatively easy: we needed sewerage systems, the provision of basic health, education and infrastructure, as well as the public services of law, order and defence against invasion. There's still a case to be made for government intervention now to maintain and improve these services, but there is less of a case for government provision of them.

Under a Social Policy Bond regime government could still prescribe such universally desired goals as basic sanitation, or very low levels of infectious diseases. But it would not have to get involved with trying to identify and provide efficient ways of achieving them. It could concentrate on what it does best: articulating society's goals, and raising funds to pay for their achievement. The actual work would be done by those who can do it efficiently: they would be bondholders, or people financed by bondholders. In this way, market forces would be given free rein over the area in which they perform best: the allocation of resources to

achieve the ends prescribed by government; with government acting in its proper role as people's representative, rather than as an investment company.

### 5.6.6 Dooh Nibor (2008-06-17 11:04)

..or Robin Hood in reverse. In today's [London] *Independent*, Dominic Lawson [1] writes about how China subsidises oil consumption:

While crude oil prices have doubled, the price of a tank full of petrol on the forecourts of the Middle Kingdom has not increased by a single renminbi - and is not likely to do so this side of the Olympic Games. In this context, the article by the vice-premier of China's state council in [the 16 June issue of the London] *Financial Times* was almost comical. Wang Qishan argued that his government "gives high priority to energy and resources conservation and the protection of the environment". No one can doubt the pressures the Chinese Politburo is under to meet the aspirations of its people and neither should we in the West criticise their desire to enjoy the opportunities which industrialisation bestowed on us. But still, how can the representative of a government which pays its industries to burn more fuel expect to be taken seriously as a proponent of "energy conservation"?

This seems, on the surface, to be one of the greatest paradoxes of the modern world: while democracies such as those in the European Union have been sufficiently insensitive to the wishes of their consumers as to have provoked disturbances over the price of petrol and diesel - augmented as they have been by very high taxes - totalitarian states such as China have pre-empted the possible political consequences of high domestic gasoline prices. Perhaps it is because the rulers of such countries know their people do not have the safety valve of elections to let off steam; so if things get ugly they could get very violent indeed. There is a less charitable explanation. In China, only the wealthiest two per cent own a motor car; the proportion is not much more in many of the other developing countries with high petrol subsidies: so we are seeing the subsidisation of the richest in the Third World at the expense of all. ...It is exactly the same as the global food market, in which subsidies ostensibly designed for the benefit of everyone are in fact disproportionately directed at the richest, paid for by national exchequers which supposedly represent the interests of nations as a whole.

And so it goes on, at great cost to the environment and ordinary people. Though we do have elections in the west the agricultural subsidies to which Mr Lawson refers also continue - decades after it was realised how wasteful, socially unjust and environmentally disastrous they are. We cannot foresee all the ramifications of our policies, but we should at least be able to stop the ones that are failing. That, our current policymaking system seems incapable of doing, no less in the west than in the ..er.. People's Republic of China.

### **5.6.7 The case against a referendum... (2008-06-20 16:15)**

... is also the case for more referendums. An interesting article by Steve Richards in the [UK]*Independent* on 17 June: writing about the Irish referendum result and one UK politician's resigning to call a by-election on the single issue of civil liberties, Mr Richards [1]writes:

a referendum is a device proposed by leaders only when they are certain they can win. Conversely it is used by voters to cast their verdict on a variety of subjects often unrelated to the single issue they are supposed to be voting on. ... Similarly, single-issue by-elections are a distortion, the crusading candidate implying that one policy can be plucked out of the air and made the subject of excessive and simplistic attention, when any national leader must address the subtleties of the relevant single issue and give more prominence to other policy areas.

All this is true. But would it be true if there were more referendums? Politics, as Mr Richards also says, is 'about the resolution of disagreement through debate, manoeuvring , winning votes in parliament, persuading voters and the media to come on board.' Ordinary people are too far removed from this

business , I think, so when we are given the chance we often adopt the 'plague on both your houses' approach that Mr Richards ( rightly ) derides. One answer could be to express policy goals more in terms of outcomes than process; more in terms of ends than the means of reaching them. Notions of trade-off and opportunity cost seem to be remarkably absent from most of the media discussion about policymaking , at least in the UK. But having to choose between different outcomes could refocus the debate, and give us more realistic expectations of what our politicians can deliver. They are, after all, our representatives. We should be given such choices more often: we'd then identify more closely with our politicians, who have to make policy decisions all the time; and give us less incentive to let off steam when, as now, the opportunity to do so is a rare event.

### **5.6.8 Social Policy Bonds - the panoptic view (2008-06-26 20:41)**

The stunning indifference of the publishing world (so far) to my draft book on Social Policy Bonds makes me wonder whether the concept has a future. If there were enough diversity in

the policymaking world, Darwinian adaptation would see the survival of only the fittest political systems. Social Policy Bonds, or something like them, would have to prove themselves against the alternatives - regardless of whether my ideas ever convince an influential audience or not. There are a couple of flaws in this idea. First, is that I doubt that there is sufficient diversity of political systems - not given the limited time (I think) we have to avoid catastrophe, whether environmental, social or whatever. Evolution *of systems* has little chance to play a major role.

This contrasts with the role that evolution can play *within* the Social Policy Bond paradigm: when bonds are issued, people have incentives to explore, refine and try out new ways of doing things, and to exploit only the most successful

approaches . There is greater diversity of, for example, different potential solutions to climate change, than there is of different political systems. The combination of diversity and adaptability works within the bond paradigm, but is unlikely to select the paradigm itself against the entrenched existing policymaking systems.

The second reason why I am a little pessimistic about evolution leading to the selection of Social Policy Bonds or any greatly improved policymaking system concerns the definition of 'fittest'. As I understand it, in biological evolution, the fitness that Darwinism favours is reproductive fitness. Someone who leads a miserable, diseased life, has plenty of children, and dies at age 20 is more fit, in this sense, than a healthy, happy but childless person who lives to be 100. Fitness in the policymaking world may have a similarly narrow meaning: a system that is fit in evolutionary terms need not be the one that maximises the well-being of its people, especially in a world where any group of moderately well-off misanthropes can increasingly access technology that can threaten anybody else. (Present-day North Korea for instance.) It so happens that in recent decades, by and large the societies (or coalitions of societies) that were militarily most successful were also the ones that delivered the largest economic surpluses to their population, and that such surpluses were correlated with well-being as well as military success. But there is no inevitability about such correlations. The relationship between economic and military might breaks down if you have a regime as nasty as, say, North Korea. And the link between economic wealth and the power to threaten also breaks down, if you have regimes sufficiently misanthropic, deranged or suicidal.

So, overall, a pessimistic picture. But a very speculative one, and I shall persist for a while in trying to get my ideas at least considered by those with influence.

## 5.7 July

### 5.7.1 Transcending evolution? (2008-07-04 13:46)

Over 99 percent of the species that ever walked, flew, or slithered upon this earth are now extinct. This fact alone appears to rule out intelligent design. When we look at the natural world, we see extraordinary complexity, but we do not see optimal design. We see redundancy, regressions, and unnecessary complications ; we see

bewildering inefficiencies that result in suffering and death. Sam Harris, [1]*Letters to a Christian Nation* (page 75)

In a infinite universe the best way of making policy would simply evolve. In what used to be a diverse world, it certainly looks as though the *worst* ways of making policy - those that destroy or enfeeble part or all of their population - are on the defensive or even on the way out. The liberal countries are generally more prosperous, and the more fortunate citizens of failed states can migrate to those that manage their affairs better. If someone had to choose the type of real-life society in which to live, given the whole range of past and current societies , and without knowing what their status within that society would be, they would probably choose a western liberal democracy.

But, tempting as it is to believe the opposite, it doesn't follow that these societies will persist, let alone improve. A glance at history is all that's necessary to see that there was nothing inevitable about the rise of liberal democracy: if Hitler had put off his invasion of the Soviet Union or had developed atomic weapons before the US.... Similar warnings should be heeded today. There's nothing inherent in our current policymaking system that says, for example, that we can successfully avoid environmental or social catastrophe, or that any society that remains after such an event would be more pleasant to belong to. The suffering and death to which Mr Harris refers can mean the suffering and death of the entire planet. In an infinite universe, there will always be other planets that actually do evolve the best policymaking system - which might look nothing like the liberal democracy that is our current best effort.

All this is to say that there is a case to be made for deliberate intervention rather than waiting for evolution to do its work: for stipulating that one of the outcomes we want to see is the survival (at the very least) of our species and actively targeting that outcome. Our past experience barely equips our policymakers to acknowledge global threats, let alone to respond effectively to them. The threats come from too many different sources and have too much uncertainty attached. There is no inevitability that our curent systems can deal with them.

So there is a strong argument, I believe, for something like Social Policy Bonds that reward people for ensuring that no social or environmental catastrophe occurs. Such bonds could be redeemed after a sustained period during which no huge upheaval, *however caused*, led to large numbers of people being killed, injured or made homeless. Holders of such bonds would do their utmost to prevent social and environmental collapse. The issuers of the bonds could include global bodies (such as the United Nations), using funds raised from the world's governments. To me, this targeting of a universally desirable outcome, is far preferable to waiting millennia for evolution to come up with better systems than we have now, especially when our planet itself and every living thing on it might in the long run be merely one of those unsuccessful mutations that doesn't survive.

## 5.7.2 Why who? (2008-07-05 12:05)

The Zen header of this post is my asking why the title of the current *Economist's* article about world governance is headed 'Who runs the world?' You can't blame the *Economist*. In common

with the rest of us, it sees problems as arising from the failure of organisations. But I think this approach is outdated. Consider:

The third impetus to rejig the way the world organises itself is a dawning realisation on the part of governments, rich and poor, that the biggest challenges shaping their future—climate change, the flaws and the forces of globalisation, the scramble for resources, state failure, mass terrorism, the spread of weapons of mass destruction—often need global, not just national or regional, solutions. [1] *Who runs the world?* (subscription, probably)

Yes, they need solutions, and the solutions should drive institutional changes, rather than the other way round. Reward people for solving global problems, and they will have incentives to develop institutions entirely geared up to solving them. Our current institutions are woefully not up to the task; nor are they up to devising new institutions that are. The key is to subordinate organisational structures and funding to targeted goals, not for some academics, policy wonks or super civil servants to try (as the *Economist* goes on):

to figure out is which bits of the global architecture need mere tweaking, which need retooling or replacing—and who should have the right to decide.

That, I guarantee, is not going to work. The question we should be asking is not 'who runs the world?', but 'what problems do we want to solve?' Then we can set about issuing [2]Climate Stability Bonds or [3]Conflict Resolution Bonds or whatever and putting organizations, with all their inefficiencies, hang-ups and intrigues, in their proper place: subordinate to human goals.

### 5.7.3 The new mediators (2008-07-06 21:38)

An interesting article in the current *Economist* about the new mediators: small groups, away from the UN razzmatazz, working behind the scenes to resolve conflict, with some success.

The UN has traditionally provided a forum for the discussion and resolution of international disputes. However... "There are no equivalent mechanisms for intrastate dispute resolution...despite the fact that most violent conflicts today are not international but intrastate in character." The new mediators provide the new mechanisms. Many of these contemporary conflicts involve insurgents, secessionists or even "resource-warriors"....[1]*The discreet charms of the international go-between* , 'The Economist', 3 July 2008 (subscription, probably)

This is actually quite a positive story. It even puts UN efforts in a good light: at the very least they provide a distraction from the quiet efforts made by the new mediators that would

fail if they attracted too much attention. Purists might object to the involvement of terrorist groups in the mediators' negotiations. It is repellent to me also; but as far as the well-being of populations is concerned, it is very often the best tactic.

[2]Conflict Resolution Bonds would embody the principle that meaningful outcomes are more important than history, taste, ideology, facts or even justice when it comes to negotiating the end of conflict. I'm pleased that the new mediators recognise that. A CRB, by targeting socially beneficial outcomes, would probably see such valuable initiatives arising less haphazardly than now .

#### **5.7.4 Subsidising fisheries destruction...a continuing story (2008-07-08 18:10)**

I can't put it any more forcefully than [1]George Monbiot in *the Guardian* of 8 July:

The [EU] fishermen make two demands, which are taken up by politicians in coastal regions all over the world: they must be allowed to destroy their own livelihoods, and the rest of us should pay for it. Over seven years, European taxpayers will be giving this industry €3.8bn. Some of this money is used to take boats out of service and to find other jobs for fishermen; but the rest is used to equip boats with new engines and new gear, to keep them on the water, to modernise ports and landing sites; and to promote and market the catch. Except for the funds used to re-train fishermen or help them into early retirement, there is no justification for this spending. At least farmers can argue - often falsely - that they are the "stewards of the countryside". But what possible argument is there for keeping more fishermen afloat than the fish population can bear?

EU politicians are not stupid. They know what they are doing. But they cannot summon up the will to change it. They are, like the rest of us, prisoners of a dysfunctional political system. It speaks volumes that these politicians lead what are probably the least corrupt regimes in the history of mankind. What chance then that they, or governments anywhere else, will tackle the really serious problems, where even the smallest step will create far more losers than even a complete dismantling of EU fisheries?

Very little, I'd say. We need a policymaking system that transcends sectoral, entrenched interests. A Social Policy Bond regime would be a good start: by expressing policy in terms of clear, meaningful outcomes, it would see more public participation and more willingness to do things that are unpopular but necessary.

### 5.7.5 Violent crime in the UK (2008-07-10 19:12)

From an article about violence in England in the current *Economist*:

Policemen may hold surgeries for local people, but they can take or leave whatever requests such meetings throw up. Instead, they are subservient to a rigid system of central targets, which has inadvertently encouraged coppers to focus on busting minor offenders rather than on keeping their patches safe. [1]*Violent Britain*

I think it's inevitable that in large, complex societies, policy is going to be determined and measured by numerical indicators of our well-being. This may be regrettable, but it's probably unavoidable. Unfortunately our governments aren't much better at devising decent indicators than were Soviet-era central planners. Their choice of targets is largely a product of their bureaucracies: they relate to the functions and structures of government agencies more than they do to outcomes that are meaningful to ordinary people. It's similar in the health services: targets are too narrow and can be too easily manipulated to serve any useful non-bureaucratic purpose.

Sadly, British Government seems to be responding to the rising level of (non-murderous) violent crime by trying to preserve:

the police authorities that now exist, but insisting that their members be elected. [UK] Home Office research shows that the "vast majority" of Britons have never heard of police authorities, and most of those who have don't know what they do.

As the *Economist* says 'It is hard to imagine chief constables being bossed around by anonymous people elected on a minuscule turnout.' And as I say, the possibility of subordinating policy to broad, meaningful goals, has been sacrificed on the altar of existing institutional structures.

### 5.7.6 Biodiversity or cheaper petrol? (2008-07-13 14:12)

How much is biodiversity worth? How is the avoidance of lost biodiversity to be weighed against people's wish for cheaper fuel?

Social Policy Bonds cannot answer these questions, but they can help in two ways:

Bonds could be issued that target some index of biodiversity. The market prices of the bonds at flotation and thereafter generate estimates of the total and marginal costs of achieving targeted goals. The total cost estimates would be continuously refined and updated by a large pool of motivated observers. They would probably be better estimates than those calculated from the sort of estimates made nowadays: typically one-off calculations performed by a relatively small number of academics or government employees. The marginal costs derived from bond prices would also represent a big improvement over the information currently available to decision-makers, once they have decided which projects to support. So the cost of maintaining a given level of biodiversity can be calculated.

Ultimately, any decision as to whether it's worth maintaining that level against a few pennies off the price of petrol will have to be made on a political basis. But here again, a Social Policy Bond regime could help: a bond regime, because of its transparent targeting of meaningful outcomes would make it easier for more people to participate in policymaking generating more buy-in than current politics affords. If we want to trade off [1] orang - utans , then, for biofuels , at we'd know whose responsibility it is - ours - rather than, as now, delude ourselves that it's the fault of corrupt third-world governments.

### **5.7.7 The logic of incremental adaptation (2008-07-16 19:06)**

Social systems seem to behave in similar ways to ecological systems. An economy is not (despite lazy journalism) something that is steered, but rather a complex web of agents, flows beset by time lags, and mutations - some adaptive, some not. Same with society as a whole. The current economic system is undergoing a shakeout, and I see two broad scenarios. Everything will be done to try to shore it up: taxpayer bailouts of financial institutions, vastly inefficient biofuel programs, subsidies to those who make the most noise, who have the biggest clout, or who make the largest political campaign contributions. Even that might not be enough, and the second possibility, a systemic collapse, will ensue. Then Milton Friedman's phrase comes to mind: 'Only a crisis produces real change. When that crisis occurs, the actions that are taken depend on the ideas that are lying around.'

To be honest, I can't see Social Policy Bonds being deployed before such a crisis. To my knowledge, nobody has issued them in the 20 years or so that the idea has been in the public arena. However, the idea is at least lying around, and I think it's a lot better than some of the other ideas that could be (or indeed have been) picked up at times of severe social disruption. I am about to finish a book of about 70000 words on Social Policy Bonds. If any reader can help me find a publisher please could you contact me?

-

### 5.7.8 Targeting walkability (2008-07-17 19:49)

It's difficult to come up with robust indicators of well-being. This difficulty is particularly obvious when we are thinking about which goals a Social Policy Bond could target. But it's just as relevant, if more obscure, when we look at policymaking under the current regime. Many indicators of well-being are good at the basic level. At the lower levels of wealth, income, nutrition, literacy, for instance, numerical indicators (dollars, caloric intake, ability to read) are both easy to measure and strongly correlated to well-being. At higher levels, such correlations tend to break down.

If we needed, though, indicators for well-being at a community, or neighbourhood level, I'd think seriously about including

walkability . Here's the complete post from [1]Grist:

Software company Front Seat has released a ranking of the most walkable U.S. cities, rating the relative distance to and density of businesses like grocery stores, bars, book stores, and coffee shops to calculate an overall walkability score. San Francisco took top honors, followed by New York City, Boston, Chicago, and Philadelphia; the lowest scoring cities were Jacksonville, Fla.; Nashville; Charlotte, N.C.; Indianapolis; and Oklahoma City. The rankings also singled out the nation's most walkable neighborhoods, with Tribeca , Little Italy, and Soho in NYC placing first. "It's both healthy for the Earth and for humans to be able to walk to most of the places they need," said Kate White of the Urban Land Institute. "Your carbon footprint is significantly lower than someone who has to drive everywhere ... and you're able to have real neighborhoods where you're not totally separated from your neighbors." People [in the US] can see their own 'hood's walkability score at [2] Walkscore .com.

I like this idea. With quantification comes the possibility of measurement and targeting. There are always going to be other criteria, but walkability , I think, is important, and deserves a higher rating in town planning than it has right now.

-

1. <http://www.grist.org/news/2008/07/17/walkable/index.html?source=rss>

2. <http://walkscore.com/>

### 5.7.9 Justice or expediency (2008-07-21 21:25)

The current [1]'*Economist*' (subscription), discussing whether the president Sudan should be brought before the International Criminal Court:

The spectacle of justice thwarted is hard to stomach. But in the argument between justice and expediency, both must have their say.

Quite. Sometimes it's worth holding your nose and subordinating the interests of justice to those of ordinary people who just want to get on with their lives in peace. It's difficult, in the heat of conflict, to reach that conclusion, but I suspect that if people in areas of long-running conflict (the Middle East, for instance) were given the chance in a secret ballot, they would opt for compromise and peace over war every time. I might be quite wrong about that, but surely they should be given the chance to make that decision. In most conflicts, one person's justice is another's revenge, but even in cases (like the Sudan or Zimbabwe) where the wrongdoers can be objectively identified, expediency is sometimes going to be the best solution for almost everybody.

Unfortunately, the way in which policy made tends not to target outcomes such as 'peace'. We think it wrong for murderous leaders to be given at the expense of overseas taxpayers a perpetual holiday in a golfing resort of their choice. But that might be the most efficient solution to conflict, and one that the people most involved would, if they had the opportunity, wholeheartedly support.

### **5.7.10 Fannie Mae and Freddie Mac: more perverse subsidies (2008-07-24 16:32)**

Commenting on the US taxpayer bailout of Fannie Mae and Freddie Mac, [1]*the Economist* (subscription) says:

Normal financial-services firms should have been dealing in the safe, middle-of-the road mortgages that Fannie and Freddie specialise in. Except that they were crowded out into subprime mortgages. Fannie and Freddie should never have grown so large. Except that they wanted to exploit the margin between the government-guaranteed borrowing costs and the commercial lending income. They should have been stopped by Congress and their regulator. Except that they spent some of their subsidy on a fierce lobbying machine.

It's a vicious circle: the subsidies enrich an interest group, enabling it to resist anything that threatens its power to enrich itself further. We see it in other sectors: agriculture, fisheries and corporate welfare generally, and there's very little transparency about it. Ordinary people don't vote for subsidies to the wealthy (and that often accelerate destruction of the environment), but that's where quite a significant proportion of consumer and taxpayer subsidies go. (In the current draft of my book I estimate perverse subsidies to amount to about 7 or 8 percent of all the world governments' spending.)

Governments and their corporate beneficiaries can keep this nonsense going because we are used to accepting as reasonable the specification of policy goals in terms of vague

promises, are so turned off by the arcane business of policy making, with its emphasis on legalisms, spending plans, institutional structures and process, process, process.

A Social Policy Bond regime would be different. Outcomes would be explicit and transparent. They'd be meaningful to voters and they'd be costed. If the goal is, for instance, to help poor people buy their own homes, then that would be targeted, rather than some alleged means of bringing that about. Bonds would be issued that rise in value once the number of poor people helped to buy their homes had risen beyond a specified level for a stipulated period. There'd be no ambiguity, and no substitution of corporate goals for voters' wishes.

### 5.7.11 Obesity is like climate change (2008-07-27 20:25)

[1]Rob Lyons, discussing [2]*The Diet Delusion* by Gary Taubes , writes:

What seems abundantly clear is that banging on at entire populations to eat less and exercise more has been an utter failure in terms of reducing levels of obesity.

Social and environmental systems are as complex as obesity and as unresponsive to the 'cause and effect' model of government intervention. In the early days of benign government the relationship between a problem and its cause was often much easier to identify - and probably still is for the afflictions of the poorest members of society. In such cases provision of, for example, basic infrastructure, education and housing was - and is - an almost unambiguous good. But society today is as complex as the human body. Identifying a single cause of, for instance, obesity, or baldness, cancer etc, is unlikely to be fruitful. Sadly, that is the way governments operate: indeed it is the way our individual thinking operates. But for complex problems more subtle ways of finding solutions are necessary. They require diverse approaches, and ones that adapt over time. Climate change and nuclear proliferation, to take a couple of urgent challenges, are at least as complex as obesity, and are going to be at least as unresponsive to the usual approach.

The Social Policy Bond approach is to stipulate the targeted goal: a stable climate, or nuclear peace, and reward people for achieving it, however they do so. It would be up to investors in the bonds to research, investigate, and implement different approaches. They would be highly motivated to terminate their unsuccessful projects (something that government rarely does) and to adapt and replicate their successes. I think the bonds offer a better solution to complex social and environmental problems than the current, cause and effect, model.

## 5.8 August

### 5.8.1 Old Beijing (2008-08-01 21:05)

Reviewing *City of Heavenly Tranquility: Beijing in the History of China* by Jasper Becker, the [1]*Economist* (subscription) says that one of its strengths

is the depiction of Beijing as a canvas for the projection of others' fantasies. In the case of 17th-century Jesuits or 20th-century Westerners in search of the exotic, this was fairly harmless. With purges, famine and urban destruction, Mao Zedong visited immense grief on a city he treated as a blank page. But it is China's recent dictators who have finished off Beijing, bulldozing its past with the criminal approval of the world's leading architects throwing up "signature" structures....

There's nothing unique about China in this respect. Most British cities, for example, suffer from ludicrous zoning rules, brutal modernism, and the car cathexis of town planners. The desolation of our urban environment is a physical manifestation of how policy is made. Well-meaning (for the most part) government has its own ideas about what's best for the people. But the gap's too wide: they don't really know what's best for us. They have to rely on aggregated data and their own ideology, and it doesn't work. Heavily influenced by big business and corporate goals, our physical and social environments serve abstract, ideological or economic goals.

A Social Policy Bond regime would be different. The economy would be seen as a means to various specified ends, not as an end in itself. And the specified ends would be meaningful to ordinary people. It's possible that aesthetic, social, psychological and environmental horrors - in the eyes of Mr Becker (and me) - would still be perpetrated, but they would then happen with the people's participation and consent. More likely, some economic growth or Olympic razzmatazz would be traded off against a higher level of well-being. That would be policy as if outcomes mattered.

### 5.8.2 Entrenching insanity (2008-08-05 17:23)

With 88 percent of the EU's fish stocks over-fished, diminishing fuel supplies, and its Kyoto emission targets looking unlikely ever to be met, what is the response of the EU Commission? Raise fuel subsidies to the fishing industry of course. You can read about it [1]here. Also today's [2]news gives more details of UK government bailout of Northern Rock, which currently owes UK taxpayers will stand to lose up to £17.5 billion.

There's a perverse logic to these perverse subsidies. Once you've started dishing out subsidies, it's very difficult to stop. The effect of the subsidies is to swell the power of the recipients to oppose any reduction in their subsidies. It's a corrupt, insane way of running things from the point of view of society as a whole. But who has that point of view any more?

### 5.8.3 Government suppresses adaptation (2008-08-09 14:19)

...Americans have been eating oil and natural gas for the past century, at an ever-accelerating pace. without the massive 'inputs' of cheap gasoline and diesel fuel for machines, irrigation, and trucking, or petroleum-based herbicides and pesticides, or fertilizers made out of natural gas, Americans will be compelled to radically reorganize the way food is produced, or starve. James Kunstler , [1]*The Long Emergency* (page 239)

Without government subsidies, it's unlikely Americans (and other industrialised countries) would be in this predicament. Government has subsidised the extraction of oil. It was also obsessed with maximising per hectare yields of farm products, and the way it subsidised agriculture led to highly intensive, specialised production that relies absolutely on oil. Without government backing, we'd probably still be eating oil, but not to the same degree and we'd not be so locked into that mode of production. Government is not immune to the winnowing effect of Darwinian evolution. But replacing governments take time, during which irreversible harm can be done to people and the planet. The Soviet Union was directly responsible for the death of millions, but its demise took decades. If government had refrained from getting involved in subsidising oil and agriculture we'd probably be in a much better position to deal threats like oil shortages. The effect of government has been to suppress our capacity to adapt. That's partly because it thinks it knows how best to achieve social goals. It thought that an oil-based infrastructure and agriculture would maximise social welfare, and because of the self-entrenching nature of its subsidies it's as locked into that paradigm as the rest of us.

Social Policy Bonds are an alternative. Instead of targeting narrow goals such as miles of roads built or yields per hectare, it would set basic nutritional or health standards for everybody. The incentives would be for people to maximise people's health in ways that are diverse and adaptive. The bond principle is to subordinate government-funded activities not to the one-time opinions of a handful of experts but to targeted outcomes themselves. The result would be a more resilient food supply system - one that would have the capacity to adapt and evolve.

#### **5.8.4 Why isn't this guy running for President? (2008-08-12 19:51)**

This from Jonathan Rowe, of West Marin Commons:

The purpose of an economy is to meet human needs in such a way that life becomes in some respect richer and better in the process. It is not simply to produce a lot of stuff. Stuff is a means, not an end. Yet current modes of economic measurement focus almost entirely on means. For example, an automobile is productive if it produces transportation. But today we look only at the cars produced per hour worked. More cars can mean more traffic and therefore a transportation system that is less productive. The medical system is the same. The aim should be healthy people, not the sale of more medical services and drugs. Now, however, we assess the economic contribution of the medical system on the basis of treatments rather than results. Economists see nothing wrong with this. They see no problem that the medical system is expected to produce 30 to 40 percent of new jobs over the next thirty years. "We have to spend our money on something," shrugged a Stanford economist to the *New York Times*. This is more insanity. Next we will be hearing about "disease-led recovery." To stimulate the economy we will have to encourage people to be sick so that the economy can be well. [1]*Harper's Magazine*

There's nothing to disagree with here. There are difficulties in measuring happiness or social wellbeing, but there are far better indicators than abstract, highly aggregated economic variables. Broad indicators of physical and environmental health would be a start, and under a Social Policy Bond regime we could explicitly target them and channel market incentives into improving them. Another critical goal could be the avoidance of catastrophe, whether its cause be social, environmental or military. Again, Social Policy Bonds could be issued that reward people if a catastrophe - which could be defined as a single event that kills 10000 people in any 24 hours - is avoided for a sustained period.

There are not enough incentives directed at such goals, which are both more meaningful to ordinary people and more widely held than those economic aggregates that we do, by default, target. A Social Policy Bond regime could do something to redress the balance.

#### **5.8.5 Bruce Schneier gets it (2008-08-13 22:36)**

Bruce Schneier , suggesting the actions that the US Government could take to boost cyber security:

[L] legislate results and not methodologies. There are a lot of areas in security where you need to pass laws, where the security externalities are such that the market fails to provide adequate security. For example, software companies who sell insecure products are exploiting an externality just as much as chemical plants that dump waste into the river. But a bad law is worse than no law. A law requiring companies to secure personal data is good; a law specifying what technologies they should use to do so is not. Mandating software liabilities for software failures is good, detailing how is not. Legislate for the results you want and implement the appropriate penalties; let the market figure out how – that’s what markets are good at. [1] Memo to the President

Exactly; and as in security, so in other policy matters. Government doesn’t know how to do things, but it’s the best forum we have for deciding which outcomes we should strive to achieve , and it’s the best way we have of raising revenue to achieve those outcomes. For such tasks, being big, monolithic and decisive are advantages, and government has them. But for actually achieving goals in complex, ever-changing societies, we need diverse, adaptive approaches. Stipulating outcomes and rewarding people for achieving them: government can do those things very well. But as Mr Schneier says, the market is the best way we have of allocating resources to actually achieving society’s goals.

### **5.8.7 What is it all about? (2008-08-19 18:49)**

From testimony delivered 12 March before the US Senate Committee on Commerce, Science, and Transportation, Subcommittee on Interstate Commerce by Jonathan Rowe, codirector of West Marin Commons, a community-organizing group, in California:

Every time you say that “the economy” is up, or that you want to “stimulate” it, you are urging more expenditure and motion without regard to what that expenditure is and what it might accomplish, and without regard to what it might crowd out or displace in the process. That term “the economy”: what it means, in practice, is the Gross Domestic Product—a big statistical pot that includes all the money spent in a given period of time. [1] *Our Phony Economy* , "Harper's Magazine", June

In the absence of any clear, coherent, agreed goals, growth in Gross Domestic Product, or GDP per capita , has become the *de facto* objective of most governments. Thankfully more people are realizing that GDP or economic growth as conventionally measured, is not a meaningful end in itself - at least not to ordinary human beings in western economies. GDP probably was a useful indicator in the past, when it correlated strongly with social wellbeing , but we'd do better now to focus on different measures.

A government-backed Social Policy Bond regime would mean asking what it's all about right from the start. As a society we'd need some agreement on where taxpayer funds should be spent - or rather, on what they should be spent to achieve. In my view, we'd do best to target broad, basic levels of health and education; and lower levels of crime and pollution. We could also target the absence of social or environmental catastrophe: using the bonds as an insurance policy against calamity. Of course , the Social Policy Bond concept is versatile enough for any group of wealthy individuals, who could issue their own bonds for their own, hopefully philanthropic objectives. In this [2]example ( pdf ) I discuss the possibility of issuing bonds targeting female literacy in Pakistan.

### 5.8.8 Buy-in and regional development (2008-08-23 18:43)

A key chapter, titled 'What sort of Future?', by David Byrne , in [1] *Geordies : Roots of Regionalism*, discusses amongst other things the British Government's policy towards northeast England in and after the 1930s:

The proposals for regional development ... were an interesting and fruitful combination of macroeconomic industrial strategy and Keynesian social strategy. ... All public bodies were involved in this programme, but the major initiatives were associated with a new political form, the corporatist political organizations created by the Special Areas Commission in the form of appointed rather than elected bodies. ... The significance of this separation of economic development from direct democratic control by local government cannot be overstated.

The significance, to me, is that of a growing gap between government and the people it is supposed to represent. It's a reminder of the crucial importance of buy-in to policies that affect us. The continuing turmoil in the world's financial markets tells us that even banking experts don't fully understand the nature of the risks they are taking in a complex environment. There is a case, then, for delegating economic and policy decisions being taken by a small group of experts. But their *goals* should be those of the people affected. Economic policy can be arcane and amenable only to specialists. But its goals need not be. A Social Policy Bond regime, by targeting broad social and environmental objectives, could draw more people into the policymaking process. Some statistical economic growth might be sacrificed but the benefit in terms of more buy-in could be immense. It could do a lot to eliminate the bitterness and rancour that affects so much of Britain outside the southeast; the feeling of being colonised by the capital, of being a victim of decisions made hundreds of miles away.

### 5.8.9 Ends and means in energy policy (2008-08-27 19:44)

James Lovelock in [1]*The Revenge of Gaia* :

I find it sad, but all too human, that there are vast bureaucracies concerned about nuclear waste, huge organizations devoted to decommissioning nuclear power stations, but nothing comparable to deal with that truly malign waste, carbon dioxide.

Energy policy is largely politicised; which means that people are less likely to engage in rational argument. But Lovelock's case for going nuclear should be debated. Unfortunately, like so many other facets of life in a complex world, nuclear technology is highly technical, which probably explains why most of us react emotionally to it. But Social Policy Bonds could bring about more public participation in the debate - essential if we are going to have the buy-in that will become increasingly necessary. Under a bond regime we would target broad environmental indicators and supply of energy. These are the outcomes of an energy policy, and much easier to understand than highly specialised technical data. Holders of bonds targeting such environmental and social goals would have incentives to achieve the specified goals, but it would be up to them to decide how. They would have powerful incentives to meet the agreed environmental criteria. And these criteria would be agreed by society in general, rather than a handful of politicians taking advice from a few scientists and industry lobbyists.

Nuclear or non-nuclear: that is not the question. Meeting agreed social and environmental goals: that is what is important, and that is what an outcome-based policy approach, such as Social Policy Bonds, would deliver.

### **5.8.10 Fossil fuel subsidies: facts and figures (2008-08-28 19:47)**

I'm pleased to see that the United Nations has tried to quantify subsidies to fossil fuels:

Globally, governments spend some \$300 billion on fuel subsidies that encourage consumption, delay transition to cleaner energy sources, and mainly benefit the already-rich even though most of the programs are intended to help the poor with fuel costs. "In the final analysis, many fossil-fuel subsidies are introduced for political reasons but are simply propping up and perpetuating inefficiencies in the global economy," said U.N. Environment Program director Achim Steiner.... Russia is the largest fuel-subsidy spender, throwing down some \$40 billion a year mainly to subsidize natural gas; Iran is in second place, spending about \$37 billion a year on fuel subsidies. [1]*You're not fueling anyone* , 'Grist'

Perhaps surprisingly, most of these subsidies are given by governments of the developing countries. The UN report says that the 2006 Stern Report:

estimates that direct government support to the deployment of low- carbon energy sources worldwide is currently of the order of \$26 billion per year: \$10 billion on deploying renewable sources of electricity and around \$16 billion on supporting existing nuclear power. [2]*Reforming Energy Subsidies* ( pdf )

The problem with subsidies is that they are so difficult to terminate, even decades after they are shown to be economic nonsense, environmentally disastrous and socially inequitable. Subsidies of this sort finance a coalition opposed to their removal.

For more on fossil fuel subsidies see: [3]End Oil Aid, which has a database showing subsidies to the oil industry by country; and [4]Oil Change USA; an informative, entertaining site which looks at the influence of oil in the US.

### 5.8.11 Management of the market (2008-08-31 11:32)

In today's *Observer*:

For three decades a single dominant thought has crowded out all others: that managing, whether of economies or organisations, is a matter of switching on the automatic pilot of the market's invisible hand and letting rational selfishly motivated individuals do the rest. .... But the dominant idea is now under attack. One prong of the offensive is the course of events; after all, it wasn't supposed to be like this. Over the past decade, rather than a stimulating pat on the back, the invisible hand has administered a succession of increasingly damaging haymakers : South East Asia, hedge fund LTCM , the dotcoms , Enron and other corporate scandals, now the sub-prime shambles. After several knockdowns, the unfettered market has put the global economy on the canvas for the count. [And] just as the practice of financial capitalism is being questioned, so are its intellectual underpinnings. As it excavates the foundations, the burgeoning school of behavioural economics is shouldering aside the desiccated calculations of economic man to make legitimate space for emotion, altruism and fair play in economic behaviour. [1] Simon Caulkin  
, 31 August

Mr Caulkin points out that there are many incentive structures that can bring about excellence in the private sector and that:

It has nothing necessarily to do with stock options, private ownership or extravagantly paid senior executives. It does have to do with effective work organisation and systems, which the individual performance management regimes favoured by the private sector are as likely to destroy as to support. It is now apparent that where the private sector does excel is in disguising the full costs of its incentives by externalising their dysfunctional results on to society as a whole. Today's credit crunch is the most stunning example of this perverse behaviour in economic history.

Mr Caulkin ends by saying that 'Management of the market is as important as management by it'. I can't disagree with this, except to point out:

1. that the public sector also behaves anti-socially (see *passim* on this blog or the websites at right references to perverse subsidies) and
2. that the broader incentives *do* matter when it comes to the private sector externalising its costs (onto the environment as well as 'society as a whole').

There are few incentives not to so externalise. The private sector is always going to 'excel in disguising the full costs' of its negative impacts on the rest of us if it doesn't get punished for doing so, or rewarded for not doing so. It is reacting rationally (and anti-socially) to the incentives on offer. So the question is not so much 'how is the market to be managed?', but rather 'how can we rejig the incentives so that the organizations - whether they be private or public sector - behave themselves?' That's where Social Policy Bonds enter the picture. They can act as a market-based device for correcting market failure. If the product of the mix of private and public sector bad behaviour is a filthy environment or a high rate of crime, then

rather than regulate with a (*pace* Mr Caulkin ) not-always-efficient public sector, a bond regime with environmental and social goals that are understood and agreed by ordinary people could be the solution. Social Policy Bonds could be issued that reward people for bringing about a cleaner environment and a lower crime rate, however they do so.

So management of the market could in effect be done by the market. The beauty is that under a bond regime it is that the market would be allowed to do what it is best at doing - allocating scarce resources - but in the service of social and environmental goals, rather than the private accumulation of wealth.

## 5.9 September

### 5.9.1 Fossil fuel subsidies: Norman Myers interview (2008-09-05 18:52)

From an [1]interview with Norman Myers, environmental scientist:

it is absolutely urgent that we begin calculating the cost of climate change, and pass the cost on to the people who are doing the burning and emitting. .... The number of people who die each year in China because of air pollution is in the order of 400,000. That's a huge mortality rate, and the cost should be built into the price of fossil fuels.

Why then do governments continue to subsidise fossil fuel extraction and use?

Well, it's partially inertia. Fossil fuels play a very large role in our economies, and to phase them out would cause a lot of disruption. However, it will not be nearly as difficult as living in a world that has been ravaged by climate change. The other reason is the influence of lobbyists. In Washington, for example, there are large numbers of lobbyists who whisper in the ears of Congress in order to keep subsidies to fossil fuels in place. I believe that lobbyists are spending as much as US \$250 million a month in the United States, much of which goes to lobbying on behalf of the fossil fuels.

As with agriculture, fisheries and road transport, fossil fuel subsidies have always been perverse. Right now they appear to be suicidal as well. They are the sort of policies that get implemented when nobody thinks about outcomes but only about the supposed means of reaching them. The tragedy is that they don't stop even when the evidence about their perversity is overwhelming, and has been overwhelming for decades.

A Social Policy Bond regime would be different. From the start it would clarify what are society's goals, and what, like, say, cheap, easy transport, are not necessarily goals at all.

And then it would inextricably link rewards to the achievement of them. A government-backed bond regime wouldn't spend billions of taxpayer funds on corrupt, insane policies that are financial and environmental disasters. It would subordinate all projects, all activities, all institutions to the goals themselves. Apart from much greater efficiency, there would be a lot more transparency. Current institutional structures, both public and private sector, would be threatened, to the extent that they impede rather than assist achievement of social goals. Mr Myers is writing a book titled *How Institutions Block Our Road to Sustainability*. It should make interesting reading.

### 5.9.2 The myth of the tragedy of the commons (2008-09-09 10:58)

Community management isn't an infallible way of protecting shared resources: some communities have mismanaged common resources, and some commons may have been overused to extinction. But no commons-based community has capitalism's built-in drive to put current profits ahead of the well-being of future generations. Ian Angus, [1] *The Myth of the Tragedy of the Commons*

This is an important essay. The 'tragedy of the commons' myth has provided intellectual backing for the destruction of many of those things, difficult to define and more difficult still to quantify, that give life meaning. As Mr Angus points out, self-regulation by communities was the way in which the commons were looked after. The notion of communities itself is disappearing (largely, in my view, for the reasons identified by Robert Putnam: too much [2]immigration and diversity). Could Social Policy Bonds help preserve the commons? One way might be to target those benefits that real, self-regulating communities generate, and reward people for achieving them - or for removing the obstacles to their achievement.

Take crime. Freedom to walk around cities at night is one of those difficult-to-quantify things that has been lost, at least in the countries I know best, New Zealand and the UK. Current efforts to reduce street crime seem to focus on better policing or increased surveillance; but perhaps more thinking out of the box is required. A Social Policy Bond rewarding safer streets (measured by, say, something like a sophisticated footfalls: crime ratio), could see the emergence of more subtle and less obvious approaches. These could include the provision of entertainment facilities for young potential robbers; better street lighting; deregulated taxis; subsidised public transport. Together an optimal combination of measures could bring about not just the benefits of the commons, but also *the community that self-regulates*.

There's little in our current political approach that enhances community. Friction between individuals is inevitable, but our current ways of dealing with it tend to encourage even greater mutual isolation, mirroring the institutional

structures that government embodies and understands. Problems like those of crime or the preservation of scarce resources or the maintenance of other aspects of the commons are not always amenable to the straightforward, cause-and-effect, one-size-fits-all, top-down approach

that government does best. A Social Policy Bond regime, targeting desirable, broad outcomes of the sort that the community evolved to provide, could be one answer to the question: how do we best preserve the commons?

### 5.9.3 A multitude of inventions (2008-09-10 20:56)

William D. Nordhaus writes:

The history of technology suggests that we should avoid trying to pick the winners in our search for revolutionary energy technologies. Radical invention is fundamentally unpredictable. Who could have predicted the nature of modern electronics, biotechnology, or communications a century ago? Similarly, it is a safe bet that we have only the foggiest ideas about the technologies that will save the globe from climate change a century hence. We should avoid thinking that we need a climate Manhattan Project to develop the key technology. It seems likely that new climate-friendly technologies will be the cumulative outcome of a **multitude of inventions, many coming from small inventors, and originating in unrelated fields.** [1] *The Question of Global Warming: An Exchange*, 'New York Review of Books' [my emphasis]

Exactly. The key principle is that government can supply incentives for the endeavours of the inventors, but it cannot get too closely identified with them, because if it does, it won't terminate failed inventions. A Social Policy Bond regime could channel government incentives into finding solutions to the climate change problem, or other quantifiable problems. In that way, government could do what only government can do, and what it does best: articulating society's goals and raising the revenue required to achieve them. But through the Social Policy Bond mechanism it would let the market do what it does best: allocating scarce resources to meet our goals with maximum efficiency. For more about Social Policy Bonds and climate change, read this short paper about [2] Climate Stability Bonds.

### 5.9.4 More about car parking (2008-09-11 19:21)

I've posted [1] before about the hidden costs of 'free' car parking, in relation to [2] *The High Cost of Free Parking* by Donald Shoup. Writing about Australia in particular, Christian Seibert concludes:

Minimum parking regulations are costing Australia. A standard component of the urban planning frameworks of our towns and cities, they distort transport choices, skewing them away from walking, cycling, and public transport. They encourage the growth of sprawling cities that do not reflect their inhabitants' true land-use preferences. They make housing more expensive, a particular concern given that housing affordability is a major issue in Australia. They harm those on low incomes, because they make basic goods, services, and housing more expensive for those who can least afford cars and so benefit least from parking. Finally, the parking lots built to meet minimum parking regulations blight our urban landscapes. [3] *There's No Such Thing as a Free Parking Space*

I agree. Minimum parking regulations are a typically well-intended, but ultimately destructive, over-reaction to a highly visible symptom. Policymakers can't see the forest for the trees and they confuse means with ends; the result is unpleasant and dangerous cities for everyone. Oh, and no solution to parking problems either. Social Policy Bonds would make us focus on objectives, rather than supposed means of getting there. And if there are no clear, agreed, unambiguous objectives, then we'd leave that policy area alone.

### 5.9.5 Who decides what is a social problem? (2008-09-13 10:29)

In Australia today, there is a 'social policy establishment' that defines what 'social problems' are and prescribes the policies needed to resolve them. It includes academics working in universities and research institutes, welfare state professionals, political activists working in the nonprofit sector, social affairs journalists and commentators employed in the media, and bureaucrats employed in federal and state governments to research social problems and advise ministers on the best solutions. Most of these people believe similar things and think in similar ways. They were educated in the same kinds of degree courses, reading the same books and internalising the same basic theories and perspectives. They interact regularly at seminars and conferences where they reaffirm the core ideas they share. They referee each other's writings, award each other research contracts, and evaluate each other's job applications. They often live in the same neighbourhoods, send their children to the same schools, and read the same newspapers and periodicals. Collectively, they 'know' what our society is like, and they 'know' what needs to be done to improve it. [1] *Six social policy myths*

, Centre for Independent Studies

These authors argue that inequality, for instance, is labelled a social problem when, in fact, it isn't a real one. I think their argument is valid so far as it goes. I agree that the group

doing the labelling is too small narrow and unrepresentative, and I believe that widening this group would be an end in itself. But the main difficulty is that even when there is a wide consensus over what constitutes a social (or environmental) problem, there is very little linkage between the resulting policy and the problem's solution. Somewhere along the way, policies become corrupted. They generate interest groups that are adept at manipulating government action in their favour. So instead of addressing poverty directly, with explicit, clear goals the achievement of which they will be held accountable, government policies end up subsidising the wealthy (the western world's agricultural policies, for instance) or the destruction of the environment (agriculture, fisheries and transport policy).

This grotesque disjunction between what people what government to do and what it actually does is not so much a result of an unrepresentative group of people deciding what are social problems (though that is a factor), but rather a result of the way in which government bodies operate. In particular, there is no link between their effectiveness in achieving social goals, and how much they contribute to that achievement. They have no incentives to do well, nor to terminate failed policies. Indeed, if they are extremely successful, they are likely to be disbanded.

A Social Policy Bond regime would inextricably link the solution of social problems to incentives. Markets would allocate funding. And it would be in investors' interest to end disastrous, or even merely inefficient, programmes - in stark contrast to the current system.

### **5.9.7 Thinking aloud (2008-09-19 20:56)**

This week's financial turmoil speaks to me of a confusion in high places between policy ends and means, but I confess I have no easy answers. It shouldn't have got to this point, of course, where taxpayers prop up the financial system, rather than the other way round. Under a Social Policy Bond regime the health or otherwise of any single industry - financial, agricultural, manufacturing or whatever - would be subordinated to goals that are meaningful to ordinary people. In other words, instead of targeting the health of particular sectors ('means') we'd target objectives like literacy, physical and mental health, environmental well-being and the eradication of poverty. Government objectives are currently too obscure or too mutually

conflicting, so that it's not in any people's interests to prevent this sort of catastrophe. Or rather, the oversight is done by government agencies, which, as in any other policy area, is not rewarded in line with its achievement. This is the same sort of oversight that has led to nuclear proliferation, for instance, with all its attendant, catastrophic, dangers.

A Social Policy Bond regime would reward the successful, sustained, avoidance of catastrophe, however caused. And it would inject market incentives into the maintenance and improvement of the standard of living of natural persons, rather than abstractions such as 'the financial sector'.

### **5.9.8 Government should help people, not sectors (2008-09-22 10:36)**

I see the US bailout of its financial sector as another, and probably the most disastrous, in the long line of perverse subsidies that have done so much to waste scarce resources, divert taxpayer and consumer funds from the poor to the rich, and devastate the social and physical environment. From agriculture to fisheries, road transport to energy, these perverse subsidies invariably favour the large and global at the expense of the small and local, and corporations and abstract economic variables at the expense of ordinary people.

How does it come about that government ends up subsidising the forces that have done so much to make life miserable for natural persons? The motivations start out as well intended, and even apparently necessary. After the second world war, food availability was critical and governments (mistakenly) identified it with local food production. So government got into the business of intervention; imposing trade barriers, providing open-ended guarantees to farmers, and all the rest. That logic led us to structural surpluses to be dumped onto the third world, undermining developing countries' own food production. It also bid up the price of farmland at home, intensifying agriculture at great cost to the environment and animal welfare, and making it difficult for ordinary people to enter farming, unless they were lucky enough to inherit farmland. Worse, the bidding up of asset values made it very difficult for government to contemplate withdrawing its support. Like a drug habit, subsidies were easy to start, difficult to end. And of course, the subsidies created a whole new set of lobbyists whose entire raison

d'être is to oppose their withdrawal.

It's a similar story with the other sectors. Government intervenes for short-term but well-intentioned reasons. The sector becomes dependent on government for its survival, and ends up, in effect, a nationalised industry. When the sector is small, the financial burden is perhaps bearable, though it still represents a diversion of scarce resources from things that could be valuable - education, health care etc - into things that are worse than useless: over-capitalized farming and fishing, grotesque overinvestment in road transport and dependence on fossil fuels, for instance.

But the latest perverse subsidy - to the financial sector - is bigger than all of these. How it will play out is difficult to foresee. But it seems that institutions that were 'too big to fail' are to

be replaced by even bigger institutions. And if the history of previous perverse subsidies is anything to go by, the US financial sector will become another ward of state for a long long time.

The root cause of this tragic misallocation of resources is the lack of clarity at the highest levels about what government is actually for. It's *not* there to prop up ailing sectors. It's *not* there to save particular corporations. And it's *not* there to bolster asset values or abstract economic variables like the rate of growth or GDP per capita . Government's purpose is to supply public goods and services, and beyond that to provide a basic minimum level of health, education and welfare for all. Once it starts trying to work out *how* to achieve these things it goes awry. Government is a centralized, top-down decisionmaking body. It does not and cannot do adaptation or diversity - and it is precisely adaptation and diversity that a vibrant, prosperous market economy needs. By its latest massive intervention and bailout it will throttle the US economy, institutionalise the corrupt incentives that led to the crisis in the first place, and deny disadvantaged Americans the help they need.

What the US Government should do is something it should have done a long time ago: realign its policy to serve its ordinary citizens. All its policies and all its interventions should be subordinated to the provision of public goods and services, the maintenance of a decent social and physical environment, and a safety net for all. Sadly, its bailout of the finance sector looks like taking it further away from those guiding principles.

### **5.9.9 The market: a means not an end (2008-09-24 19:20)**

Recent research showed that of the 121 fisheries using Individual Transferable Quotas 14 % were over-fished to the point of exhaustion. By contrast, those fisheries without ITQs suffered twice the rate of collapse (28 %). [1]David Bollier takes up the story:

The *New York Times* faithfully trumpeted the news: "Privately Owned Fisheries May Help Shore Up Stocks." But are ITQs truly effective because they rely upon a "market-based system"? Or do they work because they set overall fishing limits, a commons-based solution?

Mr Bollier was pointed to research by Seth Macinko and Daniel W. Bromley, who have written:

All the talk about rights-based fishing and [ITQs] is a red herring that throws all of us off the track of what is important. [ITQs] do not work because they are rights, or because they are property rights.... [They] work because they involve an assigned catch, as opposed to having catch be determined competitively.

This chimes with my belief that the market is only a means to various ends. They can be effective and efficient, but it when it comes to crucial social and environmental goals, markets must be subordinated to specified outcomes. Markets allocate resources efficiently; but that's a fairly limited vision. If we are to use their formidable efficiencies to solve social and environmental problems, they need to be constrained by the political process. A Social Policy Bond

regime would do that: specific outcomes would be debated and agreed. Social Policy Bonds would be issued that targeted these goals. Until the goals were achieved, the bonds would not be redeemed. Their value would be inextricably dependent on how well investors achieve social goals.

### **5.9.10 Conspiracy to distract - or just too much information? (2008-09-27 18:50)**

Peter W Galbraith writes:

John McCain proclaims his goal [in Iraq] to be victory and says we are now winning in Iraq .... He considers victory to be an Iraq that is "a democratic ally." George W. Bush has defined victory as a unified, democratic, and stable Iraq. Neither man explained how he will transform Iraq's ruling theocrats into democrats, diminish Iran's vast influence in Baghdad, or reconcile Kurds and Sunnis to Iraq's new order. Remarkably, neither the Democrats nor the press has challenged them to do so. [1] *Is This a 'Victory'?*

Is there too much information about? Do we miss the forest for the trees? It's easier to believe not so much that there is a conspiracy to keep us focused on the celebrities, sport or petty politics, but that, being ceaselessly bombarded with information and entertainment, we lose perspective. That goes not only for ourselves as citizens and voters, but perhaps also for the decision makers and the media. The Democrats and the press have little incentive to focus on what's important, because that's not we, as voters, are urging them to do, even supposing they do have the capacity. With our shrinking attention spans, and the sheer volume of information and entertainment available, we tend to focus on the immediate, the visual, and, often, the trivial. Disasters that are too slow moving or too complex for the visual media - the unravelling of our financial system, nuclear proliferation, for instance - cannot compete with the proverbial skate-boarding rhinoceros or the religious beliefs of would-be political leaders.

One way a Social Policy Bond regime would be an improvement over the current system is that it would focus our resources, if not our constant attention, on what is important. We can all understand outcomes, even if we don't know how to reach them. Indeed, we cannot be expected to know how to achieve them, because that often takes a long time and is rarely amenable to a single, simple, predictable approach. Experimentation, the exploration of alternatives, the termination of failed methods: all these are essential to finding the best solutions to our social and environmental problems. Under a bond regime, we might still follow trivial issues, but most of our scarce resources would be channeled into achieving social goals. *Right from the outset, and at every time thereafter until they are achieved, we'd know exactly what those goals are.*

## 5.10 October

### 5.10.1 Complexity: a reason to target outcomes (2008-10-02 16:42)

Writing about the current financial turmoil, James G Rickards says:

But beyond chaos lies complexity that truly is unpredictable and cannot be modeled with even the most powerful computers. Capital markets are an example of such complex dynamic systems.[1] *A Mountain, Overlooked: How Risk Models Failed Wall St. and Washington*

A more technical explanation of the same phenomenon, by Nassim

Taleb appears [2]here. Confronted with such systems, how should we make policy? I suggest: target outcomes rather than the supposed means of reaching them. Our failure to do so assumes that government knows or can always identify cause and effect - a feat whose impossibility when applied to social and environmental systems is obscured by the ever-increasing quantities of data and information about them.

The Social Policy Bond approach contracts out the responsibility for achieving targeted outcomes to the private sector. It gives investors in the bonds incentives to adopt diverse, adaptive projects and to terminate the ones that fail. It recognises our epistemological limitations by substituting

adaptability and evolution for central planning and over- our under- regulation.

### 5.10.2 What is government for? (2008-10-03 21:20)

The current turmoil in the financial markets and the reaction of our ruling politicians to it reveal something about the way we make policy. Simply: it's haphazard. There's little sense of where we should be going. The United States Government didn't set out to bail out reckless lenders, but that is what it is going to do. Its rescue package is another, and probably the most disastrous, in the long line of perverse subsidies that have done so much to waste scarce resources, divert taxpayer and consumer funds from the poor to the rich, and devastate

the social and physical environment. From agriculture to fisheries, road transport to energy, these perverse subsidies invariably favour the large and global at the expense of the small and local; and corporations and abstract economic variables at the expense of ordinary people.

How does it come about that government ends up subsidising the forces that have done so much to make life miserable for the average citizen? Its interventions start out as well intended, and even apparently necessary. Take agriculture: after the Second World War, food availability was critical and governments – disastrously – identified that with local food production. So government intervened: imposing trade barriers, price controls, and giving open-ended guarantees to farmers. That logic led to structural surpluses to be dumped onto the third world, undermining developing countries' own food production. It also bid up the price of farmland at home, intensifying agriculture at great cost to the environment and animal welfare, and making it difficult for ordinary people to enter farming, unless they were lucky enough to inherit land.

Worse, the bidding up of asset values made it very difficult for government to contemplate withdrawing its support. Like a drug habit, subsidies were easy to start, difficult to end. And of course, the subsidies created a whole new set of lobbyists whose entire *raison d'être* is to oppose their withdrawal. It's a similar story with the other sectors. Government begins its intervention for well-intentioned but short-term reasons. The sector becomes dependent on government for its survival, and ends up, in effect, a nationalised industry. When the sector is small, the financial burden is perhaps bearable, though its subsidies still represent a diversion of scarce resources from things that are valuable – education, health care etc – into things that are worse than useless: massively overcapitalized farming and fishing, and grotesque overinvestment in road transport – all of which, note, entrench an absolute dependence on fossil fuels.

But the latest perverse subsidy – to the financial sector – is bigger than all of these. How it will play out is difficult to foresee. But it seems that institutions that were 'too big to fail' are to be replaced by even bigger institutions. And if the history of previous perverse subsidies is anything to go by, the US financial sector will become another ward of state for a long, long time.

The root cause of this tragic misallocation of resources is the lack of clarity at the highest levels about what government is actually for. It's not there to prop up ailing sectors. It's not there to save particular corporations. And it's not there to bolster asset values or abstract economic variables like the rate of growth or GDP per capita. Government's purpose is to supply public goods and services, and beyond that to provide a basic minimum level of health, education and welfare for all. Once it starts trying to work out how to achieve these things it goes awry. Government is a centralized, top-down decision-making body. It does not and cannot do adaptation or diversity – and it is precisely adaptation and diversity that a vibrant, prosperous market economy needs. With its massive intervention and bailout of the finance sector the US will throttle its creativity, institutionalize the corrupt incentives that led to the crisis in the first place, and deny disadvantaged Americans the help they need.

What the US Government should do is to work on the basis that:

Our financial and economic systems are means not ends.

The ends, for government, are law and order, minimal standards of good health for all, basic health and education, a decent social and physical environment, and the provision of a tightly woven safety net for everyone.

The health or otherwise of any particular sector are of interest to the government only insofar as they affect the ends.

Instead of spending taxpayer funds on avoiding a catastrophe it should have clearly and unambiguously channelled society's scarce resources into avoiding the consequences of that catastrophe on those who most need help. Government targets should be inextricably linked to the well-being of ordinary people – as distinct from government agencies, economists or corporations. Its failure to realize this wouldn't matter if government were small, and diversity and adaptation could flourish outside its restricted confines. But of course government isn't small at all.

The US Government cannot now back away from supporting the finance sector any more than western governments can suddenly withdraw support from its other wards of state. But it can put a definite time limit on such support. More generally, governments must clarify what their goals are. They have a crucial role to play in limiting the impacts of any sort of catastrophe on ordinary people – but not to foresee and try to prevent the catastrophe itself. There must be no expectation that government will bail out any sector for any reason. Our governments should do something they should have done a long time ago: realign their policy to serve ordinary citizens. All their policies and interventions should be subordinated to the provision of public goods and services, the maintenance of a decent social and physical environment, and help to those who most need it. Sadly, the bailout of the finance sector, like the persisting perverse subsidies in other policy areas, looks like taking our governments further away from those guiding principles.

■ George Monbiot writes about US subsidies to big business [1]here.

### **5.10.3 The experts aren't in control (2008-10-10 08:04)**

There are worrying parallels between the world's financial situation and the global environment. Both are complex systems that are deregulated in the sense that people can do what they want to them with few real controls, and everyone has to live with the consequences because (1) there are so many of us and (2) their failure affects everyone. Traditional management systems that took centuries to evolve and were based on trust, loyalty, and morality have all gone out of the window. The current sentiment is to do what you can for yourself, try to stay within the law, and externalise the negative impacts. That mentality has always been around, but in the past the damage it could do was more limited.

#### **5.10.4 Locking us into monoculture; as in agriculture so in banking (2008-10-12 12:13)**

As in agriculture, so in banking. Government wades in to rescue something abstract: a sector, a system. In doing so it amplifies the trend towards aggregation and monoculture. More, it locks us into that oligopolistic monoculture, and makes us still more vulnerable to the highly improbable - the 'black swans' of [1] Nassim

Taleb . In time, government finds it almost impossible to withdraw from the sector, which now has its highly paid teams of lobbyists whose sole function is to keep the subsidies or subsidy equivalents going.

If government had a clearer idea about what should be its proper focus, this disastrous sequence of events would never get started. Government is not an investment company or a racing syndicate, whose goal is to pick winners, or maximise returns on taxpayer funds. Its role is not to target on abstract economic variables, financial indicators nor to rescue corporations nor even entire sectors. Government should instead be looking after the basic interests of ordinary people and all its activities should be subordinate to that over-arching goal. Or at least, that should be the starting point. Transferring billions of dollars from the poor to the rich is not only socially inequitable; it's bad for all of us, from the risk management point of view. We'll end up in banking, as in agriculture, with a highly specialised, highly concentrated finance industry, overly dependent on government favours, and we'll find it very difficult to get back to a sector whose size, structure and outputs are decided by the undistorted market, which is to say: ordinary people.

#### **5.10.5 Incentives to avoid catastrophe (2008-10-14 09:23)**

In an earlier [1]post and in my recent [2]book, I talk about using Social Policy Bonds as a means of insuring against the possibility of catastrophe. As George Monbiot [3]points out, we are no more capable of avoiding an environmental calamity than we were the financial calamity that we seem now to have narrowly avoided, or perhaps merely postponed. There have been dire warnings about both sorts of disaster, but all our incentives encourage us to ignore them, or hope that any serious problems can be kicked forward to be faced by future generations. It's in our nature to react rationally to incentives, and rather than bemoan our short- termism and our unwillingness to anticipate worst-case scenarios, we could rejig the incentives we face so as to encourage maintenance of the positive features of the status quo .

Under a Social Policy Bond regime, these need not be specified precisely - which would be a difficult task. We need only target the broad stability of the major determinants of our wellbeing . This is one huge advantage of targeting outcomes, rather than the alleged means

of achieving them. It is their impacts on natural persons (and the animal and plant world) that we target rather than each of their myriad causes. So, for instance, rather than try to cut back on greenhouse gas emissions, with all the bureaucratic nonsense that that entails, we target [4]climate stability. Rather than specify how a banking system should operate, we target the physical and financial health of ordinary people.

Current policymaking is obsessively short term. But a Social Policy Bond regime would reward people for making progress toward long-term goals, in a way that the current system does not. And broad, long-term goals, such as stability of climate or our financial system, don't vary very much, and enjoy a wider consensus than the day-to-day management type objectives that define our current politics and obscure the longer-term trends and threats. Of course there are people who care about our long-term prospects, but the incentive systems in place ensure that their voices are rarely heard, and still less commonly heeded.

If Social Policy Bonds are issued with long-term stability as a goal, investors in the bonds benefit by ensuring that no disaster occurs during the time they hold the bonds. That need not be very long - the value of the bonds would probably rise as investors did what they could to avoid disaster. They could then sell their bonds, benefiting from the rise in their market value. It sounds quite mercenary; and it probably is. But then, society at large seems to be engaged in a form of mass suicide because of the systemic incentives that encourage, for instance, the destruction of environment. Countervailing incentives are desperately needed.

### **5.10.6 Food policy is not health policy (2008-10-16 11:32)**

Michael Pollan writes:

Four of the top 10 killers in America today are chronic diseases linked to diet: heart disease, stroke, Type 2 diabetes and cancer. It is no coincidence that in the years national spending on health care went from 5 percent to 16 percent of national income, spending on food has fallen by a comparable amount — from 18 percent of household income to less than 10 percent. While the surfeit of cheap calories that the U.S. food system has produced since the late 1970s may have taken food prices off the political agenda, this has come at a steep cost to public health. ... Cheap energy, however, enabled the creation of

monocultures, and monocultures in turn vastly increased the productivity both of the American land and the American farmer; today the typical corn-belt farmer is single-handedly feeding 140 people. [1] *Farmer in Chief*

Much like a see-saw, when government successfully achieves a narrow social or environmental goal, another problem asserts itself. Sadly, our level of aggregation is now so high and our interconnectedness so pervasive that we cannot target social and environmental problems in the usual way, which involves trying to tackle the supposed causes. Society is just too complicated; the relationships between cause and effect are too obscure, the time lags too long, and the number and impact of unanticipated factors so huge that only the broadest social and environmental goals should be explicitly targeted.

And the most meaningful. Raising food production is not a meaningful objective, nor is reducing the price of food. These are bureaucratic or corporate goals, unrelated to the wellbeing of ordinary people. What *would* make a meaningful is the physical wellbeing of people: more difficult to quantify, granted, but not impossible. It is that goal that an enlightened government-backed Social Policy Bond regime would target, inter alia, law and order, the eradication of poverty, and basic levels of education and housing for all. Governments issuing Social Policy Bonds would focus on ends, rather than means, so that the tragic outcomes of government intervention in agriculture (for example) could be avoided and instead rewards would flow inevitably to those who help achieve social outcomes rather than, as at present, those who can best game the system.

### 5.10.7 Climate change and long-term planning (2008-10-19 12:51)

.... Franco Frattini, the Italian foreign minister and former European commissioner, called for "flexibility" over the EU's ambitious plans to reduce planet-warming emissions by 20 percent by 2020, pointing out that such measures would cost 1.14 percent of his country's gross national product. Speaking in Rome, Frattini called for the proposals to be accompanied by an "impact study on the real economy," .... Germany is arguing for protection against foreign competition for sectors like steel, cement and aluminum, and Poland says it should have to shoulder less of the burden of combating global warming. [1] *Huge fight looms in EU over climate change*

'International Herald Tribune', 14 October

One of the advantages of targeting outcomes, rather than the supposed means of achieving them, is that outcomes are more stable over time. So long-term objectives, like climate stability, can be targeted. Consider the likely reaction of investors to the debate reported on above. Added to all the daunting scientific uncertainties about solutions to climate change now comes a policy uncertainty: will governments continue to give climate change the priority they gave it when the economy was in a better state? Any long-term planning becomes

fraught with difficulties in such a policy environment. But long-term investment is exactly what is needed if climate change is indeed occurring.

A Social Policy Bond regime would have many advantages over the current policymaking framework; efficiency, transparency and greater buy-in, to name some of the most important. But, from the standpoint of potential investors in bonds targeting remote objectives, another huge advantage is stability. A global consortium issuing [2]Climate Stability Bonds would be declaring its intention to reward the achievement of climate stability *regardless of what happens in other policy areas*. Events, such as a banking crisis, could assume a higher priority for policymakers, but as far as would-be investors in the bonds were concerned, that would not affect their investment decisions. Policy goals are much more stable over time than the supposed or best means of achieving them and much more stable than the views or indeed the composition of governments.

The Social Policy Bond principle enlarges the scope of policy goals that we can effectively target to embrace a range of very long-term objectives, including not only climate stability, but the eradication of world poverty and the ending of violent political conflict. Even if they take decades to achieve, bondholders would not be deterred from doing their best to help bring them about by the sort of uncertainty about policy that plagues today's decision-making environment.

### 5.10.8 Who cares about the space race? (2008-10-22 08:15)

What [President Eisenhower] hadn't seen was the way his enemies and vested interests within the aerospace industry and military would be able to use Sputnik as a stick to beat him with. Throughout the Cold War, fear of communism had been exploited less by governments than by self-serving minor politicians and bureaucrats like Senator Joseph McCarthy and the Machiavellian FBI director J. Edgar Hoover....  
[1]*Moon Dust* , Andrew Smith (page 130)

It's all too easy for events to be used and abused to derail governments - under the current system. Whether the fear of the USSR or communism was genuine or not, it provided a pretext for the diversion of prodigious quantities of US government funding into its space programme. And whatever one thinks of the value of that programme, there's little doubt that the US people were not consulted about the reallocation of scarce resources:

It is sometimes argued that concealing the development of high tech industry under the cover of "defense" has been a valuable contribution to society. Those who

do not share that contempt for democracy might ask what decisions the population would have made if they had been informed of the real options and allowed to choose among them. Perhaps they might have preferred more social spending for health, education, decent housing, a sustainable environment for future generations...as polls regularly show. [2]*Failed States: The Abuse of Power and the Assault on Democracy*, Noam Chomsky

Space exploration became an end in itself - for the US Government. One huge advantage of Social Policy Bonds over the current system is the clarity it demands about ends and means. Another is the stability of those ends over long periods of time. Under a bond regime, if there were consensus that, say, the eradication of poverty had a higher priority than moonshots, then fears of losing the 'space race' would miss out, at least when it came to public sector funding. The continual chopping and changing of government means and ends, with their different and ever-changing priorities, is one reason why, in the richest societies that have ever existed, poverty, illiteracy, crime and homeless remain.

### 5.10.9 Personal grooming costs versus outcomes (2008-10-27 06:22)

It's not surprising that the US election debates and commentary centre on questions of character, judgement, image and spin. The correlation between what candidates say and what they do is almost nil. Does anybody now remember the current President's talk of 'compassionate conservatism'? So people decide for whom to vote on the basis of factors that should be extraneous: past associations, church membership, personal grooming expenses, and the rest. Politics itself has diverged: on the one hand the rhetoric is simple-minded, bite-sized and calculated in every respect. On the other, actual policymaking is arcane, obscure and incomprehensible to outsiders.

In the middle of all this are ordinary people, voters, our children, the environment, and other aspects of the commons. Our politics doesn't address really speak to such interests, and it's becoming systemically less capable of doing so.

One solution, and the one I advocate, is to express policy goals in terms of outcomes that are meaningful to ordinary people. Not simply the sound-bites intended for public consumption, as under the current system; but policies themselves. Rather than, for instance, allow our leaders to invade countries on grounds that turn out to be spurious, we should target such goals as absence of use of weapons of mass destruction, or the elimination of terrorism *directly*. Under a Social Policy Bond regime, these goals could then be contracted out to the market, which would have incentives to achieve and sustain them *at minimum cost*. Similarly, we should see assistance to particular sectors, whether they be agriculture or banking as what they are - subsidies to rich corporations. Under a bond regime, it would still be possible to divert scarce resources from the poor to the rich, but we'd do it with our

eyes open. Expressing policy in terms of goals means that we should have explicitly to vote for such policies before they can be implemented.

- Sales of my book have been minimal. If you have any suggestions as to how the Social Policy Bond idea, or the broader *Policy as if Outcomes Mattered* concept can be promulgated I'd be grateful to have them.

## **5.11 November**

### **5.11.1 Make campaigning meaningful: focus on outcomes (2008-11-04 13:12)**

[T]he opposite of competition is not solidarity, but monopolies and the maintenance of privilege. ...too much state spending involves taking money from the many, who pay taxes and consume goods, and handing it to the few: ex-state monopolies, special interests, regional favourites or incumbents. As a rule of thumb...politicians will rarely challenge interests that feature in children's books : such as farmers, fishermen, firemen and those who build exciting things. *E urope's baleful bail-outs* , 'The Economist' , 1 November

It is not the size of these subsidies or their wastefulness or their contribution to environmental collapse and social injustice, but their persistence in the face of the overwhelming evidence of their perversity that makes one despair about the political system that cannot eliminate them. Consider some of the issues that *did* get the attention of the media in the US election campaign: the offhand comments of close relatives and pastors of the candidates; similarly casual comments about 'spreading the wealth'; costs of the candidates' clothes.... There's nothing necessarily wrong with raising these issues. It is just a pity that in the absence of any debate about substance we try to infer what the candidates' real intentions or character

are from their behaviour. One of the benefits of a Social Policy Bond approach is that political debate would we could avoid this nonsense and focus directly on the outcomes that candidates say the want to achieve.

### 5.11.2 Big government is monoculture (2008-11-08 06:09)

While one might quibble with the technicalities and the source, the Heritage Foundation's Index of Government Dependency does tell a convincing story: in the United States, as William Beach [1]puts it "dependency on government has grown steadily and at an alarming rate in recent decades." Mark Steyn [2]writes: "While few electorates consciously choose to leap left, a couple more steps every election, and eventually societies reach a tipping point." This appears to happen regardless of whether ruling parties are supposedly from the left or right, and regardless of the rhetoric about tax cuts, freedom, or rolling back the frontiers of state.

Does it matter? I think it does; partly because big government is generally remote government, and that is a loss in itself. But remote government is also cumbersome and inefficient. It's unresponsive to events. It can crowd out more efficient, more local ways of doing things. Being big, cumbersome and fond of one-size-fits-all policies, it generates the vulnerabilities of any monoculture. It is extremely exposed to disruptive, unanticipated events, and because of its size, the impact of its failure can be devastating. The current financial crisis is one symptom of this. Another is climate change, which in large part is a product of governments' favouring an infrastructure - and agriculture - that is entirely dependent on fossil fuels; often by subsidy, and almost universally by socialising the costs of fossil fuel use.

One answer could be Social Policy Bonds. Government would still take on the responsibility for raising revenue and targeting such desirable goals as the eradication of poverty or the end of violent political conflict. It would raise revenue to achieve such goals - something it can do very effectively. But by issuing Social Policy Bonds, it would contract out the actual achievement to the market. Organizations would be set up whose structure and activities were entirely subordinated to the targeted goals. Diverse, adaptive solutions would arise the product of our limitless ingenuity and the incentives that would be on offer. In short, by issuing Social Policy Bonds we could achieve important, broad social goals without the huge, coercive and monolithic government that we currently think is necessary.

### **5.11.3 Avoiding disaster, nuclear or otherwise (2008-11-10 07:38)**

Reviewing *The Culture of War* by Martin van Creveld , Barry Gewen [1]writes:

The world came perilously close to nuclear war during the Cuban missile crisis, and as more and more countries acquire nuclear weapons, it requires a real leap of faith to believe that deterrence will continue to work at all times in all places. And that's not to mention nuclear terrorism.

I share Mr Gewen's pessimism. Many believe that there's something intrinsic in our nature that means our species will persist. With some this is a religious belief, with others it's an expression of faith in our rationality or self-interest. For myself, and as with other existential challenges, I don't think we should rely on such feelings. I think we could do more, and that we should be concerned not so much about the survival of the human race, but about the potential loss of millions of lives.

One way of addressing the challenge would be to issue [2]Disaster Prevention Bonds, which could act so as to moderate or countervail the incentives currently on offer to the people and corporations who are quite happy to militarize our planet. These bonds could function as an insurance policy, rewarding people who work to avoid human catastrophes of any sort, specified or not. Disaster Prevention Bonds would not prejudge how human calamities shall be avoided, but would simply reward the sustained non-occurrence of such

calamities . Under a bond regime, diverse, adaptive approaches that are efficient would be rewarded. Failing policies would be swiftly terminated.

Nuclear proliferation and environmental disaster are only two of the existential challenges we face. Others are looming and we cannot anticipate all of them. Under a Disaster Prevention Bond regime there would be no need to. The outcome - the avoidance of millions of avoidable deaths - would be specified, but not the means of achieving it. They would seem to me to be more reliable than crossing our fingers and hoping for the best.

#### 5.11.4 Car madness (2008-11-11 14:14)

Once again, it's time to ask: what is government for?

From '[1]the Australian', 11 November:

Car industry praises \$6.2bn assistance package

Car companies and component makers believe the Rudd Government's [Australian] \$6.2billion assistance package will help safeguard the future of the automotive industry in Australia.

Meanwhile [2]Associated Press is reporting that

President-elect Obama suggested to President Bush that the administration immediately help struggling U.S. automakers, aides to the Democrat say, in the first face-to-face meeting the pair had since Obama's election victory.

And the BBC's [3]Robert Peston reports on another possibility:

For me, the most interesting story of the past 24 hours is that VW, the stressed German carmaker, is trying to raise €2.8bn (£2.2bn) from the European Central Bank. It plans to raise cash from the ECB in exchange for €2.8bn of securities backed by car loans. In effect, *the ECB - and ultimately taxpayers in the eurozone - would be financing purchases of automobiles*. Crikey, is all that comes to mind. What next? [My italics]

Indeed. As I have said many times, it's the persistence of this sort of mad subsidy that defies explanation. We know they redistribute our scarce resources to large corporates at the expense of ordinary people and the environment. We've known this for decades, but at a time of crisis, we cannot stop ourselves throwing more money in the direction of what are some of the least socially and environmentally sensitive corporations on the planet. This is, it seems to me, a failure of our entire system of government.

#### 5.11.5 "How could these companies be so bad for so long?" (2008-11-13 13:33)

Thomas L Friedman asks the question:

Last September ... the chief executive of Chrysler [was] explaining why the auto industry, at that time, needed \$25 billion in loan guarantees. It wasn't a bailout, he said. It was a way to enable the car companies to retool for innovation. I could not help but shout back at the TV screen: "We have to subsidize Detroit so that it will innovate? What business were you people in other than innovation?"

How could these companies be so bad for so long? Clearly the combination of a very un-innovative business culture, visionless management and overly generous labor contracts explains a lot of it. It led to a situation whereby General Motors could make money only by selling big, gas-guzzling SUVs and trucks. Therefore, instead of focusing on making money by innovating around fuel efficiency, productivity and design, GM threw way too much energy into lobbying and maneuvering to protect its gas guzzlers. This included striking special deals with Congress that allowed the Detroit automakers to count the mileage of gas guzzlers as being less than they really were - provided they made some cars flex-fuel capable for ethanol. It included special offers of \$1.99-a-gallon gasoline for a year to any customer who purchased a gas guzzler. And it included endless lobbying to block Congress from raising the miles-per-gallon requirements. The result was an industry that became brain-dead.  
[1]How to fix a flat, 'International Herald Tribune', 13 November

I'm getting a bit fed up of lobbyists telling us that the health of the economy depends on the health of the finance sector, the housing sector or the car industry. If it does, then 'the economy' is, to put it bluntly, not worth defending. What government should be about is looking after the wellbeing of actual people, not particular industries, failing corporations or abstract economic variables. If social and environmental wellbeing require a smaller or more responsive finance sector or car industry, and if that means some adjustment costs for these industries then so be it.

I'll go out on a limb here and say that taking taxpayers' money on such a scale and giving it so transparently to inefficient corporations is politically unsustainable. True, governments in the west have done this with agriculture for a long time now, but the disastrous effects of such transfers - on consumers, taxpayers, animal welfare and the environment - have been too slow-moving to arouse public anger. Bailing out the car industry and the bankers though, I think, is different.

What the French Revolution, writes [2]William Doyle

most certainly was not, was a single event. It was a series of developments, bewildering to most contemporaries which stretched over a number of years. It was a sustained period of uncertainty , disorder , and conflict....

If our governments can't come up with any better solutions to the current financial crisis than by bailing out on a massive scale the deadbeats in industry and finance then I fear for the future.

### **5.11.8 Incentives to preserve the commons (2008-11-22 13:51)**

Lewis Lapham wrote:

The United States has been ridding itself of its First World status for as long as it has been privatizing its critical infrastructure (a.k.a. the common good), at the same time despoiling the natural resource embodied in the health, welfare, courage, and intelligence of its citizenry. Over the past eight years, under the absentee landlord economic policies of the Bush Administration, the stepped-up rate of disinvestment has resulted in ...Third World confusion and management.... [1]*Estate Sale*, 'Harper's Magazine', May 2008 (subscription)

The people who devised American democracy probably never envisaged such irresponsibility from those entrusted with power. The constitutional checks and balances are mainly about process, not outcomes. In a large society, erosion of the commons is permitted, encouraged, or even necessary, when we vote for individuals, ideologies, image or economic abstractions. Highly aggregated, highly mobile societies, whose composition is constantly changing,

cannot evolve the ways in which traditional commons used to be safeguarded. If we want to keep the benefits of living in such societies, where appeals to do the right thing are likely to be ignored until it's too late, we shall have to constrain our behaviour more directly than through legislation. All the incentives are to externalise social and environmental costs, and corporations and their mates in government are adept at finding effective ways of doing so.

One answer may be to redress the balance: issue Social Policy Bonds that have as their explicit goal the preservation of the commons. Devise ways of measuring environmental health (not too difficult) and social cohesion (more difficult, but not impossible) that can be targeted. Monetary incentives for the preservation of the commons need not compromise principles of trust, character and stewardship. Social Policy Bonds that rewarded the maintenance of the common good would simply mean that people who want to benefit the commons have more res

ources with which to do so .

### **5.11.9 Smoke and mirrors: the limitations (2008-11-24 05:41)**

If the current inflation rate is really 6-9 percent instead of the 2-3 percent claimed by government and most U.S. money managers, then Washington's official estimates that the economy still grew at a rate of some 0.6 percent in the first quarter of 2008 become nonsense. Subtracting a 6-9 percent inflation rate from nominal GDP growth would identify an economy that was deteriorating and shrinking, not growing. Concerned foreign dollar-holders would become even more concerned. Kevin Phillips, [1]*Washington's Great 'No Inflation' Hoax*

Marvellous. Even the numbers that policymakers target are a part of the commons that they have degraded. We are a long way now from government by the people for the people. Mr Phillips makes it clear that the erosion of accuracy in US growth, inflation and unemployment statistics has been mainly an opportunistic process, begun in the 1960s. Perhaps it was inevitable that large corporations and very wealthy individuals would use every available means to pervert the policymaking process. When the result is a serious possibility that taxpayers will now subsidise failing car manufacturers there is clearly something very wrong with the current ways in which we formulate policy.

Put simply, I think it's that ordinary people think it's all too complicated. Whether it's by expressing policy in terms of arcane legalisms, institutional structures, tedious processes or, as we now see, misleading numerical indicators, our disengagement from the world of policy is almost complete - to the great satisfaction of those who share the spoils. That is, the very rich, the larger corporations, and government agencies themselves.

Perhaps this is the time then to reorientate policy along Social Policy Bond lines: express policy goals in terms of outcomes that are comprehensible and meaningful to ordinary people. Economic growth, even when measured accurately, is not an end in itself. It is a means

to various ends, including the eradication of poverty and the provision of public goods and services. Government would do better to target these goals directly than to try to fool us all with their smoke and mirror arrangements, whose credibility is fast disappearing.

---

### **5.11.10 Empowerment (2008-11-30 04:28)**

Social Policy Bonds have many advantages over the current system of policymaking . Most important is their efficiency. As well, they would have stable objectives over time - which means that very long-term goals can be targeted. Another advantage is that they are explicit and transparent in what they are targeting. This is both an end in itself, and means of achieving buy -in on the part of the public, who would be far more likely to participate in the policymaking process when outcomes are being discussed, rather than the current opaque mix of funding arrangements, legalisms, or tinkering with institutional structures.

But another advantage, and one that I have not stressed before, is empowerment. Under the current system, those charged with achieving social and environmental goals are mostly employed either by government or by non-governmental organizations. The contrast between the performance of the two groups is compelling.

"Ask yourself," wrote John Fund of the *Wall Street Journal* more t han a decade ago, "If you had a financial windfall and wanted to help the poor, would you even think about giving time or a check to the government?" I think we'd all answer with a resounding "no". We'd much rather give to charity or a non-governmental organization. We know they will be more motivated and make better use of their limited funds. Part of the explanation, I believe, is that they are empowered to make important decisions, in ways that government employees increasingly are not. Consider the proliferation of narrow targets with which UK Government attempts to shape its National Health Service. A recent one is the stipulation that doctors must give after-hours care in the form of appointments that last ten minutes, and only ten minutes:

[UK Prime Minister] Gordon Brown believes in pre -booked, ten-minute appointments and will not pay us the extended hours money if we do seven and a half minute

appointments. I'm not prepared to fudge, or lie (some practices are, he said sanctoriously) so my late evening surgery is now booked at ten-minute intervals. I will see twelve patients rather than the usual sixteen. I will enjoy having that little extra leeway. I may even be able to use some of the time to catch up on paperwork. [1]

*NHS Blog Doctor*

It's not just the inefficiency that this sort of directive generates, or the gaming of the system that will occur. It's also the resentment that such micro-management will inevitably breed. Applied with ever more abandon, such micro-goals take away the intelligence from any form of decision-making. They imply and generate a low level of trust, and reinforce a command-and-control hierarchy.

The contrast with a Social Policy Bond regime targeting broad social and environmental goals is stark. In the health sector we need only agree on and target broad indicators encompassing length and quality of life - not a simple matter, but one that would clarify exactly what government's role should be and one, moreover, that would empower and motivate health experts to go about achieving them in the most efficient ways they can. The obvious disenchantment that NHS Blog Doctor feels along with others whose autonomy is eroded by misguided application of narrow targets would be a thing of the past.

Dental Moreno Valley (2009-07-21 07:09:18)

This is a very interesting post. NGO's are with small budget, but they are service oriented, in the sense that they will help as far as they can.

## **5.12 December**

### **5.12.1 Seeing the forest (2008-12-03 11:52)**

Sometimes I think we cannot see the wood for the trees: [1]Grist quotes Rajendra Pachauri, chairman of the Nobel-winning Intergovernmental Panel on Climate Change (IPCC) as saying:

"It defies any kind of logic, if you look at the type of money that the world has spent on these [banking] bailouts, 2.7 trillion dollars (2.13 trillion euros) is the estimate, and it's been done so quickly and without questioning." Pachauri recalled that when the Millennium Development Goals for attacking poverty and sickness were being drawn up, a panel chaired by Ernesto Zedillo, the former president of Mexico, suggested "a fairly modest estimate" of 50 billion dollars a year in help for poor countries. "But

everyone scoffed at it. Nobody did a damn thing," Pachauri said in the interview on Monday [1 December].

Perhaps cynicism is built into our system of resource allocation, or perhaps a banking crisis, being much more dramatic and televisual, outweighs in the public mind the misery of poverty and sickness, or the threat of catastrophic climate change.

We need, I think, to assess policy priorities coolly and rationally. One of doing so would be to express policy goals in terms of outcomes. Instead of reflexively allocating taxpayer funds to sectors or corporations in crisis, we should take the time to discuss and agree on what exactly is the purpose of government. Is the purpose of the current bailouts to support corporations, to reduce unemployment, or to alleviate poverty?

A Social Policy Bond regime targeting poverty, for instance, would not assume that existing industries or institutional structures are to be taken as given. There might be far more effective ways of eliminating poverty than, for instance, bailing out inefficient car manufacturers. Let the market, with all its ingenuity and its under-rated but essential willingness to terminate failed experiments, answer the question of how most efficiently to eliminate poverty. Providing, of course, we want government to serve people, rather than corporations or abstract economic variables.

### 5.12.2 Incentives for researchers (2008-12-05 13:18)

*The Economist* recently reported on research into the 'broken windows' theory of crime: that where the windows are broken, or similar conditions of 'disorder' prevail, crime rates go up:

The most dramatic result, though, was the one that showed a doubling in the number of people who were prepared to steal in a condition of disorder. In this case an envelope with a €5 ( \$6) note inside (and the note clearly visible through the address window) was left sticking out of a post box. In a condition of order, 13 % of those passing took the envelope (instead of leaving it or pushing it into the box). But if the post box was covered in graffiti, 27 % did. [1] *Can the can*

, 'The Economist', 20 November

It's good that this sort of research is conducted, and even better when it can be applied to solve social problems. In my view, though, there are too few incentives to explore this sort of relationship; the sort, that is, which is not at all obvious or intuitive. Most social and environmental problems are bedevilled by similar complexity, with the relationships between cause and effect obscured by huge numbers of variables, time lags, severe data limitations and the difficulty and expense of conducting trials. That said, a large proportion of the resources allocated to research programmes comes directly or indirectly from government, with all the usual deficiencies that that implies. One important such deficiency, in my view, is

that there will typically be no link between successful research and the financial rewards paid to the researchers. The result is predictable: too much academic research - in any academic field - has drifted away from the concerns of ordinary people. A glance at any economics (for instance) journal will convince most of that.

By subordinating policy to society's wishes, expressed in terms of clear, verifiable outcomes, a Social Policy Bond regime would automatically re-orientate the system of allocating research funding in ways that improve those outcomes. There will always be obscurities in research in the social sciences, but Social Policy Bonds would transfer the cost of conducting inappropriate or useless research to the researchers themselves, rather than, as is usual nowadays, the taxpayer.

### 5.12.3 Why Kyoto will fail (2008-12-07 03:54)

From *New Scientist*:

Our new-found love for flat-screen TVs could come back to haunt us. Earlier this year, researchers warned that the growing popularity of this technology was releasing increasing amounts of a powerful greenhouse gas into the atmosphere. Now, researchers say levels of the gas are four times as high as previously estimated, and warn they are rising "quasi-exponentially". Nitrogen trifluoride (NF<sub>3</sub>) is 17,000 times more effective at warming the atmosphere than an equal mass of carbon dioxide. Yet the Kyoto protocol does not set limits on NF<sub>3</sub> emissions because it was made in tiny amounts when the protocol was agreed in 1997. [1] *Warm glow of TV*, 'New Scientist', 1 November

There we have it. Kyoto does not aim to reduce the rate of climate change. It does not even aim to reduce anthropogenic greenhouse gas emissions. It is concerned solely with reducing those gases that were thought to be greenhouse gases at the time it was devised. A [2]Climate Stability Bond regime would be a big improvement. If we want a more stable climate, then we should reward people who help us achieve one *however they do so*. Our scientific knowledge is rapidly expanding. We cannot rely even on today's science to tell us what will be the best ways of stabilising the climate throughout the necessarily long time it will take us to do so. Relying on 1990s science, as Kyoto does, is even worse.

#### **5.12.4 Riots in Greece (2008-12-12 10:33)**

The riots in Greece are, I fear, a dismal portent of what is to come. Governments have consistently drifted away from what should be their real responsibility: to look after the interests of ordinary people. The logic of incremental adaptation has seen them make policy on behalf of big corporations, their own agencies, or abstract (and manipulated) economic indicators like Gross Domestic Product. Aware at some level of consciousness of their policy failings, they have responded with a blizzard of meaningless micro-targets. But they have lost sight of the big picture. And that is looking more alarming by the day.

By making self-perpetuation their over-arching goal, governments have, I believe, helped bring about the current crisis. They have sacrificed social cohesion and the environment on the altar of economic growth. Now that growth looks unlikely to happen, and the glue that holds our societies together - the expectation of an improving quality of life for ourselves or our children - is vanishing. Perhaps it was an illusion anyway.

My suggestion, and I have been making it for years, is that governments realign their policies in favour of outcomes that are meaningful to ordinary people. This does not mean bailing out the auto or finance sectors, or indeed maintaining any other of their corrupt, insane, perverse subsidy programmes (to agriculture, for instance, or the fossil fuel industry). Government has a legitimate role in shielding people from the *consequences* of disaster. Bailing out its chums in the large corporations has nothing to do with that. Instead government should target goals like the eradication of poverty, the maintenance of peace, law and order, and a decent physical environment. What else is government for?

-

Policy as if outcomes mattered  
SocialGoals.com

---

#### **5.12.5 What is government for? (2008-12-16 04:30)**

*With unemployment in the west soaring and millions of people likely to lose their savings and even their homes, it's time to ask a very basic question: what is government for?*

Governments have reacted in their instinctive way to the current financial crisis: they are either printing more money, or they are borrowing money to prop up the wobbly structures and sectors whose tactics created the crisis in the first place. In essence, they will rip off the older generation - those with savings - by inflating. And they will rip off the next generation, by borrowing.

This is smoke and mirrors - and cardboard and sellotape. It might or might not suffice to stave off an immediate and precipitous collapse, but either way the western financial and economic system is looking very precarious. That system depends on confidence and trust,

and people believing that their lives or their children's have a good chance of getting better. That faith is evaporating. There is now a real danger of social collapse and blood in the streets. History tells us that bloody revolutions are not single events, but processes that can mean years of instability at best, and terror at worst. The riots we are seeing in Greece right now could portend the beginning of the end of democratic liberalism

The danger is that western governments' bailout commitments to financial and corporates will turn out to be something like their farm support policies. These programmes have functioned as a tax on food bought by consumers in the rich countries. But the bigger victims are the landscape and wildlife in those countries, which suffer grievously from intensive farming; and farmers in the food-rich developing countries who depend on exports for a decent standard of living. The waste, inequity and environmental depredations of the rich countries' corrupt and irrational agricultural policies have been known about for decades, but their governments have found it very difficult to stop them. They have created a sector entirely dependent on government; one that, thanks to government largesse, can spend significant sums on lobbying against the withdrawal of that largesse and a return to rationality.

But the latest subsidies - to the financial and automobile sectors - are bigger still. If the history of previous perverse subsidies is anything to go by, the US financial sector and its auto industry will become another ward of state for a long, long time. And where do ordinary members of the public feature in all this? In a crisis of this dimension, appearance is reality. And it looks very much as though millions of people are losing their jobs, homes and savings, while their government is bailing out the fat cats.

### **What is government for?**

The western governments' Pavlovian response to the financial crisis is probably all we could expect in the short run. But in the longer term we need a totally new basis on which to formulate government policy. We need to ask, and keep asking, the question 'What is government for?' Western governments, let's not forget, spend about a third of national income, create statutes and regulations, and have a monopoly on legitimate violence. They have the potential to do a lot better than subsidise inefficient, parasitic or downright destructive, sector groups. And they have the potential, if they act quickly and wisely, to restore our faith in democratic liberalism.

Let's be blunt: the purpose of government is not to prop up ailing industries. It's not to save particular corporations. And it's not to bolster asset values or abstract economic variables like the rate of growth or Gross Domestic Product per capita. Government's purpose is to supply public goods and services, and beyond that to provide a basic minimum level of health, education and welfare for all. In short, government should be looking after ordinary people.

Without this clear sense of purpose, it goes awry. Instead of helping people, it gets seduced by the ever more turgid lobbying industry, who are experts at convincing government that the best use of its powers and tax revenues is to support - surprise, surprise - the groups they are paid to represent.

Government is a centralized, top-down decision-making body. It does not and cannot do adaptation or diversity - and it is precisely adaptation and diversity that a vibrant, prosper-

ous liberal market economy needs. With its massive intervention and bailout of the US finance sector and the dinosaurs of Detroit the American Government is institutionalizing the corrupt incentives that led to the crisis in the first place while denying disadvantaged Americans the help they need. The US bureaucracy is like a supertanker: it's going to take years to change this mentality.

### **Policy as if outcomes mattered**

We need to realign government on the basis that our financial and economic systems are not ends in themselves, but means to ends, and those ends, first and foremost are about looking after ordinary people. The outcomes government needs to ensure are law and order, minimal standards of good healthcare for all, basic education and housing, a decent social and physical environment, and the provision of a tightly woven safety net for everyone.

Instead of spending taxpayer funds on bailouts government should clearly and unambiguously channel society's scarce resources into avoiding the consequences of financial and economic crises for those who most need help. Government targets need to be inextricably linked to the well-being of ordinary people – as distinct from those of economists, bureaucrats or corporations.

But with a bit of imagination, this crisis of casino capitalism could mark the starting point for an improved policymaking process. One in which:

- Government targets outcomes that are meaningful to ordinary people,
- Government rewards people who achieve these outcomes, however they do so.

Government is good at articulating society's concerns and raising revenue for their achievement. It is not so good at keeping to its core remit. As a big organisation itself, it spends far too time and treasure on its chums in big business at the expense of small enterprises, ordinary people and the environment. What is needed is a government that focuses on rewarding outcomes that are meaningful to ordinary people – rather than activities, institutions or large corporations.

### **5.12.6 Nothing changes (2008-12-18 11:55)**

Ross Clark has been...

...trying to square the [British] Government's tough new proposals on welfare reform, which will involve slashing housing benefit and forcing single mothers of one- year-old children out to work, with its announcement last week of a mortgage rescue plan to allow homebuyers to take a two-year holiday on their mortgage repayments if they suffer a loss of income. But I am afraid I am not doing very well. [1]*The peculiar case of middle-class benefits* , 'The Times', 8 December

Me neither. It is the persistence of these subsidies to the wealthy and middle classes, after decades of accumulated evidence of their wastefulness, that makes one despair. Originally

well intentioned, they have largely been capitalised into asset values so that they fail even in the narrow terms of their stated original purpose. Our economies are so complex that policymakers can escape censure by stringing together high-sounding ideals ('home-ownership', 'food security', 'energy independence') with some seemingly apposite policy, which appears to bring us closer to the supposed ideal, but in reality leads off in a completely different direction: one that favours vested interests, wealthy individuals, big corporations - and economic inefficiency.

Under a Social Policy Bond regime, policies would be expressed in terms of what they actually achieve. All the activities they would then stimulate would be entirely subordinated to specified, agreed, transparent outcomes.

### **5.12.7 Not very optimistic (2008-12-21 10:19)**

Adam Shatz [1]writes:

The one demand [the protesters in Greece] shared was that the government resign. Their protests struck a chord among students in other European countries dismayed by their dim economic prospects and unresponsive leaders. 'London Review of Books', 1 January 2009

Exactly so - see my previous post.

Blogger.com tells me this is my 600 th post, and this blog has been going for four years now. So it's a good time to summarise where the Social Policy Bond idea is going. For the Social Policy Bond principle, it hasn't been a great year, to be frank. Most importantly, policy still seems to be driven by virtually anything except outcomes. I see policies that I regard as ineffectual or disastrous continuing to consume vast amounts of bureaucratic energy, political capital and other resources, without making people or the environment significantly better off. Little is being put in place to insure against nuclear proliferation, climate change or any other type of disaster - areas where, I think, the Social Policy Bond idea could score heavily over any other policy, even where such policies (like Kyoto) are at least being considered.

Intellectually, it's been more satisfying, in that I recently published my latest book on the subject. At 60000 words it's the definitive work on Social Policy Bonds, so far. But I couldn't find a publisher prepared to take it on, so I've had to publish it myself, at no cost, via Lulu enterprises. After a couple of months, sales to people other than myself (for proof-reading purposes) haven't made it into double figures.

According to my website statistics sources, this blog and the SocialGoals .com site between them are seen between about 10 or 20 times a day. But many of these visits are short; almost nobody this year has emailed me about the bonds or even left comments on this blog.

Taken together then, I'm not too optimistic and I am considering what to do with this blog and my time. Publication of my book and four years of this blog mean that a resource is available for those who are interested, and it might be better to let the idea lie until somebody is sufficiently motivated to take it further. I will have a think about that.

### **5.12.8 The party's over (2008-12-22 13:44)**

An interesting article about the failure of the economics profession to foresee, let alone forestall, the current financial crisis:

An entire field of experts dedicated to studying the behavior of markets failed to anticipate what may prove to be the biggest economic collapse of our lifetime. And, now that we're in the middle of it, many frankly admit that they're not sure how to prevent things from getting worse. [1] *Paradigm lost* , Drake Bennett, 'The Boston Globe', 21 December

There are plenty of reasons for this, some suggested by Mr Bennett. For myself, I think the goals of economists are have, like those in other professions, drifted away from their ideals; something that's inevitable when tenure, salaries and prospects depend on spurious micro-targets: number of papers published, frequency with which they are cited, and the rest. With the ever-lengthening and ever more tenuous link between the producers of economic theory & policy and the people they are supposed to be helping, the economics profession has become little different to that of politics and policymaking in general: governed by meaningless volume of output indicators, image, ideology - anything, that is, except outcomes. They have got away with it - until now. My suggestion is that they use this crisis to ask themselves the fundamental question: [2]What is government for?

### **5.12.9 Target outcomes, not economic variables (2008-12-29 05:40)**

Reading the excellent [1]*Bad Samaritans : the guilty secrets of rich nations and the threat to global prosperity*, by Ha- Joon Chang, it becomes clear that many of the assumptions underlying development theory have no basis in fact. All too often we accept, with little evidence, assertions that, for example, Foreign Direct Investment is good for a country's development prospects. But:

Not only is FDI not necessarily a stable source of foreign currency, it may have negative impacts on the foreign exchange position of the host country. FDI may bring in foreign currency, but it can also generate additional demands for it ( eg importing inputs, contracting foreign loans). Of course, it can (but may not) also generate additional foreign currency through exporting, but whether it will earn more foreign exchange than it uses is not a foregone conclusion. (Page 89)

More FDI , like a lower rate of inflation (also discussed by Chang) is not an unmitigated blessing. Like a host of other variables such as economic growth itself, explicitly or implicitly targeted by governments in the rich and poor countries, they are imperfect indicators, that may have been highly correlated to societal well-being in some countries at some points in the past, but that are not always inevitably so. In a complex and interdependent world, there are too many other variables, time lags and other confounding factors that make targeting of *anything other than outcomes* problematic - as Chang illustrates throughout his book. And that is assuming that those doing the targeting on behalf of others (in Chang's book: the World Trade Organization, the IMF and the World Bank on behalf of the developing countries), are well meaning.

Social Policy Bonds would be a radical change in that they would target and reward the achievement of social and environmental goals themselves. Much work has been done, for example, on the [2]Human Development Index, which, with a bit of tweaking could be targeted by governments in the poor and rich countries, or philanthropic groups . A modified HDI would be inextricably correlated with social well-being, and under a bond regime people could be rewarded for raising it *however they did so*. This would be a stark contrast with they sometimes cynical, often ideological and generally failed policies of Chang's Bad Samaritans.

# 2009

## 6.1 January

### 6.1.1 The unimportance of getting it right (2009-01-02 11:49)

If non-financial incentives carried much weight, then it would be helpful if they could correlate in some way with desirable social or environmental outcomes. They would then perform some tiny act of offsetting the financial incentives that are on offer to those whose activities end up degrading our wellbeing. Unfortunately though, in the UK at least, the royal honours system has largely followed the prevailing trend and been given over to celebrities, sportspeople or entertainers. Or, as this [1]letter to the *Times* (2 January), points out, to those civil servants whose approaches are tried, tested - and failed:

Sir, Courtiers in days of yore used to know that it was far better to be wrong in grand company than to be right on your own — so it is today. The Permanent Secretary to the Treasury, a Gordon Brown insider, Nick MacPherson, gets a knighthood for presiding over the management of the economy that has led to the most dangerous financial boom in living memory and which has resulted in the present bust and deep recession. By contrast, the eminent economist Roger Bootle gets nothing, despite having many times warned us that deflation was a more dangerous enemy than inflation and that Mr Brown and the Bank of England should stop worrying unnecessarily about inflation and should, instead, take steps to stem the flow of irresponsible debt, which has fuelled the unsustainable property boom.

Stephen Porter

### 6.1.2 Incentives to be responsible (2009-01-07 23:58)

In the course of a long article about Italy's woes, Alexander Stille writes:

Italy has half a million people who have been retired for more than forty years. The cost of paying for much of this was deferred, creating Italy's huge debt. It takes about 10 percent of GDP just to service it. [1]*Italy Against Itself* , 'New York Review of Books', 4 December 2008 (subscription)

Sometimes you wonder whether our complex social and economic organization is just a device for obscuring our irresponsibility . The costs of our behaviour - on future generations, past generations, our the environment - might even outweigh the benefits of specialisation. I'm not convinced, either, that the benefits to this generation are that compelling. At college we learned that alienation and interdependence were the disadvantages of specialisation; nowadays much these are supplemented by extreme uncertainty.

I think it's time to rein in the influence of so-called 'market' forces - those manipulations and distortions of real markets that work against the interests of ordinary people. A Social Policy Bond regime would be one way of inextricably linking rewards to socially desirable outcomes: something that we do not have at present when, for instance, it's claimed that 'a rising tide lifts all boats', or that wealth 'trickles down' from the super-rich to society as a whole. Social Policy Bonds targeting social and environmental outcomes couldn't be manipulated or used to obscure baser motives. They would subordinate all activities and institutional funding to the actual achievement of targeted goals. Opportunities to game the system would disappear - in stark contrast to the corrupt politics that seems to bedevil even the richer, developed countries.

### **6.1.3 Perils of incremental adaptation (2009-01-09 00:15)**

From Harper's Index:

Average percentage by which a bar-smoking ban in a US county increases the rate of drunk-driving fatalities: 13 Harper's Magazine, July 2008

The source cited is Scott Adams, University of Wisconsin-Milwaukee, and this [1]link (pdf) takes us to Adams' paper showing that the increase in road deaths arises from the extra distances that smokers travel to reach a bar where smoking is allowed. This illustrates a larger truth: that incremental evolution and adaptation along lines determined by current institutional structures often takes us away from the goals we actually want to achieve. In this instance pressure, presumably from anti-smoking lobbyists and well-meaning healthcare agencies, generates a rise in road deaths. Nobody actually has a strong incentive to look at the big picture.

A Social Policy Bond regime would be different. Broad outcomes, such as the general health of an entire population, could be targeted, giving people incentives to help improve it - rather than, as at present, to work on things (such as smoking restrictions) that sound helpful but that actually do nothing for the wellbeing of the population.

#### **6.1.4 Getting away with it (2009-01-12 09:57)**

Politicians and government bureaucrats can always escape or deflect censure for their failed policies because of the complexity of our social system. In the same way economists - public or private sector - can excuse their failure to foresee catastrophic events:

But if a doctor repeatedly deemed patients to be healthy that were soon found to have Stage Four cancer that was at least six years in the making, the doctor would be a likely candidate for a malpractice suit. Yet we have heard nary a peep about the almost willful blindness of economists to the crisis-in-its-making, with the result that their central role in policy development remains beyond question. [1] Why so little self-recrimination among economists?

To that end, all in positions of power and influence have a vested interest, no doubt manifested sub-consciously, in increasing the complexity our social organization. In that way we can be sure that their mistakes, or favouring of chosen sectors or corporations, can always be shrouded in obscurity. Economists often talk of the 'tragedy of the commons', but the tragedies occur not when ownership of a resource is undefined, but rather when it's hidden, constantly changing or otherwise too complicated to ascribe to any accountable person. If we are going to have accountability for social and environmental failure, we need to bring some clarity into the policymaking process. I think this can best be done by rewarding meaningful outcomes, perhaps by issuing Social Policy Bonds. (This is one reason, incidentally, why I dislike proportional representation, at least in the form that it takes in New Zealand: the electoral process itself is unnecessarily complicated for most ordinary people, while the horse-trading that goes on between parties after the election is also inaccessible to most. I'm open to persuasion about this, however.)

#### **6.1.5 Miswanting (2009-01-14 09:20)**

Citing work by US psychologists Daniel Gilbert and Timothy Wilson, Elizabeth Farrelly writes about 'miswanting', which is:

our tendency to want all the wrong things, things that are

wrong not just morally or environmentally but even in their capacity to deliver the satisfaction they promise. ... [M]iswanting occurs because we are hardwired to mispredict both the intensity and the duration of our emotional response to getting what we desire. [1] *Blubberland : the dangers of happiness*

We make better decisions when we are not distracted by the salience factor:

Salience is the intensity or vividness of perception that makes us much more susceptible to the immediate objects of our senses - to what we see and feel - than things we abstractly know.

The implications for the way we live are profound, not least in policymaking, which is often diverted from a rational course by the immediacy of televisual events. So our oceans are overfished, because the plight of small fishing communities is much more salient than the environmental catastrophe of depleted seas - and, indeed, the long-term prospects for the fishing communities themselves. It's par for the course when policy is expressed in terms other than meaningful outcomes. Government funding and legislation can all too easily be diverted into compelling causes at the expense of our long-term goals. We, for instance, still subsidising not only fisheries, but large agri-business corporates and fossil fuel extraction and consumption.

A Social Policy Bond regime would be far less susceptible to the manipulation of the salience factor. We might still choose to subsidise the destruction of the seas or large cash transfers from the poor to the [2]enormously wealthy, for example, but it would have to be done with our eyes open, and with some degree of consensus. Somehow, I think that our collective consciousness, would find more deserving causes.

### **6.1.6 Social Policy Bonds as a metasystem (2009-01-17 12:37)**

A jarring commentary by Theodore Dalrymple on seeing two schizophrenics in the Paris Metro, obviously in some discomfort and distress, but being ignored by the passengers:

[W]hat really struck me about the scrawlers [of slogans on advertising posters] of the Réaumur-Sébastopol station was their passionate certainty about large and distant abstractions; while at the same time, no one among many thousands knew, apparently, what to do in practice about the two individuals who were causing some inconvenience, displeasure, and even fear to those same thousands. [1] *Reading the Signs*

, 'City Journal' 6 January

Social Policy Bonds are a meta-system. They don't assume, as do most of us, that government will do the things that we cannot currently do, or choose not to do. Government is never slow to expand its role ([2]'With government, mission creep is the defining feature' says Mark Steyn), and we acquiesce too easily in letting it. But a Social Policy Bond regime would reward people for achieving targeted social goals, however they do so and whatever their identity, provided only that they are efficient. If government cannot provide decent care for disturbed people, then others, including volunteers, should be given the resources to enable them to do the job. A Social Policy Bond regime would allocate resources impartially, with efficiency in achieving targeted goals being the sole criterion for allocating taxpayer funds.

### 6.1.7 Catastrophe: coming soon (2009-01-23 11:11)

From The atomic bazaar, by William Langewiesche :

[D]etailed knowledge of nuclear bomb-making has fully escaped into the public domain, placing nuclear arsenals within the reach of almost any nation. Once countries make that choice, their rivals will hear the same call. The United States, Russia, Britain, France, China, Israel, South Africa, India, Pakistan. North Korea and soon perhaps Iran. At least twenty other countries are in position to proceed. ... In Western capitals today there are quiet people, serious people, who, while recognizing the low probability of [a Hiroshima-type fission explosion] nonetheless worry that the successful use of just a single atomic bomb could bring the established order to its knees - or lay it out flat. [1]*The atomic bazaar: the rise of the nuclear poor* (pages 13 and 19).

Given such a consequence, the large number of countries involved, the multiplicity of possible causes of conflict, and our total uncertainty as to where the greatest dangers lie, I think this is one policy area where incentives to achieve a result - the absence of nuclear explosion - should be supplied, however that result is to be achieved. In that way, people would investigate and implement those ways that do most to reduce the probability of a nuclear explosion per dollar spent. Application of the Social Policy Bond principle - see my essay on [2]Conflict Reduction Bonds - would ensure that the incentives are always in the hands of those best placed to achieve the target.

Nuclear conflict, like conflict in general, needs a diverse, adaptive approach. One shaped by our dire need to avoid catastrophe, whatever its source, rather than by the structures, goals and funding of bureaucracies. Unfortunately, it is the latter that have the traction.

### 6.1.8 Condemned by governmental structures (2009-01-25 23:54)

From [1]*the Atomic Bazaar*:

The construction of a [fission] bomb is not a casual project. The required machinery, the noise and especially the presence of team members who are unlikely to be locals provides the West with the last practical chance of self-defence.... In even the most chaotic neighborhoods... it would be difficult to keep the neighbors from asking inconvenient questions. [In Istanbul], Mombasa, Karachi, and every other city where a bomb could conceivably be built ... are urban collectives, ungovernable perhaps, but not necessarily uncontrolled. Western agencies that could find a way to lay traplines in their slums would have a better chance of stopping a terrorist attack than any port-inspection program, bureaucratic

reshuffling , or military maneuvering can provide. Here again, though, **there is little evidence that Western agencies are capable of emerging from their rigidly governmental frameworks.** ' The Atomic Bazaar: The Rise of the Nuclear Poor', by William Langewiesche ((pp68-9) [My emphasis]

Precisely. People who work for government are, in my experience, well-meaning and hard-working. But they have no incentive to investigate untried solutions to problems - however serious those problems are. Like all organizations, government agencies have one single, over-arching goal, and that is self-perpetuation. Achieving social or environmental outcomes may or may not be consistent with that goal. Are we to be condemned to a future of nuclear warfare because government bodies are incapable of giving nuclear peace a higher priority than their own structures and procedures?

Here is my suggestion: a group comprising philanthropists, non-governmental organizations and other interested parties (public or private sector) back a particular application of the Social Policy Bond principle: [2]Disaster Prevention Bonds. These would be redeemable for a fixed sum once a sustained period of absence of a humanitarian disaster had passed. The type of disaster need not be specified: it could be natural as well as man made. The redemption terms would stipulate that they would become worthless the moment an unspecified calamity killed, say 20 000 of the world's citizens by a single catastrophic event in any 48-hour period. Such a bond issue would provide incentives for people to investigate and explore ways of avoiding a nuclear exchange, as well as mitigating the effects of natural disasters. Their priority would transcend those of organizations currently working on those problems. Their over-riding criterion for the mix of projects they would initiate will be efficiency: the maximum reduction in the probability of a humanitarian disaster per dollar spent. That's in stark contrast to the existing bodies charged with safeguarding humanity's future who, despite the best of intentions, find it impossible to explore ways of doing things other than those that are tried, tested and failed.

-  
Policy as if outcomes mattered  
SocialGoals.com

### **6.1.9 Gradual re-orientation of policy (2009-01-30 11:54)**

On January 27 th [Gordon Brown] announced a £2.3 billion ( \$3.2 billion) package of loan guarantees to support carmakers , the development of clean low-carbon cars and the skills to produce them. Another scheme, yet to be devised, will aim to stimulate demand by helping finance companies that lend money to buy cars. [1] *Mandy's Promise*

, 'Economist' 29 January

There's no real discontinuity between the perverse subsidies given to agriculture, the fishing industry and the fossil fuel sector over many decades, and the current bailouts of the finance and car-manufacturing sectors. In all cases short-term expediency and the interests of powerful corporate and government agencies are given a higher priority than those of ordinary people. This is little different from what the way we have treated our physical and social environment. My own feeling is that the logic of incremental adaptation has led us too far from our best interests, and that that is now becoming clearer to everybody. Whether the inevitable re-orientation of policy occurs peacefully and constructively is, I think, open to question. One way of minimising the inevitable pain could be to move towards a Social Policy Bond model.

Such a transition could occur gradually, with existing institutions that are charged with solving our social and environmental problems (mainly government agencies) having their funding reduced by a couple of percentage points a year, while funds are diverted to the redemption of Social Policy Bonds targeting the goals supposedly being achieved by these bodies. The existing institutions, if they were efficient, could work to achieve these goals, and expect to gain at least as much funding as they had before - but only if they were efficient. And their efficiency, and hence their funding, would be objectively assessable at all times via the market for the bonds.

[2]My book goes into more detail about such a gradual transition, as it does about all aspects of the Social Policy Bond idea, but if you are interested you can also contact me directly, through a comment here or via the email address given in my profile page.

## **6.2 February**

### **6.2.1 Refocusing government (2009-02-01 09:58)**

Take away the expectation that we or our children will enjoy a higher standard of living, and all bets are off. From riots in Greece, strikes in France, protests in [1]China and demonstrations

in the UK (against EU workers), I am quite pessimistic about the future of liberal democracy. Yet we read about government, which is supposedly there for our benefit, spending ever larger proportions of the incomes of the wealthiest societies that have ever existed in history. With all that public sector spending, and all the high technology and human ingenuity available to the public sector, why are our prospects so dim? There are many answers, and quite a few point to the failure of government. From, corporate welfare schemes and scams, [2]subsidies to the rich or to [3]environmental destruction ( pdf ), or to the creation of a legislative and regulatory environment that is heavily biased in favour of the large and global at the expense of the small and local, government's failings have implications for us all. My sense is that government as a whole has become too specialised, too big, and hence too remote from the people it is supposed to serve. Writing in the UK, Minette Marrin says

...public servants are distinguished by three facts, unique (when united) to them: first, the taxpayer pays for them, second, their jobs and their pensions are protected (by the rest of us) and third, it's extremely difficult, if not impossible, to sack them. Some of them do crucially important things, and some of them do those important things well; but many of them do important things badly, and a lot of them do things that do not need to be done at all, least of all at public expense, and with impunity. *Watch out quangocrats* , [London] 'Sunday Times', 1 February

A Social Policy Bond regime, I think, would be one way by which we could refocus government spending on what is important. Democratic governments could potentially be extremely effective at articulating society's social and environmental goals, and pretty efficient at raising revenue for their achievement. But they are not so good at achieving those goals themselves. Indeed , they appear to have lost sight of any explicit broad long-term goals, being distracted as they are by the day-to-day running of the government machine. But if instead they concentrated on what they are good at - defining desirable outcomes and funding them- while contracting out their achievement to a motivated private sector via Social Policy Bonds, then our societies would have the best of both worlds: optimal social and environmental outcomes achieved at minimum cost.

## 6.2.2 How did it happen? (2009-02-05 05:25)

From a letter to the editor of the *Economist*:

There was little to argue with in your appraisal of the [ GW ] Bush years and the man himself. What is so deeply troubling is that you couldn't see this coming in 2000. Mr Bush came to that election with one of the most disturbing biographies of any candidate this past century—a man who incurred the wrath of his college professors as lazy and arrogant, a frat boy for sure, simplistic and indifferent to complex ideas. He went on to become an alcoholic, business failure, a military no-show during the

Vietnam war, a legacy candidate for state office, and a governor whose term in office was little more than a stage-managed prelude to running for president. Jack Luft , Letter to the Editor of [1]'the Economist', 31 January

Even less excusable was the re-election of GWB in 2004, when his administration's small-minded incompetence was clear for all to see. How could it happen? I have blogged before on [2]environmental stunts and I think the public reaction they elicit explains much. To put it briefly , we are turned off, mightily, by being told what to do by people who think they know better than us what's good for us. Now in lots of instances they *do* know what's better for us, and this is the tragedy. Too often the rational, well-intended argument is - in the minds of those of us who are neutral or even faintly in favour of the argument - negated by the apparent smugness of those making it. So to spite the self-satisfied we puckishly vote against them. It's unjust, silly, irrational and destructive ; but it is something that, perhaps, the US Democratic Party has learned. Leadership, at least of reasonably well-educated people in democracies, is not (just) about having the right arguments and doing the right things: it's also about engaging with ordinary people and winning them over.

Disastrous as it was, the re-election of GWB was perhaps not the worst outcome of our childish tendency to act against our best instincts in order to take the 'do- gooders ' down a peg or two. In conversations I have with highly intelligent people about climate change I detect the same reaction. In this instance, it's irrational to the point of suicidal, but no less real for that.

So do I have any positive suggestions? This could be a case where humility plays a role. Not only in presenting our arguments - though that is crucial - but also in recognising that while we can clearly see social and environmental problems, the best ways of solving them are not always known. Better then to advocate climate stability, say, than to demonstrate against coal-fired power stations or additional airport runways. The advantages are two-fold. First, it's more difficult to antagonise the public, and easier to win them onside, when discussing outcomes that are universally desired, rather than to make judgements on their behaviour. Second, it's more efficient not to prejudge the best ways of solving our complex social and environmental problems and to let people decide them for themselves on the necessary trade-offs.

And this is where Social Policy Bonds enter the picture. Under a [3]Climate Stability Bond regime (for instance), a motivated market would constantly assess the necessity to do something about climate change, and it would constantly be working out the optimal mix of solutions to the climate change problem. In my view the setting up of such a regime, being focussed on a universally desired set of outcomes rather than the supposed means of reaching them, could involve the participation and hence the support of a far wider public than the alternatives that are currently being discussed. Without that support on this and other urgent challenges, I am afraid we are headed for catastrophe.

### 6.2.3 Peak everything (2009-02-10 09:41)

If this nation [ ie the US] wants to survive without an intense political convulsion, there's a lot we can do, but none of it is being voiced in any corner of Washington at this time. We have to get off of petro -agriculture and grow our food locally, at a smaller scale, with more people working on it and fewer machines. This is an enormous project, which implies change in everything from property allocation to farming methods to new social relations. But if we don't focus on it right away, a lot of Americans will end up starving, and rather soon. [1] Jim Kunstler

You don't have to accept the entire Kunstler thesis to believe that huge adjustments in the way we organize ourselves are going to be necessary in a world of climate change, peak oil and peak many other things that we take for granted. I'm not at all sure that western governments can anticipate any necessary changes and guide us toward them. There are flaws in our political systems, to which I have alluded many times: notably their favouring of large, global corporates at the expense of ordinary people and the environment ; and the incentives they face to concentrate on visual, fast-moving crises at the expense of deeper, more urgent problems. But there are also the daunting complexities in our social organization that make the effects of any large policy action impossible to identify.

This is where Social Policy Bonds could play a useful role. If we want to avoid widespread starvation - or nuclear catastrophe or calamitous climate change - then we can admit that we don't know how best to do so, but issue bonds that will motivate people to explore and implement policies that will avoid disastrous outcomes. The complexity of our society and the many huge challenges we face, in my view, point toward an outcome-based approach: one, such as Social Policy Bonds, that subordinates all our current vested interests and dysfunctional institutions to targeted social and environmental outcomes. Successful policy at this juncture is about encouraging diverse, adaptive initiatives , rather than continuing with the tried, tested and failed policies that have led us into this impasse.

### 6.2.4 Unlikely relationships (2009-02-14 09:51)

[1]n houses with at least one smoker, a mobile-phone purchase led to a 32.6 percent drop in tobacco consumption for each adult - the equivalent of an entire pack each month. 'The Lesser Evil', *the Atlantic*, October 2008 (page 24)

Exploring unlikely relationships is something that bureaucracies don't do very well. Who would have thought that one way of making people healthier would be to encourage the purchase of cellphones? More to the point, who has the incentives to investigate and exploit such relationships ? Certainly nobody working for a large organization in the public sector, and probably nobody in a large private sector organization either. Why rock the boat? Under a Social Policy Bond regime targeting broad indicators of societal health people would be motivated to explore all sorts of new relationships . They might, for instance, find that the most cost-effective

ways of increasing longevity include subsidising taxis for youths emerging from nightclubs after 2am; or diverting subsidies away from industrial agriculture and into organic farming; or dishing out cellphones to smokers.... The point is that under the current system there are too few incentives to initiate projects with potentially high rewards that might fail; it's difficult to terminate failed projects under the current system. But this year, the 200 th anniversary, we ought to remember that the evolutionary fitness of a species requires diversity and adaptation. It's the same with policies.

### 6.2.5 Policy monoculture (2009-02-19 09:22)

Writing about stem rust, a devastating disease which threatens to wipe out much of the wheat crop in Africa, Sharon Schmickle writes:

In the biological churning that constantly endows old pests with new genetic combinations, stem rust had acquired a frightening ability to punch through the resistance that had guarded wheat for decades. Eighty percent of Asian and African wheat varieties are now susceptible, and so is barley... [1]*In the Wheat Fields of Kenya, a Budding Epidemic* , 'Washington Post', 18 February

I've written before about the dangers of a policy monoculture, most fully in my book. While it's a laudable aim to have broad overall goals for a large society, it's not at all helpful to prejudge the best way of achieving a goal and then to prescribe it to the exclusion of all others. The danger is analogous to that in agriculture: lack of diversity and a heightened risk of catastrophic failure. Diversity, responsiveness and the swift termination of inefficient projects are essential when it comes to solving social or environmental problems, which typically arise from a multiplicity of complex causes and are not amenable to command and control. It would be a shame if, as seems possible, government's tendency to assume it knows everything about, for instance, climate change or a healthy economy, causes it to invest all its - rather, 'our' - efforts in the solutions it currently prefers.

The Social Policy Bond principle could combine (1) government's expertise in defining social goals and raising the funds for their achievement, with (2) the market's efficiency in exploring different initiatives and terminating failures. For the example of climate change see [2]here.

## 6.2.6 Incentives to fail... (2009-02-21 10:37)

...well, maybe not, but certainly 'absence of incentives to succeed'. Ross Clark writes:

You think you couldn't find a more extravagant bonus culture and an even more absurd system for rewarding failure than exists at the banks? Just look at the public sector. In fact, let's start by looking at the public sector employee who was charged with the task of monitoring the banks to ensure they didn't get into trouble. That man was Clive Briault, managing director of retail at the Financial Services Authority. Having failed completely to detect anything wrong at Northern Rock, he resigned last April. That is as it should be, except that far from falling on his sword, Mr Briault appears to have been allowed to run off with it and melt it down and use the silver to augment his pension. The FSA's annual report reveals that he left with £356,452 of compensation for lost salary and bonuses, £36,000 of pension contributions and £202,500 for 'compensation for loss of office'.

Hang on, let's just get this right. An employee resigns because he failed to do the job demanded of him — and he still gets paid a bonus, plus compensation for suffering the ignominy of having to resign. His case is not a one-off. Take Rose Gibb, who left her £150,000-a-year job as chief executive of the Maidstone and Tunbridge Wells NHS Trust just before the publication of a critical report by the Healthcare Commission into an outbreak of *Clostridium difficile* in which 345 patients died. To see her on her way, the Trust offered her a £250,000 severance package. Only £75,000 of this was pay in lieu of her notice: the other £174,573 was, as with Mr Briault, 'compensation for loss of office'.

Although, after an outcry, the Health Secretary, Alan Johnson, tried to block the payout, he later backed down and allowed Ms Gibb her £75,000 in lieu of notice. Even so, she has gone to the High Court to claim the full whack.

What kind of an employment contract is it that ends up paying you more for being booted out for failing than it would have done had you worked out your notice? The sort of employment contract which is all too common in the public sector, that's what. The government no longer offers jobs for life; it now just offers payment for life, whether you manage to hold on to your job or not. [1] *Want a big bonus? Get yourself a public sector job*, Ross Clark, 'the Spectator' [London], 21 February

## 6.2.7 More bio-foolery (2009-02-23 04:14)

The use of crop-based biofuels could speed up rather than slow down global warming by fueling the destruction of rainforests, scientists warned Saturday. [1] Grist News

, 18 February

Exactly so. Climate change is one of the many complex, urgent challenges about which scientists don't know everything - and politicians know hardly anything. Does it make sense to invest everything in our current best knowledge, while knowing that we don't know much and that our knowledge is expanding prodigiously? I think not, but that is what we are doing, and one result is bio-foolery; another is Kyoto.

As a society, when it comes to solving complex social and environmental problems, we need more humility. Targeting outcomes, without prejudging which array of solutions will work best, is one way of accepting that our current knowledge is limited, but nevertheless not being content to stand by and do nothing. Issuing [2]Climate Stability Bonds would inject the market's incentives and efficiencies into solving what is probably our most urgent environmental problem, while accepting that we don't yet know what will be the most effective and efficient solutions.

## 6.2.8 Losing diversity (2009-02-25 08:50)

George Steiner writes:

I have conjectured, without being able to offer proof, that the generative justification for the 'crazy' number and fragmentation of tongues - more than four hundred in India alone - is analogous to the Darwinian model of adaptive niches. ... It is the seemingly wasteful plethora of languages which allows us to articulate alternatives to reality, to speak freedom within servitude to programme plenty within destitution . ... Hence the truly irreparable loss, the diminution in the chances of man, when a language dies. ... The extinction of languages which we are now witnessing - dozens pass annually into irretrievable silence - is precisely parallel to the ravaging of fauna and flora, but with greater finality. George Steiner, [1] *My Unwritten Books* (pages 59-60)

I am actually in favour of a monoculture of outcomes: food, clothing, shelter and security for all. What doesn't work, and indeed can be disastrous, is the sort of policy monoculture which insists that, for example, human wellbeing can be achieved only in the form and by the methods conceived by any single organization, well meaning or not. It is this thinking that gave us murderous ideologies, the piling up of nuclear weapons or our dangerously absolute dependence on fossil fuels.

A Social Policy Bond regime would actively stimulate diversity; in the Darwinian sense and with a Darwinian result. It would target broad social and environmental goals and let the private sector, in all its diversity, work out how best to achieve them. Diverse, yes, and also adaptive: unlike government bodies, investors in Social Policy Bonds would have every

incentive to abandon failing programmes. Only efficient projects would survive. And, in stark contrast to today's world, under a bond regime private sector goals would be exactly the same as those of society.

## 6.3 March

### 6.3.1 The real revolution: targeting outcomes directly (2009-03-02 09:35)

The *philosophes* claimed that critical reason would prove emancipatory. Reason and science, they held, would make people more humane and happy. But certain scholars have recently been arguing that just the opposite occurred. When rulers and administrators heeded the promptings of 'reason', it was to increase their power and enhance their authority, in ways which often penalized the poor, weak, and inarticulate. Roy Porter, [1]'The Enlightenment'

Knowing what we do about the complexity of our society, it's less forgivable nowadays that at the time of the French Revolution to say we're targeting, say, poverty, by implementing policies whose effect, at best, is indirect. You do not target, for example, the wellbeing of people who are farming by a hugely elaborate system of import and price controls whose main beneficiaries are the [2]very rich, agribusiness corporates and fraudsters. You do not, these days, necessarily raise literacy standards by spending more on education. Nor crime by spending more on police.

If we want to raise literacy, why not target literacy? If we want to reduce crime, why not reward people for reducing crime, however they do so? In short, why not target outcomes, rather than activities, institutions, inputs or outputs, and let the private sector, rather than the taxpayer, be penalised for failure? Revolutionary talk. But such would be the effect of a Social Policy Bond regime.

### 6.3.2 Why so coy? (2009-03-03 09:52)

Overfishing, which affects 19 percent of major commercial fish stocks monitored by the FAO [the UN's Food and Agriculture Organization], was being facilitated by a

higher number of trawlers in operation and increasingly effective technology, it said.  
[1] Grist  
, 2 March

The United Nations report to which this press release refers is due out next week. I hope it mentions the grievous role that UN member governments have played in subsidising overfishing. Many of the subsidies to the industry, [2]estimated to be worth around \$30 billion annually, take the form of reduced-cost fuel, or cheaper high-technology that does much to contribute to the destruction of the world's fisheries.

### 6.3.3 Targets (2009-03-05 09:29)

If we're going to have large, centralised governments, we should probably accept that much of their policy will centre round the use of highly aggregated numerical data. The Social Policy Bond principle is no different, but I advocate that the bonds target broad indicators of wellbeing that are meaningful to ordinary people. Here's what happens when governments use Mickey Mouse micro-targets:

[H]ead teachers in the [ UK's ] government-controlled sector live and die by targets. Their careers depend on them. One of the targets is high attendance. Then came the snow [in the first week of February]. Most schools in London were closed on the Monday. But more schools managed to open on the Tuesday. Now you might think that those schools whose head teacher and staff struggled into work for the benefit of the children in their care were particularly conscientious. Not in target-land however. They were mugs. Since their schools were open, the many absences of children from their schools on that snowy day will count against them when it comes to calculating how good their attendance figures have been. But those schools which stayed shut will be deemed to have been shut because of exceptional circumstances and their attendance figures will not be affected at all. So the conscientious schools that opened will be punished with bad attendance figures. The less conscientious schools that stayed shut will be rewarded with high attendance figures. Thus does the state give perverse incentives. [1] Source

SocialGoals.com

1. [http://www.thewelfarestatewerein.com/archives/2009/02/the\\_wonderful\\_w.php](http://www.thewelfarestatewerein.com/archives/2009/02/the_wonderful_w.php)

### **6.3.4 Reacting rationally to perverse incentives (2009-03-11 10:36)**

The Icelandic financial crisis explained:

You have a dog, and I have a cat. We agree that they are each worth a billion dollars. You sell me the dog for a billion, and I sell you the cat for a billion. Now we are no longer pet owners, but Icelandic banks, with a billion dollars in new assets. "They created fake capital by trading assets amongst themselves at inflated values," says a London hedge-fund manager. "This was how the banks and investment companies grew and grew. But they were lightweights in the international markets." [1] Wall Street on the Tundra

, Michael Lewis

The result? In the same article, we learn that

When their three brand-new global-size banks collapsed, last October, Iceland's 300,000 citizens found that they bore some kind of responsibility for \$100 billion of banking losses—which works out to roughly \$330,000 for every Icelandic man, woman, and child.

The details are no doubt more complex, but I would guess, that as in the rest of the financial world, the Icelanders were reacting rationally to the incentives on offer. Indeed, facing those incentives, the multitudes of traders, bankers and experts would have been mugs not to behave irresponsibly.

A Social Policy Bond regime might have avoided the entire calamity, at least from the viewpoint of ordinary people. Unlike with other financial assets, investors in Social Policy Bonds might well get rich, true, but their rewards would be inextricably linked to achievement of specified social and environmental goals. Achievement of such goals might be as complicated as the financial markets used to be, but the investors' goals, and those of the general public would be entirely congruent. If government backed Social Policy Bonds then social and environmental goals would be decoupled from the financial world's volatility. There would still be huge gyrations in fortunes, but not at the expense of taxpayers.

### 6.3.6 Climate change: the problem (2009-03-12 09:21)

The problem:

If a product is made in China, by a company based in Singapore, using Australian coal, for a company in the UK, and exported to end users in the US, then which country should 'own' the emissions?". [1] Oliver Tickell  
, 2008

The solution? Subordinate policy to the desired outcome: climate stability. Not to the wish to attribute emissions to particular countries. Nor even to the wish to cut back emissions. Our politicians are too adept at gaming whatever will be agreed, while climate change is simply too complex to address with one policy, which might well not be effective or efficient.

The solution in more detail? Issue Climate Stability Bonds, which will transfer the burden of assessing the cost of stabilising the world's climate to investors who have an incentive to stay abreast of our rapidly expanding scientific knowledge and technology. The bonds will reward the achievement of the climate stability goal without prejudging how that shall be achieved. For more details, see [2]here.

### 6.3.7 Centralization: costs and benefits (2009-03-13 10:29)

"The food system is so centralized that, when a food crisis hits like it did this year, we are less able to react," said Eric Holt Gimenez , executive director of Food First/Institute for Food and Development Policy. "We get these tremendous spikes in commodity prices. ... It also shows up at the cash register." [1] Our Hungry Planet  
, Chris Serres , Startribune .com (cited in an [2]

Oligopoly Watch post  
about Cargill )

Centralisation doesn't always work against societal wellbeing . Indeed, in my view it's essential for such tasks as articulating society's needs and wishes, and for raising the revenue needed for public goods and services. But extreme centralization, I think, has two main, overlapping, problems. First, it fosters [3]corporatism, and works in favour of big companies at the expense of small enterprises and the interests of ordinary people. Second, and more relevant to the Social Policy Bond idea, is that it creates a policy monoculture. As Mr Gimenez indicates, this can mean a disastrous sluggishness; it also inhibits diversity of response, and so limits the degree to which successful policies and projects can supplant the failures.

For all these reasons, Social Policy Bonds could score heavily over our increasingly centralized policymaking decisions. Under a Social Policy Bond regime national governments or supra-national bodies like the United Nations could do what they are best at: setting long-term social and environmental goals, expressed in terms of outcomes that are meaningful to ordinary people. But rather than spawn a centralized bureaucracy supposedly aimed at achieving these goals, the bonds would be bought by private investors, who would have powerful incentives to co-operate with each other to achieve targeted goals as cost-effectively as possible. With Social Policy Bonds we could enjoy the benefits of centralization *and* the benefits of a multitude of competing, diverse, adaptive programmes and projects.

### 6.3.8 Anyone any better idea...? (2009-03-17 09:52)

Quietly in public, loudly in private, climate scientists everywhere are saying the same thing: it's over. The years in which more than two degrees [Celsius] of global warming could have been prevented have passed, the opportunities squandered by denial and delay. On current trajectories we'll be lucky to get away with four degrees. Mitigation (limiting greenhouse gas pollution) has failed; now we must adapt to what nature sends our way. If we can. [1]George Monbiot

The current solutions are not working. There's not a sliver of the political will necessary to meet the challenge. The unattractiveness of the Kyoto process probably has something to do with it: high, upfront cost for an uncertain, remote, reward. A process that politicises the climate change issue, setting country against country in ways that encourage negotiators to spend all their time defending their country's short-term interests at the expense of a global solution. This, and the fact that it's underpinned by 1990s science with little role for our expanding scientific knowledge, has sealed Kyoto's fate, and possibly that of our entire planet.

[2]Climate Stability Bonds might not be perfect - but has anyone any better idea?

–

### 6.3.9 The meaninglessness of abstract economic variables (2009-03-18 11:41)

[1]Andrew Gelman asks 'What is Russia's GDP per capita?'

\$7,600 (World Bank 2007)

\$9,100 (World Bank 2007)

\$14,700 PPP [Purchasing Power Parity] adjusted, World Bank 2007)

\$4,500 (World Bank 2006)

\$7600 or \$14,400 (gross national income: "Atlas method" or "purchasing power parity," World Bank 2007)

\$12,600 (IMF 2008), \$9,100 (World Bank 2007), or \$12,500 (CIA 2008)

\$2,637 in 2000 US dollars (World Bank 2007); that's \$3,200 in 2007 dollars

\$2,621 (World Bank 2006) or \$8,600 (IMF)

I've posted [2]before on the uselessness of Gross Domestic Product as an indicator of societal well-being. The disparity that Mr Gelman depicts is another reason why I think we should as far as possible target meaningful outcomes themselves, rather than indicators that might be, or might in the past have been, strongly correlated with wellbeing . In large, complex societies such indicators will be hard to find, but we can make the attempt. Take physical health: in the rich countries we could use broad health indicators such as longevity and infant mortality. In the poorer countries we might encounter problems gathering reliable longevity data, but objective sample data on, for instance, infant mortality, weights of young children, nutritional intake, could be available and useful. Refinement by experts, and aggregation into something like the Human Development Index, would see the creation of much targets that would be both more sound and more meaningful than the current array of indicators such as GDP per capita which, in the absence of sensible targets, has become the de facto over-arching target of governments everywhere.

### **6.3.10 Peak everything (2009-03-23 10:16)**

Reading books like [1]Peak Everything: Waking Up to the Century of Declines by Richard Heinberg one is struck by the apparent certainty and magnitude of the decline we human beings face. We seem to be on the brink of some sort of collapse, whose precise form and precipitating causes cannot be foreseen. It's very much like the unravelling of the world's financial system, whose impacts, even now are uncertain.

Many of the causes, though, are similar. To my mind, the underlying problem is the combination of extreme globalisation with lax regulatory policy. The market for financial instruments is effectively, a single global market. With its massive volumes, the rewards

from exploiting even inadvertent regulatory deficiencies can be massive - and entirely legal. No regulatory system can anticipate and stop up all loopholes. What could have been done, though, was to set up countervailing incentives: reward people for avoiding the collapse that we are now seeing.

Disastrously, in my view, we are heading in the same direction in other areas. Take climate change or peak oil. With both these challenges our governments are behaving inadequately. Now government is not all-powerful and, as with financial markets, it cannot foresee which laws, regulations or projects are going to best deal with the problems. But what it can do (apart from obvious things like remove subsidies to oil consumption) is to offer incentives for people to avoid catastrophe, *however they do so*. One way of doing this would be to issue Social Policy Bonds that would reward investors in the bonds if (say) climate-related disasters are avoided or their impacts minimised. See an [2]earlier post on this theme. The key is to target the desired outcome, rather than try to anticipate and deal with all the impediments to such an outcome - an impossible task, as we have seen in the finance sector. We urgently need outcome-based policy when it comes to climate change and other environmental and social problems, which are just too complex for the conventional approach.

### **6.3.11 Does financial collapse prefigure social and environmental catastrophe? (2009-03-26 08:28)**

The pattern of land use in the expanding cities of the South and West [of the US] - which have had the most rapid population growth, with very few people per square kilometer - was itself established over the period that has elapsed since the energy crisis of the 1970s. It is a consequence of prices as well as preferences, and of the changing distribution of public expenditure, or public partiality. Emma Rothschild, *Can we transform the auto-industrial society?*, 'New York Review of Books', 26 February

I'm glad to see a recognition that the, to my mind, disastrous, changes in land use that we have seen in the US owe a lot to government intervention. With its corrupt, insane subsidies to agribusiness and big landowners and its gung-ho promotion of the oil extraction and consumption infrastructure, the US Government is, sadly, [1]not alone in favouring corporations and abstract economic indicators at the expense of the wellbeing of ordinary people - and the environment. Bio-fuels are the latest in the long litany of woeful government wheezes, ostensibly aimed at solving some genuine social problem, but mainly an effort to divert taxpayer funds to election campaign donors. Tragically, our social and environmental pathways seem to be paralleling those of the financial sector, and for much the same reasons: government and big business working hand-in-hand to postpone the solution of urgent problems and along the way grab what they can for themselves.

Politicians are almost as much the prisoners of this absurd system as the rest of us, and there's little point now in trying to allocate blame. The problems that the corporatist state has created are now so huge that they require further government intervention. I feel strongly that government should stop trying to prescribe solutions (a la [2]bio-fuels) and instead switch to something like Social Policy Bonds, by means of which it can reward people for achieving such widely agreed goals as the [3]avoidance of catastrophe, without imposing its own (or its paymasters') ideas as to how to achieve these goals. We need diverse, adaptive policies and projects, not the dead hand of government and its friends in big business with their failed and fossilised thinking. We need to specify the outcomes that we want, instead of blindly aim for economic growth whatever its consequences and whoever benefits. To be frank, I'm not optimistic that anything like this will happen; not before some calamity anyway.

### 6.3.12 Self-esteem (2009-03-30 13:18)

"In government papers it's considered that everybody should have more self-esteem... It's thought to be the answer to crime, abuse aggression, risk-taking and almost every problem..." From all the studies, however, there is no good evidence to show that low self-esteem causes anti-social behaviour. Quite the reverse: people who rate themselves highly are the ones most prone to do violence and most likely to take risks, believe themselves invulnerable. John Naish (quoting Nicholas Emler) in [1] *Enough: breaking free from the world of more*

In society, as in our economy and the environment, things are just too complex for any single organization to understand. As well, causal relationships change dramatically over time, as does our knowledge and expertise. No single policy approach can work. And when government is so big that it forms a policy monoculture, the consequences of getting it wrong can be disastrous. It's far better to target universally-desired outcomes, rather than the means that government at some stage thought was the best way of achieving them.

## 6.4 April

### 6.4.1 Biodiversity and Social Policy Bonds (2009-04-03 09:32)

The United Nations Convention on Biological Diversity estimates three species become extinct each hour. That's 72 every day; 26,280 each year. .... [Paul Ehrlich] compares nature's biodiversity to the engineered redundancy in an airplane. The "rivet hypothesis" holds that you can lose some rivets in a plane's wing and it will continue to fly, said Ehrlich. At some point, however, the loss of just one more rivet becomes catastrophic. [1] 'Dead Reckoning'

, Scott LaFee

How would a Social Policy Bond try to tackle loss of biodiversity? One way could be to target not the number of species (remaining, or becoming extinct) because the data are so scanty, but rather to target some index comprising habitat and a large number of indicator species. For ease of measurement it could be stipulated that a random sample of, say 100 out of a total of 10000 species, will determine whether the redemption conditions of the bonds have been met. Similarly, with the areas of habitat loss. Investors in 'Species Preservation Bonds' would therefore concentrate their efforts on preserving all species, and all habitat.

There are lots of fish-hooks in this idea, and all sorts of potential for abuse and corruption. But does anyone have a better alternative? I don't see any effective global alternatives to application of the Social Policy Bond principle even being discussed. The link makes clear that we are headed for an ecological catastrophe if we carry on as we are doing. By 'we', I mean human beings. Some species will benefit from our demise:

[I]f mass extinction goes on long enough - events have lasted from hundreds of thousands to millions of years - what's left may consist only of "weedy survivors," said Peter Ward, a paleontologist at the University of Washington. These are animals supremely adaptable and opportunistic, such as flies, rats, crows, coyotes and intestinal parasites.

### 6.4.2 Kyoto is doomed (2009-04-05 12:19)

Meredith Niles looks at the US 'Clean Energy and Security Act' :

Buried about halfway through the monster 648 page draft is a crucial statement: "controlling emissions in small as well as large amounts is essential to prevent, slow the pace of, reduce the threats from, and mitigate global warming and its adverse effects." I couldn't agree more, which is why I was shocked to see that the bill fails

to address greenhouse gas emissions from agriculture, factory farms, and animal manure whatsoever—and even goes the extra mile to specifically exempt the entire sector from any type of regulation. [1] *New climate legislation overlooks a major GHG source: industrial ag*

This short excerpt supplies two reasons why, in my view, Kyoto is doomed to fail. First, monitoring small amounts of emissions is inherently going to be expensive, intrusive and divisive. But if it's not done, then controlling emissions of specified gases (let alone controlling climate change) is just not going to happen. Second, and even more obviously, if favoured sectors are exempted from Kyoto's provisions (on what basis?), then Kyoto will fail.

It's hopeless: I firmly believe that only an outcome-based approach has a chance of working at a reasonable cost. The point is simple: if we want to reduce climate instability, we should reward people for [2]reducing climate stability. We don't know whether trying to control greenhouse gas emissions is the best way of doing that, so we need to give incentives for people to find out. About the only thing we can be certain of is that not limiting greenhouse gas emissions will do nothing to stop climate change. And that's exactly what's happening.

### 6.4.3 Avoiding disaster (2009-04-09 00:54)

Discussing the origins of the current credit crisis, Jeff Madrick writes:

The mortgages traveled such a long distance from institution to investor that no one was in personal touch with the actual mortgage holder any longer. Now, the likelihood of defaults was assessed not by someone who tracked a specific mortgage holder but by complex, computer-generated statistical models of the entire portfolio of mortgages. Like all such models, no matter how mathematically intricate, they required an estimate about the future based on the past - an estimate that was inherently incapable of adequately taking into account the consequences of a historically rare and therefore seemingly unlikely crash in housing prices. [1] *How we were ruined and what we can do*

, 'New York Review of Books', 12 February

Society's burgeoning complexity means that the chances of similar disasters occurring in all areas loom ever larger. By their nature, they cannot be anticipated. Even if we can see looming calamity in, say, the way the climate is changing, or the proliferation of nuclear weapons, we cannot know in advance the precise pattern that the calamity will take, still less do anything to avoid it. Our interconnectedness, aided (as in finance) by something approaching a [2]policy monoculture, can amplify the consequences of unanticipated events. Remedies may be too little or too much - but they will always be too late.

One solution could be to issue [3]Disaster Prevention Bonds, which could act so as to moderate or countervail the incentives currently on offer to the people and corporations who are quite happy to militarize our planet. These bonds could function as an insurance policy, rewarding people who work to avoid human catastrophes of any sort, specified or not. Disaster Prevention Bonds would not prejudge how human calamities shall be avoided, but would simply reward the sustained non-occurrence of such calamities. Under a bond regime, diverse, adaptive approaches that are efficient would be rewarded. Failing policies would be swiftly terminated.

Different bond issues could be used to insure against different broad categories of disaster, but always with a focus on outcomes rather than abstract variables ; ends rather than means. In the area of finance, for instance, rather than target economic indicators (such as growth rates or house prices), bonds could target numbers of people unemployed or homeless.

The bond principle could be applied in other policy areas. Though we might fear a nuclear exchange or climate change in particular, Disaster Prevention Bonds targeting disasters need not be so specific. They could, for instance, target separately the potentially calamitous consequences of man-made or environmental disasters. In such bond issues the desired outcome - the avoidance of millions of avoidable deaths - would be specified, but not the means of achieving it.

#### **6.4.4 Shock: somebody else concerned about policy outcomes! (2009-04-10 12:39)**

But a progressive policy needs more than just a bigger break with the economic and moral assumptions of the past 30 years. It needs a return to the conviction that economic growth and the **affluence it brings is a means and not an end. The end is what it does to the lives, life-chances and hopes of people.** Look at London. Of course it matters to all of us that London's economy flourishes. But the test of the enormous wealth generated in patches of the capital is not that it contributed 20 %-30 % to Britain's GDP but how it affects the lives of the millions who live and work there. What kind of lives are available to them? Can they afford to live there? If they can't, it is not compensation that London is also a paradise for the ultra-rich. Can they get decently paid jobs or jobs at all? If they can't, don't brag about all those Michelin-starred restaurants and their self-dramatising chefs. Or schooling for children? Inadequate schools are not offset by the fact that London universities could field a football team of Nobel prize winners. (Emphasis added) [1]*Socialism has failed. Now capitalism is bankrupt. So what comes next?*, Eric Hosbawm

This is where Social Policy Bonds come in; or, at least, outcome-based policy. We cannot afford any more ideological experiments, even benign ones. But neither can we return to the days

when the world was simple enough for the relationships between policies and their effects to be reasonably accurately identifiable. The only solution I see is to express policy in terms of agreed, targeted outcomes. It seems Hobsbawm agrees.

#### **6.4.5 Incentives are important (2009-04-13 12:43)**

In a remarkable illustration of the power of lobbying in Washington, a study released last week found that a single tax break in 2004 earned companies \$220 for every dollar they spent on the issue – a 22,000 percent rate of return on their investment. The study by researchers at the University of Kansas underscores the central reason that lobbying has become a \$3 billion-a-year industry in Washington: It pays. [1] *Investments Can Yield More on K Street, Study Indicates*

(registration), Dan Eggen , 'Washington Post'

It's sad that only highly-paid specialists have ready access to the people in power. The political process is so legalistic and arcane that ordinary people haven't the time or the legalistic knowledge to get involved. One solution might be for policy to be expressed primarily in terms of outcomes.

If Social Policy Bonds were issued, there would be still be scope for lobbyists, but their focus would be on the precise definition of targeted outcomes. Take climate change for example. The definition of a [2]climate stability target could include any combination of a wide array of scientific, financial and human indicators. Discussion of these and their targeted values would no doubt be protracted and esoteric. But there is a difference between such debate and the current lobbyists' efforts. Currently, lobbyists represent the bodies that pay them: they will argue that, for instance, cutting back carbon dioxide emissions hurts 'the coal industry'. The trade-off between such pain and the goal of emission reduction would then be made opaquely; even the decision-makers would be making subjective judgements.

It would be different under a bond regime. Lobbyists for the coal industry would have to argue not that cutting back emissions from coal burning would hurt the coal industry, but that the targeted climate stability goal was inappropriate. The relationship between coal burning and climate change would be for investors in Climate Stability Bonds to explore, rather than policymakers. The policy debate, centring as it would on outcomes, will be accessible to far more people than the restricted group of specialists who currently have an interest in policymaking .

#### **6.4.6 Short selling and Social Policy Bonds (2009-04-17 09:26)**

A correspondent asks me whether short selling would pose a problem for [1]Middle East Peace Bonds - an application of the Social Policy Bond idea aimed at eliminating violent political conflict in that part of the world: "If bonds are freely tradable , then presumably a terrorist organization might choose to short these bonds, thereby profiting from the much more easily and cheaply achieved goal of causing destruction to the peace process."

The gist of my reply is that, first, the comparison should be with the current system, rather than a Utopian ideal. MidEast Peace Bonds ( MEPBs ) I think would improve on the current possibilities, but they will not be perfect. Under the current system terrorists could profit by short-selling of share indices before they commit an outrage. If they short-sold MEPBs , the probability of their being traced would be greater than under the current system, simply because there would be fewer traders of the bonds than share indices. Efforts to track or deter such trading could be made simpler by the bonds being issued for large sums combined with some system of ownership registration, as with current financial instrument trading; they could be issued in denominations of \$1 million or upwards, say.

By short-selling the bonds the terrorists would therefore risk exposure, as well as suffer the public opprobrium of appearing calculating and pursuing pecuniary benefit, which might not sit well with some of their supporters.

More generally, it is almost certain that the price of any particular Social Policy Bond would not always be rising monotonically from its float price to its redemption value. It would be justifiable, as well as efficient, if bondholders could hedge against consequent falls in the value of their assets. People who do not hold bonds might want to participate in markets for derivatives of bonds, some of which would rise in value as the targeted goal became more remote. This in turn means that speculators and short sellers could certainly profit from short-term bond price falls, and the question again arises as to whether these people would then take steps to impede progress towards any targeted goal.

There are two main reasons why they would probably not. The first is that, in the long term, the weight of money would be against them. Provided sufficient funds were allocated to achieving the targeted objective, there would be a net positive sum of money payable if the targeted objective were to be achieved, and a net zero sum paid as long as the goal were not achieved. All the long-term incentive would be to achieve the targeted objective. Those who, for whatever reason, would suffer from achievement of the objective could be compensated by bondholders, or bribed to change their ideas. Note also that for every buyer of a 'put' option there would be a seller, and that for every futures contract bought on the expectation that the bond price would fall, there would be an equivalent futures contract sold on that basis, so that the net incentive generated by derivatives would be in line with the incentive

created by the underlying financial instrument, the Social Policy Bond: in the long run, this would favour achievement of the targeted objective. The other reason that short sellers, or holders of 'put' options, in Social Policy Bonds might not take actions aimed at interfering with achievement of the goal is that such actions might well already be illegal or, again given the incentives that the bonds would generate, be made illegal - or have their provenance more enthusiastically investigated - once the bonds had been issued. Some miscreants might be tempted to sell bonds targeting water pollution short (or buy 'put' options) then dump a million tons of manure into Chesapeake Bay. But they would know that such an act is illegal - and that there will be people at the other end of their transactions who will be highly motivated to see the law enforced to its fullest extent.

The last two paragraphs, above, are based on an excerpt from my book on Social Policy Bonds, completed recently and available [2]here, in electronic or hard copy.

#### **6.4.7 Cap-and-trade, carbon tax, or Climate Stability Bonds? (2009-04-18 13:01)**

Barry Brook and Tim Kelly present a useful submission about cap and trade. Their arguments against it have force:

1. A cap and trade mechanism is by its nature, an all consuming policy instrument that extinguishes the effectiveness of voluntary actions, harming rather than enhancing the evolution of a low carbon economy.
2. With a cap and trade approach, the target is everything as both the emissions cap and emissions floor are locked in. No one can do better than the cap, and so the cap must be a science based [all-]consuming sustainable target pathway that won't lock in failure. ....
3. ... The cap and gateway will either be too aggressive and will cause a political backlash, or [too] soft leading to coasting when we should be transforming the economy. [My ellipses] [1]

*CPRS vs carbon tax: Senate Inquiry*

They have further points, all pointing to a carbon tax in preference to cap-and-trade. My own thinking is that there's nothing a carbon tax can do that [2]Climate Stability Bonds cannot do better. If investors in Climate Stability Bonds think cutting back greenhouse gas emissions is the best way of stopping climate change then they will have a powerful incentive to demonstrate that and lobby for it. But if they come up with better ways of cutting back emissions - or halting climate change - then they will explore and implement these. In such a way, the risk that a carbon tax will fail to halt climate change is transferred away from taxpayers, consumers

and indeed the world's entire human, animal and plant life, to investors in the bonds. And the investors have far more compelling incentives to get things right than whoever levies and pays (or more likely, tries to avoid) any carbon tax.

#### **6.4.8 Wish I'd said that... (2009-04-22 05:24)**

After pointing at research showing that nitrous oxide is a much more potent greenhouse gas than had been thought, 'The Economist' opines that:

T]he case of biofuels shows that without proper consideration of all greenhouse gases, not just CO<sub>2</sub>, it is too easy to rush headlong into expensive methods of mitigation that actually make things worse. 'Biofools', *Economist*, 11 April

My title is an ironic reference to the many times I've said (this blog, *passim*) that we urgently need to solve problem of climate change, rather than its supposed causes, about which we do not yet have enough knowledge. For more, see my paper on [1]Climate Stability Bonds.

#### **6.4.9 Incentives need not be monetary (2009-04-26 04:16)**

Work by Swiss professor, [1]Bruno Frey reinforces and analyses something that economists tend to forget: that monetary incentives don't always work. Indeed, they stand a good chance of undermining our willingness to do the right things for ethical and moral reasons. People perform valuable social or environmental services not only for monetary gain, but also because they enjoy doing them for their own sake, because they believe them to be the morally right things to do, or because they believe that their actions will advance some cause to which they are committed. These 'intrinsic' motives are qualitatively different from external, monetary incentives, and offering monetary rewards might 'crowd out' or undermine these less mercenary and more civic-minded motivations. Crowding out internal motivation can occur, writes Frey, because, monetary incentives can undermine people's feelings of self-determination and self-esteem. Also, when external incentives are supplied, the 'person acting on the basis of his or her intrinsic motivation is deprived of the chance to exhibit this intrinsic motivation to other persons.'

Not mentioned by Frey, but also plausible is that financial incentives can undermine the

cognitive outlook that sees socially and environmentally beneficial services as worthwhile in their own right, rather than as a cost for which compensation and payments must be paid by taxpayers. Professor Frey looks in some detail at these circumstances.

Links to some of Professor Frey's work are [2]here, and you might also be interested in [3]this video talk on the same theme, by Barry Schwartz.

What do these findings mean for Social Policy Bonds, which at first sight seem to be entirely based on pecuniary incentives? It's important to note that, as Frey points out, the crowding-out effects are not always significant. In markets, which are based on relationships amongst essentially self-interested strangers, financial incentives as exhibited through the price effect do work as classical economics predicts. That is, they work to increase supply. And when (as they would be under a bond regime) external rewards are seen as recognition of the importance of, say, civic duty rather than an attempt to 'buy' one's civic performance, they may well support, rather than undermine, moral and other intrinsic motivations. A bond regime could give bondholders incentives to further Frey's research, exploring the relationships between financial incentives and civic performance. They could use this knowledge to minimise the costs of achieving targeted objectives by, for example, finding out when monetary incentives are least likely to supplant the intrinsic motivations of people who help achieve objectives, and concentrating their use in those circumstances.

Social Policy Bonds in this view, then, are not merely a system by which monetary incentives are funneled into the most efficient providers of public goods and services, but a 'meta-system' that motivates bondholders to find the best ways of encouraging socially beneficial behaviour - whether these be monetary or not.

#### **6.4.10 The Special Interest State (2009-04-27 07:41)**

Discussing the 'Special Interest State', James V DeLong [1]says:

The Special Interest State could get along quite well when it simply nibbled at the edges of the society and economy, snipping off a benefit here and there, and when the number of victorious interests was limited. But the combination of moral entitlement, multiplication of claimants, and lack of limits on each and every claim is throwing them into conflict, and rendering unsustainable the ethic of the logrolling alliances that control it.

Earlier:

Some minority-rights groups claim the right to control all speech. Victim groups of all kinds see a never-ending need for lawsuits. A provision inserted at the behest of the

Teamsters into the recent stimulus bill, which was read by no member of Congress in its entirety, started a trade war with Mexico for the sake of banning 97 Mexican trucks from U.S. highways. Providers of higher education demand continuing escalation of subsidies for four-year B.A. programs rooted in the 19th century. Public employees have become perhaps the largest and most powerful interest group — 20 million strong, politically active, and dedicated to the ideals of no cuts in employment, absolute pension safety no matter what happens to everyone else's retirement accounts, and little accountability.

Precisely so. And how sustainable is this?

As the government has grown in size and reach, it has justified its claims to power by accepting ever more responsibility for the economy and society. Failure will result in rapid loss of legitimacy and great anger. It is amusing to read pundits' pronouncements that the Chinese government must deliver economic stability and growth or suffer social unrest; what do these pundits think will be the fate of an American government that fails in these tasks? And as the government's reach extends, any chance that it will meet its self-proclaimed responsibilities declines.

Government has lost sight of what should be its over-arching goal: to look after the wellbeing of its people. 'People' - not institutions or special interest groups. And people are more than members of special interests. Bailing out car manufacturers, airlines, farmers or any other well-represented lobby group is not equivalent to looking after the wellbeing of the stakeholders in these groups. Of course, it's much easier for governments to listen to the lobbyists, and to equate the health of powerful interest groups with that of the people they are supposed to represent. But it is a temptation that must be resisted: it's based on, and tends to fossilise, a static view of society. Progress comes through diversity and adaptation. Looking after special interests stymies that sort of evolution. Worse, it diverts resources from the people who really need it.

And that is where Social Policy Bonds can offer a better solution. If governments were accustomed to expressing society's goals in terms of outcomes that are meaningful to ordinary people, then the bailing out of special interests would be clearly seen as the corrupt folly that it is. Social Policy Bonds would subordinate all policy goals to such outcomes and channel our scarce resources into their achievement. Under a bond regime, government could not deceive

itself and the rest of us with the pretence that, by protecting powerful interest groups, it's doing any favours to the people it should be representing.

#### **6.4.11 The Corporate-Welfare State We're In (2009-04-28 08:50)**

Thank you, Paul Krugman, for putting this so plainly:

Wall Street is no longer, in any real sense, part of the private sector. It's a ward of the state, every bit as dependent on government aid as recipients of Temporary Assistance for Needy Families, aka "welfare." I'm not just talking about the \$600 billion or so already committed under the TARP. There are also the huge credit lines extended by the Federal Reserve; large-scale lending by Federal Home Loan Banks; the taxpayer-financed payoffs of A.I.G. contracts; the vast expansion of F.D.I.C. guarantees; and, more broadly, the implicit backing provided to every financial firm considered too big, or too strategic, to fail. [1] *Money for nothing*

'New York Times', 26 April

Next time your acquaintances speak disparagingly of people on welfare, it's worth recalling that much of the corporate sector in every western economy is equally dependent on government. As well, families on welfare don't typically subvert the financial system or the environment, or manipulate the regulatory system, to suit their aims.

## 6.5 May

### 6.5.1 Swine flu and Social Policy Bonds (2009-05-04 06:55)

The response to swine flu suggests that a decentralized approach is best. This crisis is only days old, yet we've already seen a bottom-up, highly aggressive response. In the first place, the decentralized approach is much faster. Mexico responded unilaterally and aggressively to close schools and cancel events. The U.S. has responded with astonishing speed, considering there are still few illnesses and just one hospitalization. ... Second, the decentralized approach is more credible. ... Finally, the decentralized approach has coped reasonably well with uncertainty. .... David Brooks, *Globalism goes viral*, 'New York Times', 28 April

We probably have a more centralised policymaking process than we should have if we were used to expressing policy in terms of outcomes rather than activities or institutional funding. There are benefits to centralisation, certainly when it comes to articulating society's goals and raising the revenue to achieve them. But the penalties of too much centralisation are ever more apparent, and Mr Brooks alludes to some of them. It is the efficiency of the decentralised approach to policy achievement that is most convincing. This efficiency derives from the combination of its adaptability and its diversity. Decentralised, bottom-up, decisionmaking, as Mr Brooks says, is faster. It terminates failed initiatives and encourages the exploration and implementation of successes.

A Social Policy Bond regime would entail centralised direction -setting, but decentralised, bottom-up, project initiatives. Social Policy Bonds, whether issued by government or the private sector, would guide investors towards society's common social and environmental goals. But the actual projects would be done - and done efficiently - by a decentralised body of highly

motivated bondholders. Swine flu, like other diseases, is adaptive and highly goal-oriented. Social Policy Bond regimes, would deploy the same qualities in favour of our species.

### **6.5.3 Truly sobering (2009-05-09 08:08)**

About the disappearance of large fishes from the Caribbean coral reef, scientist John Bruno commented:

Seeing evidence of this ecological and economic travesty played out across the entire Caribbean is truly sobering... [1]'Sobering' Decline Of Caribbean's Big Fish, Fisheries: Overfishing Deemed Most Likely Cause, ScienceDaily , 6 May

With a rising human population, the article goes on to say, and the increasing demand for ocean-derived protein, Given that about half the world's populations live near coastlines and that the world population is growing, demands for ocean-derived protein will continue to increase, prospects look bleak. One scientists warns that:

meeting such demands while retaining healthy coral reefs may require multiple strategies, including implementation of marine reserves, finding alternative sources of protein, and increased efforts to implement family-planning strategies in densely populated areas.

The difficulty, and this is one that is common to many social and environmental problems, is that we are not very good at multiple strategies. We have handed responsibility for meeting this sort of challenge to a highly centralised body: that is, government. Any single large institution finds it almost impossible to conceive of the diverse, adaptive approaches necessary to meet our most urgent challenges, still less to implement them. Traditional societies evolved their own forms of property rights, their own taboos and disciplines, for dealing with the problems that are now given over to government bodies. So climate change,

for instance, is something that will be dealt with by a top-down, one-size-fits-all, policy of controlling emissions of greenhouse gases - or rather, those that were identified in the 1990s as greenhouse gases. Such a policy is incapable of adapting to changed circumstances or our rapidly expanding knowledge of scientific relationships.

A Social Policy Bond regime would be different. It would recognise the necessity for high-level centralised decision -making about the planet's needs, but it would have the effect of devolving the ways of achieving them to smaller bodies, who would have incentives to try different solutions and, unlike typical government organizations, terminate their failures and concentrate on their successes. Applied to the Caribbean reef fish ecology, a bond regime would no doubt try the multiple strategies mentioned above, and probably several more. Under the current system, there is, I fear, little reason to be optimistic.

#### **6.5.4 Costing large objectives (2009-05-12 04:02)**

When it comes to large social or environmental goals, such as reducing a (carefully defined) crime rate, one advantage of Social Policy Bonds is that they can defuse controversy about how much government should spend. Issuers of Social Policy Bonds, though they would have to decide on the maximum amount they want to spend on achieving their objective, would not have to work out how much the actual cost would be with any accuracy. That would be done by bidders for the bonds in the open market. Assume that bonds are to be used exclusively in pursuit of a 50 percent reduction in the crime rate, and that an urban authority issues one million bonds, of redemption value \$10.00. If the market valued these bonds on flotation at \$1.00 each, the net cost to the issuers of achieving the targeted objective (ignoring administration costs) would be \$9 million. In other words, the market at the time of issue believes that the cost of achieving the objective, including its profit margin and after taking into account risk, would be \$9 million.

Now suppose the bond issuers are completely in the dark about how much it will cost to achieve the targeted objective and instead of issuing one million bonds they issue ten million with the same redemption value, \$10.00. They would then be liable for a maximum cost of \$100 million. However, the market would still reckon that it could achieve the objective for around \$9 million. So instead of valuing the bonds at \$1.00 competition between potential investors would bid up the issue price of the bonds to around \$9.10. (Social Policy Bonds would be an unusual financial instrument, in that the more that were issued, the higher would be their value!) The issuers therefore *would not have to estimate with any accuracy* how much a targeted objective might cost to achieve, and they would put a cap on their total liability by limiting the number of bonds issued. The costing of achieving the targeted goal has, in effect, been contracted out to the market, and the market bears the costs if it gets it wrong - not the taxpayer!

This could be a huge advantage in dealing with climate change, for example, where

there are sufficient uncertainties to explain, if not justify, politicians' reluctance to do anything meaningful until, quite probably, it's too late.

### 6.5.5 The true comparison (2009-05-13 12:37)

As so often, [1]John Kay sums it up succinctly:

Regulation by rules invites compliance with the rules rather than the objective of the rules, and the more extensive the rules the easier it is to lose sight of the objective.

I'm sometimes asked what would happen if, for instance, holders of Social Policy Bonds targeting crime in a particular region simply laid on a shuttle bus service for burglars into an adjacent region. If, in short, the *intent* behind a bond issue were undermined while remaining within the *letter* of the bonds' redemption terms. There are difficulties with such negative-but-legal ways of achieving Social Policy Bonds' stated objectives but, and this is a crucial point, *exactly the same difficulties apply under the current system*. More generally, the proper comparison of a Social Policy Bond-based regime should be with the best of the current system, rather than some unattainable utopia.

Social Policy Bonds do need discussion, application on a small scale, and refinement before they can be widely applied to large social and environmental problems. Even then, they would have their drawbacks. But, in my view, at least until they have been tried and tested, they offer significant improvements over the current, activity- or institution- based ways of trying to improve social wellbeing. Under a bond regime, we'd still rely on people's willingness to comply with the spirit of bond issues. But that's exactly the same as under the current regime. As Mr Kay goes on to say:

It is hard, perhaps impossible, to remain honest when the culture is corrupt; hard, perhaps impossible, to live on an MP's salary when others exploit the allowance system and accept dubious consultancies; hard, perhaps impossible, to manage a bank prudently when your competitors inflate profits by operating differently. That is why values of integrity, of public service, and of responsible stewardship of the money of others can never be replaced by rules or imposed by regulation.

### **6.5.6 Keeping the globe livable (2009-05-16 05:34)**

Paul Krugman has been visiting China:

As the United States and other advanced countries finally move to confront climate change, they will also be morally empowered to confront those nations that refuse to act. Sooner than most people think, countries that refuse to limit their greenhouse gas emissions will face sanctions, probably in the form of taxes on their exports. They will complain bitterly that this is protectionism, but so what? Globalization doesn't do much good if the globe itself becomes unlivable. It's time to save the planet. [1]  
*Empire of Carbon*  
, 'New York Times', 14 May

In an increasingly complex and interlinked world, like it or not, there's going to be a greater need for government regulation and restrictions on the ways we have been doing things. Diffusing the negative externalities of, for instance, power generation is no longer politically sustainable when the impacts could be drastic and far-reaching - even if there is uncertainty about the exact size of the impacts.

In our newly constrained world, there may be a place for Social Policy Bonds. There will be a sharper focus on bottom-line outcomes. Up to now, governments have got away with assuming away many negative externalities. So: economic growth has always been good; so too has been the freedom of movement of goods and capital. The assumption has always been that the market and non-market positive impacts have outweighed the negative. We can no longer make such an assumption. To have a globe that is livable is now something that will require co-ordinated government action.

Of course, government doesn't have all the answers. But what it can do is determine, or rather articulate, the broad social and environmental outcomes that we wish to pursue and reward the achievement of those outcomes, *however it is done*. Such goals, I suspect, would include the avoidance of major catastrophe, whether natural or man-made, and the stabilising of a (carefully defined) array of indicators and measures of the global climate. Government is fairly clueless about how to achieve such goals, but it does have strengths in articulating them and raising revenue for their achievement. So, using the Social Policy Bond principle, it could issue [2]Disaster Prevention Bonds, or [3]Climate Stability Bonds. These would have the effect of contracting out the work necessary to achieve these fundamental objectives without prejudging how best to do so. They would also ensure that the livability of the globe would be achieved at minimum cost.

### 6.5.7 The only alternative? (2009-05-17 12:31)

Financial capitalism has failed. We need to democratize the economy.

Oskar

Lafontaine , [1] 'We want to overthrow capitalism'

, Interview with Spiegel Online

The global financial crisis is at a very early stage. What seems clear to me is that the western mixed economy model has been totally discredited. This is not to imply that there are any better systems out there; rather that it has lost the consent to operate that it enjoyed over the past few decades. The tacit agreement was that the private sector would work, within laws, regulations and unwritten codes of decency to maximise sales, market share or profits. Government would impose taxes on producers and consumers, mainly to provide public services (law and order, defence, infrastructure, education and healthcare etc) and transfer income to the poor. What happened? Big business and government corrupted each other, at the expense of small enterprises, ordinary people and the physical and social environment.

It was always a bit haphazard; the idea that trickle-down or government action would ensure that the net non-market impacts of corporate activity would be positive, and that the human (as distinct from corporate) casualties of capitalism would be looked after by a benevolent, caring state. There were always visible signs of rot, to those who had time to look at, for instance, who actually benefited from [2]subsidies to agriculture and other corporate welfare scams. Now the extent of that rot has become visible to all.

How can we ensure a better working model, and avoid what looks like a very painful transition to it? One answer could be Social Policy Bonds; rather than leave the achievement of social and environmental wellbeing to chance or coercion, we could instead subordinate all government activities to our broad social goals. So, for instance , if we wanted to achieve full employment we'd reward people who help achieve it, *however they do so*. We wouldn't subsidise or bail out inefficient industries simply because they allegedly need some temporary help or are too big to fail (or more likely, have too much political muscle and aren't afraid of using it). Rather than gamble with climate change, by assuming (or pretending to assume) that cutting back (or aspiring to cut back) greenhouse gas emissions will bring about climate stability, we'd issue Climate Stability Bonds that would reward people for stabilising the climate, *however they do so*.

Governments everywhere have shown that they cannot master the inevitable complexities of an increasingly interlinked world. Perhaps no organization can. We need large numbers of diverse, adaptive programmes and projects to restore social and environmental harmony. Targeting outcomes, and rewarding the people who achieve them would, I believe, work better than either the corrupt corporatist-capitalist model whose day has recently ended or large-scale central planning, whose day ended many years ago.

### 6.5.8 Non-monetary incentives (2009-05-18 06:50)

The king's counter to his subjects' reluctance to be knighted was a general order in 1234 to all sheriffs that they should proclaim throughout their bailiwicks that all men who held one or more knights' fees in chief of the the king should procure arms and cause themselves to be knighted. ... Nevertheless it is clear that through the greater part of the thirteenth century the government was trying ... to keep in being a military form of society which was out of date. It was probably with this end in view that kings stressed the pageantry of the ceremony by which men were admitted into the order of knighthood. ... Edward I realized that knighthood must be tied to the court and the glamour of the court if young men were to be drawn into the knightly order.

[1]*English society in the early Middle Ages* , Pelican History of England vol 3, Doris Mary Stenton , 1965

The conceptual leap that we have to make is that knighthood in those days was a burden. It entailed an obligation to serve the king in military conflicts. It's not clear how successful was the introduction of the elaborate ritual to which Lady Stenton refers. But the principle of getting people to do things for reasons other than monetary ones is clearly long established. In this recent [2]post I refer to research showing that under some circumstances financial incentives can actually undermine our willingness to do the right thing. How would that sit with the Social Policy Bond principle, where monetary incentives at first glance seem paramount?

Actually Social Policy Bonds are not merely a system by which all the people who help bring about social wellbeing are financially rewarded. Rather it is a 'meta-system' that motivates bondholders to find the best ways of encouraging socially beneficial behaviour - whether these be monetary or not. In my book I mention the Japanese, who have carefully graded levels of respect for people according to how well they are seen to have served society. Paradoxically, holders of Social Policy Bonds would have financial incentives to devise nonfinancial ways of encouraging people to achieve our social and environmental objectives. This could be much more efficient than our current, somewhat haphazard system of rewards. And, as the Japanese and the old kings of England knew, it could be much less expensive.

### 6.5.9 Reform will happen (2009-05-20 14:42)

When a group becomes too rich and powerful, it can wield influence over politics and over commercial activities in which its members are not directly involved. The effect is to enhance that wealth and power. This process is likely to end in political and economic crisis. That was the history of royal courts across Europe, from Versailles to St Petersburg. More recently, it has been the experience of many developing countries and transitional economies. In the three decades since Margaret Thatcher and Ronald Reagan inaugurated the market revolution, it appears that Britain and the US have joined their ranks. [1]*Beware bail-out kings and backbench barons* , John Kay

Big business and government have had an easy time of it over the past few decades. Our societies have all become richer on the back of cheap energy and globalisation. So it's been easy to be tolerant of distorted, corrupted markets and financial shenanigans in high places. It's been easy, too, for governments to spend huge proportions of national income inefficiently if not corruptly.

Those days are over. The transition will prove painful and where will it lead? I'd like to suggest that we'd do well to re-orientate policy so that it is focused entirely on outcomes that are meaningful to ordinary people. Its success or failure would be measured by how close it comes to achieving those outcomes. That sounds an obvious thing to do, but it would represent a stark change from the current regime where government (when it is well intentioned) rewards the ways it thinks will best achieve social goals. These alleged ways have led to bloated government agencies, a profound and tragic reluctance to terminate failed experiments, and resistance by public sector unions to any meaningful reform. They have also helped create the conditions by which big business has captured and corrupted government. Although Social Policy Bonds have been in the public arena for something like 20 years without any signs of take up (that I'm aware of), I am confident that something like them or, even more likely, outcome-oriented policy, will play a bigger role in the future. The question is: how far away is that future? John Kay continues:

But, as Louis XVI learnt as the guillotine fell, the longer reform is delayed, the bloodier the revolution. And the more unsettled and chaotic would be the eventual outcome for us all.

### **6.5.11 What government can and cannot do (2009-05-25 04:48)**

Government seems to keep growing. We look to government for solutions to everyone else's problem. To the degree that government creates problems, this is understandable. The lunacy of industrial agriculture, with its subsidies to [1]rich landowners and large agribusiness corporates can be solved only when government changes its policies. Similarly for [2]fisheries. But today's North Korean [3]nuclear test is a dramatic example of how little governments can do. North Korea doesn't care about the wellbeing of its people; its government is answerable to no-one. Any attempts by governments to influence North Korea is going to be sold to North Koreans as coercion, and raise the stakes accordingly.

But our governments are not completely powerless: they could issue Social Policy Bonds that reward investors for the avoidance of a nuclear exchange, *however they do so*. More generally, they could issue [4]bonds that target reductions in all sorts of violent political conflict. Government might not know what actions to take. And, as in the case of North Korea, it might be inherently incapable of bringing about good outcomes directly. But it can create incentives for people to research, discover and implement their own solutions to the urgent and huge problems humanity faces.

### **6.5.12 A priesthood of politicians (2009-05-25 12:54)**

I'm sure the irony won't be lost on many. The British Minister of Finance, the man who draws up the UK's taxation policy, claims for, and receives, £1400 of taxpayers' money so that he can pay somebody else to [1]ensure that "the correct amount of tax was paid in respect of my office costs". It's not his personal fault, of course, that our politicians are now seen as a distinct caste. The rules they devise for the rest of us are too complex and too grubby for them to engage with fully. But being of the priesthood they have no need to. Frankly, I dread to see what form the public reaction to this expenses scandal and our parlous economic state will take. I hope it will re-orientate policy so that it is expressed in terms of meaningful outcomes for ordinary individuals, and that such a transition will take place without too much pain. I doubt it though.

-  
Policy as if outcomes mattered  
SocialGoals.com

### **6.5.13 State of paralysis (2009-05-27 12:30)**

California has immense human and financial resources. It should not be in fiscal crisis; it should not be on the verge of cutting essential public services and denying coverage to almost a million children. But it is - and you have to wonder if California's political paralysis foreshadows the future of the [US] as a whole. [1] *State of paralysis*, Paul Krugman, 26 May

More than 30 years ago Californians voted for Proposition 13, under which property tax rates were capped. This has made the state more dependent on income taxes, which have been falling steeply during this recession. Initiatives like Proposition 13 give consultation with the public a bad name. The problem as I see it is that the implications of such an initiative are just too complicated for anyone to understand. That's where expressing policy goals in terms of meaningful goals, as would happen under a Social Policy Bond regime, comes in. Policymakers could target goals such as reducing the crime rate or atmospheric pollution, and if they issue Social Policy Bonds, the cost of such goals would be much more apparent than under the current system: the system that leads to a free-floating feeling that government spending on public services is too expensive, and to crude and counter-productive efforts to put a lid on it.

How so? Simply put, Social Policy Bonds are a tradable contract to achieve a specified outcome. The bonds are issued on the open market. There would be competition amongst bidders for the bonds, and in that bidding they would, in effect, be pricing the targeted outcome. Competition ensures that that cost is minimised. Crucially, such a cost is visible to everyone: the bonds' prices would be quoted just like those of other financial instruments. The transparency of such a system would not allow politicians -whether at local, regional or national level - to make vague promises or to gull the public into false beliefs about the cost of getting things done. This transparency, as well as much greater efficiency, is one of the huge advantages that Social Policy Bonds would have over the existing system, whereby contracts are doled out for the provision of certain outputs and the risk of private sector failure almost always borne by the public.

-  
Policy as if outcomes mattered  
SocialGoals.com

### **6.5.14 Why we are not surprised (2009-05-30 17:37)**

Andy Kroll writes:

What cannot be disputed, however, is the [US government] financial bailout's biggest loser: the American taxpayer. The US government, led by the Treasury Department,

has done little, if anything, to maximize returns on its trillion-dollar, taxpayer-funded investment. So far, the bailout has favored rescued financial institutions by [1]subsidizing their losses to the tune of \$356 billion, shying away from much-needed management changes and—with the exception of the automakers—letting companies take taxpayer money without a coherent plan for how they might return to viability. [2]*The Greatest Swindle Ever Sold*, 'The Nation', 26 May

So why are we not surprised? The compelling reason is that there is no compass to give the bailout any meaningful, coherent, direction, unless it is simply to shore up the short-term prospects of the politicians in power and the most powerful interest groups. Ordinary people are well down on the list of things to worry about. It is this indifference that has characterised policymaking for many decades. Time was, though, that there was a reasonable correlation between the interest of powerful lobbyists and the wellbeing of the general public. Over the years, as inequalities have widened and society become more complex, that correlation has weakened. Bailouts to big business at the expense of society and the environment - the [3]corporate-welfare state - are the result.

Social Policy Bonds would make passing this sort of corporate subsidy programme more difficult. They would subordinate all government interventions to the wellbeing of human, animal and plant welfare. How raising such welfare is to be achieved would be left to the private sector; under a bond regime raising welfare would be the private sector's goal, rather than doing things that can be sold to government as necessary or otherwise gaming the system for government funds.

## 6.6 June

### 6.6.1 A new organising principle (2009-06-02 21:38)

Mick Hume talks about the effect that the expenses scandal is having on UK politics:

What politics have New Labour or Conservative MPs really got to stand on today? Which of them now is really going to offer themselves to the electorate as a party loyalist? In that sense, perhaps the candidates will all be 'independents' at the next election, standing on no more than their expenses sheets or promises to be purer than the old gang. ... No, we may not need the old political parties or political class. But we do need politics, and much more of it - political ideas and principles that can contest a fight for the future. I do not support any of the existing parties - or, for that matter, any of the new ones to emerge so far. But I do recall why political parties were formed in the first place: to represent distinctive interests, classes and

movements in society, standing on manifestoes that meant something to people. Today we have the empty shells of parties without politics, which have become little more than closed, self-serving patronage and PR machines. We would be better off without them. But to shape the future we are still going to need organised politics of some form, with people standing for collective interests, rather than ragbags of worthy but pointless wandering independents. [1]

*They're all 'independent' now - but from what? , Mick Hume, 1 June*

Here's a suggestion: organise politics around outcomes, rather than personalities, personal probity, or the interests of powerful corporations and bureaucracies. Political debate centres on trivial or arcane details, rather than the broad direction government should take about society and the environment. All too often, these important questions are answered by default; usually by deferring to vested interests. The big decisions are rarely put to the voters. We simply aren't used to consulting people about the outcomes they want, and the priorities they place on them.

But there's no inevitability about continuing along those lines. Policymaking is largely about making trade-offs. It would be no bad thing if we, the people, had to choose between incompatible outcomes. A Social Policy Bond regime, because it [2]costs objectives would give us the information we need to make these choices. Apart from greater efficiency, transparency and stability of policy goals, Social Policy Bonds would therefore bring home to us the realities of decision making. They would make clear that we cannot look to government to solve all our problems, all the time.

### **6.6.2 Mickey Mouse micro-targets (2009-06-04 11:18)**

It's important, I think, that we have some way of monitoring the performance of bodies charged with solving our social and environmental problems. In our large, complex societies, that means we have to use numerical measures and indicators. They all have their weaknesses, but alternatives are, almost by definition, subjective and even less reliable. The Social Policy Bond approach would target broad goals that are meaningful to ordinary people. Its goals would, as far as possible, be inextricably correlated to social or environmental wellbeing. Unfortunately, the use of numerical indicators for targeting purposes is acquiring a bad reputation. Current targets are unsystematic, too narrow, and almost totally uncorrelated with the wellbeing of ordinary people.

Take the well-meaning goal of reducing the waiting time for patients entering the Accident and Emergency wards of UK hospitals to less than four hours. [1]James Bartholomew explains what happens in practice:

1. The ambulance bringing the patient to the hospital is kept waiting outside. The hospital simply declines to accept the patient. This means that the starting time of

the four hour wait is delayed and the hospital can claim it is meeting the target.

2. The hospital refuses to accept any emergency patients for a while. The patient has to be transported to a different hospital. This enables the first hospital rightly to claim that patients who get into the hospital are not kept waiting for more than four hours.

Why are the hospitals so keen to meet the target? Because the hospitals receive less money from the government if they fail to meet it.

Who or what suffers? Of course the patient suffers from being kept waiting for emergency treatment for more than four hours. In the second case, the patient may be carried to a hospital that is much further away, delaying treatment. Also people suffer who need an ambulance but cannot get one because ambulances are being kept waiting outside hospitals or taking journeys to hospitals far away. But this suffering is not a direct result of the target. It is a result of inadequate emergency provision in NHS [National Health Service] hospitals. What suffers directly as a result of the target and the cheating on the target is the truth and public awareness of the truth. That, of course, suits the government well. The truth that is kept secret from the voters is the extent to which the massive increase in spending on medical services in Britain has been wasted. We simply do not know the extent because NHS statistics are lies.

### 6.6.3 What matters in politics? (2009-06-07 15:52)

George Monbiot , writing about the recent £6.2billion contract to expand the M25 motorway around London, contrasts it with the politicians' expenses scandal in the UK, with its costs to the taxpayer amounting to about one-thousandth that of the road-widening scheme:

The issue is too remote and too complex to ignite public indignation. The scheme's obscurity has protected it from the outrage now being directed towards [British] MPs . George Monbiot , [1] *'The real expenses scandal'*  
, 26 May

What is frightening is how this has now become quite general. Hugely important decisions about the energy, transport, immigration, law and order, are taken almost by default. Public attention, and this is especially noticeable in the UK, settles on images and personality, and on crises only if they have effects that make a dramatic impact when filmed for tv . Slow-moving, complex crises, like climate change or the ballooning of public and private debt, deteriorate over the years, until they manifest themselves unequivocally forms that can be covered in a short news bulletin. There's an inevitability about this, and it's perfectly explicable in a world in which we are bombarded by information. But it is not efficient, because resources

are devoted to avoiding images of failure, rather than actual failure. Serious but non-visual crises, as we have seen in finance and the environment, slowly and undramatically gather pace until their effects become unavoidable. By that time, of course, it might be too late to do much about them, even with enormous quantities of spending.

A Social Policy Bond regime could be different. It could target the maintenance of the favourable aspects of the status quo : avoidance of too much [2]climate instability; the absence of nuclear warfare; the prevention , indeed, of any sort of [3]human catastrophe , however caused. The emphasis of much of the media attention in the UK currently is on the personality of the Prime Minister and possible contenders for the leadership of his party. About these matters there is much debate. It is unfortunate, to my mind, that the energy given over to such debate is not devoted to more substantial policy matters. If it were, we could better answer such questions as 'what is "too much" climate stability?', and how shall we best define 'human catastrophe', and take some steps in the direction of solving these and other genuine policy problems. Who would be the best Prime Minister is, to my mind, a distraction. We need, in short , urgently to express our political views in the form of desirable outcomes, rather than in terms of personalities or party politics.

#### **6.6.4 It's just too complicated... (2009-06-09 22:47)**

...for government, or indeed any single organization, to handle. From 'New Scientist':

The life-cycle emissions generated by cars, buses and aircraft are dominated by tailpipe emissions pumped out in day-to-day running of their engines. Hence, the best way to reduce emissions from these modes of transportation would be to increase fuel efficiency and push for renewable fuels. Crisscrossing the US with a rail network, however, creates a different problem. More than half of the life-cycle emissions from rail come not from the engines' exhausts, but infrastructure development, such as station building and track laying, and providing power to stations, lit parking lots and escalators. Any government considering expanding its rail network should take into account the emissions it will generate in doing so.... [1]*Train can be worse for climate than plane* , Catherine Brahic , 8 June

Can you imagine any government doing that? And getting it right? And continuing to get it right when new technology or new information about emissions and their effects becomes available? It's not going to happen.

Which is why we need, urgently, an outcome-driven approach. The old way of doing things, with government doing what it thinks is best, might have worked when government was well intentioned and environmental depredations much simpler to identify. It just doesn't work nowadays, when government does what its paymasters want it to do and environmental

relationships are much more complex. Government is not up to the job of working out whether climate change is best tackled by subsidising rail, windmills, or catalytic converters. It's not what government is good at, it's not what people go into government to do, and it's not what they are motivated to get right.

What government can do is set up a regime whereby people are rewarded for achieving climate stability, however they do so. In other words, it could contract out the achievement of a more stable climate to a motivated, diverse, adaptive private sector. It could, in summary, issue [2]Climate Stability Bonds.

### 6.6.5 Studying ordinary people (2009-06-10 20:34)

Graham Watson, one of the leading lights of the Liberal EU Parliamentary Group responded to the most recent [EU] election results by saying he couldn't understand why the turnout was so low, and therefore 'we need to study why people don't go out and vote'. Sadly, Watson's lack of understanding of the realities of political life in the EU is not just an act; he is genuinely so out touch with public sentiment that he simply doesn't get it. Leading EU politicians frequently look upon their electorates as exotic and incomprehensible species whose habits and sensibilities must be 'studied'. [1]*How EU bureaucrats are destroying public life* , Frank Furedi , 10 June

It was perhaps inevitable that politicians, as with other professions, would evolve into something like a separate caste from the rest of us. As with airline pilots, we actually want our highly polichymakers to specialise and know exactly what they are doing. The problem is that, unlike airline pilots, our politicians' goals have become quite distinct from, and often in conflict with, those of ordinary people - the public they are supposed to represent. Is 'studying' these people the best way of re-aligning policymakers' goals and visions with those of society?

A better alternative might be to rethink the entire policymaking process. Instead of expressing policy goals in vague terms, or as the product of arcane, stultifying debate about legalisms, funding, or institutional structures, we could instead define policy goals in terms of outcomes that are meaningful to the non-politicians amongst us. Take, for instance, climate change. The psychological connection between cuts in emissions of greenhouse gases and climate stability is a tenuous one, even if the physical relationship turns out to be direct and significant. Legislating for cuts in greenhouse gases is already proving divisive, and threatens our entire climate stabilising project. Much better, in my view, for policymakers to target climate stability itself; a goal with which all of us can identify. Let investors in [2]Climate Stability Bonds work out how best to achieve this goal; responding as only motivated private sector agents can to our rapidly growing knowledge about the causes and effects of climate change.

### **6.6.6 Where are we heading? (2009-06-14 16:04)**

Diminishing numbers of people voting; a disdain for incumbent parties; a disenchantment with existing politics...the results of the recent European Union elections just reinforce what we already know and feel: the widening gap between politicians and the people they are supposed to represent. The British Members of Parliament expenses scandal adds piquancy to the mix. The centralising of government and its continued accretion of powers great and small are reaching their logical conclusion: an almost complete detachment of politics from ordinary people. Apathy and resentment - and the possible rise of extremist parties - are an almost inevitable result. It's particularly unfortunate now, when humanity's challenges are so urgent, and so demanding of a consensus and social cohesion that are rapidly disappearing.

I don't think we can continue along these lines, and see a necessary, painful transition to a new sort of politics . But what will be the result? Here are some possibilities:

1. A benign authoritarianism, Singapore-style. A corporatist-style government : freedoms are sacrificed to economic growth, punishments for misdemeanours are harsh, parliament is a rubber-stamp, and any political opposition is only token. Social cohesion is enforced and synthetic. Society and the environment are managed. The big advantage is that the streets are safe and with smart people at the top, the system works well in its own terms.

2. The US model, but without the economic growth that sustained it. Something along South African lines, where people retreat into their own communities; intra -community relationships are tense; anybody who can afford it lives in a gated suburb.

Neither model is attractive to those used to the western way of doing things. And that's where Social Policy Bonds, or something like them, could enter the picture. Currently politicians form a separate caste, and political debate centres on arcane spending and legal decisions

with all the opportunities that presents for conscious corruption or the massive over-representation of special interest groups. Under a Social Policy Bond regime political goals would be expressed in terms of outcomes that are meaningful to ordinary people. Government funds would be exactly congruent with the achievement of social and environmental outcomes.

Risks of underperformance and failure would be borne by the private sector, rather than taxpayers. Goals would command a wide consensus, being of broad appeal. There wouldn't be the destructive, corrosive and ultimately distracting arguments about who should provide various socially beneficial goods and services. Instead there would be a strong emphasis on efficiency, and one that would arise naturally by the workings of a free market in Social Policy Bonds.

People understand outcomes, and there would be greater public participation in which goals shall be targeted. Such participation is an end in itself, and could be worth even more than the efficiency benefits that, in my view, a Social Policy Bond regime would generate. At a time when the current system appears to be disintegrating, and the alternatives seem unattractive or repellent, Social Policy Bonds, with their focus on meaningful outcomes and consensual goals, would bring something absolutely critical to policymaking and something that is fast running out. And that is buy-in: people's agreement to support something because they have been involved in formulating it.

### **6.6.7 Ends and means in transport (2009-06-15 23:14)**

Though I try to look after myself, eating carefully and going to the gym frequently etc, I now doubt whether Social Policy Bonds will be issued within my lifetime. But, quite apart from the potential of [1]cryonics, I take heart that at least one of the principles underlying the bonds is entering the mainstream; and that is the much deeper thinking about the social and environmental outcomes we want to see. Away from the mainstream media anyway, there is greater clarity about the conflicts between vague, implicit or unstated policy goals and these outcomes. For instance, transport is being seen more and more not as an end in itself, but as a means to various other ends - with which it might be in conflict. A large part of the problem is that many of the outcomes we want to see are less easily quantified than traffic flow figures and the like, so they fall through the cracks in our highly centralised bureaucracies. [2]John Adams is perfectly aware of these ends, and thinks that as well as asking:

Would you like a car, unlimited air miles and Bill Gate's level of access to all the electronic modes of travel? [3]

*Hypermobility : too much of a good thing ( pdf )*

we should also ask:

Would you like to live in the sort of world that would result if *everyone's* wish were granted? Assistance with the answer might be given by rephrasing the question - would you like to live in a dangerous, ugly, bleak, crime-ridden, alienated, anonymous, undemocratic, socially polarized, fume-filled greenhouse threatened by terrorism without precedent?

Quite so. We need absolute clarity about the ends of all social and environmental policy. There might have been strongly causal relationships between means (road links, for example) and ends (more wellbeing ) in the past, or at certain stages of societal development, but that doesn't mean they will always apply. Or, as Mr Adams puts it, in relation to transport:

To question the benefits of hypermobility is not to deny freedom and choice. It is to ask people what it is that they really, really want, and to confront them with the fact that their choices have consequences beyond the primary objects of their desires.

### **6.6.9 Why the state cannot save the economy (2009-06-19 18:01)**

Concluding his article titled [1]*Why the state cannot save the economy*, Frank Furedi says:

[The UK public sector's] inefficiency will not be overcome any time soon. This is not to counterpose the state to the market, but rather to say that there are states which are weak or strong, smart or stupid. We are good at recognising failed states in Africa, but not so good at noticing the failed states closer to home. Similarly, markets are by no means always robust and there are some in major need of overhaul. What we need, and this is something we can all help to bring about, is a state with new policies that are more worthy of the twenty-first century and which is better able to meet our needs. We do need a state that can contain the most destructive effects of the global crisis, but we mustn't think for one second that the state can save the economy. That is because we

shouldn't be trying to save the economy - we should be restructuring it. 'Spiked',  
18 June

I'm not sure what Mr Furedi means by 'we' here. I'm more sure that any conscious effort at restructuring is unlikely to be fruitful and quite likely to be disastrous. Society is a complex as an ecology and if the economic history of the past 100 years teaches us anything it's that central planning and picking winners fail even in their own terms. And that strenuous, government-backed efforts in economics usually concentrate on one or two specific variables - with Mao Tse - Tung it was steel production or sparrow destruction; with most governments now it is economic growth - at the expense of everything else, including human wellbeing .

So I for one am wary of vague efforts calling for the sort of reform that can be carried out only by government and its agents. I'd rephrase Mr Furedi's last sentence to say: 'we shouldn't be trying to save the economy - it should be refocused so that it supplies broad social and environmental goals'. Government does have an indispensable role to play and those are in doing what only it can: articulating society's concerns, and raising the revenue to finance their achievement . Where government fails is when it detaches itself from society, and tries to achieve goals itself. Part of the reason for its failure is that it's not subject to the efficiencies of a competitive market. In particular, it doesn't terminate failed experiments . Any monopoly, whether private or public sector, stifles diversity and the variant approaches to which it gives rise. We need diverse, adaptive projects and programmes, focused toward achieving our broad social and environmental outcomes.

Social Policy Bonds are a means whereby this sort of restructuring could come about. Under a bond regime, government would do what it's good at doing: setting social and environmental target, while investors in the bonds would do what the private sector is good at doing: exploring, investigating and implementing an array of approaches, responsive to events and specific to regional variations, all in the service of the overall goal. Their rewards would be inextricably linked to their success in bringing about society's wishes, as articulated by government. Only then would efficiency in the fulfilment of social goals, almost a forgotten concept in government circles these days, be maximised.

### **6.6.10 Success cannot always be codified (2009-06-21 21:12)**

For anyone who genuinely wants to quit smoking, an

Easyway

session can be both an enlightening and exhilarating experience. For an observer, especially a non-smoker, it must be as

interesting

as reading the instructions for assembling a model aircraft kit, without have the slightest intention of actually putting the contraption together. After sitting through four four-hour sessions, [Dr] Judith [

Mackay

, Director of the Asian Consultancy on Tobacco Control and anti-smoking campaigner] had to admit that she could not fathom how the method works. Not knowing the answer to this question has never bothered me.... [1] Allen Carr

, [2]*Packing it in the Easy Way* (page 237)

There are large, important areas of individual life where even after we have achieved something, we find it difficult to articulate how we did it. Mr Carr's [3]

Easyway

method was successfully followed by millions of smokers who wanted to quit, but Mr Carr found it impossible to explain how it works.

Doing the right thing so often is the result of behaviour that cannot be codified, even by an individual practitioner. How then can we devise institutional arrangements that will ensure, for example, that a catastrophic nuclear exchange will not take place, that we can avoid environmental calamity, or that children shall not die of malnutrition or malaria in their millions? I think it can be done, but only in retrospect. Allow experimentation, and in particular the termination of failed approaches, so that only the successes are widely applied. But for that to happen, we need to start with an array of diverse approaches .

So it's unfortunate that those the organizations to whom we look for solutions to our most important social and environmental problems are large enough to be immune from extinction if they fail: I refer to national governments and supra-national bodies such as the United Nations. Particularly when it comes to global challenges, they function as monopolies, insofar as they crowd out diverse approaches even if they do not actively stifle them.

Something like

Easyway

- successful, but impossible to codify - would never be considered by a government body. Tried, tested and failed approaches will always be preferred to something that by its success and its non-compliance with codified procedures threatens existing organizations' over-arching goal of self-perpetuation.

That's where Social Policy Bonds could help. Under a bond regime our existing monopolistic bodies - national governments - could still have roles to play: articulating society's concerns, and raising the revenue for their achievement. These are crucial roles, and the monopoly powers of government mean that only they can do them effectively . But under a bond regime the actual achievement of social and environmental goals would be contracted out to the private sector. Bondholders would have incentives to investigate and explore diverse approaches, and there would be no safety net for failures. Success in achieving social goals efficiently would be the sole criterion for a particular policy approach. In such a way could we bypass the stultifying barriers to successful new approaches imposed, consciously or not, by government, with its monopoly powers and insistence on

codifiable

, tested methods.

### 6.6.11 Outcomes trump intellect... (2009-06-24 19:34)

...as a policy driver. [1]Chris

Blattman

quotes from

Mahmood

Mamdani

's [2]*Saviours and Survivors*:

'The Rwanda genocide unfolded at the same time as the elections marking the transition to a post-apartheid South Africa—during the first half of 1994. At a meeting of African intellectuals called in

Arusha

later that year to reflect on the lessons of Rwanda, I pointed out that if we had been told a decade earlier that there would be reconciliation in one country and genocide in another, none of us could have been expected to identify the locations correctly—for the simple reason that 1984 was the year of reconciliation in Rwanda and repression in the townships of South Africa. Indeed, as subsequent events showed, there was nothing inevitable about either genocide in Rwanda or reconciliation in South Africa.'

Mr

Blattman

goes on to ask:

I'm only a few pages into

Mahmood

Mamdani

's *Saviours and Survivors*, but I'm immensely enjoying it already. ... The book is

Mamdani

's broadside against the tide of

Darfur

advocacy movements in the US. The academic in me loves

Mamdani

's basic point: politics, like life, is complex. Boiling the

Darfur

conflict down to a slogan and popular campaign is at best naive, and is probably doing a disservice to peace and stability itself. The problem as I see it: simple messages, credos for action, and the call to "save" Africans will always mobilize more attention and enthusiasm than "Well, on the one hand...". Are we ...doomed to obscurity by our monotony and

evenhandedness

?

I think the answer is 'yes', but obscurity need not mean ineffectiveness. It probably does when there's a strong correlation between spending and results, but that doesn't always apply. Indeed, some conflicts, particularly in the Middle East, would probably benefit hugely from obscurity to the point of being invisible to the outside world. Complex issues are rarely amenable to the solutions available to large single organizations, like governments. Such organizations just are not responsive enough either to local variations, to information flows, to new technology, or to events on the ground.

Where governments, or supranational organizations like the United Nations could help is in funding the achievement of objectives by, for instance, issuing Social Policy Bonds. Preventing or ending conflict in

Darfur

or anywhere will probably require a mosaic of diverse, responsive projects, policies and initiatives. Social Policy Bonds would motivate investors to explore and implement these and, importantly, to terminate those that don't perform.

By issuing Social Policy Bonds governments, or the UN, or any group of interested philanthropists could fund a complex array of solutions to the conflict they target, even if they cannot anticipate what these solutions shall be. For more on this, see my essay on [3]*Conflict Reduction Bonds*.

### 6.6.12 Threat simulation (2009-06-27 12:14)

We'll probably never fully understand why we dream but, in an article suggesting reasons, [1]Jesse Bering describes the 'Threat Simulation Theory':

Originally proposed by Finnish neuroscientist [2] Antti

Revonsuo , this clever evolutionary theory holds that dreaming serves a biologically adaptive function because it allowed our ancestors to simulate problem-solving strategies for genuine, waking life threats. [3]Antonio Zadra , Sophie Desjardins , and Eric Marcotte of the University of Montreal neatly summarize the central argument of the theory this way: “By giving rise to a full-scale hallucinatory world of subjective experience during sleep, the dream production mechanism provides an ideal and safe environment for such sustained practice by selecting threatening waking events and simulating them repeatedly in various combinations.” What we should see in contemporary dreams, argues Revonsuo , are “threat scripts” depicting primitive themes of danger that would likely have been relevant in the ancestral environment, such as being chased, falling and so on. [4]*Dreaming of Nonsense: The Evolutionary Enigma of Dream Content* , ' Scientific American ' , 25 June

Could the benefits of testing alternative scenarios outweigh the costs, in terms of a brain that's more active than you'd think it needs to be? It's plausible , if unprovable. But it's a fact that whether we are conscious of it or not, much of our individual decision-making relies heavily on trial and error. Real life is messy, in the sense that there often are too many variables and time lags to relate unequivocally cause and effect.

Unfortunately, in handing our social and environmental problems to large organizations, like governments, we are effectively making the very large assumption that the causes of our problems can be fixed with a minimum of trial and error. That's because large monopolistic organizations just do not do trial and error: they have their own ideas about how to go about things, often dictated by ideology or, more likely these days, by corporate interests and campaign funders, but either way, immune from competition from alternatives. So failed experiments are never terminated, while ordinary people's coping mechanisms are undermined.

All of which is not to say that government shouldn't get involved in solving our social and environmental problems. There are some things that only governments do, and that they can do well. One such is raising the revenue to tackle our problems; the other would be to articulate these problems in the first place. But the efficient *achievement* of our targeted outcomes requires the sort of trial and error, and the continual selection of only the best method; and that is something that governments are too big, too monolithic and too unmotivated to do. And that's where Social Policy Bonds enter the picture. Under a bond regime trial and error - essential at the societal as well as the individual level - operates automatically to select the most efficient projects and programmes. Failures are swiftly terminated. And this happens because society's targeted goals are exactly the same as those who invest in the bonds who bear the risks of failure while society benefits from their success.

## **6.7 July**

### **6.7.1 Flying blind (2009-07-01 16:24)**

There is optimistic talk about emerging from the recession in the UK and Europe. I think we are confused on several fronts. First, the health of an economy, even if it were accurately measured, is not the health of a society. Second, because what passes for the health of an economy these days are, essentially, the profits and sales of large corporations, and the rate of growth of house prices. Far more important though, are what is left out: the numbers of unemployed, debt levels, crime rates and the huge negative non-market impacts that a growing fossil-fuel dependent economy has on the environment. All this is not to deny that there are positive non-market externalities when the economy, as simplistically measured, is doing well. There are, but the negative impacts: climate change, for instance, or the risks of other environmental catastrophe, or an alienating physical infrastructure; these are ever more serious on a shrinking planet.

And we're not addressing them. The politicians and their corporate paymasters are desperate to revive the old economy. At the global level there are no systems in place to deal with climate change, nor man-made disasters such as a nuclear exchange. There's very little explicit targeting of such desirable but elusive goals as 'avoiding catastrophe'. At the national level, governments fiddle with well-intentioned, but meaningless or even [1]harmful Mickey Mouse targets. The problem is similar to that of the public sector: the interests of government agencies and public sector auditors are the interests of their organization, and when they conflict with the greater good - for which, admittedly, goals are difficult to define - it's the wellbeing of the organizations that wins every time.

So we are flying blind. Our flightpath is determined by powerful corporate interests and their friends in government. On our aircraft there are many well-intentioned people doing the right thing. But the overall direction they are travelling in bears little relation to their efforts or intentions. It's not the wellbeing of ordinary people that will determine whether, or when, we fly into a mountain, or crash into the sea, but the short-term interests of large organizations, public and private sector, as measured - badly - by the accountants.

### **6.7.3 Biologically programmed to crash and burn (2009-07-05 22:42)**

As products of evolution probably the one thing that we are not designed for is to live sustainably. Evolution selects for reproductive fitness. Now that *can* be consistent with restraining our numbers in the short run or, less often, with restricting our consumption levels, but it is more generally in conflict with them. Our institutional apparatus - bodies like United Nations peacekeepers , atomic energy watchdogs, or the numerous non- governmental

organizations working in the developing world - do heroic work in difficult

circumstances . But their influence on the big picture seems peripheral . Are they merely pebbles on the road to ruin? Faced with overwhelming

environmental or man-made catastrophe, we appear not to be very interested in looking after the long-term interests of human, animal or plant welfare. We all know that it's in nobody's interests to have, for instance, a rapidly changing climate, or the proliferation of nuclear weapons. But we seem unable to link that knowledge to effective action. Perhaps we are genetically incapable of defusing crises unless they are fast-moving and have readily identifiable causes.

Social Policy Bonds could help by targeting universally desired outcomes: perhaps above all the [1]avoiding of catastrophe. They could blur the distinction between our narrow, short-term, individual goals, and the greater good of the planet. They could align our daily self- and family-sustaining activities with the achievement of our broad social goals. It's a big claim, but I do not see any alternative. The current political system is, frankly, not up to the job of managing our future. More and more it seems we are destined to crash and burn.

#### **6.7.4 Nobody ever dies of divergent goals (2009-07-07 22:01)**

My header is an inelegant echo of an old article by Garret Hardin: [1]*Nobody Ever Dies of Overpopulation* . What I'm saying is that the current rioting in China is only the most visible sign of an economic and political system gone badly wrong. In brief, the goals of the government and its corporate allies are not only different from, but are in conflict with, the goals of the wider population. And not only different, but diverging. At the beginning of industrialisation it's largely true that what's good for the corporations is good for the people . And when things are improving it's easier to be optimistic that more of the same will bring about a better standard of living for everyone. But at some point, and this is by no means unique to China, government listens less and less to the people, and more and more to the big corporations . The interests of the corporations - essentially reducible to profits, revenue or market share - become identified in the politician's mind with those of the wider citizenry. Then, when even the corporations are ceasing to grow, and the economic figures no longer look promising, the degraded social (and physical ) environment assumes a larger, baleful role. The things that cannot be captured by the statisticians and that are of little concern to corporations , begin to assert themselves. Riots, blamed on something else, are one manifestation . We shall see more of this, I'm sorry to say.

One way of realigning ordinary people's interests with those of government and the wider economy would be to introduce government-backed Social Policy Bonds. In a world that is now largely designed by governments and corporations , it's unfortunate that unless something is explicitly targeted, it's going to be neglected and probably suffer as a result. A bond regime could change that by having as its over-arching goals improved social and environmental

wellbeing . We cannot know exactly which goals people will decide on, though I'd offer 'avoidance of catastrophe, man-made or natural' as a high priority: one of the larger benefits of a bond regime is that society's goals would be decided by ordinary people ourselves. That would be in stark contrast to the current system, whereby it's assumed they are congruent with those of politicians and corporations , until the inevitable collapse in social cohesion becomes impossible to ignore.

#### **6.7.5 Two degrees or 350ppm? (2009-07-09 21:40)**

The G8 countries have [1]approved a target of 2° C rise in global average temperature above the natural, preanthropogenic climate, that they resolve should be avoided. But would 350 parts per million of carbon dioxide equivalent in the atmosphere be a better target? Frankly, given that the agents ultimately charged with achieving the target are governments, I don't think it matters. There will be no accountability and no penalty if the target is not achieved. Instead - you can hear it now - there will be excuses. Administrations change, and politicians are expert at evading and deflecting blame. They will be able to blame vagaries in measurement, or in the scientific relationships ; or previous administrations , other countries' administrations , 'unexpected' events, ...the list goes on.

Broad target setting is all very well. It does, indeed, underpin the entire Social Policy Bond concept. But there has to be motivation as well. Government and its agencies are paid to perform activities, to stop other people performing activities, to allocate funds, to ensure compliance with rules - and a whole host of other things, not all of them useless. *But they are not paid to achieve outcomes.* Climate change is a huge, urgent challenge. Well-meant targets must be backed up by powerful incentives so as to reward success and penalise failure. And that's where Climate Stability Bonds should enter the picture. The G8 (or the United Nations) could still set broad climate-related goals. They could still raise the funds to reward investors in the bonds. But, by issuing the bonds, they would be contracting out the achievement of climate stability to people who are motivated to succeed, rather than merely paid to turn up to work. A huge, and quite possibly a planet-saving - difference. Look under 'climate stability' [2]here to find out more.

### 6.7.6 Kyoto will fail (2009-07-15 19:08)

What the G8 summit in Italy decided to do about climate change last week was much less than is necessary, but the very best that a realist could have hoped for. Some tens of millions of people will probably die as a result, or some hundreds of millions if we are really unlucky, but there is still time to avoid the worst. And anyway, it can't be helped: this is the way we do business. [1] Gwynne Dyer  
, 10 July

Talking with friends recently I'm more and more convinced that efforts to cut greenhouse gas emissions are going to have a minimal effect on the climate. As a species our chances of controlling the climate, looking at it from the process-engineering angle, appear to be minimal. That said, the Kyoto process might not be totally without benefit. It might encourage us to do the right things (like reduce our absolute dependence on fossil fuels, conserve energy etc) for the wrong reason. There's nothing wrong with that, except that the Kyoto's upfront costs could probably be better spent in reducing the impact of climate catastrophe; and the risks of failure to stabilise the climate are not only large, but will be borne by the wider population. If the real goal genuinely is to stabilise the climate then something like [2]Climate Stability Bonds would be far more efficient than Kyoto. Incentives are important, and the over-arching incentive I see falling out of the Kyoto process is to game the system.

### **6.7.7 Perils of the McNamara approach (2009-07-17 21:11)**

One of the most intelligent men ever to hold public office, [Robert] McNamara mused in retirement on why a project that promised so much had gone so badly wrong. Decentralised markets had systematically outperformed central plans, planned development strategies had failed. Detroit's obsession with numbers had fallen victim to the Japanese passion for quality, and the American military machine was defeated by the forces of North Vietnam. [1] John Kay

, 15 July

It's worth pondering what might have happened to the car industry if there'd been no Japan, no competition from decentralised markets. We'd have something like we have today in global affairs, where responsibility is largely handed over to huge organizations, devoid of any pressure to be competitive, efficient, or even effectual. The United Nations, for instance, or the World Bank/IMF. The decisions of any large monopolistic body are going to be determined entirely its culture and goals, and there's no inherent congruency between these goals and those of the people they are supposed to serve.

We're coming late to the idea that the evolutionary forces that have propelled most of us out of abject poverty - trial-and-error, experimentation, diverse approaches with termination of failures, adaptation - can actually be consciously deployed, as they would be under a Social Policy Bond regime. But it is heartening to read [2] here that the idea is at last being discussed and tried in an area that desperately needs it: development.

### **6.7.8 Does government intervention lead to too much monoculture? (2009-07-21 19:34)**

'Too much' in the sense that a properly functioning policy, with undistorted competition, would lead to more diversity and less vulnerability to drastic downturns. I suspect the answer is 'yes'. Take agriculture. Government has a long history of intervention in agriculture in the industrial countries. Perverse subsidies to the sector in the rich countries have contributed to the devastation of the physical environment, diverted wealth from the poor to the rich and accelerated the massive overcapitalization of farms and rural depopulation.

And in much of the countryside in the west, the visual testament to a long history of government involvement is square kilometre after monotonous square kilometre of land devoid of trees, hedges and human beings, devoted to intensive production of crops or pasture. Subsidies have exaggerated this specialisation, partly because guaranteed prices have reduced the risks of on-farm specialisation and partly because capital assets receive favourable tax treatment. So one result of the combination of subsidies and centralised price-fixing and subsidies has been a greater degree of monoculture in agriculture than would

otherwise prevail. As well, without the high levels of subsidy it's unlikely that farms would be as land-intensive as they are today. Net production would be lower, but so too would use of fossil fuels, pesticides and prices to consumers.

Government involvement in infrastructure has similarly increased our dependence on fossil fuels. Government has implicitly guaranteed oil supplies. It's done it on our behalf and as a result the construction industry has, as in agriculture, entrenched and exaggerated our dependence on oil.

The construction industry: not necessarily a part of government but certainly remarkably close to it. Perhaps my header would read more accurately if I inserted the words "on behalf of its corporate friends" after "intervention". And rephrased it as a statement, rather than a question.

### 6.7.9 Preoccupied with trivia (2009-07-22 20:37)

In the midst of the most profound financial and economic crisis in living memory, what issues are the [British] political class arguing over? Not how our society should produce and distribute its wealth in the future, but how much a few bankers should get in bonuses and which bankers or bureaucrats should sit on financial regulation committees. Mick Hume, [1]*What good's an election without alternatives?* 22 July

Public debate is always going to centre around issues that people understand. Our politicians and their corporate paymasters have successfully obscured most of the big issues in politics. Only specialists understand them, so matters of importance to ordinary people are resolved in favour of the existing vested interests. The media are filled with trivia, and urgent crises are ignored.

One of the big benefits of a Social Policy Bond regime is that it would start by clearly and transparently, deciding on society's targeted outcomes. These could include the [2]absence of disasters, as well as more positive goals, such as [3]reducing unemployment, or [4]cleaner air and water. There would, in my view, be significant efficiency gains when a bond regime channelled market forces into achieving these goals. But perhaps of even greater benefit would be the accessibility of the public debate about which outcomes should be targeted, and their relative priority . People understand outcomes, so we could expect greater public participation in policymaking . We could also expect more attention to be paid to the big issues, rather than the trivia .

### 6.7.10 Give greed a chance (2009-07-26 22:09)

Climate change, the world's financial system, the risk of nuclear war or pandemics: the list of huge problems that our politicians are unable to comprehend, let alone deal with, is scary. We know little about the exact scale of the problems, still less about how costly will be their solutions. And even less about how most efficiently to go about finding such solutions. The consequences of getting any of these calculations wrong under the current command-and-control policy system is immense. And these consequences are borne entirely by people who cannot or do not want to bear them.

Social Policy Bonds can transfer the risks of getting it wrong to people who are prepared to take on that risk, in the hope of profiting from solving our social and environmental problems. The bonds channel the market's incentives into the achievement of universally desired goals rather than, as now, corrupting the global banking system or marketing dogfood. It is only 'greed' in the sense that going out to work, rather than staying at home while collecting a lesser sum on the dole is also 'greed'. That sort of greed can be helpful to us all if it's channelled correctly, and if the 'greedy' people's goals are exactly congruent with those of society. They would be so congruent under a Social Policy Bond regime. Read more by clicking on the links in the right-hand column.

### 6.7.11 Conflict Reduction Bonds (2009-07-29 16:44)

I've just begun reading [1]*Breaking down the wall of silence*, by Alice Miller. From the preface:

What makes a person wish to destroy the world? ... [T]echnology alone is not sufficient to protect us from the consequences of denied, and thus uncontrolled, emotions. Without facing up to their origins - the production of hatred in childhood - we will be unable to resolve such hatred and put an end to the work of devastation. It is in no way exaggerated to say that *every tyrant*, without exception, prefers to see thousands and even millions of people killed and tortured rather than undo the repression of his childhood mistreatment and humiliation, to feel his rage and helplessness in the face of his parents, to call them to account and condemn their actions.

This sounds plausible to me. The problem, from the point of view of policymakers, is that the evidence for or against it is too scanty right now to provide a firm basis for policy. Our national political systems are geared to deterring or fighting wars, rather than their looking for their psychological causes. Our global political systems are geared to intervening in existing conflicts or interposing themselves between likely antagonists. Investigating the psychological causes of war is too speculative and long term for government bodies. Government, including global bodies like the United Nations, are good at dealing with, say, disease outbreaks or natural disasters. There, the causes are by and large known, the actions to take are specific, monitoring of progress is easy. Indeed, only large organisations like government can effectively deal with such emergencies. Where such organisations fail, though, is when

the relationship between cause and effect is not so simple to identify. The tendency then is to allocate resources according to factors other than long-term effectiveness and efficiency.

Prevention of violent political conflict may well require a mosaic of approaches, including those currently followed by the United Nations. But if Ms Miller is correct, then the huge disparity between the resources given to current prevention methods as against investigation of psychological causes would be especially grievous. When faced with something as apparently intractable as war, the right approach, I believe, is to specify a desirable outcome - some robust definition of 'peace' in this example - and reward people for achieving it, *however they do so*. We can't know in advance whether looking at children's treatment in the family will reduce the level of conflict, but we can take steps to encourage investigators inspired by Ms Miller to pursue their enquiry if it shows signs of promise. [2]Conflict Reduction Bonds, issued with the goal of reducing violent political conflict to a very low level, would channel resources impartially into the most promising lines of enquiry, however obscure or unfashionable they might now appear.

## 6.8 August

### 6.8.1 Magical solutions (2009-08-02 21:58)

[T]he British government has enacted a law ...requiring emissions reductions of 34 percent below 1990 levels by 2022, which would be upped to 42 percent if the world reaches a global climate agreement in Copenhagen in December. What is missing from the debate over targets and timetables is any conception of the realism of such proposals. If a proposal is not realistic, it is not really a policy proposal but an exercise in symbolism, a "magical solution." Symbolism is of course an essential part of politics, but when it becomes detached from reality — or even worse, used to exclude consideration of realistic proposals — the inevitable outcome is that policies will likely fail to achieve the promised ends. This outcome is highly problematic for those who actually care about the substance of climate policy proposals. [1]Roger A Pielke , Jr

Professor Pielke goes on to point out that if Britain is going to achieve its stated reduction goal it would have to deploy about 30 new nuclear power plants in the next six years. 'One does not need a degree in nuclear physics to conclude that is just not going to happen.'

What's going on? It's part of a broader problem: conventional policymaking is too complex for ordinary people. There are just too many diversionary opportunities for powerful interests to exploit. We cannot safely not evaluate policies or politicians in terms of outcome: there are too many variables involved, and too many time lags. Cause and effect are obscured

and political debate centres around soundbites and personality as portrayed on tv .

Or symbolic statements that have no meaning. As Professor Pielke says:

[C] limate policy has become about demonstrating one's strong feelings about the reality and urgency of climate change and not so much about implementing policies that can actually work.

We could, of course, let outcomes drive policy. If we are serious about climate change, even allowing for the massive uncertainties over what's going on and what's causing it, we'd issue [2]Climate Stability Bonds, which would reward people for taking measures to stabilise the climate (or reduce the impact of an adverse climate). But that would be an efficient, effective solution, rather than a magical one.

## 6.8.2 Violence and farm subsidies (2009-08-06 18:48)

More from [1]Alice Miller:

National leaders intent on war do not want to believe that the destructive forces from which they constantly attempt to free themselves at other people's expense are in themselves revenge feelings for old, very personal wounds. in the face of even the possibility of nuclear war, we simply cannot afford to go on ignoring this fact. But that is exactly what we do: numerous civil servants and government specialists deal with the results of child abuse, without being able to see and know its origins.

[2]*Breaking down the wall of silence* (page 94)

If Alice Miller is correct, violence against children is self-entrenching. The more it's done, the more it will happen in the future. In this it's similar to other destructive policies: farm subsidies for example, which enrich a tiny minority at great cost to everyone else and the environment, and enable this minority to oppose their removal. The corrupt madness of agricultural subsidies in the west has been known about for decades, but last year they totalled [3] \$265 billion. And in both areas, it's going to take a long, wearisome wait, for better policies to arrive. Darwinism selects only for a fairly narrow definition of fitness; it does not select for 'optimal from the point of view of human wellbeing '. Even then, I don't think we could rely on evolution to work, even after many generations, unless perhaps we are considering large numbers of planets and are indifferent to what happens on our own.

## Agricultural

subsidies , for all their many faults, don't threaten entire populations, but nuclear warfare does. We might well be inhabiting a planet where violence against children has irredeemably taken hold, and the 'fittest' in that paradigm are fit only to destroy human life on it. Rather than hope for the best, or wait eons for evolution to work in our favour, we could instead let a basic targeted outcome drive policy: absence of nuclear war. We could do this by issuing [4]Conflict Reduction Bonds. It's true that, given numerous planets, the ultimate survivors may be those on the planet that, for some random reason, did not succumb to self-entrenching destructive madness. But for our planet and in our time, I think we need explicitly to target human survival, and to reward the people who help maintain it.

### 6.8.4 Who's in charge? (2009-08-11 22:34)

Europe's dairymen are so obsessed by the need for regulation that the worst economic slump in more than 70 years barely enters their consciousness. The European Commission will spend €600m this year on export subsidies and buying unwanted dairy goods which will then moulder in cold storage (the EU is not recreating mountains, insists one Eurocrat , "more a butter hillock"). [1]Economist , 6 August

Who are these people, channeling your savings and the next generation's income into subsidised overproduction of butter? Who makes these decisions? It's been known for at least thirty years that these subsidies do very little except bolster the market value of farmland and transfer funds from ordinary people [2]to the very rich. As with the bonuses for cynical bankers, our political system seems incapable of behaving rationally.

The truth is that, without any guiding principle other than expediency, our politicians are lost. There's no relationship between the policies they enact and the outcomes the people they represent want to see. Society, economics, the law; they and the way they interact are far, far too complex for anyone fully to understand. So short-term considerations are king.

A Social Policy Bond regime would be different. It would subordinate all activity to targeted outcomes. There can't be many who'd want to see the corrupt, insane systems of agricultural support of the west, which apart from enriching aristocrats are environmental and economic disasters. People or governments would instead concentrate on defining the outcomes that we do actually want to see, and let the market decide how best to achieve them.

### **6.8.5 Policy by interest group (2009-08-13 21:40)**

Patrick Basham describes how tobacco policy in the UK is being shaped by anti-tobacco groups:

So just who, then, in the DoH [Department of Health] was responsible for conducting a wide-ranging, objective, and transparent review of the evidence about tobacco advertising and tobacco displays and their supposed effect on young people? It certainly wasn't regular civil servants with expertise on tobacco issues who approached the issue without a vested interest. Instead ...the review was a product of Cancer Research UK, a charity that has also acted as an advocacy group consistently calling for bans on tobacco displays. [1]Displaying the truth about policymakin[2]g, Spiked, 13 August

In this blog I've often criticised wealthy corporate bodies, as well as government agencies, for their influence over policymaking. They take advantage of the difficulty of non-initiates in comprehending the often arcane and always complex, long-winded process of law-making. Mr Basham's article is a reminder that it is not only large corporations who can hijack policy, but also well-intentioned lobby groups:

In effect, the government's policy about tobacco displays is not the result of wide-ranging research, evaluated objectively and transparently, but rather was based on a single report produced by an advocacy group campaigning for a display ban, and helped along by a senior official from that group working inside the DoH. What's objective, evidence-based, comprehensive, or transparent about that?

### **6.8.6 Complexity and catastrophe (2009-08-17 16:34)**

With time lags and great complexity, it's all too easy for people to game a system, consciously or not, so that they benefit in the short term by either spreading the costs of their activities to society in general (socialising them) or by postponing them to future generations. In a sense, mankind has been doing that since the time of Malthus; and our existence as well as our very high material standard of living are the happy outcome of unforeseeable technologies arising that do much more than solve old problems. But I wonder whether we can still afford to do this when we bump up against finite limits. Dissemination of successful technologies has, so far, and with a couple of close shaves, outpaced our destructive tendencies. But there is no inevitability about that it will continue to do so.

We don't know what are the biggest threats to our existence: nuclear proliferation? Climate change? Impact with an asteroid? What the credit crunch and climate change appear to tell us is that disaster are probably unfolding now, but we have no idea what forms they will take. Still less do we have a political system capable of defusing enormous threats before they become perilously close to reality.

This is perhaps where Social Policy Bonds score heavily over the current way of doing things, which is essentially a passive approach, characterised by too much or too little action when it's too late. Under a bond regime we can prescribe an outcome and contract out its achievement to a number of investors, who will have incentives to cooperate to bring about this outcome. Social Policy Bonds could function as an insurance policy against specified or unspecified catastrophe. Backers of [1]Disaster Prevention Bonds, whether they be government or private sector philanthropists, could choose to reward the continuing absence of major human catastrophe without specifying the nature of the catastrophe, and without themselves having to pick out potential solutions. In that way, the complexity that allows us to ignore unfolding disasters can work in humanity's favour, by selecting efficient, effective solutions.

### **6.8.7 Doing something, achieving nothing (2009-08-20 13:22)**

Regardless of what you might think of Richard Courtney's suggested solution, his summary of our response to the possibility of catastrophic climate change is accurate:

Developing countries say they will not limit their emissions, and industrialised countries have problems reducing theirs. China releases more of the emissions than any other country, is industrialising, and says it is entitled to the same emissions

per head of population as the US. So, China says it intends to increase its emissions more than four fold. India says the same. The US is having problems adopting a 'Cap and Trade' policy that would harm American industries and force industries from America to China. The EU adopted a 'Cap and Trade' policy that collapsed and has not affected the EU's rising emissions. The Australian Parliament has recently rejected a similar policy.

Politicians have been responding to the failure of the Kyoto Protocol by showing they are 'doing something'. They have adopted pointless and expensive impositions on energy industries, energy supplies and transportation. And the public is paying the large costs of this in their energy bills.

The Copenhagen Conference will provide a decision because it has to, but that decision will have no more effect than the Kyoto Protocol. And this will put more pressure on the politicians to be seen to be 'doing something' with further cost and harm to peoples and to industry. [1] Richard S. Courtney , 17 August

As with climate change, so with nuclear proliferation or any number of other possible disasters. We shall never know for certain, until it's too late, whether threats are potential or actual. Our default position then, is as described by Mr Courtney: to do nothing. There's something to be said for that: it costs very little. In particular, it avoids the payment of large upfront costs for uncertain future gains.

But the threats might turn out to be real, in which case today's inaction is criminally negligent. What is a genuinely concerned individual - politician or not - to do?

I can't think of a better solution than Social Policy Bonds. Governments or groups of concerned people could issue bonds that would reward the avoidance of

anything they don't want to see: from a rise in regional unemployment to a global catastrophe. They wouldn't have to decide how likely is the disaster they wish to avoid; nor would they need to know how best to avoid it. Those decisions would be taken collectively , by investors in the bonds. These investors would have powerful incentives to explore, research and implement the most efficient ways of avoiding calamity. Importantly, they would also have incentives to terminate failed experiments. They would also bear the risks of failure.

Social Policy Bonds with the aim of [2]avoiding disasters might not forestall all calamities. But they would be much, much better than our current efforts.

### **6.8.8 The bean counters move into childcare (2009-08-24 16:48)**

A US study, as reported by Frank Furedi , suggests that between 1981 and 1997:

there has been a noticeable increase in the amount of time that children spend on scheduled activities. ...Children's free time has declined, and free time is increasingly structured. [They] spend less time playing and more time 'going places'. This development ... reduces the amount of time family members spend just sitting around, talking and not doing anything in particular. In turn, parents spend more time organizing and driving children from one stimulating activity to the next. [1]Paranoid Parenting  
(page 84)

Many of the world's problems, in my view, can be attributed to the difference between accountability and human wellbeing . One is about ticking boxes and measuring that which can be measured. The other is about leaving people to find their own ways of fulfilling themselves. Even economics - the allocation of scarce resources to best meet prescribed ends - doesn't see quantification and management as ends in themselves. The ends in economics can be broad and, if well chosen, can correlate strongly with

wellbeing . But so much of policy is no longer about wellbeing ; it's about process and covering yourself; implementing procedures that have been tried, tested and (often) failed. It's about concentrating on those things that can be easily measured, while ignoring the broader concerns.

That approach worked when numbers correlated strongly with what we actually want to achieve. And for much of the world today many numbers still do: improvements in Gross Domestic Product, nutritional intake, basic literacy and numeracy, or something like the [2]Human Development Index, for instance.

But that approach, which serves developing economies quite well, is failing us in so many areas. Rich countries still pursue economic growth as if it's a solution to all our problems. Major challenges, such as nuclear proliferation or climate change, go unmet. Surveillance powers combine maximum intrusion to minimum effect. Schooling is an opportunity for social engineering. The disconnect between politicians and the people they are supposed to represent grows wider and wider. And as Mr Furedi indicates, the same tendency to manage everything and achieve numerically impressive results at the expense of everything else, has moved into childcare or 'parenting' in western countries.

### 6.8.9 Targeting the bigger disasters (2009-08-27 22:41)

[A] robust system needs to produce frequent crashes, with citizens immune to them, rather than infrequent total collapses which we cannot cope with. By constraining cycles and assuming "no more boom and bust" (as [the UK] current government did) you end up with a very large bust - and I am sure that I do not need more events like the recent crisis to prove the point. [1]Nassim Nicholas Taleb,

27 August

Experts in process engineering, with whom I've recently talked, have suggested that Social Policy Bonds might well control the smaller, frequent crashes, or their equivalents. In other words, you could use the bonds to, say, reduce unemployment or achieve universal literacy and numeracy. But, they say, that would come at the cost of an increased risk of a bigger problem. My response is twofold: First, we could issue Social Policy Bonds that target as a priority the bigger problems: global catastrophe or major [2]disasters, however caused. Social Policy Bonds are a versatile concept: the exact nature of any disaster to be avoided need not be specified in advance. And second, I point out that the bonds are to be compared with the current system, which as Mr Taleb rightly points out, is geared toward actively encouraging bigger catastrophes.

### **6.8.10 Agricultural subsidies (2009-08-29 01:09)**

Is there anything to be said in favour of the west's agricultural subsidies? [1]No there isn't. And here's more:

A study in the American Journal of Clinical Nutrition found that a dollar could buy 1,200 calories of potato chips or 875 calories of soda but just 250 calories of vegetables or 170 calories of fresh fruit. With the backing of the government, farmers are producing more calories — some 500 more per person per day since the 1970s — but too many are unhealthy calories. Given that, it's no surprise we're so fat; it simply costs too much to be thin. [2]Getting real about the high price of cheap food, 'Time', 21 August

## **6.9 September**

### **6.9.1 What really drives policy? (2009-09-01 19:09)**

There's no one single driver of course. In many countries ideology is one of the biggest. In the UK, ideological egalitarianism has been an important driver of education policy, for instance.

Personality and imagery are also important. But in the US, increasingly and overwhelmingly, corporate money is the biggest policy driver. Paul Krugman explains why health care reform is now far harder to contemplate than it was during President Nixon's time:

[O]ur political system's ability to deal with real problems has been degraded to such an extent that I sometimes wonder whether the country is still governable. As many people have pointed out, Nixon's proposal for health care reform looks a lot like Democratic proposals today.

Nixon also embraced tighter regulation of insurers, calling on states to "approve specific plans, oversee rates, ensure adequate disclosure, require an annual audit and take other appropriate measures." No illusions there about how the magic of the marketplace solves all problems. So what happened to the days when a Republican president could sound so nonideological, and offer such a reasonable proposal? Part of the answer is that the right-wing fringe ...over one of our two major parties [the Republicans].

But there's another reason health care reform is much harder now than it would have been under Nixon: the vast expansion of corporate influence. ... The health insurance industry, in particular, saw its premiums go from 1.5 percent of G.D.P. in 1970 to 5.5 percent in 2007, so that a once minor player has become a political behemoth, one that is currently spending \$1.4 million a day lobbying Congress. [1] Missing Richard Nixon, 30 August

Even that might not be reprehensible if corporate lobbying power were correlated in some way to people's preferences. But, as Noam Chomsky has [2]pointed out, corporate power is instead used to manipulate markets and distort the regulatory environment. The winners are the big corporations. The losers are smaller businesses, ordinary people, and the environment.

We need a better policy driver. Policy is complex; there are too many variables and time lags for any but the specialist to have any idea what's going on, and even they get it wrong frequently and in big ways. Corporate interests are adept at filling this vacuum, and Mr Krugman well describes one, but only one, of the policy areas that they have adapted to their own purposes.

Social Policy Bonds could be the answer by which the interests of all of us could be represented and achieved. Social Policy Bonds would subordinate all policies, all activities and institutions, to socially desired outcomes. Corporate power would result from success in achieving these outcomes, rather than a determinant of policy. Under a bond regime corporations and their interests would be entirely subordinated to the goals of policy. And because policy goals are more readily comprehensible to the public than the myriad complex ways in which they are supposedly achieved, these goals would generate public participation in their formulation and, crucially, buy-in. Sadly both are missing when it comes to making health policy in the US; and to much policy elsewhere: one reason why the political system of the US and other countries has become incapable, as Mr Krugman puts it, of dealing with real problems.

## **6.9.2 Outcomes a better policy driver than advocacy research (2009-09-05 19:58)**

In his discussion about child-rearing techniques Frank Furedi tells us:

The experience of the past tells us that when science is used to provide legitimacy to speculation, there is always a possibility that we will find what we are looking for. Researchers sometimes admit that they are looking for research-based evidence to justify a cause. ... Most of what goes by the name of parenting research is best described as advocacy research . Advocacy

research does not set out to discover what's not known it seeks to convince and influence public opinion. [Emphasis in original] [1]Paranoid Parenting: abandon your anxieties and be a good parent (pages 156, 160)

Of course it's not only in parenting that you can generate figures that confirm your prejudices. My own field, economics, is another obvious case in point. It's an important consideration in the world of policymaking . Mr Furedi raises the questions of breastfeeding or smacking children. Similar reservations arise in other fields: crime, for instance , or mental health. What exactly is the role of government when research findings are inconclusive and controversial?

Social Policy Bond could help. They would stipulate a targeted outcome, rather than the supposed means of achieving it. So if society's goal is, for instance, to reduce lung cancer rates, then a bond issue would - probably - lead to the sort of restrictions on smoking that we now see. But if the goal is to reduce crimes committed by young people, where the scientific evidence on raising children is far more equivocal, investors in bonds would have to investigate and explore a much wider range of alternative approaches, the nature of which need not be specified in advance . Advocacy research would be regarded with far more skepticism than currently, because investors in bonds targeting youth crime would be looking for results, rather than confirmation of their prejudices . They would

have powerful incentives to find only the most efficient ways of reducing youth crime, and to that extent would be impartial in their observations and conclusions.

Social Policy Bonds' focus on outcomes would have the same impartiality in helping achieve a wide range of social goals where research findings are vague or hotly disputed, and so we are collectively paralysed into inaction. They include larger ones about which I have written many times before, such as [2]climate change or the [3]prevention of natural or man-made catastrophes .

ZenTiger (2009-09-14 22:53:09)

I often see an approach to a problem apparently making things worse. For example, rising pregnancy and abortion rates in the UK by under 16's, in spite of a huge sex education drive over the last several years.

In light of a failure to produce the promised outcome, their solution was to increase funding even higher. More free condoms, younger sex education, more advertising.

I think the entire approach is flawed, and only makes things worse.

How would your policy bond concept facilitate a recognition that the approach is flawed given the outcome hasn't been achieved?

(Sorry, point me to another post if the answer is relevant, rather than retype a response here)

Ronnie Horesh (2009-09-14 23:21:50)

Thanks Zen Tiger for your comment. I agree with you about the existing approach and its flaws. Typically a government agency looks at something like abortion rates or teen pregnancy rates and thinks it knows best how to reduce them. It identifies a cause (in this instance, lack of education and condoms) and channels other people's money into its preferred solution. When that doesn't work, it does more of the same. The Social Policy Bond mechanism is quite different. It would set explicit targets for abortion rates and teen pregnancy. It would reward their achievement *however they are achieved*. The sum of money it would devote to the purpose would be stipulated in advance and capped. Purchasers of the bonds would have incentives to seek out and implement the most efficient ways of reducing abortion and teen pregnancy rates. These ways could include a mass condom helicoptering and leafletting operation, but it would be up to bondholders to work out which ways are going to achieve the best result for each taxpayer dollar. Crucially, investors in the bonds would have incentives to terminate useless programmes. Efficiency - as well as transparency and a cap on expenditure - are built into the Social Policy Bond mechanism.

ZenTiger (2009-09-17 04:34:08)

Thanks for that explanation, I understand the concept now. (Actually, I just needed my memory jogged as it has been a while since I first read about this [here amongst other places], and your blog had slipped off the reading list when I changed browsers).

Good to see you still blogging.

### **6.9.3 What sector shall we subsidise next? (2009-09-09 18:57)**

When policy takes the form of targeting, you have to be very careful that your targets either are, or are inextricably and strongly correlated with, what you want to achieve. I've blogged many times about the meaninglessness of gross domestic product as a target (see [1]here or [2]here, for instance). Governments implicitly or explicitly target GDP per capita (as 'economic growth'), often with unfortunate results such as the degradation of the social or physical environment.

Here's another instance of policymakers getting it wrong. Not long ago governments

were in thrall to the motor industry. Then came computers and IT. But today, or until recently, it was finance. Here's George Monbiot quoting UK Prime Minister Gordon Brown:

In 2004 he told an audience of bankers that "in budget after budget I want us to do even more to encourage the risk takers". In 2007 he boasted that the City of London's success was the result of the government "enhancing a risk based regulatory approach, as we did in resisting pressure for a British Sarbanes - Oxley after Enron and Worldcom ". [3]The great cop-out, 8 September

The problem is deeper and more widespread than that of governments' complying with the wishes of their paymasters in big business. Our governments are democratic, so have to sell their degenerate thinking to the electorate. And, not being specialists, we too easily identify the success of particular sectors or, say, an increase in GDP, as improvements in societal wellbeing . This, they might have been at lower levels of development. But they are not always so, and our policymaking system has been too slow to recognise this.

It's hardly surprising. Society is so complex that it takes us too long to identify the causes of social and physical depredations, by which time it's very often too late to do much about them. The policymaking process to the outsider is too complex and arcane to follow closely. Perhaps Social Policy Bonds are the answer. They would subordinate all activity and funding to the achievement of social and environmental outcomes, rather than try to prejudge how best to achieve these outcomes. Insiders and outsiders would see clearly that a healthy finance, or IT, or whatever, sector is not an end in itself, but a means to various ends, and that government would be both more efficient and more transparent if it targeted these ends directly.

#### **6.9.4 Corporate welfare: Wal-Mart (2009-09-15 22:18)**

Around the time that the young Sam Walton opened his first stores, John Kennedy redeemed a presidential campaign promise by persuading Congress to extend the minimum wage to retail workers, who had until then not been covered by the law. Walton was furious. Now the goddamn federal government was telling him he had to pay his workers the \$1.15 hourly minimum. Walton's response was to divide up his stores into individual companies whose revenues didn't exceed the \$250,000 threshold. Eventually, though, a federal court ruled that this was simply a scheme to avoid paying the minimum wage, and he was ordered to pay his workers the accumulated sums he owed them, plus a double-time penalty thrown in for good measure. Wal-Mart cut the checks, but Walton also summoned the employees at a major cluster of his stores to a meeting. "I'll fire anyone who cashes the check," he told them. Harold Myerson, [1]In Wal-Mart's Image, 11 September

Here are the types of subsidy that Wal-Mart receives, as documented by [2]Good Jobs First (pdf).:

- # Free or reduced-price land
- # Infrastructure assistance
- # Property tax breaks
- # State corporate income tax credits
- # Sales tax rebates
- # Enterprise zone (and other zone) status
- # Job training and worker recruitment funds
- # Tax-exempt bond financing
- # General grants

### **6.9.5 Mickey Mouse indicators (2009-09-16 20:52)**

Simon Darragh [1]writes about his experiences of mental health care in the UK:

[A]bout nine years ago I was close to suicide again and found myself being taken into another hospital. Things had changed. Now we had the policy of 'care in the community'. All notion of protection, of asylum, had gone: a patient (or was it 'client'?) information leaflet explained that one's stay would be as brief as possible. Nurses no longer spent much time with patients: they were closeted together in an office filling in 'care plans', and could get quite cross if one knocked on the door to point out that a patient was smashing up the furniture or another patient. Usually, in fact, knocks on the door were ignored. True, we saw psychiatrists as often as once a week, but their concern was to see whether we were ready to be discharged. We lived in dread of being called before the psychiatrist: many, including myself, tried to seem madder than we were in the hope of delaying discharge. I managed to stay a month - twice as long as the 'target' period - before being ejected despite my vigorous protests. I was soon back. Returning to the same hospital I expected the nurses to be surprised and disappointed to see me again; they batted not an eyelid. Soon I noticed familiar faces among the other patients; people who had been discharged during my earlier stay and who were back again. Nine years later I have lost count of how many times the NHS has 'cured' me of severe depression. Clearly the new policy is statistically -

and that's what counts - very successful. It must have cost them far more than one long stay, but they've had half a dozen cures instead of one. Simon Darragh , Letter to the Editor of London Review of Books , dated 24 September

Our big, complex societies do require the targeting of some sort of numerical indicator and mental health is an extremely difficult concept to quantify. But surely we can do better than the number of discharges from psychiatric hospital care? Such indicators are rather like economic variables: if they are too narrow, the tendency will be to game the system, consciously or not. I've blogged [2]before about meaningless targets in the UK health system.

Under a Social Policy Bond regime , there would be similar problems in choosing the best indicators to target. But there would be much more ingenuity applied to devising them. They would be broad rather than narrow, and transparent. But most important, they would be inextricably tied to societal wellbeing , in a way that 'number of hospital discharges' plainly is not.

-

Every 100 posts, I update progress on the Social Policy Bond idea. This is my 700 th post, and there has been zero progress in the past few months. Sales of my [3]book have been negligible, and after initial bursts of enthusiasm from one tv producer in particular, interest has fizzled out. The Social Policy Bonds concept has now been in the public arena for 20 years but, as far as I know, nobody issues them. I intend, though, to continue to post on this blog, and to maintain the main Social Policy Bonds [4]website.

### **6.9.6 Into Africa (2009-09-18 19:10)**

From [1] ClubOrlov :

Medical reform has been attempted before, and the outcome can be foretold with some accuracy: efforts at reform will fail because any meaningful reform would be financially damaging to powerful vested interests, and so national bankruptcy will have to be an essential part of the work-out. Feelings of the electorate on the matter are irrelevant.

And from [2]Rolling Stone:

Just as we have a medical system that is not really designed to care for the sick, we have a government that is not equipped to fix actual crises. What our government is good at is something else entirely: effecting the appearance of action, while leaving the actual reform behind in a diabolical labyrinth of ingenious legislative maneuvers.

The cynicism bodes ill but is quite justifiable. The gulf between voters and the people supposed to represent us is wide and growing. We might well be reaching a tipping-point when we all feel it's our right - or duty - to game the system for the benefit of ourselves and our families.

It might be time to look at another way of formulating policy. The current way is obscure, complex and legalistic. It's far too arcane, time-consuming and open to manipulation to serve ordinary people.

Social Policy Bonds could be the answer. A bond regime would target outcomes that are meaningful to all members of society. All activities, research, programmes and initiatives would be devoted to achieving these outcomes at least cost to the taxpayer. Apart from the huge benefit of greater efficiency, Social Policy Bonds would be transparent. If the aim were to subsidise or buy off medical insurance companies, for example, that would have to be openly stated when the redemption terms for the bonds are drafted. Even US lawyers and lobbyists might find it irksome to insert such terms into a list of otherwise socially beneficial policy goals.

What's the alternative? Societies in which extracting whatever one can get away with for oneself and one's family are not pretty. Theodore

Dalrymple writes about his experiences in Rhodesia:

The black doctors who earned the same salary as we whites could not achieve the same standard of living for a very simple reason: they had an immense number of social obligations. They were expected to provide for an ever-expanding circle of family members and people from their village, tribe, and province. An income that allowed a white to live like a lord scarcely raised a black above the level of his family. Mere equality of salary, therefore, was quite insufficient to procure for them the standard of living that they saw the whites had and that it was only human nature for them to believe themselves entitled to, on account of the superior talent that had allowed them to raise themselves above their fellows.

These obligations also explain the fact, often disdainfully remarked upon by former colonials, that when Africans moved into the beautiful villas of their former colonial masters, the houses swiftly degenerated into a species of superior, more spacious slum. The degeneration of colonial villas had nothing to do with the intellectual inability of Africans to maintain them. Rather, the fortunate inheritor of such a villa was soon overwhelmed by relatives and others who had a social claim upon him. They brought even their goats with them, and one goat can undo in an afternoon what it has taken decades to establish. [3]Out of Africa, 'The American Conservative', 16 January 2006

### **6.9.7 We're all Siberians now (2009-09-21 18:01)**

Colin Thubron quotes ' Shamil ', an inhabitant of Severbaikalk , at the northern tip of Lake Baikal:

Young people don't feel connected with this country, because its system isn't ours. It's an old people's system. It comes from another time. So we'll go to America, or anywhere that will free us. It's not that we don't love Russia, it's just that we have to live properly. We're young men born into an old man's world. Colin Thubron , [1]n Siberia (page 151)

Old people as individuals probably do feel some responsibility for their legacy. But old people collectively, acting politically, are different. They are bequeathing a world in which environmental challenges are addressed, if at all, when it's too late to do much about them. Similarly for man-made challenges, such as the risk of nuclear catastrophe. The systems supposed to solve global problems, and many national problems, have been given over to organizations that take an old-fashioned view of problem-solving; a command-and-control paradigm that relies on top-down identification of the causes of a problems, and the hand-picking of the most politically correct solutions . It is in that sense that we are all Siberians.

A Social Policy Bond regime would be different. The identification of causes of problems would be contracted out to investors in tradable bonds, which become redeemable for a large sum only when the targeted problem has been solved. No special political caste, or priesthood, would choose how to solve the problem; that would be left to powerfully motivated bondholders , or their competitors in the bond market. In such a way, failed solutions would be swiftly terminated, rather than, as now, continued indefinitely to save political face or to prolong the life of redundant, but politically powerful, vested interests. A Social Policy Bond regime would be a young person's system, in the sense that it would reward efficiency and success rather than seniority and control.

### **6.9.8 Going nowhere, doing nothing (2009-09-26 18:43)**

Kyoto's approach has not obviously paid off. Global carbon-dioxide emissions have grown by 25 % since the protocol was adopted in 1997. That is partly because the treaty left out big emissions sources such as deforestation ..., but also because potential participants were put off by the idea of internationally binding commitments. [1]Avoiding a crash at Copenhagen, 'Economist', 26 September

Quite. There are no meaningful incentives actually to comply with Kyoto. All the costs are upfront and obvious; all the benefits well into the future, and diffuse. The fact is that if we want to cut emissions, we have to provide incentives to cut emissions. I'd go further: if we want to reduce climate instability (or the damage done by climate instability) then we have to

provide incentives to reduce [2]climate instability. All the portentous talk and well-intentioned but meaningless declarations of intent by the world's top politicians will not alter these facts.

### **6.9.9 Closing the gap (2009-09-27 18:20)**

A week ago I [1]blogged about the widening gap between voters and the people who are supposed to represent us. 'We might well be reaching a tipping-point when we all feel it's our right - or duty - to game the system for the benefit of ourselves and our families.' For a similar view, beginning with examples from sport, read the [2]article by Will Hutton in today's Observer :

What is dangerous is that when cheating reaches a certain mass, it becomes impossible to contain. Rules become there to be broken. Those who dive on the football field will hardly think an annulled suspension for a couple of matches for Arsenal's Eduardo sufficient deterrent not to try it themselves - and the football authorities have to be careful in their sanctions, because diving is so rife. Equally, governments find it hard to challenge the accounting industry, along with much of the financial services' so-called structured (cheating) investment operations, built around advising the rich how to avoid (and even evade) tax. Too many people have been allowed for too long to build a career on advising others how to cheat. ....

There is a change in society that has driven the growth of cheating - from sportsmanship to business ethics - over the last generation. It is not that there was some cheat-free golden age. Back in the 1960s and '70s there were sports cheats and some businesses bent the rules. However, most CEOs of public companies were like Courtaulds' Sir Arthur Knight, punctiliously filing every penny of his income and refusing "tax efficiency" schemes on principle as dodges to help the rich avoid their civic responsibilities. He strongly believed he was a privileged member of a community whose rules he wanted to respect. I know a few CEOs like him now, but it is a culture that is fast disappearing.

The problem is that the social sanctions against cheating are becoming ever harder to operate as communities disintegrate. ....

The outstripping of the top 0.1 % from the rest - in sport and business alike - has undermined the core belief in reciprocity on which association and rule-keeping depends. If the top does not need the approval of others - because the distance between us in income, wealth and status has grown so vast - then we cannot make them feel the harm that they do. They do not feel the consequences of not paying tax, rigging markets or bending the rules. They can behave unfairly without consequence. The leaders set the tone; the rest follow and so cheating becomes

the norm. [3]We now live in a society so cynical that cheating has become the norm, 'The Observer', 27 September

As I said in my post, the end-point of widespread cheating is not a pretty sight, but we are moving toward it so long as the ends of politicians are different from the ends of ordinary people. And unfortunately, they seem to be both wide and diverging.

Social Policy Bonds cannot, themselves, rebuild communities - not immediately anyway. But they could be a way of bridging the gap between politicians and public. By focusing political debate on outcomes, rather than process, spending or activity, they could boost public participation in the policymaking process. Under a bond regime it would be more difficult for large corporations or government agencies to influence or dictate the direction of policy. The distinction between leaders and the rest of us would diminish.

## 6.10 October

### 6.10.1 Evolution in business and public policy (2009-10-02 14:16)

I've talked about evolution as against command-and-control many times. Evolution has the big advantage that it implies the termination of failed projects and programmes. This is especially important when, as in public policy, the suppliers of services are (usually) government-funded monopolies: there's no competition to ensure selection for efficiency. John Kay sums up the role of evolution in business:

Businesses are also complex systems. We tend to infer design where there was only adaptation and improvisation, and to attribute successful business outcomes to the realisation of some deliberate plan. .... Large and complex corporations not only are, but could only be, the product of incremental change and adaptation. The specific mechanisms of organisational evolution differ from those of biological evolution. But their common essential characteristic is inexact replication. Such replication is associated with a tendency to favour modifications that improve the fit between the organism and the environment. There is a better shortened explanation of the success of evolution than the survival of the fittest. It is that "evolution is smarter than you". [1]Evolution is the real hidden hand in business, John Kay, 'Financial Times', 30 September

Social Policy Bonds would introduce evolution into the provision of public services. Under a bond regime, government could continue to stipulate and reward the achievement of agreed social and environmental outcomes. But the bonds would, in effect, contract out the achievement of these goals to the private sector. Investors in the bonds would compete with each

other to supply goal-achieving services. The more efficient they think they will be, the more they will bid for the bonds. Once holdings have been allocated on that basis, the incentives will be to co-operate with other bondholders to achieve goals as efficiently as possible. Unlike biological evolution, which has only reproductive success as its over-arching goal, Social Policy Bonds would have objectives that are, or are strongly correlated with, social and environmental wellbeing .

Jeff Mowatt (2009-10-03 05:15:40)  
Interesting Ronnie.

We have similar aims, I think

You came up on radar recently when someone commented on an Economist article.

[http://www.economist.com/displaystory.cfm?story\\_id=14493098](http://www.economist.com/displaystory.cfm?story_id=14493098)

We've been active as a business for social purpose and it was also interesting to see you blogging about Siberia where our first project took place.

<http://www.p-ced.com/projects/russia/>

From what I read on the Observer article, and between the lines, venture capitalists want to pass off both your efforts and ours as their own thinking.

Jeff

Ronnie Horesh (2009-10-03 14:45:34)

Thanks Jeff; and thanks also for the P-CED link. Many years ago I did try to interest Sir Ronald Cohen in Social Policy Bonds; I don't remember his exact reply, but it wasn't enthusiastic. After reading the 'Economist' article I emailed to see if he and his organization think they could benefit from some of my work. I'll do a blog post if I hear anything. I'll probably do a post soon anyway on the 'Economist' article. Funnily enough, in the same issue there was an [1]article about paying people not to destroy forests - at some point the movers and shakers there were interested in using the Social Policy Bond idea for that purpose. But nothing came of it.

1. [http://www.economist.com/sciencetechnology/displaystory.cfm?story\\_id=14492973](http://www.economist.com/sciencetechnology/displaystory.cfm?story_id=14492973)

## **6.10.2 Social Policy Bonds become mainstream! (2009-10-04 12:09)**

Well almost: to readers of this blog, this will sound familiar:

A more innovative idea, perhaps, is the "social impact bond", the brainchild of [1]Social Finance. The idea is to attract private capital into solving a deep-rooted

problem that is soaking up public money. Take, for example, reoffending by released prisoners, which costs the British government millions of pounds a year. A social-impact bond could raise money to pay for the expansion of organisations with the expertise to reduce reoffending rates. The more money the organisations save the government, the higher the return the bond would pay investors. This goes beyond a standard public-private partnership, which is expected to provide the same service as the state, but more cheaply. The social-impact bond would reward better social outcomes and not merely cut costs. [2]A place in society, 'The Economist', 26 September

I have emailed Social Finance to see if they are interested in the work I have done on Social Policy Bonds. I am glad that the idea of rewarding socially and environmentally beneficial outcomes, as against activities, inputs, outputs or gestures, is becoming more widely accepted. It's 20 years since I first floated the Social Policy Bond idea into the public arena - and about 19 years since I sent information about it to 'The Economist'.

### **6.10.3 Kyoto's going nowhere (2009-10-07 16:09)**

Talking to friends attending the United Nations climate change [1]talks being held in Bangkok it's clear that any outcome will be political: representation is largely of nation states, by nation states. Influencing national governments are business people on the one side, who argue that any effective disciplines will undermine the economy; and people whose highest priority is the environment, for whom drastic reductions in greenhouse gas emissions are a necessary, but not sufficient, way of avoiding global catastrophe.

I am in the comfortable intellectual position of being able to accommodate the wishes of both sides. By issuing [2]Climate Stability Bonds, we shouldn't need to take a position on (a) whether catastrophic climate change is happening, or (b) what is causing it if it is happening, or (c) how best to deal with it, whatever is going on. Issuers of Climate Stability Bonds would only need to define objectively the boundaries of acceptable climate, impacts of climate, or rate of change of climate. They then need issue bonds redeemable for a fixed sum only when the array of stipulated climate variables fall within their ranges for a sustained period of time. Everything else would be left to potential and actual investors in the bonds.

If climate change is not actually happening (as some still believe ), then the cost to governments of achieving climate stability will be minimal. They would issue bonds that would fetch a high prices, relative to their redemption price, on the open market. If it is happening, then investors in the bonds would be powerfully motivated to stop it. They might well choose to cut back on greenhouse gas emissions, but even if - as with Kyoto - that is their only solution, they would go about it more efficiently than the cumbersome, inefficient and divisive way that we are currently pursuing. More likely they would research, explore and implement all sorts

of ways of reducing climate instability: their investigations would be impartial as between country or method. Their projects would be entirely subordinated to results, and these would be entirely defined by how much climate instability they would achieve per dollar spent. There would be all sorts of costs to taxpayers and consumers; but under a bond regime, in stark contrast to the current system, these would be minimised. And the costs of failure would be borne not by taxpayers, but by bondholders.

#### **6.10.4 The end of fish (2009-10-08 13:39)**

Daniel Pauly writes:

One study, published in the prestigious journal Science, forecast that, by 2048, all commercial fish stocks will have “collapsed,” meaning that they will be generating 10 percent or less of their peak catches. ....There is no need for an end to fish, or to fishing for that matter. But there is an urgent need for governments to free themselves from the fishing-industrial complex ..., to stop subsidizing the fishing-industrial complex and awarding it fishing rights, when it should in fact pay for the privilege to fish. Daniel Pauly, [1]

Aquacalypse Now , 'The New Republic', 28 September

Yes, a vital first step, and one that we seem incapable of taking in [2]agriculture as well as fisheries, is to stop subsidising environmental destruction. That's necessary, but hardly sufficient. Rejigging the incentives is crucial, as Mr Pauly suggests. But if, as Mr Pauly also says, '[t]he truth is that governments are the only entities that can prevent the end of fish,' then we are in a sorry state indeed (as we are when dealing with other urgent global challenges - see my previous post, about climate change).

Government's incentives are different from those of the people they represent, and they are certainly different from the wider interests of the world's human population.

So how would Social Policy Bonds try to avert the impending collapse of world fisheries? First : stipulate a goal. Governments are more likely to agree on a desirable outcome, than they are the means of reaching it. And ordinary people are more likely to get involved when policy is seen to be about meaningful outcomes than about surreptitiously subsidising favoured interest groups. So we could expect that national governments, influenced by genuine public participation , will collectively decide that the survival of the world's fisheries are a worthwhile goal. The definition will be subject to negotiation and fine tuning of course. Most likely 'survival' would include an array of stock and flow variables that would have to fall into stipulated ranges for the target to be deemed met. But once the goal has been defined, governments, under the auspices of some global body, would undertake to redeem the 'Fisheries Survival Bonds' that they back, once the target had been met and sustained for a lengthy period.

The effect would be to generate financial incentives for people to take care of the world's fisheries. Of course there would be difficulties with this approach. But I'd expect they'd be mostly semantic (what is 'a fishery'? 'what is survival?') and technical (how do we measure the health of a fishery?) and therefore solvable. What's clear is that the current course is heading for calamity. Has anyone got any better idea?

### 6.10.5 What exactly do we want? (2009-10-09 13:19)

People nevertheless use the stockmarket as a barometer of economic health. So a rise in equity markets can be (and has been) seen by governments and central bankers as evidence that the economy is headed in the right direction. That can lead to policy mistakes, such as a lax monetary stance, and further irrational exuberance. [1]The nature of wealth, 'The Economist', 8 October

Our economies and societies are almost too big to govern in any way other than targeting highly aggregated data. Sadly, today that is being done opaquely, unsystematically, and almost unconsciously. In sum: badly. Social Policy Bonds are not utopian, but they would be better than the current system, under which appallingly inadequate indicators (not only stockmarket indices, but things like Gross Domestic Product or house prices) are implicitly or explicitly targeted because nobody's bothered to ask: what exactly do we want?

You couldn't get away with such ineptitude - bumbling at best, corrupt at worst - under a Social Policy Bond regime, because when issuing bonds you would have to be clear right at the start about desired outcomes. Nobody would target house prices, or GDP or share prices under a Social Policy Bond regime, because these are not ends in themselves. Indeed, the confusion between ends and means at the highest levels of policymaking probably explains much about why we may well be heading for social, environmental and economic disaster.

### 6.10.6 Anything except outcomes (2009-10-10 06:38)

The Nobel Peace Prize committee has been awarded to US President Barack Obama "for his extraordinary efforts to strengthen international diplomacy and cooperation between

peoples." That is, for efforts, rather than achievements. Or perhaps it's for hope? Or for who the President is, rather than what he's done? This sort of nonsense is one reason why we are in such dire trouble. We reward anything - activity, image, inputs, outputs, victimhood - anything ... except outcomes.

All institutions have as their over-riding goal that of self-perpetuation. If the Nobel people were really concerned with peace, they'd reward one of the thousands of dedicated people working selflessly and successfully in dangerous areas trying to prevent or defuse conflict. But they are more concerned about raising the profile of their committee and their lucrative, [1]ludicrous prizes. Is there any field of public life immune from celebrity worship?

### **6.10.7 Not fit for purpose: our justice and healthcare systems (2009-10-14 14:54)**

Two [1]podcasts from the Cato Institute, the Criminalization of (Almost) Everything , and How American Health Care Killed My Father , go a long way in showing how far removed our legal and healthcare systems are from the interests of ordinary people. The costs, financial and human, are huge; the waste extraordinary. Unfortunately, efforts to re-orientate the systems in piecemeal fashion are also likely to be very [2]costly. As well, they'll require more regulation and more government intervention. The problem is one of capture by vested interests, including government agencies; nothing is changing there, so the divergence between the goals of each system and the public is likely to continue.

Social Policy Bonds are a meta-system. If any current correctional or healthcare (or education, or environmental, or whatever) system were actually efficient and meeting defined needs, then under a Social Policy Bond regime little would change. But even if the starting point were the same, you would not get, under a bond regime, the gradual evolution of systems to serve the service-supplying institutions and other vested interests rather than ordinary citizens. Social Policy Bonds subordinate all activities, programmes and projects to targeted, meaningful social and environmental goals. Under the current system, it's the institutions - generally public or private sector monopolies - that call the shots. And their over-arching goal has little to do with public benefit. Quite simply, it's self-perpetuation.

### 6.10.8 Everyone's doing it... (2009-10-18 15:20)

...I mean, misdirecting or abusing taxpayer funds (sigh):

The [UK] Department for International Development ( DfID ) claims to be “leading the UK government’s fight against world poverty”. However, by 2011 it will have spent over £1 bn of taxpayers’ money on propaganda, according to Fake Aid , a new report from International Policy Network. Recipients of this money include trade unions and other partisan political organisations in the UK. Examples include:

-£1.2 million given to the Trades Union Congress ( TUC ) since 2003 for activities including: lobbying, hiring new staff and a Caribbean-themed party to celebrate “International Women’s Day” in the UK. DfID also paid the TUC to hold lessons in how to apply for DfID funds.

-£300,000 to the National Union of Teachers to “enable them [teachers] to become global agents of change”. ...

The report highlights the waste of DfID funds on political campaigning while a child dies every 30 seconds from malaria in poor countries. “The money DfID is wasting in this year alone could in principle treat 230 million people suffering from malaria,” concluded [one of the report’s authors, IPN’s Julian Harris. [1]Over £1 bn of UK foreign “aid” used to spread propaganda, International Policy Network

Our government agencies are too removed from the world of ordinary people to attend to their stated remits. They are far more concerned with self-perpetuation. In this, they are like any other large organization. Big private sector corporations are not inherently different; there is an element of competition which helps to keep them honest, but once they have become big they often find it more profitable to manipulate government regulations, and subvert competition and free markets, than to engage with them. It’s a flaw intrinsic to any large institution : government agencies, corporations, universities, trade unions etc. Perhaps it’s built into our psychology: words, thinking, concepts and ideals so often screen us from reality, creating a self-perpetuating secondary reality that separates us from the truth. At the individual level, meditation, music, humour or breathing techniques can all be used to steer us back to the real world. But what to do with organizations?

Perhaps Social Policy Bonds, with their insistent emphasis on meaningful outcomes as the measure of success , are the answer. Under a bond regime, all activities would be subordinated to social and environmental goals. The bonds would build the need for efficiency in achieving stated outcomes into an organization’s everyday thinking, as well as longer-term projects. Organizational thinking then would become exactly congruent with societal thinking. The DfID grants described above, and far more wasteful expenditures, would be unthinkable under a bond regime. Bondholders who engaged in inefficient or corrupt spending would quickly find themselves outbid for their bonds by more efficient operators. And ‘efficiency’ in a Social Policy Bond regime means

efficiency in achieving social goals - not simply in managing to keep an organization going.

-

### **6.10.9 Objectives and outcomes (2009-10-21 13:22)**

John Kay writes that, after the fall of France in 1940:

neither Churchill nor any other British leader could have had any realistic conception of how that goal [victory] would be achieved. Even if the Germans failed to invade Britain, a British invasion of Europe without overwhelming assistance and support was inconceivable. Churchill understood that American participation in the war was a precondition but had no means, and no plan, for bringing this about. The events that changed the direction of the war – the failed German attack on Russia and the Japanese bombing of Pearl Harbor – were neither predictable nor predicted. ... Maintain a clear sense of long-term objectives but acknowledge the limits on your day-to-day actions. The gravest errors in the financial and business world are made, not by those who control or know too little, but by those who control or know less than they think. [1] True survivors do not clutch at straws , 'Financial Times', 21 October

It's amazing what can be done if you have a clear, long-term goal in mind. Unforeseeable events are immediately interpreted in relation to that goal. One's entire attitude of mind is orientated toward achieving the goal. When our leaders' goals coincide with public benefit, then the possibilities are immense. But what happens when they don't?

Very much what we have now. Serious environmental challenges that are not being addressed. The piling up of conventional weapons and the proliferation of nuclear warheads. The subordination of global outcomes to the nutters and ideologues, whether they be 'religious' or political extremists. The drift toward financial collapse, and economic ruin. The alienation of the moderates. The continuing fraying of the social fabric.... Our politicians are letting us down: their goals, if they have them, are political survival, and the possibility of personal (or familial) enrichment. Our bureaucrats don't want to rock the boat. It seems as if our policymaking system, like our [2] legal, or (in the US) healthcare systems, are divorced and diverging from public needs.

Unless there's an obvious, and preferably ( tele )visual crisis on our hands, we don't think in terms of clear, long-term goals. A Social Policy Bond regime could change that. We could aim to address urgent, meaningful global problems such as [3] war, [4] climate change, or [5] disasters of any sort. We could focus on [6] regional conflict, or national problems such as [7] unemployment. In all cases, a bond regime would start off with clear, transparent, meaningful long-term goals. Investors in the bonds, and the wider public, would then have a strong interest in seeing targeted objectives become outcomes.

Anonymous (2009-11-02 05:55:16)

Problem is that people at policy level have inherent biases. Take a look at <http://online.wsj.com/article/SB40001424052748704335904574495643459234318.htm> I

one proposed solution to pump sulphur dioxide into air. The science say it could work and makes the point that seemingly insurmountable problems often have cheap and simple solutions

Ronnie Horesh (2009-11-02 09:06:35)

Thanks for your comment. I agree that sometimes solutions can be cheap and simple, but I do not agree that pumping sulphur dioxide into the atmosphere is one such solution. This [1]post convinced me of that. Just one reason: pumping SO<sub>2</sub> into the air would not stop the acidification of the oceans. Your broader point is well taken though. We do need incentives for scientists to look for the most efficient solutions to our social and environmental problems, and our current policymaking system does not do that. It is largely driven by the interests of large organizations, be they public or private sector. These interests are not always the same as those of most ordinary people - and often conflict with them.

1. <http://www.realclimate.org/index.php/archives/2009/10/why-levitt-and-dubner-like-geo-engineering-and-why-they-are-wrong/>

### **6.10.10 Plundering the future (2009-10-26 12:07)**

A scary post on the UK's national debt concludes:

if we wanted to be cautious - admittedly not something our present rulers have been much good at - we'd say our real national debt is now in the range £7-8 trillion. Or around £300 grand for every single household. Wat Tyler, [1] Latest on Real National Debt , 19 October

That works out at slightly more than £100000 per person. When people point out to me some of the difficulties of a Social Policy Bond regime, my response is simple: such a regime would by no means be easy to implement, but it would be better than the current system. One of the difficulties of a bond regime would be in trying to anticipate and target for elimination, all such negatives as plundering the future, whether by building up debt, or destroying the physical environment. Surely, I'm asked, we'd simply transfer problems to unforeseeable policy areas? A first answer then would be that the current system doesn't even attempt to address such concerns. There's very little, for instance, environmental accounting, and we all know now that there's very little account taken of the financial needs of future generations. The current system relies on postponing problems for at least as long as it takes a new set of politicians to take over, during which time they accumulate and their effects become catastrophic.

How could a Social Policy Bond regime be worse? It could actually be a lot better. We couldn't foresee, 50 years ago, the shape of future environmental catastrophes (the ozone hole, for instance, or climate change). But if Social Policy Bonds were around then, we could

have issued something like Disaster Prevention Bonds, that would have given incentives for people to avoid all the impacts on humans of all catastrophes, however caused. People who undertook research into the long-term impacts of CFCs , or fossil fuel burning could have expected to receive additional funding from holders of Disaster Prevention Bonds. By focusing on outcomes, rather than their causes, Social Policy Bonds issued now could do a lot to prevent the building up of all disasters, environmental, financial or social, even if their full scale would not be apparent for decades to come.

## 6.11 November

### 6.11.1 A victory for short-termism (2009-11-01 06:46)

In a fascinating article, unfortunately gated, Thomas Geoghegan writes about the US economy:

First, we removed the possibility of creating real, binding contracts by allowing employers to bust the unions....Second we allowed those same employers to cancel existing contracts, virtually at will, by transferring liability from one corporate shell to another, or letting a subsidiary go into Chapter 11 and them moving to 'cancel' the contract rights....As one company after another 'reorganized' in Chapter 11 to shed contract rights, working people learned that it was not rational to count on those rights and guarantees, or even to think in future-oriented ways. [1]Infinite Debt: How unlimited interest rates destroyed the economy , 'Harper's Magazine' (subscription), April 2009

As with the environment, so with the financial system: our policymaking is heavily slanted towards the interests of the paymasters of the political parties. And these interests are overwhelmingly narrow and short-term. They have nothing to do with the long-term goals of society: indeed, they militate against long-term interests.

Rather than allocate blame for this flaw, I would advocate Social Policy Bonds as a possible solution. About policy objectives, there is a wider consensus than about the means of achieving them. Current policymaking centres on institutional structures, spending allocations, and government's necessarily limited thoughts about how best to manage problems. In contrast, a Social Policy Bond regime would subordinate all activities to society's targeted outcomes. These would be broad, and long term in nature. Stability of objectives would be one of the features of a bond regime that would make it more efficient than the current system; it would also be an end in itself; people would have a clearer idea about what society is aiming for, and what sorts of behaviour will be rewarded. As for the current system, as Mr Geoghegan says: 'No wonder people in our country began to live for the moment and take out loans and start running up debts.'

### **6.11.2 Lobbyists, buy-in and climate change (2009-11-03 10:07)**

As policymaking becomes ever more remote from the people it's supposed to benefit, it's salutary to recall that it wasn't always like that:

As Kim Phillips-Fein recounts in her new book, [1]Invisible Hands, most Fortune 500 firms didn't have Washington public-affairs offices in 1970, but 80 percent did by 1980.... [2] Labour's last stand , Ken Silverstein , 'Harper's Magazine', July

That's aside from the the cash directed at the political parties. I think it's quite dangerous to have such a disconnect between politicians and the public. The corporations have objectives of their own, which have more in common with each other and government agencies than they do with ordinary people. Results are a widespread disenchantment with politics in general, apathy and cynicism. Issues such as climate change become highly politicised, which reduces their chances of being addressed properly.

A Social Policy Bond regime could narrow the gap between politicians and people. It would take as its starting point desirable social and environmental outcomes. These are more amenable to public participation than the legislative game-playing at which Washington lobbyists are so adept. Greater public participation would promote public buy-in to policies, some of which will urgently need it. To take climate change again: there are disagreements as to whether it's happening and (more so) about what we should do about it if it is happening. A Climate Stability Bond issue that targeted an array of physical measurements, and human, animal and plant life indicators could reward the achievement of a stable (however defined) climate to the satisfaction of ordinary people. It would be left to the market to assess, continuously, what's actually going on with the climate, and to bear the risks of failing to get it right. That has to be better than the current approach, which, bogged down as it is by lobbyists, charlatans and politicians of all flavours is, to be frank, going nowhere.

### **6.11.3 Government and big business versus ordinary people (2009-11-05 05:13)**

The world's largest economies have agreed to end fossil-fuel subsidies, according to a statement made at the G-20 meeting in Pittsburgh on 25 th September 2009. Leaders of the G-20 committed to phasing out the controversial subsidies 'over the medium-term,' blaming them for encouraging wasteful consumption and undermining efforts to combat climate change. [1]Global Subsidies Initiative

Unfortunately, according to the same source: 'the announcement did lack details. In particular there was no information offered on how subsidies would be defined or the plan would be implemented.' A similar story on a larger scale is told by Simon Johnson, in 'the Atlantic':

recovery [in the US] will fail unless we break the financial oligarchy that is blocking essential reform. And if we are to prevent a true depression, we're running out of time.

The Quiet Coup , 'The Atlantic', May

It comes down to attacking the vested interests, who have become powerful enough, thanks to taxpayer funding, to resist the withdrawal of their favourable treatment. An essential first step, and one that is built into the Social Policy Bond idea, is to make policy transparent. It's quite possible that voters in a democracy would vote to sacrifice hospitals and schools to further enrich huge oil corporations or enormously wealthy bankers, so why not give us the choice? Or at least make what's going on comprehensible to outsiders. Simon Johnson again:

As the crisis has deepened and financial institutions have needed more help, the government has gotten more and more creative in figuring out ways to provide banks with subsidies that are too complex for the general public to understand.

Government and big business versus ordinary people. A familiar match. What chance have we got?

### **6.11.4 Chaotic evolution (2009-11-05 11:12)**

Centralised systems experiment too little. They find reasons why new proposals will fail - and mostly they are right. But market economies thrive on a continued supply of unreasonable optimism. And when, occasionally, experiments succeed, they are quickly imitated. If market economies are better at originating and diffusing new ideas, they are also better at disposing of failed ones. Honest feedback is not welcome in large bureaucracies.... John Kay, [1]Chaotic evolution defines the market economy, 'Financial Times' 4 November

Thanks largely to over-centralisation, we are all in a position where we need the very solutions that centralisation cannot bring us. It was national governments that created and subsidised our absolute dependence on fossil fuels, for instance, and we are looking to a centralised non-solution - Kyoto - to solve the problem. Exactly the same goes for the finance sector.

These, and other, large problems require the diversity and adaptivity of markets. That means that governments are going to have to relinquish a degree of control. But they will still have vital tasks to perform, and that is where Social Policy Bonds could be valuable. Under a Social Policy Bond regime governments would articulate society's goals and raise the revenue to reward those who achieve them. Only democratic governments can do these things, and they do them very well. But governments should bow out of actually achieving these goals, and the market's 'chaotic evolution' choose the best approaches. Is it going to happen? Frankly, I think not in the foreseeable future.

### **6.11.6 The private sector and social goals (2009-11-08 05:58)**

A correspondent asks: According to the laws of economics if there was a potential gain for private enterprise in targeting social goals, they would have addressed it by now. If the opportunity exists, what was holding back the development of such a concept until now?

A first answer of course is that the private sector does help solve social problems, largely by employing people and paying them salaries, but only as a by-product of more financially profitable activities. A more relevant answer is that most of the funds available for directly achieving social and environmental goals are appropriated from the private sector and channelled through government agencies, which have their own goals (primarily self-perpetuation), and enriching the private sector is not one of them. If government relinquished control over the allocation of some of taxpayer funds, via for instance Social Policy Bonds, then that would animate the private sector much more than the relatively paltry after-tax sums ordinary people have for solving other people's problems. In fact, these sums go to charities and NGOs, and it's generally thought they are much more efficient at solving social problems than

government. Mainly, though, the private sector would have to compete with government agencies, which apart from being big, entrenched monopolies are extremely reluctant to relinquish even control of funds, let alone funds themselves, to the private sector. Once a government did start to allow the private sector access to tax revenues, by for example issuing Social Policy Bonds, then we'd see entrepreneurs take a serious interest in solving social problems.

-  
Policy as if outcomes mattered  
SocialGoals.com

---

### **6.11.7 Q+As (2009-11-08 22:19)**

My correspondent (see previous post) goes on to ask some further questions:

*If the opportunity exists to commercialise social goals, who are the players?*

- *Who are the players for it?*
- *Who are the players against it?*

*...players for it...?* Anyone sincerely interested in efficient solution of social problems. I'd have thought philanthropists or their journals would be interested, but not one has ever responded to my emails.

*...players against it...?* Plenty, especially government agencies. In the epilogue to my book I relate this episode: "In April 2002, I presented a paper on the bond concept to joint meeting of the Agriculture and Environment Committees at the Organisation for Economic Cooperation and Development (OECD) in Paris. ... Perhaps one of the delegates articulated the deeper feelings of those present, who were overwhelmingly government employees: 'if this gets adopted we'll all be out of jobs!' My OECD paper went no further. "

What would they use such platform for? How can be made sure that it does not back fire and turn into an accessory to pursue unintended/adverse goals?

I assume that philanthropists or public sector Social Policy Bond issuers would aim to achieve social and environmental goals about which there is a wide consensus. Perhaps along the lines of avoiding of catastrophe, or achieving basic minimum levels for such things as literacy, nutrition; or maxima for environmental pollution, unemployment, crime. As for the second question: I'd have to assume that (1) people or institutions would not want openly to declare themselves in favour of anti-social goals: remember the Social Policy Bond concept is entirely transparent; redemption terms are written into each bond issue and available to everyone, and (2) there is sufficient existing sanction against illegal acts. I do address the possibility of negative-but-legal actions in my book. (See link in right-hand column.)

Whose economic or political interests are supported by the securitisation of social goals, and whose big toe would it step on?

Similar answer to players for and against it, above. Also, obviously the finance industry would benefit from securitisation. I'd hope that sincere representatives of disadvantaged people or countries would be most interested in the concept.

At what point would the platform become a competition and to whom?

I envisage Social Policy Bonds would be a bit like equities: there would be competitive bidding for the bonds at flotation and at all times thereafter, but holders would have an interest in co-operating with each other to help achieve targeted social goals after purchase.

"Are there any forerunners of this concept, and if yes how did they go.

What did they achieve, and what mistakes did they make?"

I don't think so. That's one reason I think Social Policy Bonds need careful trialling, discussion and refinement before they can be applied to larger issues. Sadly, this hasn't happened yet.

### **6.11.8 England: 1381 (2009-11-10 12:04)**

Writing in History Today , Dan Jones describes England at the time of the 'summer of blood' in the year 1381. This was the Peasants' Revolt, when the lower classes, emboldened by the labour shortages that resulted from the Black Death, flexed their muscles. In the summer of that year they began the first English rebellion of workers against their masters. Mr Jones points out the 'profound echoes with our current times':

...ordinary people protesting against an ill-manged, expensive war [against France] and the corruption of the super-rich who were seen to grow fat while the rest of the population were taxed through the nose; consciousness of and resentment towards the interfering presence of government in everyday life; the fear of homegrown subversive elements in society, organised in secret cells and mobilised through local communities. [1]The Peasants' Revolt (subscription), 'History Today', June 2009

Sounds familiar? asks Mr Jones, and indeed it does. Ordinary people, in much of the developed world, are having a rough time of it. Our political system seems biased heavily in favour of those who work for government agencies, or those in big corporations who can successfully influence government. The losers are small enterprises and the public. In so many broad

policy areas: finance, the physical environment, the social environment, our politicians have taken the easy option, postponed the difficult decisions, and allowed problems to grow so that they have become systemic threats.

That way of doing things cannot, in my view, continue. Unfortunately, the scenarios on offer seem about as unappealing as the rioting, looting, terror and counterterror that followed the Peasants' Revolt. If that sounds far-fetched, consider this display of extreme attitudes depicted by Paul Krugman :

Last Thursday [5 November] there was a rally outside the US Capitol to protest pending health care legislation, featuring the kinds of things we've grown accustomed to, including large signs showing piles of bodies at Dachau with the caption "National Socialist Healthcare ." It was grotesque — and it was also ominous. [2]Paranoia strikes deep, 'New York Times, 9 November

One way of closing the gap between people with different views, and the yet more grievous gap between politicians and ordinary people, is to recast policy in terms of outcomes. Our current system exaggerates the impact of special interests: it is these who bankroll the political parties, and they have little interest in the longer-term concerns of wider society. Ordinary people, rightly, feel disenfranchised and either adopt extreme attitudes, become cynical, or disengage from politics altogether.

Yet most people would probably find themselves in agreement about the policy outcomes they'd like to see: universal literacy, and basic minimum levels of income, housing and health care, for instance. There would also be a surprisingly wide consensus over the need to achieve some sort of climate stability - despite the huge gulf between people on different sides of the debate about what's actually happening to the climate.

Social Policy Bonds could help to close these gaps. Where people differ is less about the outcomes we want to see, and more about the ways in which government goes about achieving them - or failing to. A Social Policy Bond regime, with its focus on outcomes that are meaningful to ordinary people, would draw more people into the policymaking process. There will always be limited resources, and under a bond regime there would still be debates about priorities and costs. Politicians would have to relinquish their power to decide on how goals are to be achieved; they would, in effect, contract that out to the market. That would generate huge efficiency gains, but it would also mean an informed, public that participates and helps determine policy. Such a public would be far less likely to engage in the scary display of extremist attitudes that occurred last week in Washington DC, or the destructive, bloody actions that occurred in England in 1381.

### 6.11.9 Ending war (2009-11-13 11:29)

I'm pleased that someone else shares my belief that we can, and should aim to, end war. [1]Gordon Fellman is Professor of Sociology at Brandeis University. Here is a link to a talk he gives entitled [2]Ceasefire: the case for ending war. Some, though not all, of the impetus for weapons-making and war comes from financial incentives, and I think that if we supply sufficient incentives to end war it will become less the intractable feature of human life (as the ancient Greeks thought), and more another social problem that is best addressed by adaptive, diverse responses, of the sort that would be stimulated by Social Policy Bonds. See my essay [3]Conflict Reduction Bonds: give greed a chance.

### 6.11.10 The policy monoculture (2009-11-15 12:06)

The Organization for Economic Co-operation and Development reports on the subsidies , worth US \$285 billion, given to OECD farmers in 2008:

Support is becoming increasingly conditioned by requirements on producers to follow certain production practices in pursuit of broader objectives, such as preservation of the environment, animal welfare or food safety. Payments involving the fulfilment of such requirements comprised 4 % of [subsidies to farmers] in 1986-88, a share which had increased to 32 % by 2006-08.... [1]Agricultural Policies in OECD Countries 2009: Monitoring and Evaluation, summary ( pdf )

As in agriculture, so in every other policy area: government assistance becomes conditional on doing things the way government wants you to. There are important considerations of freedom here, especially when government is becoming ever more involved in every aspect of social and economic organisation. But I am also concerned about the efficiency and risk management aspects of this sort of process-driven micro-management. They can be summarised briefly:

- Government does not always know the best ways of achieving social and environmental outcomes; when it gets it wrong it does so on a big, and possibly catastrophic scale;
- The ways government chooses are likely to be fossilised in time, and incapable of taking into account local circumstances; government intervention will discourage adaptive, diverse approaches, experimentation and the termination of failed approaches.
- Government's edicts are also likely to be heavily influenced by considerations other than efficiency , such as the interests of large corporations.

I write at greater length on this causes and consequences of this policy monoculture in my [2]book - see the links in the right-hand column.

### **6.11.11 The corruption of scientific research (2009-11-19 09:47)**

A scary article by Stuart Parkinson and Chris Langley in the New Scientist . Their organization, Scientists for Global Responsibility has looked at impact of commerce on science and technology over the past 20 years:

Over the past two decades, government policy in the US, UK and elsewhere has fundamentally altered the academic landscape in a drive for profit. ... Chemical engineering and geology are strongly linked to oil companies, for example, and it is hard to find an engineering department in the UK which does not receive funding from the arms industry. And many life sciences

departments have extensive links with the biotechnology and pharmaceutical industries. This creates enormous potential for conflicts of interest. ... Another cornerstone of science that is being eroded is the freedom to set the public research agenda so that it serves the public interest. [1] Stop the sell-out , 'New Scientist', 7 November

Governments are increasingly focusing on the interests of corporations; and these are naturally enough focused on immediate financial benefit. The result? 'Environmental and social problems and 'blue sky' research commonly lose out to short-term commercial gain'.

It's the way of the world. As the gap between ordinary people and policymakers has widened, it has been filled by the corporations, and it is their interests that are best served under the current system. Sometimes these interests coincide with ours; often they don't; and far too often the two sets of interests conflict with each other. One reason for the disconnect between people and policymakers is the complexity of policy, focused as it is on legalistic debates about institutional structures and processes, spending patterns, personalities, image or ideology. Ordinary people aren't interested in such things. Above all we are concerned about outcomes - and that is about the only thing that policymakers do not target explicitly.

So instead of targeting something meaningful, like reducing the crime rate, governments make decisions about prisons, police numbers, justice procedures and the rest. Instead of targeting the rate of change of climatic variables, they target emissions of greenhouse gases, which by sheer coincidence require a large bureaucracy to oversee. And in matters such as scientific research, where government could usefully target broad social and environmental outcomes , it's the corporations and their goals that are served instead. Government just does not think in terms of outcomes, yet it is outcomes that matter most.

Social Policy Bonds would refocus our priorities onto outcomes. By relinquishing control over how things are done, governments could still set the agenda, but they would contract out the achievement of outcomes to the private sector. Under a Social Policy Bond regime, corporations would still play their part, and still have the chance of making profits, but only if they were efficient at achieving ordinary people's social and environmental goals. Government would become a matter of selecting and prioritising society's goals, and raising the revenue to achieve them. That would be healthier, in my view, than the current system, which is largely about government fulfilling the wishes of the private sector in pursuit of funds to finance re-election campaigns.

### **6.11.12 The ideologues are winning (2009-11-23 08:53)**

Writing about the collapse of professional journalism, Mark Bowden says:

Work formerly done by reporters and [TV] producers is now routinely performed by political operatives and amateur ideologues of one stripe or another, whose goal is not to educate the public but to win . This is not a trend likely to change.

[1]The story behind the story  
, Mark Bowden , 'the Atlantic', October

Society is complex and so is policymaking . Ideology simplifies the otherwise impossible process of relating a social problem to its causes. But it's necessarily a distortion of reality; we are in an era now where the ideologues don't communicate with each other. Take any issue - abortion, smoking, healthcare , capital punishment, climate change... - there is plenty of debate, but less and less communication going on. Vested interests fill the gap between complex problems and ordinary people's understanding of them. As Mr Bowden puts it 'the quest for information has been superseded by the quest for ammunition'.

I think this will continue so long as society remains complex and we continue with a policymaking system that seems almost designed to translate the obscurity of the relationships between cause and effect into advantage for vested interests - generally corporations, government agencies - at the expense of the broader public. We need, I believe, to think in terms of desirable social and environmental outcomes. All activities, institutional structures and spending plans should be subordinated to outcomes. A Social Policy Bond regime is, I think, the most efficient way of targeting such outcomes . It would , in essence, contract out the achievement of social goals to those players - public or private sector- who are most efficient at achieving them. The losers? The vested interests who benefit now by gaming the current system; and that includes the ideologues on all sides.

### **6.11.13 Incentives to intermarry (2009-11-24 10:46)**

It's a while since I suggested that one way of bringing about peace in the Middle East might be for investors in Middle East Peace Bonds to subsidise intermarriage. Happily, it seems that that particular suggestion looks like being implemented in Iraq:

Iraqi Vice President Tariq

al - Hashemi has an unusual proposal to mend some of Iraq's sectarian wounds: He offers mixed couples a \$2,000 "gift" if they get married.

[1]USA Today 24 November

My original essay is available at: [2] Middle East Peace Bonds: Give greed a chance .

### **6.11.14 Shakespeare versus Chekhov: Justice versus Survival (2009-11-27 00:34)**

Amos Oz, writing in 1993:

At the end of a Shakespeare tragedy the stage is strewn with dead bodies, and maybe there's some justice hovering high above. A Chekhov tragedy, on the other hand, ends with everybody disillusioned, embittered, heartbroken, disappointed, absolutely shattered, but still alive. And I want a Chekhovian resolution, not a Shakespearean one, for the Israeli-Palestinian tragedy. [1]Source

We might do better to target such a basic goal - human life - than strive for fairness and justice, when it comes to making policy. This certainly applies to the Arab/Israeli conflict (see my [2]essay on applying the Social Policy Bond principle to the Middle East). Justice and fairness can be sought for, but they must overlie the even more fundamental goal of human survival.

The same applies to [3]climate change: arguments about which countries are most responsible for the build-up of greenhouse gases in the atmosphere may be necessary, but they should not impede the more fundamental goals of reducing the rate of climate change and its impacts. Similarly with other global threats, such as nuclear proliferation. More than all else that we'd wish to see in these policy areas is human survival.

Thankfully, the Social Policy Bond mechanism allows us to fold such desirable goals as justice and fairness into that over-arching objective . Social Policy Bonds targeting [4]world peace, say, would not discourage the pursuit of justice; they would even encourage it when doing so makes human survival more likely . But they could also introduce an element of unfairness, for the sake of the greater good. Holders of bonds targeting peace would have every incentive, for example, to bribe people espousing inflammatory views to keep quiet, or to take an indefinite vacation at the golfing resort of their choice. It might not be fair; it might lead to gaming of the system; but the benefits to everyone else would be huge. We shouldn't forget either that there's plenty of such unfairness in the current system. The difference - and it's crucial - is that currently it just as often acts to worsen the chances of human survival as to enhance them.

### **6.11.15 Kyoto-Copenhagen: deeply flawed (2009-11-30 10:07)**

The warming effect of carbon dioxide has been known since at least the 1900s, and that of ozone since the 1970s, but the importance of black carbon was discovered only recently. ... no one knows exactly how much warming [black carbon] causes, but even the most conservative estimates indicate a nontrivial impact. [1]The other climate changers: why black carbon and ozone also matter, Hessica

Wallack and Veerabhadran

Ramanathan , 'Foreign Affairs', Sept/Oct 2009 (subscription, but see [2]here)

Black carbon is a widespread form of particulate air pollution and mostly originates from the burning of biomass or fossil fuels. But the important phrase is 'no one knows'. It is that phrase that exposes the flaw in the entire Kyoto-Copenhagen approach to climate change. Even if titanic efforts to reduce carbon dioxide emissions are made, at great social, financial and political cost, no one knows if they'll have any effect. Perhaps all such efforts will be swamped by any of the myriad other variables about which no one knows.

It's imperative that we shift from trying to work out the causes of climate change and acting on those, to an approach that targets the outcome we want to achieve and rewards people for doing so. We need an approach that will respond quickly to our rapidly expanding, but still deficient, scientific knowledge, and to new events. We need an array of adaptive,

diverse approaches. Kyoto-Copenhagen is none of these things. It's deeply flawed and it's going to fail, however much money is thrown at it.

I've been talking and writing about [3]Climate Stability Bonds for many years now, and will continue to do so until I see a better solution. It's a bit disheartening that the bonds' outcome-based approach is not generating any interest at political level, but I cannot see any better solution either to climate change or to any of our other social and environmental problems whose complexity will defeat any approach based, like Kyoto, on deficient, fossilised, information.

## 6.12 December

### 6.12.1 Climategate (2009-12-03 14:08)

Robert Murphy quotes from [1]one of the emails leaked the Climate Research Unit at the University of East Anglia:

The fact that we can not account for what is happening in the climate system makes any consideration of geoengineering quite hopeless as we will never be able to tell if it is successful or not! It is a travesty! [2]Apologist Responses to Climategate Misconstrue the Real Debate (Quantitative, not Qualitative)

Mr Murphy goes on to say:

....the above email is simply jaw-dropping. If the climate scientists cannot tell if a particular remedy is working, it means that they aren't exactly sure how the climate would have evolved in the absence of such a remedy. In other words, Trenberth at least is admitting that he is not at all confident in the precise, quantitative predictions that the alarmists are citing as proof of the need for immediate government intervention. And this expression of doubt wasn't from the distant past: Trenberth sent the above email in October of this year!

Precisely so: there's little point on embarking on policies if we cannot, or don't bother to, measure how effective they are. Sadly, such fecklessness is typical of most government interventions (see [3]this paper by Stephen van Evera ). It's irresponsible, wasteful, and often corrupt. It's also quite normal and generally accepted, and Kyoto-Copenhagen is simply an extrapolation of it onto a global scale.

Which is why I advocate [4]Climate Stability Bonds, which would inextricably bind all policies, activities and projects to objectively verifiable targets and indicators. Governments would not have to accept models of climate sensitivity - or indeed any other climate data - from scientists as true or false: under a bond regime assessment of that information would be done by would-be investors in the bonds. These people, or institutions, would have incentives to respond rapidly to our rapidly expanding scientific knowledge - unlike the Kyoto-Copenhagen approach, which assumes that we already know all the important causes and consequences of climate change.

Quantitative targets would be built into the Climate Stability Bond approach; but the beauty of the bonds is that they don't assume fixed relationships between interventions (cutting greenhouse gas emissions, for instance) and how climate will respond. That would be up to bondholders to work out themselves; at their own risk, and in ways that respond continually to new information. I think that's far preferable to whatever agreement will come out of Copenhagen. You can be sure that if there is such an agreement, the single impact that will be monitored assiduously and unambiguously will not be that on climate, but rather the money flows from rich to poor countries.

### **6.12.2 Soviet Earth; or Government doesn't do diversity (2009-12-06 06:21)**

Mick Hume writes:

The top bankers and businessmen of the UK might have proved themselves worse than useless. But an economy managed by state bureaucrats will be no better. ... We are left with the prospect of the worst of all worlds - a state-subsidised capitalist economy, but one denuded of the dynamic side of capitalism that Karl Marx long ago identified alongside the system's destructive aspects, and which has driven economic growth through the modern age. [1]What happens if the state turns off the 'life support'?, 25 November

All the evidence bears out Mr Hume. Government intervention has generally started out with the best of intentions: to maintain employment, to prop up allegedly strategic industries (like car assembly or industrial agriculture), and before long it becomes indispensable to its favoured sectors. Taxpayer support is capitalised into asset values, making its withdrawal problematic. Sectors use their status and subsidies to bias the international trading and domestic regulatory environments in their favour, and to finance lobbyists whose job is to maintain their vested interest. State support, like a drug habit, is easy to start, difficult to stop. And now it's propping up not just individual sectors, but our entire financial system. The result will be ossification, the Sovietization of our economies and, inevitably, collapse. If that sounds far-fetched, consider that, government accounted for [2]two-thirds of the Welsh economy -

before the financial crisis. (And read about some of the social implications [3]here.)

Difficult to imagine, but it gets worse. We are now looking to manage our global environment in the same manner: that is, by setting irrelevant targets, imposing them heavy-handedly, pre-supposing that government knows what's best, and suppressing alternative solutions. I refer of course to Kyoto-Copenhagen, where government is using fossilised science to tackle one of the alleged causes of climate change. Spectacularly expensive, politically divisive, bureaucratically intrusive - Kyoto-Copenhagen will Sovietize the entire planet. The end result is absolutely foreseeable: runaway climate change, widespread poverty and an ever more entrenched and brutal bureaucracy telling the rest of us us what to do.

The debate is so debased and politicised that anybody reading the above will think I don't believe anthropogenic climate change is happening, or that government should just sit back and do nothing. But it's just the opposite: I think climate change is far too serious to be left to the same government mentality that has given us, for example, an agriculture sector absolutely dependent on imported oil, with its denuded landscape, devastated wildlife, and polluted waterways. Government does have an indispensable role to play in ensuring climate stability: it can define our climate goals, articulating society's wishes. It can raise revenue to reward the people to help achieve that goal. But, crucially, it must stand back from dictating how that goal shall be achieved (see [4]here for my suggestion).

We need diverse, adaptive approaches, and we need them urgently. Unfortunately - tragically - government doesn't do diversity nor does it have the ability to adapt quickly to changing circumstances.

### **6.12.3 Heading for disaster (2009-12-12 10:37)**

This post summarises my position on climate change

There is overwhelming, but not quite conclusive, evidence that the global climate is changing. That said, scientists and policymakers are divided as to (a) how fast climate is changing, (b) what is causing it to change, (c) the likely effects of climate change, (d) how much we can do about it, and (e) how much we should do about it. Despite these uncertainties, climate change has the potential to inflict serious harm on large populations, so there is a strong argument for doing what we can to prevent it or minimise its adverse effects. The December 1997 Kyoto treaty required developed countries to bind themselves internationally to numerical targets.

If there is any universal consensus about Kyoto it is that, for all the bluster and bureaucracy, its impact on the climate will be so small as to be unnoticeable.

### Gaming the system

The forthcoming climate change summit in Copenhagen, if deemed successful, will be more of the same. At best we can look forward to minimal reductions in emissions; undetectable effects on the climate; and the squandering of billions of dollars on wasteful, corrupt schemes all over the world. The big beneficiaries will be third-world dictators, Swiss bankers, and the burgeoning bureaucracies at national and supra-national level who will be charged with administering and ensuring compliance with whatever emission reduction regime is agreed. This is not cynicism, it's realism. The manoeuvrings of the various interest - fossil fuel extractors and users, as well as farmers, forest owners, the auto industry, politicians and officials - tell us all we need to know about where human ingenuity is going: in bickering, lobbying in defence of vested interests, and competing with other interest groups for subsidies. Gaming the system in other words. One example: US companies and interest groups involved with climate change hired 2430 lobbyists just last year, while 50 of the biggest US electric utilities spent \$51 million on lobbyists in just six months.

They are all reacting perfectly rationally to the incentives on offer, and those incentives are perverse. They have little to do with actually solving meaningful problems, and far more to do with the prime, over-arching goal of all institutions: that of self-perpetuation - even if the rest of the world has to undergo catastrophic climate change. Under Kyoto-Copenhagen that's where humanity's boundless energy and ingenuity will be diverted and that's why it's not going to work.

### Rewarding achievers

Here's a different approach: agree on the outcome we want to achieve, and reward people for achieving it. The outcome we should be targeting is some agreed, meaningful definition of climate stability, which should include indicators of human, animal and plant wellbeing as well as climatic variables and the rate of change of those variables. Targeting climate stability means that we don't prejudge the best way of achieving it. This is, in my view, the most glaring flaw of the Kyoto-Copenhagen approach: it assumes that the best way of tackling climate change is to reduce anthropogenic greenhouse gas emissions. There is no evidence for this, even though the evidence that links such emissions to climate change appears convincing - with our current knowledge.

But our knowledge is rapidly expanding. We are constantly discovering more about the links between greenhouse gas emissions and the climate, and about ways in which we can prevent or minimise the impacts of climate change. Kyoto is a single, one-size-fits-all, top down, supposed solution to the climate change problem, and it's based on science fossilised in the last 20 years. But the climate change problem may be so huge and so urgent that we need instead a mosaic of diverse approaches that can adapt to our rapidly changing knowledge and rapidly changing circumstances.

We also need to enlarge and motivate the pool of people prepared to do something to

tackle climate change. Currently there is probably more human ingenuity devoted to marketing new brands of dog food or securing the bonuses of failed bankers than to finding ways of preventing or mitigating climate change. The fact is that the rewards to a successful pet food campaign manager or a reckless banker can be in the millions of dollars, while someone trying to generate new ideas for tackling climate change that don't fit in with the Kyoto paradigm will have difficulty getting attention, let alone adequate funding.

We need to target a stable climate however that goal is to be achieved. We cannot afford to let the bureaucrats who run the Kyoto-Copenhagen industry dictate the pattern of the world climate: we cannot afford the waste and inefficiency of brainpower that people will expend on gaming the current system.

### Climate Stability Bonds

It is for all these reasons that I believe [1]Climate Stability Bonds would be an improvement over Kyoto. Climate Stability Bonds would be backed by the world's governments. They would be redeemable once a specified climate stability goal had been achieved and sustained. They would be freely tradable and their value would rise or fall as the targeted goal become more or less likely to be achieved. The goal could be specified as a combination of climate and other indicators. And crucially, Climate Stability Bonds would not prejudge the best ways of achieving our goal. They would reward the achievement of a sustained period of climate stability, however it is achieved. Investors in the bonds would have incentives to respond quickly, appropriately and with maximum efficiency to new knowledge about what is causing climate change and to new ways of dealing with it. Governments would be the ultimate source of finance for achieving climate stability, but the private sector would allocate society's scarce resources. Investors in Climate Stability Bonds would have exactly the same interest as society: achieving climate stability and the lowest cost.

A Climate Stability Bond regime would express its aims in terms that people can understand. Its explicit goal would be climate stability. If people understand what a policy is all about, they can participate more in its development, refinement and implementation. This matters hugely when, as with climate change, government will probably have to encourage us to rein in activities to which we have become accustomed. Kyoto discourages buy-in because it is focused entirely on one single policy: the cutting back of net anthropogenic greenhouse gas emissions which, at best, will do little to prevent climate change and despite being ineffectual will impose heavy, and up-front, financial costs.

There is still some legitimate doubt about just how big a threat climate change represents. Here Climate Stability Bonds have another huge advantage: because they would be auctioned on the open market, it would be bidders for the bonds, rather than governments, who would have to take a position on just how much will have to be spent to achieve climate stability.

To summarise: Climate Stability Bonds have a comprehensible, meaningful goal: the achievement of climate stability. They would channel the market's incentives and efficiencies into the solution of our most urgent environmental problem, at least cost to society. And with their focus on a targeted outcome, rather than a supposed means of getting there, they would also encourage greater public participation and buy-in to the solutions they generate.

We need a widely supported, coherent, and efficient response to climate change. Climate Stability Bonds have all those features. Kyoto, and whatever will be agreed at Copenhagen, have none.

#### **6.12.4 We need explicit, meaningful, policy goals (2009-12-13 13:39)**

Society's size and complexity mean that numbers are going to have to be used to help determine policy. Numbers inevitably distort, but if things aren't measured they tend to be ignored at the policy level. We want numbers, ideally, to represent human wellbeing - which immediately raises the question of whether or how animal and plant life are to be weighted when it comes to setting policy goals. There are many other questions, but where numbers correlate strongly with what we want to achieve, there's no objection to targeting them, as in Social Policy Bonds, as part of a wider political process. The key is to ensure that the correlation remains strong over the target range. For instance, the correlations between, say, educational level, household income, or longevity, and wellbeing are strong at the lowest levels of all these variables, but become much more tenuous as we move into tertiary education, higher incomes or age ranges.

If Social Policy Bonds were ever to be issued, they would benefit from the work already being done to quantify even such complicated things as human wellbeing - see, for instance, the [1] Human Development Index. Now it appears that people are trying to aggregate and quantify climate change. A group called the International Geosphere -Biosphere programme has launched the '[2] IGBP Climate-Change Index'. This and the HDI would need refinement before they could be explicitly targeted, and there would always be debate about what they should include and relative weightings.

Even then, they might not be perfect as policy instruments. But what is the alternative? In the absence of explicit targets that are meaningful to ordinary people we are seeing the good intentions of politicians being almost entirely hi-jacked by the short-term financial interests of rich corporations. If that sounds far-fetched, you have only to look at the levels and persistence of government (taxpayer) support for the banks.

We the paying public can't do anything much except admit defeat and settle back for the next set of bills. In the meantime, perhaps we should try and think of a name for the new economic system, which certainly isn't capitalism: that, remember, is all about 'creative destruction', and the freedom to fail. That's exactly what we don't have. The most accurate term would probably be 'bankocracy'. [3] Bankocracy, John Lanchester

, 'London Review of Books', 5 November

### **6.12.5 Subsidising planetary destruction - the story continues (2009-12-16 09:34)**

Subsidyscope researchers found that [1]non-users of the highway system contributed \$70 billion for nationwide road construction and maintenance in 2007. [2]Source

That refers to the federal US highway system, and works out at about 35 percent of the total. This amount excludes the costs of accidents, air and noise pollution, and the impacts on wildlife. It appears that state and municipal roads in the US are [3]even more heavily subsidised.

Social Policy Bonds would mean contracting out the achievement of social goals to the private sector. Two crucial points relevant to roading are: (1) clarifying whether cheap, easy transport is an end in itself or a means to ends that would be better targeted more direction, and (2) transparency, which in this context is about making it clear to people where there taxes are going. In short, it's quite possible that people are willing to pay for cheap roading, even if many of us are nonusers. We might even be willing to shore up reckless banking behaviour, or massive agribusiness corporations, car and truck manufacturers and all the rest. But we should be given the option. The current system doesn't allow that: by emphasising process, institutional structures and spending, regulations and legalisms, it tends to exclude ordinary people from policymaking. In contrast, Social Policy Bonds would have transparency built in. A more ethical, as well as more efficient, way of achieving social goals, I think.

### **6.12.6 Sterile life-prolongation (2009-12-24 10:33)**

Sterile life-prolongation, as against creative destruction. It's what you get when major funding decisions are made on the basis of who you are (or how much you give to political parties) rather than what you achieve. And, increasingly, it's the regime under which we live. It's the way our politicians operate, in conjunction with their friends and paymasters in the large organizations, whether they be government agencies, corporations or trade unions. It's the

system that brought the Soviet Union to collapse and it's well on the way to securing the same destiny for the west. (See [1]here for a blog making this comparison.)

Creative destruction means that unsuccessful businesses fail. In social policy it should mean the same for unsuccessful programmes. But it rarely does; government too often acts as a monopoly supplier of social and (increasingly) environmental services. As tax revenues rise, government tends to crowd out alternative ways of doing things. Take scientific research, which is now essentially a nationalised industry. In itself, this need be no bad thing, but the way government typically allocates funding is always going to be determined by politics rather than results. Funding is to institutions, rather than outcomes. This leads to idiocies like the use of citation indices to evaluate research.

What's needed is a more direct relationship between taxpayer funds and those outcomes that are meaningful to ordinary people. Government can -and indeed, should - be the articulator of society's goals, and it has a vital role in raising the revenue needed to achieve them. But like all big organizations, and like monopolies in particular, it doesn't work well when creative destruction is required. It's too big to adapt quickly; it's too slow to terminate failures. It doesn't like diversity, and it doesn't do creative destruction. No single organization can. And we need diversity and adaptiveness in complex, uncertain ventures, especially where our scientific knowledge is growing rapidly. I've written numerous times about the need for a mosaic of different approaches to tackle problems like [2]climate change or [3]war. Such problems just cannot be solved by any single organization, however big and however well intentioned. Sadly, the vast majority of resources aimed at these problems is now allocated by government. Even more sadly, the failure of government to address these challenges threatens our entire species.

Social Policy Bonds would, in contrast, supply the necessary creative destruction. Projects would be appraised continuously by highly motivated actual or would-be investors in the bonds. Their motivation would be pecuniary, of course, but through a bond regime it would be channelled to serve the interests of society as a whole. Funding would be allocated entirely according to results, as anticipated by a plurality of interests. Sterile life-prolongation (a la Kyoto, for instance) would surrender to creative destruction.

### **6.12.7 Why are modern scientists so dull? (2009-12-30 10:49)**

Why are modern scientists so dull? asks [1]Bruce G Charlton. His conclusion?

[S]cientists are dull mainly because the progressive increase in the requirements for long-term plodding perseverance and social inoffensiveness has the effect of deterring, driving-out and failing to reward too many smart and creative potential scientists before they ever get a chance to engage in independent research.

I think the same could be said of policymakers and public servants and for broadly similar reasons. Any large organization is going to rely more on willingness to conform to the organization's rules and processes than on the contribution an individual makes to a particular outcome. An individual's conformity to procedures is much easier to measure than his or her contribution to a possibly nebulous or undefined outcome.

In my [2]book about Social Policy Bonds I explain how attempts in the 1980s to reform New Zealand's public service faltered over the question of how to measure departmental performance. At the outset of the reform programme, government departments had been envisaged as achieving specific outcomes, but instead outputs became the measure by which departments' performance is judged. Why did that happen?

One reason is said to be the self-interest of ministers and public servants, who are unwilling to be scrutinised. Another is that while the supply of outputs can be directly attributed to departments performance, outcomes can be influenced by factors beyond their control. As one commentator put it: outcomes are externalities in two-party relationships; therefore it is exceedingly difficult to assign responsibility for them. [3]Market solutions for social and environmental problems: Social Policy Bonds

So it looks very much as though the perceived need to assign responsibility in effect hijacked more thoroughgoing reform. The perception of such a need arises because the players - those whose responsibility is to be assigned - are known in advance and are assumed constant. And who are these players? Why, they are the existing government departments, of course. In effect the New Zealand reforms have subordinated results to an assumed need to assign responsibility, which in turn seems to be driven by existing institutional structures and their wish to perpetuate their own existence and degree of control. It's a potentially disastrous failing: leading to a divergence of the objectives of departments in particular and government in general from the people whom they are supposed to serve. The results, throughout the democratic countries, are becoming all too clear: a widespread disenchantment with conventional politics, a growing cynicism and despair over government ever being able to deliver what ordinary people want and need.

# 2010

## 7.1 January

### 7.1.1 What would Ivan do? (2010-01-03 05:34)

Chase Madar writes:

Elite professional groups, wrote [1][Ivan] Illich , have come to exert a “radical monopoly” on such basic human activities as health, agriculture, home-building, and learning, leading to a “war on subsistence” that robs peasant societies of their vital skills and know-how. The result of much economic development is very often not human flourishing but “modernized poverty,” dependency, and an out-of-control system in which the humans become worn-down mechanical parts. [2]The People’s Priest, ‘American Conservative’, February 2010

Illich does seem to have anatomised a growing problem: our passivity in the face of the growing influence of corporations, and their crowding out of non-corporate - that is, human - ways of doing things. I would include government here one of the corporations. Criticism is all very well, but as Mr Madar says:

‘A common, spluttering response to Illich ’s polemics was “Just what does he propose we do instead?” Good question.....’ Perhaps the answer is twofold: first, that economic development has gone hand in hand with population growth and life expectancy; it might not, in net terms, have raised the quality of life much, but it has certainly raised the quantity of life. We have collectively consented to that trade off, and presumably we could, if we wanted, reverse that decision.

A more proactive answer would be to subordinate economic growth or social change not to corporations ( including government again) and their incentives (primarily [3]self-perpetuation), but to the outcomes that ordinary people would wish for. A Social Policy Bond regime, for example, would allow our social and environmental outcomes to be achieved by means that are diverse, rather than dictated by government or corporations. Radical monopolies need not arise, because the most efficient way of achieving a specified outcome will most likely vary according to space and time. Investors in the bonds will be motivated to continuously reappraise their projects; they would have no built-in bureaucratic or ideological wish to convert the rest of us to their way of doing things.

### 7.1.2 Systems or results? (2010-01-08 09:45)

Reading [1] Infinite Potential , the biography of David Bohm by [2]F David Peat, one is struck by the overwhelming wish of great physicists to unify and systematise; to generalise from past data or past experience; to abstract principles that can apply to new situations. We probably all have this tendency, which has served us very well, for the most part. But in great scientists it seems to be all consuming and, perhaps inevitably, to lead to grief. Reality is just too complicated.

Policymakers in our increasingly large and complex societies are ever more remote from ordinary people. So they rely more and more on the advice of experts, all of whom are trained to abstract general principles and relationships from history and datasets . It's a never-ending, never-complete task of course but it's an approach that yields useful insights and has led to the development of unambiguously good policies. Unfortunately, though, many of our most urgent policy goals are just not amenable any longer to that approach. We are increasingly interlinked; relationships between cause and effect are ever more tangled; and society is changing so fast that there is very little precedent for solving some of our most challenging social and environmental problems.

But our policymaking system doesn't recognise this. As a result, it's both too limited and, perversely, too ambitious. Too ambitious, as, for instance, when it tries to tackle climate change by identifying one variable that it can control (or say it's trying to control) - greenhouse gas emissions - and assuming that that will be enough. Too limited, in that it fails to deal with problems, such as war, that it recognises it has no hope of solving with the current array of policy instruments.

Our policymakers are perhaps more interested in control than in results. They want not so much to see problems solved, but rather to identify organising principles and approaches that they can use to solve our problems. Implementing Social Policy Bonds would mean that politicians would have to relinquish some of their power and to subordinate their wish to identify and control policy levers (even if there aren't any) to the achievement of results. It would mean a massive psychological shift. But the rewards are potentially huge.

### 7.1.3 Madness (2010-01-10 10:28)

According to the New Scientist 's review of [1] Storms of my grandchildren , James Hansen believes that the threat posed by climate change:

...is far worse than [I] thought even a few years ago. The very survival of life on Earth is at stake.... "Your governments are lying through their teeth", he says. [T]he Kyoto protocol is a dismal failure, and its proposed successors, along with the cap-and-trade schemes favoured by [US] President Barack Obama, have no chance of achieving what is needed

either . [2]Earth on the brink, 'New Scientist', 12 December 2009

James Hansen and I agree that our political system is incapable of acting effectively because politicians serve the short-term interests of special interest groups with plenty of money to throw around, rather than the long-term welfare of citizens. It's madness.

### 7.1.4 What is government for? (2010-01-13 12:56)

In contrast with the past, what is good for America's global corporations is no longer necessarily good for the American people. [1]The disposable worker, 'Business Week', 7 January

Exactly. Big corporations are like big government: concerned almost solely with self-perpetuation. It's unreasonable to expect them to be altruistic, under the current legislative arrangements, but it is reasonable to expect governments to change those arrangements so as to favour ordinary people. Instead, most governments and political parties, most of the time, still believe that corporate goals are identical with those of wider society. Or, if they don't believe it, they behave as if they do. Often, their funding depends on maintaining that fiction.

At best, government has confused ends and means. It should concentrate not on bailing out failed businesses, or supporting inefficient sectors, but on the wellbeing of its citizens. What do we see instead? Massive transfers not only to bankers, but to large industrial and agribusiness corporations that would otherwise go under. Government instead of facilitating the creative destruction of failed business models, is resisting it. Big corporations are the winners (in the short run). So is government, which enlarges its role in the economy. But ordinary people are losing out.

We need, urgently, to realign government with the interests of natural persons, as against corporations. Social Policy Bonds could refocus government on ordinary people's wellbeing , not on the presumed ways of reaching them. If that means that certain businesses or sectors go to the wall, then so be it. Government should be about protecting disadvantaged people, not subsidising inefficient corporations.

### **7.1.5 Taking refuge in equations (2010-01-15 09:05)**

Not only was [David Bohm ] not given full credit for his plasma work, but most physicists appeared uninterested in the deeper philosophical questions of their subject. To make matters worse, they even ignored the underlying physics they were studying , preferring the surface brilliance of mathematical techniques. [1]Infinite potential: the life and times of David Bohm , F David Peat

Sadly economists and, increasingly, policymakers have exactly the same tendency. You might think or hope that their cynosure would be the wellbeing of ordinary people. But no. Like the foremost physicists of their generation, their focus is on intellectual elegance, symbol manipulation and mathematical consistency. And, in truth, it is easy to be distracted or hypnotised by the numbers and to work on the assumption that relationships that held in the past hold true today. So we have the lazy, implicit, targeting of Gross Domestic Product per capita , which takes no account of, amongst other determinants of wellbeing as the state of the environment or leisure time. Or, when the maths manifestly fails, the substitution of ideology for pragmatism, when pragmatism would do the job.

But the pragmatic approach, in policy, means some humility on the part of our politicians and bureaucrats. Social Policy Bonds, about which I have been talking for 20 years now, have gone nowhere, partly I suspect because governments would have to relinquish some of their assumptions about how policy goals are to be achieved. The bonds would encourage diverse, adaptive approaches to solving our social and environmental problems. Nobody - least of all governments - would know in advance which approaches would work and which would not. Much easier to preserve the illusion of emotional security by adopting an ideological position or taking refuge in the internal consistency of elegant equations.

### **7.1.6 Economic growth = hungry children? (2010-01-16 11:54)**

From the current Economist':

According to the Food Bank for New York City, an estimated 1.3m New Yorkers now rely on soup kitchens (which provide hot meals) and food pantries (which give away food). The number of people having trouble paying for food has increased 60 %, to 3.3m, since 2003. ... Almost half of all New York City households with children have difficulty affording enough food. A staggering one in five of the city's children, 397,000 small people, rely on soup kitchens — up 48 % since 2004. [1]The Big Apple is hungry

(subscription), 'Economist', 14 January

This must be the 'Bush Boom', that Jerry Bowyer writes about. As the blurb for his book, *The Bush Boom: How a Misunderestimated President Fixed a Broken Economy* has it:

[George W Bush] resolved to pursue an economic policy that included unprecedented tax cuts. What's the result of Bush's low-tax economic program? Jerry Bowyer confronts the critics and offers clear and convincing evidence that the Bush Administration fixed a broken economy, boosting the fastest economic turnaround since President Ronald Reagan. [2]Source

### **7.1.7 When intentions and self-interest conflict (2010-01-23 08:48)**

Frederick Barthelme describes a genial shift manager at the Paradise Casino, in his novel [1]Bob the Gambler:

Phil Post was always pleasant, always commiserating, urging us to leave when we were ahead or when we got even after a bad run of cards. He seemed genuinely friendly, but he worked for the Paradise, so who knew. He was paid to grease the skids, to shill, so it didn't matter whether he was friendly or not, because even if he was, even if everything he said to us and everybody else he dealt with was as genuine as the day was long, it still amounted to coaxing more money out of our pockets. (page 123)

It's unfortunate that, as with the well-intentioned but necessarily compromised casino employee, policymakers have no real interest in downsizing or efficiency. From the current Economist :

Periodic attempts to build "bonfires of regulations" have got nowhere. Under [George W] Bush the number of pages of federal regulations increased by 7,000, and eight of Britain's ten biggest regulatory bodies were set up under the current government. The power of these regulators is growing all the time. Policymakers

are drawing up new rules on everything from the amount of capital that banks have to set aside to what to do about them when they fail. Britain is imposing additional taxes on bankers' bonuses, America is imposing extra taxes on banks' liabilities, and central bankers are pondering ingenious ways to intervene in overheated markets. Worries about climate change have already led to a swathe of new regulations, for example on carbon emissions from factories and power plants and on the energy efficiency of cars and light-bulbs. But, since emissions are continuing to grow, such regulations are likely to proliferate and, at the same time, get tighter. The Kerry-Boxer bill on carbon emissions, which is now in the Senate, runs to 821 pages.

Fear of terrorism and worries about rising crime have also inflated the state. Governments have expanded their ability to police and supervise their populations. Britain has more than 4m CCTV cameras, one for every 14 people. In Liverpool the police have taken to using unmanned aerial drones, similar to those used in Afghanistan, to supervise the population. The Bush administration engaged in a massive programme of telephone tapping before the Supreme Court slapped it down. [2]Leviathan stirs again, 'The Economist' (subscription), 23 January

I don't see big government as necessarily a problem, but I do see remote, inefficient government as a problem, and one that's getting worse. Government is now so big it alone determines its size and rate of growth. In my view, the size of government should be a by-product of the social and environmental outcomes we want to achieve. There are some things that only government can do, two of which are articulating society's goals and raising the revenue for their achievement. Where government tends to be inefficient is in actually achieving these goals. Contracting out such achievement, as would be done under a Social Policy Bond regime, would bring competition to many services that are currently delivered by government agencies. Competition is not an end in itself, of course; it is a means to the end of greater efficiency. Unfortunately, our current system is not efficient. Some of its achievements have been impressive, but much of their cost has been deferred as far as politically possible. That's the financial cost. There have been other costs, as the Economist points out, including ever-growing state intrusion into our lives. Social Policy Bonds, or something like them, could be the answer.

## 7.1.9 Corporations versus humans (2010-01-31 09:19)

We constantly confuse means with ends. For most of recent history a society's corporate health was a fairly reliable indicator of economic health which, in turn, was reasonably well correlated with the wellbeing of an entire population. But there's nothing inevitable about such strong correlations. Corporate objectives differ from those of ordinary individuals, and often conflict with them. But large corporations and government are now so big that they can manipulate the legislative environment to make sure they grow even bigger and more influential. Any link between the success of big organizations and the wellbeing of ordinary people is nowadays almost coincidental.

Social Policy Bonds could restore that link. They would subordinate the interests and activities of corporations and government agencies to outcomes that society itself chooses. Ones that would be inextricably linked the wellbeing of ordinary people. They would eliminate the confusion between ends and means that bedevils current policymaking at any but the most local level.

Meantime, the role of the corporate actor continues to expand. David Bollier reports that, on 21 January:

[T]he U.S. Supreme Court gave the go-ahead for corporations to enclose our democracy. The Court ruled that corporations must legally be considered "persons" who are thereby entitled to First Amendment rights. By this tortured logic, long-standing limits on corporate contributions to political campaigns constitute an unconstitutional infringement of free speech. [N]ow paid speech (on behalf of market interests) is privileged over people's speech in electing our political leaders. "We the Corporations...." Corporations may now drown out the speech of real, live human beings for whom the First Amendment was designed. [1]The Corporate Enclosure of Democracy, David Bollier, 21 January

## 7.2 February

### 7.2.1 Galbraith and government (2010-02-02 23:36)

While [J K Galbraith] is perfectly able to see the defects of businessmen — their inclination to megalomania, greed, hypocrisy, and special pleading — he is quite unable to see the same traits in government bureaucrats.... A man who has devoted his life to the study of economics — and occupies one of the most prestigious chairs in the subject in the world — does not appear to understand that the existence of thousands of corporations, as well as the possibility of starting new ones, introduces a significant difference from a situation in which there is a single employer under

very tight political control. [1] The Galbraith Revival , Theodore Dalrymple , 'City Journal', Winter 2010

It's a common mistake, and an easy one to make for those of us lucky enough to live in societies with a history of benign and not-too-disastrous public policy. But the limitations of the single- employer approach are increasingly apparent. Dr Dalrymple mentions "the fact that Britain spends nearly \$100,000 per child on public education, and yet a fifth of the population is unable to read with facility or do simple arithmetic...". I would point also to the persistence of poverty and disease in the poorer countries, the failure to eradicate war, and the increasing risk of catastrophic environmental or nuclear disaster. We do, I think, need an explicit focus on such problems, and government is big and (generally) sufficiently well intentioned to provide it. But we also need a large array of diverse approaches and problem-solving bodies that can adapt their approach quickly to changing circumstances. We need in particular, a means by which inefficient solutions to social problems are terminated quickly. And government, however big and well intentioned, cannot effectively manage diverse, adaptive approaches. No single organization can.

Social Policy Bonds could square that circle. Under a bond regime, government, whether national or supra-national, is big enough to target global social problems and to raise the revenue for their achievement. It could stimulate diverse, adaptive solutions by issuing the bonds, which would be redeemed only when targeted outcomes - world peace, for example, or climate stability - had been achieved. Government can perform these tasks without getting involved in actually achieving these goals: such achievement would, under a bond regime, be contracted out to agencies (mainly private sector) who would be highly motivated to explore and implement only the most efficient solutions to our problems. Government would then function not as the monopolistic 'single employer', but more as the articulator of society's goals and the agency that transfers our scarce resources to the people who help achieve them.

## 7.2.2 Social Policy Bonds: an alternative to policy mashup (2010-02-08 12:45)

Jaron

Lanier :

If everything is a mashup of everything, then everything becomes the same, gradually .... You need to have membrane walls to have creative evolution. The reason the Beatles are the Beatles is they evolved initially somewhat separately at a club in Hamburg (Germany) and at this funny club in Liverpool. If everybody is on Ed Sullivan all the time, you can't ever get a Beatles; everything will be the same. [1]Silicon Valley visionary says life online needs some humanity, 24 January

A policymaking culture where there is only one solution to a given problem is unlikely to be effective. Government policy is increasingly centralised, and so becoming less capable of

dealing with diverse populations and circumstances. Even if a policy applied very widely is efficient to begin with it will be unable to respond creatively to changing circumstances.

There's nothing wrong with wanting a uniformly agreed outcome, such as universal literacy, or reduced crime rates. But it is folly to imagine that a single approach can be efficient in supplying one. People differ, circumstances vary, and times change. Governments are too big and cumbersome to respond, and they much prefer a uniform approach to anything more administratively untidy.

Social Policy Bonds might be the answer. They would reward people for achieving outcomes as broad as world peace or the eradication of global hunger, but they would not stipulate how these goals shall be achieved. That would be up to investors in the bonds, who would have every incentive to seek out and implement any of a wide and expanding array of approaches, varying according to space, population and time. The contrast with the current policy mashup is stark.

### **7.2.3 Zombie politics (2010-02-09 09:35)**

Describing the reaction of those conservatives in the US who now accept the mainstream scientific position on climate change, Jonathan Chait says:

[R]ather than proceed from that premise to some program of reduced emissions, they have feverishly devised a series of rationales for unlimited carbon use. Some have embraced fantastical geoengineering schemes—massive machines, for example, that would suck carbon out of the sky—with the rabid certainty of a science-fiction nut. Others insist that limiting U.S. emissions will do nothing to help force developing nations to do the same. Still other conservatives argue that the future world will be richer and thus able to cope with whatever calamities a hotter planet will bring. The telling thing here is not that these arguments are provably wrong, though they are highly speculative. It's that those conservatives who have accepted climate-change science immediately jumped to some other reason to oppose government action. ... [V]irtually no conservative intellectuals seem to settle, even temporarily, on the

view that climate change is real and that government regulation is therefore appropriate. They cling to climate-science skepticism like a life preserver, and then, when they can't hold on any more, they grasp immediately for a different rationale. If government intervention appears to be the answer, they must change the question. Jonathan Chait , [1]The rise of Republican nihilism , 'The New Republic', 30 December 2009

It wouldn't matter so much of these deadbeat political parties were subject to genuine competition or the sort of market disciplines that they themselves claim they would like to see in the economy. Sadly, though, they and their corporate paymasters are together powerful and self-interested enough to stifle any chance of real reform. Ideology becomes a means by which to paper over the widening gap between politicians' interests and those of ordinary people. It can't go on indefinitely, but it could well be that any worthwhile convergence will be preceded by some sort of catastrophe.

One way of avoiding that would be a gradual

transition to a Social Policy Bond regime. If that seems drastic and far fetched, then at the very least we should start to express policy goals in terms of meaningful outcomes, rather than as ideological counters, activities or spending on government agencies.

#### **7.2.4 Use broad, meaningful, numbers (2010-02-15 10:10)**

Severe winter weather in England. Some schools decide to close, others to stay open. Marjorie Clarke from Devon, in a letter to 'the Independent', explains why:

[I]f a school decides to close, it will not affect the official attendance record, but if it opens and only half the pupils attend, this will be counted as poor attendance ....

Letters , 'The Week', 16 January

...and the school penalised accordingly. School attendance records like this constitute another in the UK's prolific series of Mickey Mouse micro-objectives.

Using numerical indicators and targets is perhaps a regrettable, but largely inevitable part of governing large, complex societies . My work on Social Policy Bonds has convinced me that those numbers that are used should be as broad as possible, and inextricably linked to what we are really trying to achieve. There needs to be more clarity about means and ends. School attendance, for instance, however measured, is not a social goal: better educational outcomes are.

So my advice to the UK Government, or any well-intentioned body aiming to achieve meaningful social and environmental goals, is to think carefully about what you want to achieve and, as far as possible, reward people for achieving. It sounds simple, and it's

the underlying principle of Social Policy Bonds. But with the odd exception it's rarely been deployed, and when it has (see [1]here, for one example), it's seldom by governments, who are responsible for by far the biggest sums supposedly devoted to achieving social goals.

### **7.2.6 Crisis of capitalism (2010-02-24 09:03)**

Capitalism succeeds mainly because of creative destruction: the failure of businesses that respond inefficiently or not at all to the concerns of ordinary people, as manifested in a relatively free market. It fails when businesses become so big that they constitute monopolies, or so powerful that they can manipulate the trade and regulatory environment to suit their short-term interests at the expense of the longer-term interests of society and the environment. Such failure takes the form of inefficiency and a widening gap between government and big business on the one hand, and ordinary people and smaller enterprises on the other.

We are beginning to see a crisis of capitalism playing out now. Government and big business have done their best to subvert creative destruction, and are powerful enough to succeed. They are the most influential entities in our societies and they are big enough to distort or eliminate the market's way of responding to individuals' wishes. The result will be more central planning, and the increased alienation of ordinary people from the political process.

Social Policy Bonds might be a way of reconciling the need for centralised guidance of our large societies with the equally important need for efficiency - and freedom. They would contract out the achievement of our social and environmental goals to the private sector. Inefficient players would find themselves bid out of their part of the contract. Our goals would still be large scale, but the organizations of people with a vested interest in achieving them - holders of Social Policy Bonds - could be of any size, with a constantly varying composition. More important, these organizations would be subject to creative destruction. That's a marked contrast to the current system, under which the organizations supposed to help achieve our

social goals are government agencies, whose immunity from creative destruction and whose close relationship to big business are at risk of discrediting the best features of capitalism and market forces for a long time to come.

### 7.2.7 Lamentable (2010-02-26 11:16)

I refer to the standards of debate and the aspirations of some of our political representatives:

Mr Farage [UK Independence Party] drew jeers on Wednesday when he told the chamber of the European Parliament that Mr Van Rompuy had "the charisma of a damp rag" and the appearance of a "low-grade bank clerk". [1]Source

It seems it's now respectable to judge our leaders by their appearance or whether they have charisma or not. Our political process is so corrupted and obscure that, it seems, we rely on a politician's image when it comes deciding whether or not they're worth voting for. Mr Farage is probably in sympathy with a large part of the electorate in this. It's the system that's at fault, and the fault is that we have become habituated to judging politicians by anything except outcomes. In a rational society outcomes would matter most. The problem is that society is so complex, and the political process so arcane, that identifying cause and effect in politics is largely impossible.

One result is the disengagement of ordinary people from the policymaking process. Corporations and lobbyists take their place. In a vicious circle, the wide gap between politicians and the people they are supposed to represent grows every larger. The current system makes it too easy for politicians and bureaucrats to evade or deflect censure for their inefficient or bad policies.

Social Policy Bonds would, I think, have many advantages. One is that they would refocus political debate on outcomes that are meaningful to ordinary people. In stark contrast to the current system, rewards would be inextricably linked to achievement of these outcomes, and the outcomes would be clear, explicit and stable. More people could be involved in the policymaking process; they would also have more realistic views about what can be achieved with public funds and about the inevitable trade-offs that have to be made. One huge benefit is that people would buy in to the process and the resulting goals. In such a process, we'd assign the personality or appearance of politicians correctly - as zero.

## 7.3 March

### 7.3.1 Who cares about the planet so long as Al Gore look silly (2010-03-01 10:53)

One of the virtues of the Social Policy Bond approach is that setting goals would be done deliberately, consciously and more rationally than it is now. Consider this quote from David Brooks, a 'New York Times' columnist says:

I have to confess, I am not at my best when dealing with environmental issues. On the one hand, I totally accept the scientific authorities who say that global warming is real and that it is manmade. On the other hand, I feel a frisson of pleasure when I come across evidence that contradicts the models. I don't know if this is just because I distrust people who are so confident they can model complex systems or because I relish any fact that might make Al Gore look silly. [1]Source (quoted [2]here)

This sort of puckish perversity does matter, especially when widely promulgated in the mass media. In the absence of referendums about climate change and other major policy issues, it stands in for, and influences, received opinion. Yet his conclusion doesn't even reflect Mr Brooks' own opinion about the fact of climate change. Our current system gives us so little influence over policy that we treat the whole process as an entertainment.

Social Policy Bonds would bring some rationality to policymaking. Instead of focusing on personalities a bond regime would start out by considering which social and environmental goals we should aim to achieve. Because it is entirely focused on meaningful outcomes, it would bring more people into the policymaking process. We'd think carefully about which outcomes we want to target, and how we'd rank them and, in contrast to the current system, we'd do so relatively dispassionately.

### 7.3.2 More transfers from the poor to the rich (2010-03-02 10:19)

George Monbiot writes about the UK Government's feed-in tariffs for electricity produced by photovoltaic ( PV ) panels:

The government is about to shift £8.6 bn from the poor to the middle classes. ... On April 1st the government introduces its feed-in tariffs. These oblige electricity companies to pay people for the power they produce at home. ... . Solar PV is a great technology - if you live in southern California. But the further from the equator you travel, the less sense it makes.... It's not just that the amount of power PV panels produce at this latitude is risible, they also produce it at the wrong time. In hot countries, where air conditioning guzzles electricity, peak demand coincides with

peak solar radiation. In the UK peak demand takes place between 5 and 7 on winter evenings. [1]A great green ripoff, George Monbiot , 1 March

And so on and on.... This is what happens when policy is determined by image, sentiment, lobbyists and corporations. It's policy as if outcomes don't matter in the least.

A Social Policy Bond regime wouldn't allow this sort of nonsense to occur. Correction: it would - but only if people actually wanted it. That's to say, if people deliberately choose to transfer millions of pounds from the poor to the rich and to fraudsters, they could do so under a bond regime. The difference is, they'd be doing it with their eyes open, instead of having their view obscured by a policymaking regime that is concerned mainly about image, the welfare of corporations and government agencies, and arcane debate about structures and process.

### 7.3.3 Low-hanging fruit (2010-03-07 10:47)

***This blog has moved to [1]<http://socialgoals.blogspot.com>. I am working on an automatic redirect.***

The way big organizations work, whether they be public or private sector, there's often little incentive to explore cheap but effective ways of improving performance. There's little glamour attached to mundane ideas and, where status is correlated with budget size, little reason to adopt them when there's a more expensive option available. This mentality, of course, is encouraged by an environment in which outcomes don't matter. But when people do care about outcomes, there's a surprising amount of low-hanging fruit available for the plucking. Here's the result of using checklists for surgical procedures for 8000 patients for six months:

In every hospital major complications were reduced by 36 per cent and the death rate was halved.

One minute with Atul

Gawande

, 'New Scientist', 20 February

This is outcome-based policy at its best. (See [2]here for more.) All 167 hospital trusts in the UK are now adopting this simple innovation.

A Social Policy Bond regime would similarly encourage the adoption of efficient techniques, even if they are unglamorous. It would build efficiency incentives into all activities aimed at achieving the targeted goal. As Dr Gawande's work indicates, the scope for improvement under the current system is quite astonishing.

### **7.3.5 Overcoming mistrust of science: Climate Stability Bonds (2010-03-09 12:24)**

As a means of averting disaster, we might be better to formulate policy by targeting basic goals, such as human survival, rather than wait for evidence that will persuade enough people to ensure that action is taken, eventually, by our current political process. Too many influential organizations have vested interests in opposing policies that would benefit society as a whole. George Monbiot suggests that no amount of evidence will convince some people:

[1]In some cases debunking a false story can increase the number of people who believe it. In one study, 34 % of conservatives who were told about the Bush government's claims that Iraq had weapons of mass destruction were inclined to believe them. But among those who were shown that the government's claims were later comprehensively refuted ... 64 % ended up believing that Iraq had WMD .  
[1]The Unpersuadables , George Monbiot , 8 March

One of the huge advantages of the Social Policy Bond approach is that the evaluation of evidence about such potential problems as climate change is done by private interests. If [2]Climate Stability Bonds were issued, it would be potential purchasers of the bonds who would have to evaluate the evidence about climate change, its causes and consequences , and the best ways of dealing with it. They would have to do continuously from the time the bonds are first floated until they are redeemed. They would have every incentive to do so, and to do so impartially; that is, regardless of their opinion of the science, or the influence of powerful corporations or environmental bodies.

Mr Monbiot is gloomy about the prospects of doing things the conventional way:

The battle over climate change suggests that the more clearly you spell the problem out, the more you turn people away. If they don't want to know, nothing and no one will reach them.

But even people with a visceral distrust of science; even those who genuinely believe that climate change isn't happening, could not rationally oppose a Climate Stability Bond regime, under which the costs of failing to assess the risks accurately would be borne not by taxpayers, but by those who are willing and able to accept that risk by investing in the bonds. By targeting the desired outcome - a climate with tolerable impacts - governments or whoever issues Climate Stability Bonds could avoid the divisive, arduous and protracted process of evaluating the mass of evidence about climate change. It would be much easier to generate buy-in to the goal of climate stability, than to massive and shifting scientific evidence that will underpin any activities taken to bring it about.

### **7.3.6 Business as usual (2010-03-11 09:28)**

World recession? People being thrown out of jobs? House foreclosures? An imploding financial system? No worries - if you're a subsidised US farmer:

the United States budget for 2011 announced this February proposed to cut back spending by reducing agricultural subsidies by US \$ 10 billion over ten years. It suggested that subsidies only be granted to farmers earning under US \$ 250,000 a year, down from a current cap of US \$500,000 a year, and cutting aid to crop insurance companies. According to [1]Reuters, this proposal was rejected on 3 March by the U.S. House Agriculture Committee, who stated that changes to farm policies should wait until the next farm law is negotiated in 2012. [2]Will budget deficits provide leverage for farm subsidy reform?, 'Global Subsidies Initiative'

### **7.3.7 Social Policy Bonds: an alternative to the bolshevik approach (2010-03-14 10:46)**

Comparing the relative economic performance of Russia and China, David Ellerman writes:

Another part of the pragmatic approach, also evident in China, is the willingness to allow parallel experiments in different parts of the country and then foster horizontal learning and the propagation of the successful experiments. This is an important part of the alternative to the bolshevik / jacobin approach of legislating the brave new world from the capital city to be applied uniformly across the country.

[1]Pragmatism versus economics ideology in the post-socialist transition: China versus Russia( pdf ), David Ellerman , real-world economics review, issue no. 52, 10 March

This explains much of the relative economic success of China. Unfortunately it's not the way most of our social and large-scale environmental problems are tackled. For these, government agencies are usually in charge, and they adopt the top-down approach. They are also far more tolerant of failed experiments than any moderately sized private sector business can afford to be. (The largest corporations can often suppress competition so their inefficiencies can persist.) So while a competitive private sector fosters efficiency , the public sector does not. This is not only a waste of resources; it also limits our vision of what government - and only government - can do. When the public sector becomes a byword for inefficiency we don't, for example, even imagine that it can tackle such tenacious and seemingly intractable problems as violent political conflict, for instance, or global poverty.

And that's where Social Policy Bonds come in. Under a bond regime government would still do what it does best - and what only government can do: tackle large-scale social and environmental problems, and raise the revenue to reward people who solve them. But, by issuing the bonds, government would, in effect, contract out the achievement of our social goals to the private sector who would have exactly the same incentives to be efficient as any but the largest corporations have today to achieve their more limited goals. The current approach to tackling our most urgent and challenging goals is what Mr Ellerman would call bolshevik or jacobin . Social Policy Bonds would be the pragmatic alternative.

### **7.3.8 The problem with lobbying (2010-03-18 08:47)**

Michael Tomasky writes about the lobbyists against health care reform in the US:

At one point last year, more than 3,300 people were registered as lobbyists on health care. That's six for every member of Congress, House and Senate combined. ... In addition, it's worth remembering that, apart from lobbying legislators, these organizations spend vast sums for television and radio advertising. [1]The Money Fighting Health Care Reform, 'New York Review of Books', dated 8 April

Lobbying is, of course, a legitimate activity. What makes it problematic, for me, is that it is almost all done by organizations, supposedly on behalf of their members. These organizations can be corporations, trade unions, NGOs, or other bodies, but they have in common that their

over-arching goal is self-perpetuation. It is not the long-term interests of their members as individuals, still less of people in general. Lobbying today is, essentially, lobbying of corporate interests by corporations. And in achieving their main goal, they are remarkably successful. With corporations going bust everywhere, growing unemployment and a still-fragile economy, as Mr Tomasky says, 'federal lobbyists and their clients spent more than \$3.47 billion last year [2009]. That is an all-time high, according to the [2]Center for Responsive Politics, whose executive director notes dryly that lobbying is one business that appears to be "recession proof."'

We need a way of re-orienting policy towards the interests and aspirations of ordinary people. Transparency about what are government's goals would help, and a Social Policy Bond regime would necessarily bring that about. Under a bond regime, government funding would be inextricably tied to efficient achievement of agreed, explicit social and environmental goals. There would probably still be lobbyists - but no longer could they concentrate their efforts (and enticements) on the (much smaller) number of legislators. Instead they would have to convince the rest of us as to the justice of their cause. A stark contrast to, and I believe, a big improvement on the current system.

### **7.3.9 Social Policy Bonds and Social Impact Bonds (2010-03-22 11:09)**

Social Impact Bonds are a new financial instrument being developed in the UK by the [1]Young Foundation and [2]Social Finance. There is more about them [3]here and [4]here. They are similar to Social Policy Bonds in that they link rewards to success in achieving meaningful social outcomes. They appear to differ in that unlike under a Social Policy Bond regime, the contract to achieve the specified outcome would not be tradable. It seems that Social Impact Bonds would reward pre-selected organizations, or parts of pre-selected organizations for working efficiently: they would still have incentives to achieve the specified goal. They might even contract out some of the required work.

Compared with Social Policy Bonds, though, SIBs would be less tradable. There would be no transparent market for them. The composition and structure of the organization trying to achieve the outcome would therefore be fixed and pre-determined. Under a Social Policy Bond regime, on the other hand, the type, structure and composition of organizations working to achieve the target would be subordinate to the most efficient way of reaching it. This means, amongst other things, that broad, longer-term goals could be targeted. The identity of the organizations envisaged as benefiting from any efficiency gains under a SIB regime is another point of departure. They seem to be local authorities or other government agencies. It would appear, therefore, that gains from improved efficiency would be most likely to be remain with the agency and so, perhaps regrettably, be less motivating than direct financial incentives to employees.

### **7.3.10 It's not going to work (2010-03-24 07:48)**

Concluding his litany of the deficiencies of the United Nation's Clean Development Mechanism ( CDM ), Mark Schapiro says the market for carbon offsets is:

...an elaborate shell game, a disappearing act that nicely serves the immediate interests of the world's governments but fails

to meet the challenges of our looming environmental crisis.

[1]Conning the Climate

(subscription), Mark Schapiro , 'Harper's Magazine', February

Not only the immediate interests of the world's governments (politicians and bureaucrats) but also the interests of the legions of economists, assessors, validators , and big corporations. Everybody who counts that is. Heaven forbid that we reward the outcome we actually want to achieve: a climate that's reasonably stable, however one wants to define that.

Even if we believe that capping anthropogenic greenhouse gas emissions is consistently found to be the best way of averting climate change and its worst effects; even then, this author believes that the CDM and all entire Kyoto-Copenhagen edifice is structurally unsound.

But how would my proposal - a [2]Climate Stability Bond regime - be any better? Holders of Climate Reduction Bonds would probably still target anthropogenic greenhouse gases in a similar fashion to Kyoto, but they would have strong incentives to do so more efficiently . They would want and would have wider scope for action. For example, they wouldn't be bound by political correctness or realpolitik of the sort that exempts some countries that emit huge quantities of greenhouse gases from any disciplines at all. They would have the flexibility to buy these regimes off or otherwise undermine any weakening of the disciplines. Kyoto-Copenhagen is so politicised and its money flows so unpalatable that it is seen as an imposition: in the rich countries it's seen as an imposition by environmentalists on everybody else. In the poor countries it's seen as an imposition by the rich countries on them. It means huge upfront costs for a very small payoff well into the future. Being a political construct it is so compromised that even its most ardent advocates think it ineffectual in its own right. They see it as first step; but it is one that might well not be actually taken - as distinct from being endlessly discussed, debated, written into law and performed as an elaborate charade or shell game.

Climate Stability Bonds, in contrast, would target an array of outcomes that ordinary people can understand, empathise with, and support, or at least, buy into; and that would entail taxpayer spending only when it had been achieved. If we are serious about climate change and its effects, we are going to need the buy-in that only an outcome-based regime, such as Climate Stability Bonds, can bring about.

### 7.3.11 Command and control versus evolution (2010-03-29 08:52)

When it comes to generating wealth we accept that a Darwinian approach is best. This is not only on the basis of economic theory, but on empirical evidence. Success, broadly defined, comes from the creative destruction of inefficient or ineffective firms, and the redeployment of society's scarce resources into more profitable investments.

For a mixture of ethical and historical reasons, we don't adopt the same approach when looking at social and environmental problems. Here the model tends to be command-and-control. This approach can work; indeed sometimes it is the only answer, despite occasional resistance. Thus, *The Times*, editorialising (on 1 August 1854) against measures to provide basic sanitation in London:

[W]e prefer to take our chance of cholera and the rest than be bullied into health.

Sometimes, though, government or any big organization gets it wrong. And when these organizations are too big, there's very little we can do about it, except perhaps wait for their folly to antagonise coalitions of interests (natural or man-made) that are big enough to oppose them. In the ensuing conflict - between reality and nature, between opposing coalitions - large numbers of people are generally killed. It's a sort of Darwinism, but not one whose terms people would choose to accept, because its destructive power is immediate, large scale and permanent, and any benefits too nebulous and remote.

If we accept, though, that a global population of more than six billion requires big government and large corporations, we can try to supplant this clumsy, destructive way of proceeding with something less haphazard. And that's where Social Policy Bonds can come in. A Social Policy Bond regime could combine the benefits of creative destruction with those of the command-and-control approach. The difference is that instead of prescribing how social goals are to be achieved, government (or non-governmental organizations, or philanthropists) would limit themselves to setting these goals and raising the revenue required to achieve them. The market for Social Policy Bonds would bring about the termination of inefficient projects, and motivate would-be investors to seek out and implement only those projects - or combinations of projects -

that are efficient and effective .

Under a bond regime, creative destruction would play its part in selecting for efficiency, while command-and-control would do what it's best at: prescribing meaningful social and environmental outcomes for the benefit of large populations.

## 7.4 April

### 7.4.1 'The Myth of Europe's High Taxes' (2010-04-02 08:07)

SIR - Thank you for enlightening us about health care. Were it not for your cogent arguments I would never have realised that what America needs are increased taxes , a massive expansion of the federal government, less personal responsibility, more price-fixing and hundreds of billions of dollars added to the deficit to finance one of the biggest entitlement programmes in our history. Now I better understand why our forefathers risked their lives to separate themselves from Britain. Letter to the editor of the [1]Economist (subscription), Cary Alberstone, Camarillo, California, 31 March (my emphasis)

Mr Alberstone believes that Americans pay lower taxes than the British. But all is not as it seems:

Do Americans really pay fewer taxes than Europeans? Contrary to conventional wisdom, the answer surprisingly is: not really. That's because in return for their taxes, Europeans - even those unemployed during these tough times - have access to a generous support system for families and individuals that most Americans can only imagine. That includes not only quality health care but also child care, a good retirement pension, inexpensive college education, job retraining, paid sick leave, paid parental leave (after a birth or to care for sick children), ample vacations, affordable housing, adequate senior care and more. In order to receive the same level of benefits as Europeans, most Americans have to fork out a lot of out-of-pocket payments, in addition to our taxes. These payments often are in the form of fees, surcharges, higher tuition, insurance premiums, co-payments and other hidden charges. Steven Hill, [2]The Myth of Europe's High Taxes , OnTheCommons.org, 23 February

Any decent outcome-based policymaking process wouldn't be particularly interested in tax figures of the sort that mean so much to Mr Alberstone. It would instead be concerned with meaningful social outcomes and their total cost to society. More important than how public goods and services are paid for, is their efficiency and their cost to society as a whole.

#### **7.4.2 Subsidising planetary destruction (2010-04-06 12:38)**

Or: read and weep. Or: why am I not surprised?:

EU subsidy payments are helping to fund the overfishing of depleted stocks such as cod and bluefin tuna, according to new research. T

he [1]Poseidon Aquatic Resource Management consultancy and [2]Pew Environment Group analysed data from the EU's 'Financial Instrument for Fisheries Guidance', which paid almost £4 billion in fishing subsidies between 2000-2006. [3]EU subsidies linked to overfishing, 'The Ecologist', 31 March

The good news is that:

17 per cent of the subsidy payments went towards measures that would clearly result in a reduced fishing capacity ....

The bad news is that:

29 per cent helped to fund what the study defined as 'negative measures', including modernising the fleet and constructing new and more powerful fishing vessels.

And the ugly news is that:

The study's authors said they were stopped from analysing the funding from current subsidy scheme, the European Fisheries Fund (EFF), running from 2007-2013, because of new EU disclosure rules. 'Transparency has been removed with the new funding instrument....' said Markus Knigge, policy and research director at the Pew Environment Group.

This sums up all we really need to know about policymaking today. The only outcomes our political class is concerned about are the short-term ones favoured by corporations and lobbyists. When the disastrous nature of their policies threatens to become public, their first instinct is to suppress further investigation. It's a self-perpetuating and self-reinforcing system. It's corrupt and it's insane. Social Policy Bonds would not be perfect. But, with their targeting of transparent, explicit, meaningful goals, they would be far better than the system we have today, under which we are not only destroying the planet, we are subsidising its destruction.

### **7.4.3 Policy by and for large organizations (2010-04-10 09:56)**

This court, although it regards the arguments presented in favour of removal in this case to be of grave significance, nevertheless deems it necessary to consider the good of the Universal Church together with that of the petitioner, and it is also unable to make light of the detriment that granting the dispensation can provoke with the community of Christ's faithful, particularly regarding the young age of the petitioner. English translation of an excerpt from a [1]letter to Oakland Bishop John S Cummins, signed by Cardinal Joseph Ratzinger, 1985. (My emphasis)

Without making too much of an out-of-context translation of an extract from a single piece of correspondence, we can at least recognise just how powerful is the over-arching institutional goal of self-perpetuation, even when it conflicts with justice, humanity or rationality.

Every large organization is the same, whether it be a religious body, a large corporation, a trade union, university or a government agency: institutional survival is first and foremost. And, since government policy is made by and for large organizations, and government policy is now the single most important determinant of human and environmental wellbeing...well, we have a problem. The problem takes the form of social and environmental collapse. My previous post talked about subsidised over-fishing, but we face a broader challenge on many fronts. As nuclear weapons proliferate, as the climate (almost certainly) seems to be on the verge of alarming instability, policymaking hasn't adapted. While paying lip service to humanitarian concerns, we rarely see the explicit targeting of such meaningful goals as the [2]avoidance of catastrophe, the [3]stabilising of the climate, or the[4] prevention of war. Instead, the existing array of incentives, the ones that have done so much to bring us mayhem in many different manifestations, continue to enrich the powerful and to finance any opposition to their reform or removal. Like the Roman Catholic Church, our most powerful institutions - governments - hold as their highest priority, self-perpetuation. Justice, humanity or even economic rationality don't stand a chance.

All this is well documented and unoriginal. Where I perhaps differ is in offering Social Policy Bonds as a corrective: a way of re-orienting government policy, and the massive incentives it offers, to favour the achievement of goals with which individuals can identify.

### **7.4.4 No vision = mass apathy (2010-04-14 09:57)**

In trying to explain the mass apathy around the forthcoming British election, Anatole Kaletsky writes:

A more convincing explanation [than colourless] personalities or [expenses scandals is with respect to] ideas. There are plenty of new policies in the manifestos. Some are even quite good, such as the Tory plan to finance new schools run by parent co-operatives or Labour's promise of a green investment bank to finance energy technologies that cannot compete commercially with fossil fuels. The problem for all parties, as many commentators have noted, is the absence of any overarching narratives, ideological worldview or even tribal and class loyalties to link these scattered ideas. [1]The old politics is dead. But where is the new?, Anatole Kaletsky , 'The Times', 14 April

I think Mr Kaletsky is onto something here. There's no coherence behind the ideas; only sound-bite sops to interest groups . Such ideas as there are pay lip service to efficiency or value for taxpayers' money, but there's no compelling vision. He goes on:

What Britain will need in the next five years is not less government and more market or vice versa , but a whole new agenda of policies combining and adapting the principles of market and political competition to promote objectives ranging from stable financial markets and clean energy to efficient social services that neither markets nor bureaucratic institutions can achieve on their own.

That's where some combination of outcome-based policies and market incentives could play a role. I'm still hopeful that one day Social Policy Bonds will at least be considered. There are a few straws in the wind, in the form of policies that link rewards to outcomes ([2]Social Impact Bonds for example) - but they are few, and they don't have the breadth or fluidity of Social Policy Bonds. Government at all levels does find it hard to relinquish control, and rarely does so without a struggle. So, in contrast to my earlier thinking, I now believe private entrepreneurs or groups of philanthropists will be the first to try out the bond principle.

## 7.4.5 More on Social Impact Bonds (2010-04-19 09:37)

I've blogged [1]before about [2]Social Impact Bonds and how they adopt one of the principles of Social Policy Bonds: that of linking rewards to outcomes. Unfortunately, in my view, it appears that the recipients of such rewards are to be those agencies already working to achieve the specified outcomes. This limits not only the efficiency of the bonds but, perhaps more crucially, their range of operation. Existing bodies tend to have expertise in doing specified things in a certain way. Their vision is limited by the specificity of these things . Any stipulated goals, under a Social Impact Bond regime would, I believe, therefore be too narrowly defined to allow for broad social and environmental goals and the [3]creative destruction of those that are unpromising. Sadly, therefore, it would seem that Social Impact Bonds are afflicted by that bane of

policymaking worldwide: their effectiveness and efficiency are subordinate to current institutional structures. To that extent then, Social Impact Bonds represent only an incremental

improvement over conventional policymaking . Under a Social Impact Bond regime our social and environmental objectives , would continue to be driven not by society's wishes, but by the organisational needs and limited vision of those currently supposed to be supplying them. To me, that's a recipe for failure.

Nevertheless, I have emailed both the [4]Young Foundation and [5]Social Finance (as well as the [6] Economist , which publicised Social Impact Bonds) and invited them to make use of my work on Social Policy Bonds if they wish. None of these organisations has responded to any of my emails.

#### **7.4.6 UK election (2010-04-24 13:02)**

Asked about my interest in the UK election, I do not say that there's no difference between the parties. The winner would surely do things differently from the losing parties. But I do say that the nature of that difference and its implications cannot be known in advance . In 1997, former British Prime Minister, Tony Blair, said that his priorities would be 'education, education and education'. The results, after 13 years, have been dismal: 'teaching to the test', a switch to less demanding subjects, and grade inflation.

Although the current Labour government has doubled spending on schools since coming to power in 1997, pupils are falling behind their counterparts in other rich countries. Their recent showing in the tests of 15-year-olds' reading, mathematics and science skills...has been sobering. Between 2000 and 2006 Britain tumbled down the OECD's rankings in all of them.... [1]A classroom revolution (subscription), 'The Economist', 24 April

Politicians should talk about outcomes, not intentions. And election campaigning should discuss outcomes, rather than intentions, platitudes, spending plans, or vague and often conflicting so-called priorities.

#### **7.4.7 Nobody knows, even assuming they care (2010-04-26 12:49)**

[E]conomic historians will probably spend the next 75 years debating whether monetary or fiscal policy dragged the developed world out of [the current] recession, just as they still discuss whether the actions of the Roosevelt administration really shortened the Depression. [1]Heat and Dust, the 'Economist' (subscription), 24 April

Cause and effect in economics, as in society and ecology, are nearly impossible to disentangle. There are too many variables and time lags. Conditions are never replicable; experiments are close-to-impossible. As well, the interests of politicians, bureaucrats, and technocrats are rarely exactly aligned with those of society. Yet the policymakers' influence is huge, as is the scale of the problems they attempt to solve. In short, we don't know how best to solve society's complex and urgent problems, and we can't be certain that policymakers really want to.

That's where Social Policy Bonds might offer an improvement over today's approach to policymaking

which, as the excerpt above points out, is somewhat haphazard. A bond regime would mean that policymakers don't have to have advance knowledge of the best way of solving social problems: all they would have to do is target each problem, and supply a rough estimate of the maximum value to society of its solution. Investors and potential investors in the bonds would work out the best combination of ways in which the problem could be solved. They would be highly motivated to do so throughout the time it takes to solve the problem which, for broad, ambitious, social goals, could be years or decades - much longer than the usual planning horizon of politicians. And they would do so adaptively; continually monitoring the impacts of their approaches and projects so as to maximise their benefit per dollar spent. They would choose from a diverse array of possible approaches, because that would maximise their chances of above-normal success. And because bondholders' rewards would be inextricably linked to society's benefit, everyone would gain. Rather than the random approach to policy that generates the bewilderment described by the Economist, a Social Policy Bond regime would generate valuable information about those approaches that work and those that don't.

The contrast with today's top-down, one-time-only, one-size-fits-all approach is stark.

#### **7.4.8 Transparency and trade-offs (2010-04-28 03:39)**

Notions of trade-off rarely make it into the public discourse. In the abstract, we know that taking resources from, for example, people who buy food to some of the wealthiest [1]people in the land, means that ordinary people will have less to spend. But we find it very difficult actually to make some people worse off. Our policymaking system doesn't encourage us to limit expenditure on individual programmes, however ludicrous they might be, and even when it's rising insanely. The aggregate result is simply not sustainable. Joel Achenbach, says that the US national debt "which totaled \$8,370,635,856,604.98 as of a few days ago, not even

counting the trillions owed by the government to Social Security and other pilfered trust funds" and points out that:

In addition to running a budget deficit, Washington for years has had a massive deficit of political will. Over the past decade, lawmakers have avoided the kind of unpopular decisions – tax increases, spending cuts or some combination – needed to keep the debt under control. Federal Reserve Chairman Ben Bernanke testified recently that, for investors, the underlying problem with the debt isn't economic. "At some point, the markets will make a judgment about, really, not our economic capacity but our political ability, our political will, to achieve longer-term sustainability," he said. Joel Achenbach , [2]The national debt and Washington's deficit of will,

'Washington Post', 25 April

One advantage of a Social Policy Bond regime would be its transparency, not only about what would be our social goals, but about their cost. When meaningful outcomes are targeted, people can enter into meaningful debate about which ones they value most. A bond regime would mean people choosing between outcomes, sensibly and rationally. It would be clear to everyone that choices are limited by available resources and that trade-offs are inevitable. Funding of outcomes means that any organizations that came about to achieve these outcomes would be entirely subordinated to society's goals rather than, as now, to the perceived need of every public sector organization to perpetuate itself. To see this, consider what would happen if government were pressured into setting an unrealistic objective under a Social Policy Bond regime: the market value of the bonds would be so low on flotation that the cost to society of achievement would be very high but, more importantly, it would be seen to be very high, well in advance of any government spending actually being incurred.

There are many other advantages of Social Policy Bonds over the current system, about which I have written at length in my [3]book, which can be downloaded free of charge.

## 7.5 May

### 7.5.1 The curse of narrowly defined objectives (2010-05-02 08:31)

Teachers and doctors strongly resist the introduction of a bonus culture: not just because they resent measurement of performance and accountability for their activities – although they do, and with little justification – but because they oppose importing the culture of assembly lines. They fear an environment in which they would be encouraged to focus on narrowly quantifiable objectives at the expense of the underlying needs of clients. Even if many teachers and doctors are incompetent

and lazy, many others are seriously committed to the organisations for which they work, the subjects and specialisations to which they are devoted, and to a broader sense of professional ethics: and it is only people like these who establish the kinds of schools and hospitals we want as parents or patients. In education and medicine, both employees and customers sense that the disadvantages of the systemic consequences of large personalised incentives on values in organisations are likely to outweigh the benefits of such incentives for individual motivation. John Kay,

[1]When a bonus culture is just a poor joke, 'Financial Times', 28 April

Sadly, perhaps, in our complex, highly aggregated societies, we might have to accept the targeting of quantifiable objectives, for all their faults. In the western world, as in the former centrally planned economies, indicators are for the most part, narrow, unsystematic and unsophisticated; they are seldom strongly correlated with what their designers actually want to achieve, and still less so with societal well-being. The key is to use broad indicators, with which the best teachers and doctors would have no quibble and could indeed, help design: universal literacy and numeracy, for example, or longevity, perhaps [2]adjusted to take account of quality of life. Such, of course, is the Social Policy Bond principle.

Even when following that approach policymakers will need to be guided by the limitations inherent in quantifiable indicators. The policy implication would be that government could usefully concentrate on those policy areas where numbers are unequivocally helpful. It is generally at low levels of health, educational level, housing, income, caloric intake etc, that increases are strongly correlated with an individual's welfare. Beyond basic levels, individuals' ultimate objectives are for the most part inescapably subjective. They cannot be measured, nor can the societal counterpart of social welfare, and government should recognise this limitation. It can never know as much about people's well-being as other people: Lord Kelvin's remark, that 'everything exists in some quantity, and can therefore be measured' is, of course, nonsense. A better guiding principle is that attributed to Albert Einstein: 'Not everything that counts can be counted, and not everything that can be counted counts.'

## 7.5.2 Et tu, Amnesty? (2010-05-07 04:54)

Innumerable government agencies, churches, universities, trade unions, and now the - formerly - very best-intentioned non-governmental organisations: all are susceptible to sacrificing their ideals on the altar of self-perpetuation. Theodore Dalrymple

discusses Amnesty International, originally formed to support prisoners of conscious. It has recently taken on two further causes: a reduction in the disparity of maternal mortality rates in the US, and the elimination of the death penalty, where it is applied. Of the first, Dr

Dalrymple comments

This is a tragedy for all concerned. In other words, while the disparity is indicative of a problem, it is not itself the problem. The infringement of human rights has nothing to do with it. [1]Mission Creep Causes Amnesty International to Lose Focus, Theodore Dalrymple , 3 May

And of the second:

Now there are, of course, strong arguments for the abolition of the death penalty (the strongest of which, in my opinion, is the occurrence of judicial error even in the most scrupulous of jurisdictions). But there are also arguments in favor of the death penalty, and it is possible, and perhaps even likely, that the majority of the human race accept these arguments. Be that as it may, a murderer awaiting execution in the United States is hardly to be equated with a prisoner of conscience, even if it is cruel and unusual punishment to keep such a murderer on death row for years.

It's hardly surprising. Organizations do a lot of good work, but as they grow they become less focused on their original aims and more on the survival and growth of the organization itself. When these organizations become too influential, as big business and government have, then we are in trouble. The difference between the ideals and aspirations of the individuals who work in them, and the direction the organization actually takes, is often stark.

Social Policy Bonds would bring about a new type of organization: one whose existence, funding, structure and activities would all be aimed at achieving society's objectives. The organization would, in other words, be subordinate to social and environmental goals. People's loyalty would be to the goals, rather than the institution.

And Amnesty?

It is as if Amnesty grew bored with its original purpose and now seems to suffer from what one might call the not-a-sparrow-falls-but-it-is-our-moral-concern syndrome, itself a result of believing that virtue is proportionate to the number of good causes that one espouses. Therefore, one must spread one's moral wings and fly off into the ethical stratosphere.

In this sort of mission creep, it's no better or worse than most of the other organizations supposedly aimed at achieving social and environmental goals.

### **7.5.3 Voting for politicians is an outmoded concept (2010-05-11 08:34)**

The three major parties in the recent UK General Election could persuade only [1]57 percent of the electorate to vote for them. Proponents of Proportional Representation claim that:

...political debate and engagement will be improved if we overhaul the system. This makes their campaigning a displacement activity of epic proportions. They have mistaken a serious political crisis – involving collapsing ideologies, a dearth of big and inspiring ideas, and a gaping chasm between the public and the political parties – as simply a technical problem of how we vote. Their campaign is the equivalent of fiddling while politics burns. [2]The delusions of the electoral reform lobby, Brendan O’Neill, 10 May

I agree with Mr O’Neill. Politics is something of a fiction these days. It’s driven by personalities, sound bites, and trivia. At the same time we are failing to address huge, urgent social and environmental challenges. Just as with the world’s economic system, politicians and bureaucrats have little incentive to tackle these challenges until they become emergencies. Structural weaknesses are papered over until it’s too late. It makes little difference who’s in power, and ordinary people know that.

Here’s another idea: instead of voting for political party, or for the politician who looks best on tv , or for the ones that avoid real issues in the most convincing manner, how about letting us vote for outcomes? Not for the politicians who say they’ll deliver outcomes, or for the political party that, way back in history, did once deliver outcomes, but directly for outcomes. Take, for instance, the goal of [3]avoiding catastrophic climate change. That option was not offered by any of the British political parties. It’s not on offer, in fact, anywhere, as a policy for which people can vote. What is on offer are promises made by members of a political caste to do something that might do something to reduce greenhouse gas emissions, which in turn might, but probably will not, do anything significantly to stabilise the climate. Then these promises, however nugatory, [4]are broken anyway.

That’s where Social Policy Bonds can play a part. Under a bond regime, the currency of debate would be outcomes rather than political parties or well-meaning but hollow promises. Outcomes are inherently more amenable to the sort of consensus and buy-in that are essential if we are to avoid serious economic, social or environmental problems. And Social Policy Bonds, as well as increasing transparency and stability of targeted goals, would minimise the cost of achieving them. More could be done with society’s scarce resources than under the current system. Efficiency, transparency and buy-in: exactly what are lacking in today’s system. No wonder, then, that participation in a general election is so low.

#### **7.5.4 Voting for outcomes rather than slogans (2010-05-14 03:19)**

Discussing Venezuelan President, Hugo Chavez, the Economist says:

His fans salute him as a saviour for the downtrodden of the planet.... But to many others...he has come to embody a new, post-cold-war model of authoritarian rule which

combines a democratic mandate, populist socialism and anti-Americanism, as well as resource nationalism and carefully calibrated repression. This model has proved surprisingly successful across the world. Versions are to be found in countries as disparate and distinct as Iran, Russia, Zimbabwe and Sudan. In one way or another, these regimes claim to have created a viable alternative to liberal democracy. [1]The wrecking of Venezuela

(subscription), 'the Economist', 13 May

What I take from this is that democracy, as currently practised, no longer means buy-in. People vote for a party, a party leader, or for a collection of policies or attitudes. We are very rarely given the chance to vote for a single policy. We vote, indirectly, for people or parties that may or may not deliver certain collections of outcomes. There is so little correlation between a party's manifesto and those outcomes that, inevitably, other factors come into play, of which image, slogans, poses and rhetoric are prominent. This sort of politics has all sorts of disadvantages, of which one is that it tends not to be practised by people with integrity, with results that the Economist, rightly, laments. The politicians play off one group of people, or special interests, against another. They have little interest in maintaining social cohesion. The consequences are likely to be destructive or even tragic.

Rather than emphasise party and personality, as do current democratic systems, we could consider focusing on outcomes. We face urgent social and environmental challenges that need buy-in and cohesion, which the current system is not delivering. Social Policy Bonds could help in this. We could target outcomes that, when not advocated by polarising figures, most people would agree with: the avoidance of [2]nuclear catastrophe, or any major [3]disaster, for example; or the attainment of [4]universal literacy. (For more examples see [5]here.) Even people who disagree with such goals are less likely to oppose them when the process for targeting them is more robust and direct than under the current system.

For all sorts of reasons (see my [6]book) Social Policy Bonds would be more cost-effective than the current system. But in focusing attention on outcomes rather than party or personality, they would also, I believe, generate more buy-in to the entire policymaking process. Social cohesion could only benefit.

### **7.5.5 Adaptation is smarter than we are (2010-05-16 10:30)**

I haven't, yet, read John Kay's new book, [1]Obliquity: why our goals are best achieved indirectly, but I have heard his [2]podcast on the subject in which he says "Adaptation is

smarter than we are". One of the great advantages of Social Policy Bonds over the usual way that policymakers try to achieve goals, is their inherent capacity to stimulate adaptive approaches to social problems. Under a bond regime, people are rewarded for achieving targeted social and environmental goals, however they do so. Long-term, broad, goals, such as the [3]elimination of war, become feasible, because government (or whoever eventually pays for the goal's achievement ) does not have to specify who shall achieve it or how they are to go about it. That would be left to investors in the bonds, who can be expected to have diverse views about how best to eliminate war, and to adapt their views both with time and according to each conflict (or potential conflict).

If we were prepared to accept adaptation as a policy instrument, then we could not only achieve our goals more efficiently than under the current, top-down, one-size-fits-all centrally planned government-directed way of doing things. We could, as I say, target much broader goals such as the elimination of war, the ending of poverty, and universal [4]literacy. Adaptation is indeed smarter than we are. We ought to recognise that fact, and deploy it to the advantage of all mankind.

### **7.5.6 Target ends, stimulate diverse, efficient means (2010-05-22 11:00)**

From Washington to Athens, the economic crisis is producing consolidation rather than revolution, the entrenchment of authority rather than its diffusion, and the concentration of power in the hands of the same elite that presided over the disasters in the first place. Ross Douthat , [1] The Great Consolidation , 'New York Times', 16 May

When the only tool you've got is a hammer, you're likely to see every problem as a nail. Our policymakers' hammer is control. Unable to relinquish it, they accumulate more and more, creating a policymaking monoculture. And, as in agriculture, a monoculture raises the stakes: a shock can become a catastrophe.

One answer might be for government to realize that, while its stated goals may be laudable and almost universally approved of, there are many different ways of achieving them. Regulations, for example, are means rather than ends. Why not target ends rather than means? Clarity about ends would mean clarity about the costs of achieving them: something which our current system doesn't achieve. Fiscal deficits have accumulated to dangerous levels, simply because the obvious fact that you cannot spend more than you earn indefinitely has been obscured by a policymaking system that prefers vague, uncosted , mutually conflicting goals, to one that offers transparency, stability and public participation and buy-in.

That's where Social Policy Bonds can enter the picture . They explicitly targeting ends, rather than means. Their ends are costed and minimised by a competitive market. The bonds generate a cascade of incentives for all involved in achieving social and environmental goals to be efficient . One way they do this is by stimulating the exploration, investigation and implementation of diverse, adaptive approaches to our social problems, rather than the top-down, one-size-fits-all, centrally planned, uniform approach so favoured by our current policymaking system. That system, as we see, is extremely fragile. Unfortunately, it might take us all down with it.

### **7.5.7 The Empathic Civilization (2010-05-27 10:16)**

Jeremy

Rifkin

writes:

The Empathic Civilization is emerging. A younger generation is fast extending its empathic embrace beyond religious affiliations and national identification to include the whole of humanity and the vast project of life that envelops the Earth. But our rush to universal empathic connectivity is running up against a rapidly accelerating entropic juggernaut in the form of climate change. Can we reach biosphere consciousness and global empathy in time to avert planetary collapse? '[1]The Empathic Civilization': Rethinking Human Nature in the Biosphere Era

, Jeremy

Rifkin

, 11 January

There's much to agree with here. But there is a fraction, however small, of the human population that does not, and might never be able to, feel empathy. The mayhem that even a few such people can cause when they go against the hopes and instincts of the rest of humanity is well known and well documented, in for instance, the history of the 20 th century and the lives of Stalin, Hitler and Mao. We can hope that our 'empathic connectivity' can prevail against this fraction of humanity and against climate change (and other challenges). But we can also assist the process: by providing monetary incentives to encourage human survival and well-being.

Social Policy Bonds could do this. It might go against notions of fairness or justice, for instance, but paying influential psychopaths to take indefinite golfing holidays on the atoll of their choice would be a bargain for the rest of humanity. That's one example of a way in which Social Policy Bonds rewarding the [2]avoidance of catastrophe could operate. Another would be to look at the relationship between empathy and welfare: I suspect empathy comes into play only when our basic survival needs have been met and secured. Satisfying those needs

for all humanity could be a most effective way of removing threats to the empathic civilization . The point is that incentives of the sort that Social Policy Bonds would supply, which do not prejudge how to achieve a specified goal, can encourage the exploration of a wide array of approaches to bring about empathy and to ensure our survival and prosperity.

### **7.5.8 Peace in the Middle East (2010-05-31 18:51)**

Who wants it? Ordinary people, mostly. It's difficult, though, for them to express that preference. We're all susceptible to anger and impulse, to propaganda and, especially, emotional television pictures of conflict. It doesn't help, though, that the financial and status incentives are overwhelmingly on the side of conflict. The arms sellers, the men of (so-called) religion, the state and non-state militias: all have their own reasons for keeping conflict going, some of them perfectly logical. What's missing are countervailing incentives, and that's where [1]Middle East Peace Bonds could enter the picture. Ordinary people, perhaps following initial contributions from philanthropists, could set up a fund to be used for the redemption of the bonds. The bonds could aim to achieve a sustained period of peace, defined and verified objectively. It would be up to bondholders to devise and investigate the multitude of possible ways in which conflict can be avoided. They would have incentives to deploy only the most efficient of such ways.

People often write about 'intractable' ethnic, religious, or territorial conflicts. But these conflicts do fizzle out and, on reflection, the conflicts were not so intractable after all. Historical grievances, and notions of fairness or justice, loom large and play a part in perpetuating conflict. But not inevitably. People get tired, deals are done, compromises made, other events assume greater importance or time heals. Middle East Peace Bonds could accelerate all these processes. They could channel the wishes of the majority of ordinary people in the Middle East and beyond into the attainment of peace in the region. Incentives do matter.

## **7.6 June**

### **7.6.1 Preventing disasters (2010-06-05 11:08)**

The vast majority of spending on social and environmental programmes is carried out by bodies whose success is barely linked to the welfare of those who are their intended beneficiaries. These bodies, for the most part, are government agencies, or non-governmental

organizations. The motivations of individual employees can scarcely be questioned. My own experience of working in the public sector tells me that they are usually well intentioned and hard working. But they work for an institution within which the over-arching goal is self-perpetuation, and that goal often conflicts with the ostensible aim of the organization. The bigger the organization, the more remote it is from both the people it employs and the people it is supposed to serve. About half of the funds allocated to humanitarian relief and development aid organizations [1] stays with these bodies. Corporations are little different from government. Big private sector companies spend much of the time and energy trying to manipulate government and stifle competition. Unfortunately, the trend is toward more bigness.

Social Policy Bonds could be one way of realigning the goals of organizations with those of ordinary people. Under a bond regime, it would be unimportant whether problem-solving organizations were public or private sector. The structure and activities of the organization would be entirely subordinated to the goals targeted by Social Policy Bonds. The organization's funding - its very existence - would be dictated by the well-being of society, as expressed in the social and environmental outcomes targeted by the bonds. New types of organization could come into being, motivated by the cascading incentives that the bonds would generate.

All this would be a radical change from the current system. But a gradual transition is possible: one that would reward and encourage those who, even under the current system, are efficient in converting taxpayer dollars into meaningful outcomes. I go into some detail as to how a transition to a Social Policy Bond regime can occur in my book, which can now be downloaded freely - see [2] here.

## 7.6.2 Externalities (2010-06-08 14:23)

Externalities are impacts from economic activity that don't enter the market. They can be negative or positive. The negatives attract a lot of attention, especially if they are visible. George Monbiot [1] writes eloquently of the environmental costs of the oil pollution in the Gulf of Mexico. Less obvious are the social impacts, positive and negative, of business. The Gulf of Mexico pollution is truly appalling. But not all its non-market costs result in additional profits to BP. Some of it takes the form of lower oil costs. Through those, most of us benefit and so are complicit. Ideally, externalities would be internalised: costs of products would embody the social and environmental impacts of their production; and not just the visible impacts. But that's just too complex an exercise.

Social Policy Bonds might help in dealing with the most catastrophic of the negative externalities arising from our way of life. They could target the largest, most obvious potential disasters, and reward people for making sure such disasters do not occur. Because they do not prejudge *how* a negative externality shall be eliminated, they would reward the most efficient

ways of avoiding disaster. And only the desired outcome, rather than the exact nature of the disaster, need be specified. The health of plants, animals and humans could all be targeted: investors in the bonds would have incentives to mitigate any sort of threat. Click on the link to read more about [2]Disaster Prevention Bonds.

### 7.6.3 Smoking and health (2010-06-11 19:26)

Anna Gilmore of the University of Bath and her colleagues looked at how many people were admitted to hospital with a heart attack in England between 2002 and 2008. About 110,000 people are struck down each year.... Ms Gilmore and her team found that, in the 12 months after the smoking ban came into force, some 1,200 fewer people were admitted to hospital with heart attacks than even the prevailing downward trend had suggested was likely. That drop of 2.4 % saved £8.4m in emergency hospital care.

[1]Breathe Easy, 'The Economist' (subscription), 10 June

There are several problems with drawing any policy conclusions from this. The most important is: what happened to physical well-being as a whole? Heart attacks might have fallen (though not by very much), but did other forms of morbidity rise? For instance (as pointed out by one of the commenters ):

The prevalence of allergic asthma and allergic rhino-conjunctivitis decreased, in a dose-response manner ( $P = 0.03$  and  $P = 0.004$ , respectively), with increasing exposure to tobacco smoke in the adult study population. ... This study demonstrates an association between current exposure to tobacco smoke and a low risk for atopic disorders in smokers themselves and a similar tendency in their children. [2]Does tobacco smoke prevent atopic disorders? A study of two generations of Swedish residents. Hjern A, Hedberg A, Haglund B, Rosén M., 'Clinical and experimental allergy: journal of the British Society for Allergy and Clinical Immunology ', June 2001

The other important qualification is that the reduction in heart attacks might have caused completely unrelated to bans on smoking: one correspondent [3]suggests the withdrawal of hydrogenated fats from supermarket shelves.

More generally, results like this point to the need for broad indicators, not only of health, but of education, poverty, and well-being generally, including environmental well-being. Unfortunately, we are not geared up to using broad indicators for policy purposes. Or the broad indicators that do have de facto status as targets, such as Gross Domestic Product (or GDP per capita ), are seriously [4]flawed in that they bear no necessary relationship to well-being. Other indicators tend to be dictated by governmental structures, rather than the other round: policy is subordinated to the perceived need to keep public sector agencies

happy, rather than to the well-being of ordinary people. (If this sounds far fetched, take a look at my piece on the New Zealand public sector reforms of the 1980s in my [5]book.)

Social Policy Bonds would allow and encourage governments - and others - to target broad indicators of well-being; including those with a very long lead time. A [6]new type of organization would result: one whose existence, structure and activities are totally subordinated to societal goals, rather than to current vested interests. If it comes to a choice between (say) a small number of heart attacks versus a higher incidence of asthma, then such choices, under a bond regime, would be made transparently and according to transparent criteria.

#### **7.6.4 Expanding the corporatist state (2010-06-17 19:54)**

From a [1]comment (subscription, I think) to the Economist :

All right, Obama is not a socialist: he is a corporatist. Is that better? He would yoke government and big business together, pulling towards objectives defined by the great and good.

I'd disagree to the extent that I think the great and good can sensibly define objectives: it's when the ways of achieving them are centrally planned that things go awry. As the commenter recognises. He goes on:

This ignores the fact that it was this collusion that primarily got us into this mess in the first place. For example: government mandates that poorer people get houses. The mortgage industry, which is backstopped by a government controlled (and now owned) "company," tries to devise ways to do this without losing its shirt. These new techniques seem to work so well that they generate a huge bubble. The bubble bursts. And what happens then? The government intrudes even further into the home mortgage industry.

Again, the problem is government prescribing how things shall be done, rather than prescribing what shall be achieved.

"Too big to fail" is a symptom of the corporatist disease; so are "national champions," propped up by the state, to the detriment of innovation and competition. And instead of unwinding the relationship between big business and government, we're entwining them yet more. This marginalizes small businesses, which is where most

of the innovation and job creation takes place. How can a small business make any plans, or hire any workers, when every day seems to bring down a new government mandate that favors large corporations? The law is ignored (as during the Chrysler bankruptcy, when bondholders were slighted in favor of unionized workers) to bring about a politically favored result. Only large companies, with corresponding muscle, can play on this politicized field.

Exactly so. Government and big business on one side, versus ordinary people and small enterprises on the other.

Communism, socialism, fascism, corporatism: all branches of the same tree, and all based on the premise that a chosen elite must guide the average person, who will otherwise screw it up. The perversion of the Enlightenment and the long march back to serfdom continues.

I don't know about serfdom, but I do foresee a crisis. Government - and big organizations generally - are, it seems, instinctively against the 'creative destruction' of capitalism, which has done so much to lift people out of poverty. The largest corporations work more by manipulating government and trying to subvert markets. Government and big business collectively have become too big. Not 'too big to fail', but too big to ensure that, when they do fail, society can recover without crises and extremely painful transitions. Corporatism has created a [2]policy monoculture, with all the fragility and potential for disastrous consequences that that implies.

### **7.6.5 Social Policy Bonds: free riding and perverse incentives (2010-06-22 18:42)**

The Social Policy Bond principle really needs to be tried, discussed and refined before large-scale implementation. At a recent discussion with a London think-tank, I was asked a couple of questions about free-riding and perverse incentives.

I have in fact written about the possibility of some purchasers of Social Policy Bonds wanting to free ride on the activities of those bondholders who will work to achieve a targeted goal. In chapter 4 of [1]my book, I examine the issue and come to the conclusion that it probably wouldn't do much to undermine the bond mechanism. other purchasers. But, what about a variant in which people would buy a large proportion of the bonds very cheaply and sit on them with the intention of selling them for a higher price to people who are prepared to achieve the goal. This would be counter-productive to the extent that it would deter the would-be goal-achievers from actually working to achieve the goal. How could the issuers prevent this sort of free-riding? They could ensure that the initial price of bonds is not negligible. The choice of objective, the number of bonds issued, and their redemption value could all be chosen with a view to seeing that a bond redeemable for £100, say, could be expected to sell for anywhere between, say, £30 and £90.

- They could give the bonds an expiry date, so that if there were no significant progress toward the objective being achieved, or if the market value of the bonds showed no significant increase, the bonds would become invalid.
- The issuers could retain the power to declare a particular bond issue invalid, either at their discretion or, better, if certain objective criteria, such as each bond's market price, were not fulfilled.

Another question posed was: could people buy the bonds, and do nothing to achieve the targeted goal in the expectation that the issuers are so keen to see the goal achieved that they then will issue more bonds and so boost the value of all the issued bonds, including their passive holding? The possibility of a supplementary bond issue would then have the effect of reducing the motivation of would-be target-achievers to take action. If this were thought to be a significant deterrent to achieving the targeted goal, again, the issuers could:

- Build in an expiry date to the bond issue, and issue a completely new set of bonds targeting the same goal, so that holders of the first bond issue would lose their investment.
- Retain and, if necessary, exercise the power to declare the first bond issue invalid.

For large-scale issues of Social Policy Bonds then, the conclusion is that issuers should retain the right to declare bond issues invalid if bondholders don't comply with the spirit, as well as the letter, of the bonds' redemption terms.

moneymike (2010-06-25 13:51:17)

great stuff, but can u tell me where i should buy a social policy bond ?? or, do i contact my local government office ? or some other entity ???

maybe they can be used to [1]help other people and various worthy causes !??

1. <http://thebestnet.atspace.com/>

Ronnie Horesh (2010-06-25 20:00:01)

Thanks moneymike for your comment and question. Unfortunately, nobody is issuing Social Policy Bonds yet; not that I am aware of. There has been a bit of interest over the years, but nobody has actually issued them. I am hopeful that some people will get together and issue their own bonds, without the public sector getting involved. I have tried to interest philanthropic organizations but have had very little response.

If you, in conjunction with others, are interested in issuing your own Social Policy Bonds, I should be happy to help with advice and suggestions. You could also click [1]here and then download my pdf handbook.

A similar idea, which is more focused on local objectives, is the Social Impact Bond. For information about Social Impact Bonds, click [2]here. For my view of SIBs click [3]here.

### **7.6.6 Process and image versus outcomes (2010-06-24 22:41)**

Frank Furedi writes:

This is probably the most disturbing revelation to come out of the Washington hearings: that oil companies now devote far greater time and energy to managing how they appear in the eyes of the public than they do developing an effective emergency-response plan. So we learned that ExxonMobil's emergency-response plan has 40 pages on dealing with the media but only nine on dealing with an oil spill. The plan seems more preoccupied with the science of drafting press releases than with the science of taking practical steps in an emergency. [1]Why BP is not very slick in an emergency, Frank Furedi , 21 June

We do need clarity about means and ends. One of the virtues of a Social Policy Bond regime is that it would inextricably bind policymakers to focus on ends rather than procedure. If the goal, for instance, is to avoid environmental catastrophe, then Social Policy Bonds can be issued that will target the sustained absence of environmental catastrophe. Investors in the bonds would have powerful incentives to ensure that resources went into avoiding catastrophe, rather than ticking boxes or shaping a company's image. Government could spend less time trying (unsuccessfully) to regulate against every conceivable adverse event, and more time focusing on the broad social and environmental outcomes that society wants to see. Incentives, in short, would be channelled into society's goal, rather than that of corporations or government agencies.

### **7.6.7 Transition to a Social Policy Bond regime (2010-06-29 19:53)**

Asked about a migration path to a Social Policy Bond regime, I give the example of health. On introducing such a bond regime a government could decide to reduce its funding of health authorities and research institutes by 1 percent a year, in real terms. (The government could allocate the saved funding to the future redemption of the Health Bonds it has issued.) So after five years, each health authority would be receiving directly from central government only 95 percent of the funding that it formerly received. But bondholders could choose to supplement the income of some of these health bodies. They may judge a particular group of health authorities to be especially effective at converting the funds they receive into measurable health benefits, as defined by their bonds' redemption terms. Particularly effective health authorities might be working in deprived areas, where small outlays typically bring about larger improvements in health. Or bondholders might judge a particular research

body to be worthy of additional funding, because it was conducting excellent research into a condition that would be likely to respond especially effectively, in terms of health outcomes, to additional expenditure. In such cases, bondholders would supplement their selected health authorities' or research institutes' funding. It may well be that these favoured bodies end up receiving a large boost in income throughout the lifetime of a bond regime.

It could also happen that investors in bonds targeting health look at completely new ways of achieving health objectives; ways that currently receive no, or very little, funding. To give a plausible example, they may be convinced that one of the best ways of achieving society's longevity objectives is to deter teenage drinkers from driving. Following this logic, they may find that one of the most efficient ways of doing so would be to lay on subsidised taxis for teenagers attending parties on Friday and Saturday nights – but only in certain parts of the country. It is difficult to imagine how our current centralised government fund allocation mechanisms could go about implementing such a programme. A Social Policy Bond regime would quickly eliminate some of the less rational distortions in other health care matters, amongst them the British National Health Service's terminal-care budget, 95 percent of which was allocated to the 25 percent of the UK's population who die from cancer, and just 5 percent to the 75 percent who die from all other causes. It is also likely that holders of bonds targeting health outcomes would greatly expand funding in areas such as health education or preventive medicine that rely on expertise outside those bodies traditionally devoted to health care.

The important point is that a transition to an outcome-based, Social Policy Bond regime need not be disruptive. Nor need it necessarily mean the loss of funding to existing bodies, simply because they have been around for many years. But it would mean the beginning of the end for bodies that are inefficient and, in the eyes of bondholders, incapable of becoming efficient. The winners would be society as a whole, and taxpayers in particular.

## 7.7 July

### 7.7.1 How policy is made (2010-07-02 19:31)

When [Tony] Blair announced that 50 per cent of young people would be able to go to university, the first the civil servant in charge of higher education knew about it was when he heard it on the radio.... Things like that and the scheme to take drunken yobbos to cash points to pay on-the-spot fines were mainly dreamt up in the back of a car when Blair was on his way to a meeting or a TV studio. As quoted by Sue Cameron, 'Notebook', Financial Times, 1 July

What is particularly striking is how, at the highest level of national government, big decisions appear to be made on the basis of reactive, primal emotion. Rationality and the long-term interests of the people politicians are supposed to represent hardly figure at all.

...policies are often adopted on the basis of less careful analysis than their importance warrants, leaving wide room for mistakes and misperceptions . Forces of knowledge

destruction are often stronger than those favoring knowledge creation. Hence states have an inherent tendency toward primitive thought, and the conduct of public affairs is often polluted by myth, misinformation, and flimsy analysis. [1]Source ( pdf )

This type of thinking is particularly dangerous when military conflict looms. An article about Henry Kissinger's role in US foreign policy quotes him saying to US President George W Bush's speechwriter, about radical Islamic opponents: 'We need to humiliate them'. Comments like this abound in high politics. George W Bush himself cried 'bring 'em on' at an early point in the invasion of Iraq. These are not examples of high-level thinking.

One of the benefits of a Social Policy Bond regime would be the clarification of social goals, and the transparency of the process that targets them. Goals would have to be articulated before targeting. It's unlikely that random emotional outbursts would crystallise into policy in such a policymaking environment, however eminent the people who make them.

### **7.7.2 Government by television (2010-07-10 20:03)**

One of the main policy drivers, clear to all, but rarely acknowledged, is the urge not to look bad on television. Failure is acceptable, provided it doesn't take the form of tv footage.

A Social Policy Bond regime would be different. Objectives would be chosen in a calm, rational manner. Unlike under the current regime, they would be stable over time. Stable objectives would mean that rational allocation of resources would not be undermined by high-profile events. For instance, in the aftermath of a tragic rail disaster in London that resulted in the deaths of 40 people the UK Government came under considerable pressure to order the installation of an automatic braking system for trains that go through red signals. Cold calculations showed that this would cost around \$21 million for each life that the system could be expected to save. This is around five times the figure that the UK Treasury used as its benchmark valuation of a human life, which means that if the government had succumbed to pressure to install the automatic braking system it would have diverted funds from more cost-effective life-saving projects, and so caused the loss of more lives than it would have saved.

A Social Policy Bond regime that had as its objective the maximising of the number of lives saved per government dollar would not waver in the face of spectacular one-off events.

Policy as if outcomes mattered  
SocialGoals.com

---

### 7.7.3 Non-linear processes (2010-07-11 17:07)

In the fields of economics, ecology and social affairs, small differences in where you start can have a huge impact on where you end up. This is the path dependency that led to driving on the left hand side of the road (in the UK), or the near-universal use of the ([1]supposedly) inefficient QWERTY keyboard. Since tiny causes can have large effects on complex systems then 'even knowing 99 % of what you need to know leaves you vulnerable to large errors. And 100 % knowledge is impossible.' ([2]Source).

All this is one reason for considering Social Policy Bonds for, especially, those social and environmental goals that have many possible causes and are characterised by time lags and seeming intractability . The peaceful resolution of [3]conflicts, for instance, or the promotion of biodiversity, or the avoidance of natural or man-made [4]catastrophe.

As society becomes increasingly complex, you would think that policy instruments that reward positive outcomes but do not prejudge how to achieve them, such as Social Policy Bonds, might be considered more widely. I did try to interest the [5]Santa Fe Institute in Social Policy Bonds. It conducts research into complexity. However, I didn't receive a response to my approach (made nearly two years ago).

### 7.7.4 The unimportance of being right (2010-07-15 18:28)

In a series of studies in 2005 and 2006, researchers at the University of Michigan found that when misinformed people, particularly political partisans, were exposed to corrected facts in news stories, they rarely changed their minds. In fact, they often became even more strongly set in their beliefs. Facts, they found, were not curing misinformation. Like an underpowered antibiotic, facts could actually make misinformation even stronger. [1]How facts backfire, Joe Keohane , 11 July

It's a scary, but not unexpected, finding. With so much information and misinformation about, we tend to ignore the facts that go against our prejudices. All the more reason then, you might think, for policy debates to concern themselves with social and environmental goals, rather than the different - prejudiced - views about the ways of achieving them. The world is too finely grained for most of our political prejudices. We are fairly sure, for instance, that central planning, as practiced by the Soviet Union and China, was a disaster for human welfare. But central planning isn't always a bad thing. Far better to let unprejudiced actors work out for themselves what works best for any particular social goal, on the basis of evidence and an

incentive to get things right.

That's where Social Policy Bonds could enter the picture. Investors in the bonds would have powerful incentives to work out the best approaches to social and environmental problems, and to terminate failures. Careful definition and targeting of society's desired goals would mean that the bondholders' interests would be exactly congruent with those of society. If bondholders held mistaken views about how to achieve these goals, they would lose. They certainly wouldn't profit by pumping more resources into their failed projects. That's in stark contrast to the current system, whereby government agencies face few sanctions even if they make huge mistakes and persist with them for decades.

### **7.7.5 The unimportance of outcomes (2010-07-16 20:28)**

President Gamal Abdel Nasser brought Egypt dictatorship, economic ruin and humiliation in the six-day war with Israel. On his sudden death from a heart attack in 1970 Egyptians erupted in grief; some 5m people mobbed the funeral. His successor, Anwar Sadat, freed political prisoners, revived the economy and won a peace agreement with Israel that got back what Nasser had lost. When he was assassinated in 1981, Egypt fell eerily silent. His funeral was attended by foreign leaders but very few of his own people. [1]After Mubarak (subscription), 'The Economist', 15 July

Charisma, televisual appeal, soundbites or superficiality of any sort are not a sound basis for choosing policy. Currently though, we have little alternative; even those of us who aren't Egyptians. We are allowed to choose policymakers rather than policies; and we choose them on the basis of image at worst, or their stated policy priorities or ideological leanings at best. Rarely are we given the chance to target desirable outcomes.

The reasons for this are mostly historical. People were less educated and had less time to take an interest in policy. But we ought now to be in a position at least to move toward outcome-based policy. That would mean public participation in the choosing and prioritising of social and environmental goals. Social Policy Bonds lend themselves to a gradual transition to this sort of policymaking : by focusing on outcomes to be targeted they would be more transparent than the current policymaking process. They would generate more consensus, or at least - and, just as important - buy-in, for chosen goals. A transition to a Social Policy Bond regime would be quite easy to arrange, with funding to existing activity-based bodies (mostly government agencies) being reduced gradually, at the same time as funds for Social Policy Bond redemption rise. (See my book for further details.)

Nasser is not the only charismatic personality in recent history who led his people to disaster. Choosing policymakers is fraught with problems, even if they happen to be televisually appealing, trustworthy, genuine and honest. It's time to move toward choosing outcomes; there are plenty of alternative careers to politics for people with charisma and ambition.

### **7.7.6 Doing what the corporates want (2010-07-20 20:23)**

One of the virtues of Social Policy Bonds is that people, as distinct from government agencies and corporations, would decide on policy goals. As human beings, we probably would not want to divert funds from taxpayers and consumers to, for example, [1]big agriculture, [2]wealthy landowners, or big energy. The sums involved are staggering:

...more than US \$ 550 billion was spent in 2008 on subsidies to oil, natural gas and coal by 37 of the world's developing and emerging economies ...their removal would result in significant energy savings. [3]G-20 Summit sees little mention of pledge to reform fossil-fuel subsidies, by Fernando Cabrera Diaz , Global Subsidies Initiative, June/July

It's only because of the way in which government and big business make policy that they can get away with such a waste of resources. The current way of deciding on policy priorities is too obscure and protracted to engage ordinary people. Big corporations and government bodies fill the vacuum.

Social Policy Bonds would be different. The focus would be on outcomes right from the start. Organizations would be entirely subordinate to chosen social and environmental goals. A [4]new type of organization - one whose rewards would be inextricably tied to its success in achieving society's goals - would come into being. Even under a bond regime, people would disagree with some chosen policy priorities. But, having been able participate actively in the selection process, they would be more inclined to buy in to targeted goals. Of course, even then we might still opt to tax the poor and subsidise big energy and big agriculture. But we'd be doing so with our eyes open, not as a result of being excluded from the decision-making process.

### **7.7.7 Heading for disaster: Kyoto, Copenhagen and climate change (2010-07-26 20:24)**

*This is an updated version of an article that first appeared in Economic Affairs, 22 (3), September 2002, published by the Institute of Economic Affairs, London. If you wish to publish*

*it, please email me.*

There is overwhelming, but not quite conclusive, evidence that the global climate is changing. That said, scientists are divided as to (a) how fast climate is changing, (b) what is causing it to change, (c) the likely effects of climate change, (d) how much we can do about it, and (e) how much we *should* do about it. Despite these uncertainties, climate change has the potential to inflict serious harm on large populations, so there is a strong argument for doing what we can to prevent it or

minimise

its adverse effects.

The December 1997 Kyoto treaty

required developed countries to bind themselves internationally to numerical targets. Despite Kyoto's flaws, between 1990 and 2007 emissions of greenhouse gases did fall by 4 % in these countries.

(Carbon dioxide, which is given off by fossil fuel combustion, is thought to be by far the most important of the man-made greenhouse gases that form an insulating blanket around Earth.) But evaluations by leading scientists indicate that Kyoto's environmental effects, for all the bluster and bureaucracy, may be so small as to be almost unnoticeable.

Yet we are heading for more of the same. If any successor to Kyoto is ever agreed - or, more important, implemented - we can look forward to minimal reductions in emissions; undetectable effects on the climate; ingenious attempts to game the system; and the squandering of billions of dollars on wasteful, corrupt schemes all over the world. The big beneficiaries will be third-world dictators, Swiss bankers, and the burgeoning bureaucracies at national and supra-national level who will be charged with administering and ensuring compliance with whatever absurd regime is agreed. This is not cynicism, it's realism:

Canada has exceeded its Kyoto target by 29 %,[1]

[1]

but does anyone imagine it will be punished? And do we really want to see national democratic governments coerced by yet another supra-national governmental body into doing something to which their electorates object?

The successor to Kyoto will share the same, ludicrous assumption that afflicted its predecessor: that government knows the best way of achieving its goals. But with climate change the biological and physical relationships involved are many and complex. Even specialists in climatology disagree about the degree to which any of the myriad components of the world's climate contribute or react to climate change. It would therefore appear to be poor policy to impose expensive, divisive, unpopular and upfront controls on certain activities on the basis that they *might* help bring about a slightly more stable climate some time in the future.

People who were serious about addressing climate change would not embody the assumption that they know exactly how the Earth's climate is changing, what is causing it to change, and what is the best way of dealing with any change. They would not ignore a potentially catastrophic problem, but would try to be as cost-effective as possible, especially because of the colossal expenditures that will inevitably be incurred. An ideal policy would encourage

innovative solutions, stimulating the investigation and adoption of promising new technologies, and be open to new information about the causes and effects of climate change. It would most probably seek to constrain the negative impacts of climate change, while doing little to discourage any positive effects.

An ideal solution would also use markets.

Now markets are getting a bad press right now. Many blame them for the current financial crisis and for environmental deprecations. And it's true that unregulated markets are being abused to serve purely private interests at the expense of the wider public.

So it is important to remind ourselves that a market economy is consistent with many different outcomes and that market forces can serve public, as well as private, goals. Markets are simply the most efficient means yet discovered of allocating society's scarce resources. An ideal solution to the climate change problem would use market forces to

channel people's self-interest into the solution of the climate change problem.

If such a solution could be found, it would be bound to attract more support from world leaders, non-governmental organisations, and the public in general than Kyoto. Such buy-in is essential, because any solution is probably going to entail enormous costs and sacrifices.

## Targeting outcomes, not activities: Climate Stability Bonds

Climate Stability Bonds would be a new globally backed, financial instrument, designed to achieve climate stability, rather than to regulate emissions, activities or institutions. These bonds would be issued on the open market and would become redeemable for a fixed sum *only when the climate had achieved an agreed and sustained level of stability*. In this way there is no need for the targeting mechanism to make assumptions as to *how* to stabilise the world climate - that is left to bondholders.

There are obvious difficulties involved in defining what a stable climate actually is, *but the same difficulties apply when attempting to monitor the success or otherwise of Kyoto, neo-Copenhagen or any other regime*. A Climate Stability Bond regime could target an array of objectively verifiable indicators such as temperature, change in temperature, rate of change of temperature, precipitation, frequency of extreme climatic events, ice sheet volume and many other variables, at a wide range of locations. It could also target for reduction the *effects* of a changing climate on human, animal and plant life. All indicators would have to fall into a satisfactory range for a sustained period before the bonds would be redeemed.

Normal bonds are redeemable at a fixed date, for a fixed sum, and so yield a fixed rate of interest. Climate Stability Bonds would not bear interest and their redemption date would be uncertain.

Bondholders would gain most by ensuring that climate stability is achieved quickly.

Internationally backed Climate Stability Bonds would be issued by open tender, as at an auction; those who bid the highest price for the limited number of bonds would be successful in buying them. A fixed number of bonds would be issued, redeemable for, say, \$10 million each, only

when climate stability, as certified by objective measurements made by independent scientific bodies, has been achieved and sustained. Once issued, the bonds will be freely tradeable on the free market.

What will determine the price of the bonds? Most obviously, the market's assessment of how close climate stability is to being achieved. Interest rates on alternative investments will also be a factor. The bonds would sell for small fractions of their issue price if people thought there were virtually no chance of climate stability being achieved in their lifetime. People will differ in their valuation of the bonds, and their views will change as events occur that make achievement of a stable climate a more or less remote prospect. They would also change as new information about climate, and about the causes of climate change, is discovered. But the bonds, once issued, would be transferable at any time. Bondholders, having done their bit to achieve climate stability, could sell their bonds, realising the capital gain arising from the higher market price of their bonds. These market prices would be publicly quoted, just like those of ordinary bonds or shares.

Assume that Climate Stability Bonds, redeemable for \$10 million each, have been issued, and that they each sell for \$1 million. People, or institutions, now hold an asset that can give them a return of 900 percent once a stable climate has been achieved. It is this prospect of capital gain that gives bondholders a strong interest in bringing about a stable climate, as cost-effectively as possible.

Climate Stability Bonds could be issued by a world body, perhaps one supervised by the United Nations or World Bank. This body would undertake to redeem the bonds using funds that could perhaps be obtained from all countries, in proportion to their Gross National Product. It would be up to individual countries to decide how to raise funds, presumably from taxation revenue. Importantly though, no bonds will be redeemed until the objective of a more stable climate has been achieved and sustained.

### What would bondholders do?

How might bondholders aim to accelerate the achievement of a stable climate? They could:

- help finance countries' or companies' greenhouse gas emission control programmes;
- pay vacationers to stay at home rather than fly;
- supply solar heaters to villages and households in poor countries;
- carry out, or subsidise, research into schemes to remove greenhouse gases from the atmosphere.

Bondholders can also be expected to finance other climate stabilising initiatives, the precise nature of which we cannot, and *need* not, know in advance. Of course, governments, research institutes and others are already carrying out many of these activities. But there is a crucial difference. Under a Climate Stability Bond regime, the motivation arises from the self-interest of bondholders, *who have the incentive to seek out those ways of achieving a stable climate that will give them the best return on their outlay*. Their outlay, of course, is the taxpayers' outlay.

But note that it is only when the targeted degree of climate stability is achieved that governments end up paying for it. Until then, it is bondholders who have to finance the initiatives that they think will achieve climate stability. The issuing body will, in effect, be contracting out the *achievement* of climate stability to the private sector. But it will be stipulating the degree of climate stability that it wants, and undertaking to reward bondholders when that objective has been achieved.

Many will be skeptical that bondholders can actually do anything to combat climate change. It is true that too large a number of small bondholders would probably do little in isolation to bring about climate stability. If there were many such small holders, it is likely that the value of their bonds would fall until there were aggregation of holdings by people or institutions large enough to initiate effective problem-solving projects. As has happened with share privatisation issues, the bonds would mainly end up in the hands of large holders - probably institutions, brokers, governments or corporations.

Even then, each such body would probably not be big enough, on its own, to achieve much without the cooperation of other bondholders. They might also resist initiating projects until they were assured that other holders would not be 'free riders'. But note that they will have a strong incentive to cooperate with each other, and to do so as cost-effectively as possible. If they did not, the market value of their bonds would fall. Their common interest in seeing climate stability achieved quickly means that they would share information, trade bonds with each other and collaborate on climate-stabilising projects. They would also set up payment systems to ensure that people, bondholders or not, would have an incentive to perform efficiently. Large bondholders, in cooperation with each other, would be able to set up such systems cost-effectively. Governments holding bonds would benefit by enacting legislation aimed at achieving climate stability, while large bondholders could lobby for such legislation, targeting their lobbying energies at those governments who will respond most readily.

## Advantages of Climate Stability Bonds

There are two critical advantages that Climate Stability Bonds have over Kyoto and its likely successor. One is that the bonds do not rely on the robustness of our existing scientific knowledge. Kyoto aims to reduce emissions of a small range of gases. But there may be other causes of climate change that are far more important, of which we are currently unaware. And these need not be man-made: natural variability of climate has had severe impacts on human life in the past. Kyoto, responding to effects whose causes are uncertain, embodies a limited number of fixed ideas about the nature of the relationships involved. A bond regime, targeting climate change directly, may well lead to cuts in greenhouse gas emissions, but it would not assume that doing so is the best solution. Climate Stability Bonds improve on Kyoto because they encourage behaviour leading to the desired outcome, rather than seeking to control activities whose effects on the climate stability are not fully known.

The other major advantage of a Climate Stability Bond regime is that bondholders will support whichever climate stabilising projects will give them the best return for their outlay. These may involve controlling greenhouse gases, but they could also mean furthering research into such ideas as genetically engineered cyanobacteria that can soak up carbon dioxide from the atmosphere. The more efficient bondholders are in achieving climate stability the more they will gain from appreciation in the value of their Bonds. This efficiency maximises the degree of

climate stability that can be achieved per dollar outlay. Because of the colossal sums involved, the benefits that Climate Stability Bonds offer in comparison to activity-based regimes, such as Kyoto, are likely to be huge.

Further advantages of a bond regime are:

the bonds would have considerable informational advantages over such measures as Kyoto, which target activities rather than outcomes. Greenhouse gases are emitted from many sources. About half of carbon dioxide emissions, for instance, come from dispersed sources, such as cars and home heating systems. Immense quantities of information would be needed to establish and monitor a comprehensive system of control using taxes or tradeable emission permits. Costs of obtaining such information and resentment against the intrusiveness required to ensure compliance are going to be high. By contrast, Climate Stability Bonds would target and monitor a much smaller number of global indicators.

governments would pay up only when a stable climate has been achieved - any risk of failure or of undershooting the climate stability target is borne by bondholders, rather than taxpayers;

funds for global climate stability could bypass corrupt or inefficient governments or, by appealing to their financial self-interest (if they were bondholders, or bribed by bondholders) could effectively modify their behaviour in favour of achieving climate stability; and

formulating the redemption terms for Climate Stability Bonds will entail clarifying of what is actually wanted. Framing the debate in terms of outcomes, rather than institutions or activities, will bring about greater public participation and buy-in to the entire process: essential of the challenge is to be met.

Achieving a stable climate will unquestionably require a wide range of diverse, responsive projects. Reducing greenhouse gas emissions or sequestering carbon may be helpful ways, but they are not necessarily going to be the most cost-effective. Other ways yet to be discovered may be far cheaper. Kyoto is, in my view, deficient, in that it offers no incentives to find out how to achieve a stable climate most cost-effectively. Climate Stability Bonds would encourage the most efficient solutions given the knowledge available at any time, and they would stimulate research into finding ever more cost-effective solutions. This occurs because of the nature of the bond mechanism, and requires no presupposition as to the optimal set of solutions. Scientists and governments would need to decide only on the objective - climate stability - not on the ways of achieving

it.

Of course, the Climate Stability Bond concept involves surrendering of policy instruments to the private sector, and this may be difficult for politicians to swallow, even though, under a bond regime, they would continue to set, and be the ultimate source of finance for, the targeted objective. The potential benefits of a bond regime are colossal. In economic theory, and on the evidence of recent history, market forces are the most efficient means yet discovered of allocating society's limited resources.

Under a bond regime, government would do what it's good at doing: articulating society's wishes and raising the revenue for achieving them. Where government often fails is in actually achieving these goals efficiently and that is where investors in the bonds would do what they are best at; exploring, investigating and implementing an array of approaches, while responding to events and our rapidly expanding scientific knowledge; all in the service of the overall goal of climate stability. Investors' rewards would be inextricably linked to their success in bringing about society's climate stability goal, as articulated by national governments. Rather than punish countries, upfront, for dubious long-run benefits, the bonds would reward and motivate people for achieving demonstrable gains in climate stability.

Climate Stability Bonds are intended to channel the market's incentives and efficiencies into the achievement of *society's* overriding environmental objective. By appealing to people's self-interest, Climate Stability Bonds could be far more effective at achieving climate stability than Kyoto or whatever deal is struck in Copenhagen. And, by targeting a desired outcome but leaving it for the market to achieve, the principles underlying the bond concept could show the way to solving other seemingly intractable global problems, including other environmental problems, war, civil war, disease and malnutrition.

### **7.7.8 Evolutionary fitness (2010-07-30 19:02)**

...5 % of movies pay for the other 95 %, and success or failure is unpredictable. The best the studios can hope to do is find contractual mechanisms that back success after it happens and thus leverage their profits. This was what they had with distributors and cinemas, and it worked. They just didn 't realise it was these deals and almost nothing else that was paying for their

Cohiba cigars. The movie industry was what Arthur [ de Vany ]] loves best: “a complex, adaptive, decentralised system”. [1]Exactly like the human body. Evolutionary Fitness: the diet that really works, Brian Appleyard [UK] ‘Sunday Times’, 17 August 2008

And exactly like human society. The problem is that top-down planning cannot deal with such a system: it much prefers to impose the idea of equilibria , steady states, homeostasis and normal distributions about the mean on systems to which they don’t apply.

Almost all dietary and fitness regimes are based on a homeostatic view of the body – meaning it is a self-regulating system that maintains itself in a continuous, stable condition. The average is the ideal. So we are told to eat regular meals consisting of a balance of the food groups and to take regular exercise, dominated by steady aerobic activity like cycling or jogging. This is all wrong.

We have seen where this line of thinking takes us in banking and finance too (see my post about [2]Black Swans). And I suspect it fails in other policy areas, such as welfare, health and education. Our tendency is to ignore or discount the possibility and impact of catastrophe.

This is one area where Social Policy Bonds can function as a societal insurance policy against large-scale disasters that policymakers would otherwise neglect. The cause of the the disaster need not be specified: the bonds would function in a similar way to increasingly popular [3]catastrophe bonds, except that they would have the purpose - and the backing- of making it worthwhile for investors to *prevent disasters happening*. A national government (or a consortium of corporations, non-governmental organizations and concerned philanthropists) could issue Social Policy Bonds that would reward investors if an event killing more than, say 10000 of a country’s citizens in any one 48-hour period, does not occur before a specified date.

Such [4]Disaster Prevention Bonds would encourage investors to investigate all sources of potential disaster, *impartially*. Unlike current attempts at disaster prevention, then, they wouldn’t concentrate on those disasters that have a high media profile, for example.

The concept could be scaled up: a collection of governments under the auspices of the United Nations or non-governmental organizations could issue similar bonds, aimed at preventing even larger-scale disasters, such as a nuclear exchange. It’s also conceivable that, again, the private sector could issue bonds that could, for example, aim to defuse regional conflicts (preventing war), or lessen the impact of malaria or crop failure in specified parts of the world.

## 7.8 August

### 7.8.1 Give greed a chance (2010-08-03 20:34)

Tyler Cowen asks:

How many [books on morality and markets] take seriously the notion that our moral intuitions can be badly misguided for judging the operation of an impersonal market economy in the modern world? Not so many, though all seem to think they do. [1]Source

I sometimes am asked how Social Policy Bonds, which envisage self-interest as playing a still bigger role in our economy, can be reconciled with morality and ethics? I have two answers. One, that morality is at least as much a matter of outcomes as about the means of reaching them. Our private sector, whose motivation is profits (or sales, market share, or revenue), generates much of the tax revenue with which we help the disadvantaged and supply public goods and services. It also contributes much in the way of positive non-market impacts: through employment it alleviates poverty and crime, etc. In short, a system based (apparently) on greed, as regulated by government, enables us to raise the wellbeing of all, especially the disadvantaged: greed can be good.

My other answer is that what is labelled as self-interest and is disdained for that reason can be no more than someone going to work for money, to support him/herself and his/her family. Under a Social Policy Bond regime, investors in the bonds would make capital gains if they help achieve society's targeted goals. That doesn't make them profiteers or worthy of condemnation. It makes them entrepreneurs willing to take a risk so that they can pay themselves and people who work for them (at a lower risk) salaries. Competition for the bonds would bid away excess profits anyway. Largely for reasons of history and (I think) too-little-examined moral disdain for self-interest, we've been reluctant to channel self-interest into the solution of social problems. Those who are charged with solving them are rarely rewarded in ways that correlate with their success in doing so. Social Policy Bonds are my suggested way of channeling the incentives and efficiencies of the market into the achievement of social goals, including those, such as world peace and the elimination of poverty, that most would agree are morally uplifting. My header says it all.

SocialGoals.com

1. <http://www.marginalrevolution.com/marginalrevolution/2010/08/what-ive-been-reading-1.html>

### 7.8.2 Socialism, American style (2010-08-08 17:44)

That's the title of a post by Denis Weisman, which outlines some of the laws that protect US car dealers from having to behave competitively.

Some states make it illegal to sell cars at lower prices to high-volume dealers than to low-volume franchisees. Some prohibit car companies from selling directly to

the public (say, via the Internet) because it would adversely affect the competitive position of the dealers. [1]Socialism, American Style, Denis Weisman, 26 July

How did this come about? It's the usual tawdry tale of lobbyists filling the vacuum created, in my view, by a complex political system that's opaque to non-specialists; that is, ordinary people, as distinct from corporations.

In the American political system, a highly focused, well-funded lobby with tight connections in every House district is almost unbeatable when it chooses to play rough.

It's policymaking by the rich, for the rich, and there's little sign of it ending any time soon.

You can see where I am heading with this. A Social Policy Bond regime would target outcomes. Outcomes that are meaningful to ordinary people. Corporate success would be a by-product of a prosperous population, not something that grows out of the power of the lobbyist. Government's *raison d'être* is to enhance the wellbeing of the population, not corporations. Policymaking should subordinate corporate interests to those of ordinary citizens, and a Social Policy Bond regime would do that.

### **7.8.3 Scary (2010-08-14 19:48)**

An article in the Atlantic , highlights the likelihood of Iran's developing nuclear weapons.

The Iranian leadership's own view of nuclear dangers is perhaps best exemplified by a comment made in 2001 by the former Iranian president Ali Akbar

Hashemi - Rafsanjani , who entertained the idea that Israel's demise could be brought about in a relatively pain-free manner for the Muslim world. "The use of an atomic bomb against Israel would destroy Israel completely while [a nuclear attack] against the Islamic countries would only cause damages," Rafsanjani said. It is this line of thinking, which suggests that rational deterrence theory, or the threat of mutual assured destruction, might not apply in the case of Iran, that has the Israeli government on a knife's edge. [1]The Point of No Return, Jeffrey Goldberg, 'The Atlantic', September

And much of the rest of the world. But if the leaders of Iran aren't rational human beings, that doesn't mean they aren't susceptible to incentives. The usual incentives might not apply to them, themselves. But the people who work for them, who follow their orders, who supply their centrifuges or generate their electricity: some of them will be susceptible. And this is where Social Policy Bonds could help. A [2]Middle East Peace Bond or, more broadly applicable, a [3]Disaster Prevention Bond, could focus people's attention on what needs to be done in a more systematic, incentive-driven manner, than the current array of high-stakes bluster, talks about sanctions, talks about talks and all the rest of it.

#### **7.8.4 The costs of free parking (2010-08-15 18:09)**

In his book, Professor Shoup estimated that the value of the free-parking subsidy to cars [in the US] was at least \$127 billion in 2002, and possibly much more. ... "Who pays for free parking? Everyone but the motorist." [1]Free parking comes at a price, Tyler Cowen , 'New York Times', 14 August

One big advantage of Social Policy Bonds is their transparency. If we wanted to subsidise car drivers, for example, a Social Policy Bond regime would require that we do so with our eyes open. Under the current arcane, opaque policymaking process those interest groups with (essentially) the most muscle can manipulate the legislative and regulatory environment to suit their own ends. So we end up with free car parking for the minority of people who drive cars a lot. The price is high, but it's borne by society in general. The car drivers who benefit, pay very little. It's the same pattern in other sectors. The well resourced use the vagueness of current policymaking to their own advantage. And who are the well resourced? Large corporations or government agencies. More and more, it seems, their goals are not only different from those of ordinary people; they are in conflict with them.

#### **7.8.5 An argument for a governing aristocracy? (2010-08-17 22:21)**

Or perhaps, [1] lottocracy ? In a review of Philip Ziegler's biography of the former British Prime Minister, Edward Heath, Ferdinand Mount says:

[Heath] promised a 'quiet revolution', in terms which understandably convinced his right wing that he had come over to their way of thinking. By instinct, though, he preferred to control things rather than let them run free and endure the consequences . [2]Plonking, Ferdinand Mount, London Review of Books, 22 July (subscription)

I wonder whether this is a feature of all non-aristocratic policymakers. Which is to say, those politicians - almost all of them nowadays, and definitely Mr Heath - who had to struggle mightily to get to their position. Effort is all very well but, especially when it has successfully advanced a person's career, it will predispose to a controlling mindset; one that will be

predisposed to work on problems , rather than let them solve themselves. One that will be biased toward intervention and top-down, one-size-fits-all planning, rather than creating an environment whereby adaptive, diverse policies can achieve outcomes without government prejudging how they shall do so.

Social Policy Bonds could perhaps be a compromise. Under a bond regime, politicians would still articulate our social goals, and control their funding and priority; they would, though, relinquish their power to dictate how these goals shall be achieved.

### **7.8.6 Biodiversity and Social Policy Bonds (2010-08-25 20:13)**

Already the UN has conceded that [1]the targets for safeguarding wild species and wild places in 2010 have been missed: comprehensively and tragically.

[2]Talk has not halted biodiversity loss - now it's time for action, Guillaume Chapron and George Monbiot , Guardian.co.uk, 13 August

It's a tough one. Some Guardian readers' ideas, many of them worth considering, are presented [3]here. Could the Social Policy Bonds principle help? Part of the problem is to clarify whether biodiversity is a means to an end or an end in itself; and another is how to quantify what biodiversity is and what we want from it.

One option could be to for experts to list their top, say, 10000 plant and animal species, according to their intrinsic value, or their status as indicator species, representing the broader state of the environment, including biodiversity. It would probably be impractical to legislate effectively against serious depredations of such a large number of species. But a Biodiversity Bond, following the Social Policy Bond principle, could be issued, perhaps by a

combinatin of governments, non-governmental organizations, and environmental bodies. What would such Biodiversity Bonds target? Not the health or survival of the full panoply of 10000 species; that would be too complex and expensive. But what about the health and habitats of, say, 100 of these species? That would be a fairly simple matter. The key to such a regime is that the 100 species would not be known in advance by either the bonds' issuers or investors in the bonds.

Instead, the 100 species could be randomly chosen from the 10000 towards the end of bonds' stipulated expiry period. The bonds could target a broad definition of biodiversity, encompassing the 10000 species, 30 years hence. Towards the end of that 30 years, 100 out of those 10000 species or habitats would be randomly chosen. If all 100 were doing well, surviving and thriving, the bonds would be redeemed. If not, they wouldn't.

Bondholders would then have incentives to preserve biodiversity of all the 10000 species (or ecological systems), but there need be no onerous, contentious and expensive monitoring

of all 10000 species. Only a fairly small sample, randomly chosen after 29 years, need be examined. That, in my view, would make targeting biodiversity a practical proposition.

Your thoughts or comments on this idea are particularly welcome.

### **7.8.7 Surrogate markers, in medicine and policy (2010-08-28 18:24)**

A surrogate marker is an event or a laboratory value that researchers hope can serve as a reliable substitute for an actual disease. A common example of this is blood cholesterol levels. These levels are surrogates, or substitutes, for heart disease. If a medical study demonstrates that a medication can lower cholesterol level 10 %, then we assume that this will also lower the risk of cardiovascular disease. Why doesn't this same study determine if an anti-cholesterol drug decreases heart attack rates directly? After all, most folks would rather be spared a heart attack than have a silent decrease in their blood cholesterol levels. ...Surrogates often take on a life of their own, far removed from the actual disease they represent. Patients shouldn't care if their 'surrogates' are improving; their objective should be to prevent disease, feel better and live longer. [1]Evidence-based medicine in disguise: beware the surrogate, '[2]MD Whistleblower' (blog by Michael Kirsch), 1 August

Quite so. And as in medicine, so it is in policymaking, and for much the same reasons: 'It's much easier and cheaper ...to measure surrogates than actual disease events.' It's much, much easier to measure a government agency's spending than it is to measure its success or otherwise in delivering meaningful outcomes.

The problem isn't always that of measurement, or of short-term interests trumping long-term benefits. There is also the inescapable subjectivity of an important component of welfare: psychological wellbeing. To take one example that has obvious policymaking implications: in the UK for several years crime appears to have fallen, while fear of crime has risen (see [3]here). The answer, if there is one, might be to re-localise some policymaking. Some of the most important components of wellbeing simply cannot be quantified and aggregated for efficient use by our highly centralised bureaucracies. Withdrawing unemployment benefit, for instance, could actually help someone who's lacking in motivation and would gain by being made to find a job. To another person, though, the loss of a welfare payment could mean calamity. No bureaucracy can make such a distinction, and we might not want one with the intrusive powers that could.

Social Policy Bonds are no different from conventional policy in that respect, except that they have to answer, upfront, the difficult question of whether a specified goal is a surrogate (a supposed means to an end) or an end in itself. Having to do that at the outset of making

policy, is probably an advantage over the current system in which, too often, objectives are vague, conflicting, and only tenuously related to policy instruments allegedly supposed to bring them about.

## 7.9 September

### 7.9.1 Through failure to success (2010-09-03 14:03)

If you want to be more successful, increase your failure rate. Attributed to Thomas Watson, founder of IBM

We can probably all attest to the wisdom of that dictum. The problem, as I see it, is that with highly centralised government and huge corporations, we are creating a policy environment that eliminates the diversity that gives rise to success through repeated experimentation and adaptation. Decisions in policy areas such as the environment or finance are taken at such a high level of aggregation that there is no realistic chance of comeback if they fail. Government favours the uniform approach, and big corporations can attribute much of their size to their ruthless elimination of competition - in defiance of their much-lauded 'market forces' - with the full connivance of government. The entities that dictate how our ever-smaller planet shall be run now are so large that we can't afford an increase in the failure rate.

We need to revert to an environment in which failure can not only be tolerated, but can perform its necessary function of generating improved policy. Social Policy Bonds are one possibility. Under a bond regime decisions could still be taken with the aim of improving outcomes at the global level. But, unlike under the current system, the bonds would stimulate the exploration, implementation and refinement of diverse solutions. By contracting out the achievement of broad social and environmental outcomes to the private sector, the bonds would encourage diverse approaches, many of which would fail to be efficient and effective solutions to our social problems. Et voila: an increased failure rate!

### 7.9.2 (2010-09-04 05:39)

I estimated that the subsidy for off-street parking [in the US] in 2002 was between \$127 billion and \$374 billion, or between 1.2 percent and 3.6 percent of the gross

domestic product. In comparison, in 2002 the federal government spent \$231 billion for Medicare and \$349 billion for national defense. Donald Shoup ,

[1] Shoup to O' Toole : The Market for Parking Is Anything But Free, 1 September

How do we get ourselves into this sort of mess? Bureaucracy and the big corporations have their own agenda. When it comes to parking, it takes the form of mandated parking spaces for new buildings, residential and commercial. To the vast majority of us who are turned off by the whole policymaking process, minimum parking requirements sound sensible, at first hearing. (So too, did subsidies to 'family' farms, many decades ago.) The end result is the apotheosis of the car; subsidies from the poor (who have no, or minimal access, to cars) to the rich, and an aesthetic and environmental calamity.

One thing that outcome-based policy would do right from the start is bring into question such superficially appealing notions as minimum parking requirements. By focusing on ends, rather than means, Social Policy Bonds would lead to a total reappraisal of transport and town planning policy - and one in which ordinary people could participate. Is easy transport a means to an end, or an end in itself? What exactly are town planners trying to achieve? Are ordinary people consulted? Perhaps we'd all be better off if government at all levels were to target the minimal well-being of all its citizens rather than (inadvertently, perhaps, and surreptitiously, almost always) the agenda of big corporations.

### **7.9.3 The American ruling class (2010-09-09 13:56)**

Today, few speak well of the [American] ruling class. Not only has it burgeoned in size and pretense, but it also has undertaken wars it has not won, presided over a declining economy and mushrooming debt, made life more expensive, raised taxes, and talked down to the American people. Americans' conviction that the ruling class is as hostile as it is incompetent has solidified. The polls tell us that only about a fifth of Americans trust the government to do the right thing. The rest expect that it will do more harm than good and are no longer afraid to say so. [1]America's Ruling Class - And the Perils of Revolution, by Angelo M. Codevilla , 'The American Spectator', July-August

Even years after policies have been implemented, it's often difficult to know whether they were right or wrong. For that reason alone, public buy-in is increasingly necessary, as society becomes still more complex and interdependent. One reason such buy-in is difficult to bring about in today's policymaking

environment is the casting of policy in terms of activities, lofty but vague ideals, spending patterns, and arcane legislative decisions. It's difficult for ordinary people to understand and follow the policymaking process.

Social Policy Bonds could help generate more public participation and more buy-in. Their starting point is the targeting of outcomes that are meaningful to natural persons - as distinct from abstractions like corporate profits, or 'the economy'. Discussion would centre on these outcomes, their costs and relative priority.

It's dangerous, I think, when people become feel so alienated from the political class that we become cynical or despairing. Even sound, sensible policies then become objects of suspicion. Buy-in to crucial policy decisions , in times such as these, is not a luxury. It's a necessity and one that the current system is failing to provide.

#### **7.9.4 What drives policy? (2010-09-14 04:47)**

Sometimes rationality takes a back seat:

Based on surveys ...the top five worries of parents are, in order:

1. Kidnapping
2. School snipers
3. Terrorists
4. Dangerous strangers
5. Drugs

But how do children really get hurt or killed?

1. Car accidents
2. Homicide (usually committed by a person who knows the child, not a stranger)
3. Abuse
4. Suicide
5. Drowning

Quoted by [1]Bruce Schneier , orignally from [2]NPR

Unfortunately, policy is often made on the basis of public perception, rather than a cool, rational appraisal of the facts. It's a widespread problem:

...policies are often adopted on the basis of less careful analysis than their importance warrants, leaving wide room for mistakes and misperceptions . Forces of knowledge destruction are often stronger than those favoring knowledge creation. Hence states have an inherent tendency toward primitive thought, and the conduct of public affairs is often polluted by myth, misinformation, and flimsy analysis. [3]Source ( pdf ) [4]  
[5]

Social Policy Bonds could make a difference here. We react to events impulsively and irrationally but we do so for a reason: generally, to return to the status quo ante. Often, in our irrationality, we overreact. 'Too much, too late', is the common, and destructive, impulse. A bond regime, in contrast, would supply incentives to achieve the same goal, but more rationally. So, for instance, if our goal is to minimize the dangers to children, we could issue Social Policy Bonds that would aim to reduce the numbers of people dying or suffering serious injury, from any cause, before the age of 18. This goal would be stable over time, despite events that in today's environment would sway politicians and lead to irrational policy. But at the same time, investors in the bonds would have incentives to react rationally and efficiently to genuine changes in the number and severity of threats to children.

### 7.9.5 Incentives for peace (2010-09-20 12:00)

...I hear two of the wisest Israelis I know say quietly that, against all odds, these peace talks will succeed, because "we are all so tired, so weary for peace", then the Ararat test is the one to set. Can Jews and Arabs opt to forget en masse? [1]When misery is a legacy, Peter Preston, 19 September

In truth, we don't really know whether tiredness - or forgetting, for that matter - lead to peace. Society is so complex, there are bound to be occasions when either condition could contribute to war. You might just as easily find an Israeli or Arab say "we are all so tired, so weary of being persecuted by the other side...". Which is not a gloomy hypothesis: it suggests that peace can break out at any time, regardless of expectations or the views of commentators or the opinions of political leaders.

But incentives matter, and the dice are still loaded in favour of protracted Middle East conflict. Entire bureaucracies and career pathways for ambitious politicians, arms companies and men (generally) of so-called religion depend on this and other conflicts continuing into the indefinite future. These people aren't not necessarily evil. They, for the most part, didn't deliberately or even consciously perpetuate the conflict or the conditions that keep it going. But they do depend on its continuing.

And that's why the Social Policy Bond principle can break the circle. The politicians, the generals, the men with beards and countless others are reacting rationally to the incentives on offer. Those incentives are geared toward perpetuating conflict, and not only in the Middle East. Changing these incentives so that peace is rewarded instead of penalised could change everything. And a bond regime could do that. The backers of [2]Middle East Peace Bonds

don't need to work out who or what is responsible for the conflict; they don't need to devise road maps or put their livelihoods (or lives) on the line. All they need to do is to define the sort of peace they want to see, and pump as much of their own and other people's money into redeeming the bonds once their peace target has been achieved and sustained. It would be up to investors in the bonds to work out the most effective and efficient ways of reaching that target. They would probably deploy a diverse range of approaches; they would have incentives to explore, implement and adapt the more promising of these, and to terminate the failures. The bonds' backers would be recasting the incentives to encourage peace making, and if there were sufficient funds behind them, there's no reason why they would not succeed.

People casually talk about conflicts that are 'intractable'. I say, read up about the 300-year conflict between England and Scotland, then take a look at the Anglo-Scottish border. It's pretty quiet these days.

### **7.9.6 What did they expect? (2010-09-21 14:31)**

An analysis published a few days ago by the campaigning group [1]Sandbag estimates the amount of carbon that will have been saved by the end of the second phase of the EU's emissions trading system, in 2012; after the hopeless failure of the scheme's first phase we were promised that the real carbon cuts would start to bite between 2008 and 2012. So how much carbon will it save by then? Less than one third of 1 %. [2]Source

Climate change might be our most urgent environmental challenge. Or it might not. It might lead to catastrophic changes in weather patterns around the world, threatening millions of those people who are least able to adapt. Or it might not.

Our policymaking system doesn't deal well with such uncertainty. It's in most policymakers' interests to delay significant action until it becomes impossible to ignore the consequences of doing so. In similar policy areas, perhaps in most, that isn't too disastrous a policy. But there are occasions when the scale of the consequent disaster is immense.

In all these years of discussion about climate change, I haven't been persuaded that there's anything more likely to meet the climate challenge effectively than [3]Climate Stability Bonds. Under a bond regime, the private sector would bear the consequences of over- or under-estimating the severity of the problem. And they would do so adaptively. That contrasts with the current approach, whereby policymakers employ a limited number of experts using today's science in an attempt to grapple with tomorrow's events - at a time when our knowledge of the causes and consequences of climate change is small, but expanding at a prodigious rate.

It's no wonder then that, perhaps at the unconscious level, our policymakers have decided to do nothing, other than engage in bureaucratic displacement activity. There's an

unknowable, but non-zero, probability that we shall get lucky, and that this approach will prove to have been wise; but we can know that only in retrospect. And even if that were to be the case, Climate Stability Bonds, because of the way they work, would still have functioned as an insurance policy. One that could have a massive positive payoff, and one that in any event would be no more costly than the pointless rituals that signify the current way of pretending to deal with the problem.

### **7.9.7 Don't watch this space... (2010-09-27 12:04)**

...well, not too avidly anyway.

My 800 th post, so time once again to look at where Social Policy Bonds are heading. The answer is a little disheartening: nowhere. At least, not that I'm aware of. More dispiriting still, the distance between ordinary people and the politicians who are supposed (in the democracies) to represent them appears to be growing wider. But what about the Tea Party movement? Isn't that a genuine grass-roots, bottom-up, closing-the-gap, trend to be welcomed? At first sight, perhaps. But its funding sources raise [1]suspicions and, more important (to me) is that it seems less interested in outcomes and more interested in the same distractions that bedevil conventional politics; foremost among them personality and ideology.

Politicians are becoming a class apart, sharing few of the concerns of their constituents. Corporations, and especially the biggest corporations, are ever more influential in determining policy. Natural persons view politicians with disdain; politics with indifference, cynicism or despair. A realignment, along the lines of Social Policy Bonds, whereby government targets outcomes that are meaningful to ordinary people cannot come soon enough.

## **7.10 October**

### **7.10.1 Numbers have limits (2010-10-06 07:32)**

The dietary guidelines for Americans should focus on whole foods and eating patterns rather than individual nutrients, argue Dr Dariush Mozaffarian and Dr David Ludwig

in the [1] Journal of the American Medical Association pointing out that this is not a radical approach at all, but a return to more traditional, time-tested ways of eating. 'The greater the focus on nutrients, the less healthful foods have become,' they write. Quoted in [2]GI News

As society grows more complex and centralised, we see metrics taking over from intuition, instinct and insight. Much as we might try to define well-being in terms of numerical indicators, they are always going to be imperfect at best and in conflict at worst. We might, for instance, target an indicator like literacy for instance but, in doing so, transfer resources away from infant mortality, say, in such a way as to reduce overall social well-being. It's a difficulty for the Social Policy Bond approach, but it's also a difficulty with the current approach to policymaking.

The bonds do have the merit of forcing a focus on what policy is out to achieve, and to express these goals in terms of objectively verifiable numbers. That, in turn, would focus attention on those metrics that are inextricably linked to well-being. Lofty sounding goals ('punching above our weight', 'making us more secure', 'safeguarding the auto industry', 'saving the family farm') would be seen right from the beginning for what they are: distractions - and often very expensive distractions. A bond regime would probably then see more emphasis on safety-net measures: it is for the most disadvantaged that numerical indicators (of income, nutrition, literacy, for instance) most closely correlate with well-being. It would also show a sharper focus on reducing the probability of catastrophe (via [3]Disaster Prevention Bonds, for instance) because, unlike under the current system, the precise nature of the catastrophe need not be specified in advance for funds to be devoted to its mitigation.

The limitations of metrics could function as a useful discipline. They would tend to concentrate government interventions on those policy areas where they can do most good: helping the disadvantaged and insuring against catastrophe. Government could limit itself to those areas without issuing Social Policy Bonds, of course. But they don't.

### **7.10.2 Means and ends (2010-10-10 10:41)**

Michael Mascarenhas [1]asks "how do we actually measure this complex activity known as water access in subsistence communities?" and, as his article shows, it is a genuine problem. In rural Africa it's difficult to imagine any centralised system of programme funding allocation and assessment working well. The well-being of an individual or community, while it is likely to be accurately perceived by insiders, would be difficult to quantify in a way that's useful to national or NGO decision makers.

But the Social Policy Bond approach could help. Rather than try to measure such abstract concepts as 'availability', it would instead focus on, and target, the benefits that such

availability will have on verifiable outcomes: infant mortality, morbidity, longevity, birth weights, to give a few possibilities. It would be a shame, I think, if the failed paradigms of the west - the implicit or explicit targeting of such close-to-meaningless accountancy-type abstractions as 'the economy', GDP etc - were to be adopted by the developing countries. They have led us astray, quite dramatically; with the full ramifications yet to be felt.

### **7.10.3 The caste of politicians (2010-10-13 10:05)**

Brendan O'Neill articulates our disenchantment with today's politics, commenting on the recent leadership contest for the UK opposition Labour Party:

[T]his was a decadent, neo -aristocratic affair, with various party grouplets shifting their allegiances around for no clear or rational reason, while media insiders sought to provide a political personality and narrative for Ed [ Miliband , the eventual winner].  
[1]Spiked  
, 27 September

More than ever, politics resembles a caste system. Any causal relationship between the public's goals and actual outcomes seems more and more to be coincidental: a random occurrence, independent of the wishes or actions of the politicians.

Social Policy Bonds offer a way to reconnect the public with policymaking . Under a bond regime, instead of choosing professional politicians, people would choose the social and environmental outcomes they wish to see. Instead of government-funded ministries and departments choosing how to bring about undeclared, vague, or mutually conflicting objectives, as under the current system, a bond regime would see the spontaneous creation of a [2]new type of organisation, whose structure and activities were entirely subordinated to society's goals.

Of course, any adjustment to such a rational system of policymaking would take time. In my [3]book I describe a migration pathway; essentially entailing the gradual reduction in funds allocated to traditional organisations along with a corresponding expansion of funds allocated to redeeming Social Policy Bonds. It would mean a radical re-thinking of the way in which society is organised. But the alternative - the entrenchment of a political caste almost totally removed from ordinary people, and consequent alienation of even more of us from politics - would be far less edifying.

#### **7.10.4 Outrageous (2010-10-18 11:41)**

[President Obama's] political difficulties began with the revelation that AIG, which had received \$170 billion from the government, had paid out \$165 billion in bonuses to the division that had brought the company down. [Treasury secretary Timothy] Geithner had known about the bonuses but insisted there were no legal grounds to block them. (It then came out that Geithner had pressured Senate Banking Committee Chairman Chris Dodd to insert a provision into the stimulus bill that protected the bonuses.) [1]The Unnecessary Fall, John B Judis, The New Republic, 2 September

This is what happens when politics becomes a specialised craft; something so arcane that outsiders take no interest, out of apathy or cynicism. But it's the outsiders - that is, ordinary people - who suffer as a result.

One answer to the alienation caused by this extreme specialisation is perhaps more specialisation in the form of Social Policy Bonds. Under a bond regime, politicians would be limited to what they do best: articulating society's wishes and raising the revenue for their achievement. But the actual choice of objectives and their relative priority, would be in the hands of the public. And the public would be far more likely to take an interest: we'd be choosing outcomes. Outcomes that are meaningful to ordinary people. Targets like lower crime rates, more employment, a cleaner environment. Expressing politics in terms of outcomes is far more likely to engage the public than the (deliberately, one might think) opaque discussions about process, institutional structures and legalisms that feature most prominently in current politics. Once targets have been set, a bond regime would contract out their achievement to investors, whether they be public or private sector. They would have incentives to be efficient: the bonds would always be in the hands of those who believe they can achieve society's targeted goals most cost-effectively. A stark contrast with the current system, where most of the people working for organisations charged with achieving social goals are paid simply to turn up at the office. I refer, of course, to government agencies.

Social Policy Bonds, in short, would see politicians and the market each do what they are best at. Respectively: expressing our wishes as realizable, costed goals and raising revenue; and allocating resources to achieve these goals most effectively.

#### **7.10.5 The problems are systemic (2010-10-27 09:24)**

Johann Hari sums it all up in an article about US politics, but which could apply to all the democratic countries:

If you want to run for national office in the US, you have to raise huge sums of money from corporations and very rich people to pay for the adverts and the mailings that get you on the ballot and into office. These corporations will only give you money

if you persuade them that you will serve their interests once you are in power. If you say instead that you want to prevent anything destructive they are doing to ordinary people, or tax and regulate them, you will get no money, and can't run. As the Wisconsin politician Ed Garvey puts it: "Even candidates who get into politics with the best of intentions start thinking they can't get re-elected without money. Senators get so reliant on the money that they reflect it; they stop thinking for themselves, stop thinking like the people who elected them. They just worry about getting the money." ...[W]e have to be honest: the continuities with [President George W] Bush are far more pronounced than the differences. [1]The real reason Obama has let us down - and endangered us , 25 October

Against this systemic flaw, what can Social Policy Bonds offer? The clue is in my tag line: Policy as if Outcomes Mattered. The current system is too indirect. Apart from representing our views and raising revenue, government and officials are employed by organisations that are supposed to achieve these goals: government agencies, or contractors working for them. This obscures the relationship between intention and achievement . It's particularly corrosive when there's no correlation between social outcomes and the rewards to the people who are supposed to be achieving them. The system is inherently cynical: if a government agency , at any level, is too successful in, say, reducing crime, or raising literacy, it's likely to shrink in size, with its funding reduced accordingly.

It's no surprise then that, with such a loose connection between government and outcomes, ordinary people are turned off by the whole exercise. Those who do take an interest are those who are paid to: lobbyists, usually employed by large organisations : corporations, trade unions, religious bodies, or government agencies themselves. These organisations have as their overarching goal, not the interests of society, but their own self-perpetuation. Who loses? Ordinary people. Who wins? The wealthy organisations, as Mr Hari eloquently points out.

Social Policy Bonds could help. Under a bond regime, society's goals would have to be declared at the outset. We'd focus on outcomes. Not the structures or funding of government agencies; not the personalities, peccadilloes or ideology of prominent politicians; and not the high-sounding, emotional, appeals to patriotism or other sound-bites, crafted solely to garner votes under an inherently corrupt system. Government's role would be to articulate our goals, and to raise the revenue required to achieve them. But, because our politics would be expressed in terms of outcomes and their costs, ordinary human beings could participate in the policymaking process. And end in itself, but also a way of engendering buy-in - something that we need if we are, as a society, to meet our urgent social and environmental challenges.

### **7.10.6 Insanity (2010-10-30 10:09)**

Even little New Zealand feels it has to subsidise the rich:

The extra [NZ] \$20 million subsidy for The Hobbit will be paid as a tax break on a pool of profits to be shared by actors and other workers on the films, including director Sir Peter Jackson, it is understood. The Government has kept under wraps details of the extra cash incentive to Warner Bros, which comes on top of the 15 per cent subsidy worth about \$65m on the budget for the two movies of about \$670m. Prime Minister John Key said yesterday that commercial confidentiality meant he could not say what the money would go on. [1]Source

This is rancid politics. It's government pandering to the rich and glamorous with taxes paid by ordinary people. It's quite outrageous.

## 7.11 November

### 7.11.1 No way... (2010-11-02 08:42)

No way to check emissions puts climate deal in danger

reads the header of a recent article by Fred Pearce in 'New Scientist'. One example:

China does not record CO2 emissions from its small coal-burning factories and long-standing fires in mines which may result in under-reporting by as much as 20 per cent. The uncertainties for other greenhouse gases are even greater.... 'New Scientist', 9 October (page 12)

Another article, Dead Oceans , in the same issue (page 37) talks about the possible consequences of oxygen-deprived dead zones in the oceans; a result of warmer waters and the smaller quantity of dissolved oxygen they can contain. These regions:

...could come to host bacteria that emit nitrous oxide, a powerful greenhouse gas. Working out the likely extent of such feedback processes...will be a major preoccupation for scientists in the coming years.

We might not have those years. Our policymaking systems are incapable of dealing with a problem like climate change. Focussing as they do on processes and institutions they seek, at their best, to identify the causes of problems before they set up institutions supposed to solve them. Of course, these institutions develop their own agenda, and the people working for them aren't paid in ways that reward successful solutions but, given sufficient funding and sufficiently robust knowledge of the relationships between cause and effect, and plenty of time, this mechanism has been known to work.

Sadly, though, the deficiencies of such an approach become serious flaws with potentially disastrous challenges like climate change. The relationships, as the two snippets quoted above suggest, are just too uncertain and complex. Our knowledge of them, though expanding rapidly, is too sparse to generate the buy-in required to deliver effective solutions. We need diverse solutions that can adapt to changing circumstances and our expanding knowledge. And we need to target the outcome we want to achieve, rather than waste years trying (and, most likely, failing) to identify the important scientific and economic relationships before we take effective action.

That's where [1]Climate Stability Bonds could help. They'd be issued by some global organisation, and be backed by contributions from national governments. They would define some climate target, probably in terms of a combination of physical, biological and financial indicators. The bonds would reward the maintenance of a climate whose index fell within defined boundaries. It would be up to investors in the bonds to decide how best to deploy resources to achieve our goal. They would have incentives to do so as cost-effectively as possible. It would be up to them to keep abreast of all the important science. They would adapt their approaches as our knowledge expands. Every aspect of this behaviour would be far, far better than the current approach, which, to put it mildly, is not working.

### **7.11.2 Why wait centuries? (2010-11-06 10:14)**

The late Tony Judt, historian, in an [1]interview published in The Nation , 17 May:

Democracy has always been a problem. The truly attractive features of the Western tradition that we accidentally - and it really is accidentally - get the benefit of are the rule of law, liberalism and tolerance, all of which are virtues inherited from predemocratic societies, whether they were based in eighteenth-century Anglo-American aristocratic individualism or nineteenth-century European forms of a type of developed postfeudal legal state.

Indeed, the accidental effects of human actions can be beneficial as well as disastrous. Adam Smith's Invisible Hand generates material benefits, as does government planning. But they also create social and environmental problems, and only partly because of market failure. In my view, the world is too small now for the solution of social and environmental problems to be left to chance. And, once we have achieved, however haphazardly, virtues such as the rule of law, liberalism and tolerance, and once we see recognise their importance, we can consciously set out to maintain them.

This is what Social Policy Bonds could do. One of the great advantages of the bond approach is that we can encourage people to achieve social goals without anyone knowing in advance how they will do so. Issuers of 'Rule of law' Bonds could target the achievement of rule of law, in societies that currently don't have it; and its continuance in societies that do. The accidental achievement of rule of law (and liberalism and tolerance) in the societies that

have it took centuries of conflict and bloodshed. We cannot know how best to achieve these virtues in remote, complex societies, nor how to sustain them in more fortunate societies. But we can offer incentives for people to do so. Yes, defining what we mean by 'rule of law' poses difficulties. But the alternative, waiting for societies to achieve it accidentally is unlikely to be any easier.

### **7.11.3 Catastrophe avoidance: we're not doing it (2010-11-14 22:46)**

Stepping back from the society's turmoil for a moment, it's pretty clear that we aren't developing ways of dealing with our social and environmental problems. The negative impacts of a person or firm's profit-making used to be either small, or uncertain, or simply ignored because society as a whole counted for too little against the power of wealth. There was much distress, then, as costs of economic activity were socialised, while most of the gains accrued to the few. In response, we have laws, rules, and regulations. But the disparity between the wealth of the corporate sector and the ever more constricted and degraded lives of most individuals has rarely been so striking as today. On the whole, the aggregation of corporate incentives is not, these days, seen as improving the quality of life of most of the population. The planet is too small for the corporate sector's bye-products, social and environmental, to be absorbed or ignored as in the past. And corporate incentives now influence (to put it mildly) much of government: the form of organisation whose legitimacy is entirely based on its role in enhancing the lives of most of its citizens. No wonder, then, that we are facing multiple crises, taking the forms of cynicism and despair about politics, and threats of massive financial, economic and environmental disruption.

In response, I believe we need to make a conscious effort to re-align incentives. Society and the environment are too complex and rapidly changing for market failure to be addressed by laws, regulations and small-scale tax or price adjustments. We urgently need to give priority to things that really matter. I'd target, above all else, the avoidance of catastrophe, however caused.

Social Policy Bonds are one way in which we can give catastrophe avoidance the priority it deserves. It's clear now that it needs explicitly to be targeted, and [1]Disaster Prevention Bonds are one way of rewarding people for maintaining a habitable planet. How would they work? Governments (and non-governmental organisations) would set up a fund that would be used to redeem bonds, issued on the open market, that would become valuable after a sustained period during which no major disaster has occurred. Investors in the bonds would have incentives to anticipate potential catastrophes and seek out those ways of avoiding them that are most cost-effective. The advantages over the current way of doing things are many: The exact nature of the catastrophe need not be known in advance. We'd stimulate a diverse, adaptive range of approaches. Cost-effectiveness is built into the bond mechanism. In effect, we'd be creating a new, protean, type of organisation: one that, in contrast to the current multiplicity of, mostly, ineffective bureaucracies, would be motivated not merely to

turn up for work and perform various activities, but actually to achieve an explicit, urgent, and vital goal: the survival of human beings on planet Earth.

#### **7.11.4 Innovation is a threat to the public sector (2010-11-25 09:26)**

But the benefit of competition is not just that it serves customers' needs today, but that it is a mechanism for adapting to what they will need tomorrow. The dynamism of a market economy comes from innovation in products and processes, and radical innovation in products and processes often - in fact usually - comes from outside the existing market structure. Apple is changing the nature of the phone industry, Amazon the book business. But anyone who had approached these industries from the marketing or the legal standpoint would have concluded that there was enough competition already. [1]Radical innovation rarely comes from within, John Kay, 'Financial Times', 24 November

There are bodies, whose weaknesses Mr Kay discusses, that are charged with improving competition in the private sector. And it's true that they are often needed. It's unfortunate, though, that there's no such mechanism for public sector monopolies, because it's these bodies, typically government agencies, that are supposed to bring about social outcomes that, from a broad perspective, are far more important than reasonably priced books or phone calls. We rely on various levels of government to, for example, relieve poverty, reduce crime rates or insure against environmental - or financial - catastrophe. The absence of innovation in achieving these outcomes is an embarrassment. Yes, there have been some minor changes in the identity of the service-deliverers, some contractings -out and quite a few privatisations. But on the whole, the contrast between the private and sectors is stark. Our political system, like any other institution, has as its over-arching goal that of self-perpetuation, and its interests are not only different from those of ordinary people; they are often in conflict with them.

Perhaps Social Policy Bonds could re-align the goals of our policymakers with those of the citizens they are supposed to represent. Under a bond regime how outcomes are delivered, and who delivers them, would be less important than the fact of their delivery. There would be less discussion about structures and spending; instead there'd be a constituency of highly-motivated investors whose goals would be entirely congruent with those of society. By maximising their own rewards, bondholders would be necessarily achieving social goals, whether they be local, national or even global, as efficiently as possible. Innovation, to investors in Social Policy Bonds, would be an opportunity not, as under the current system, a threat.

## 7.12 December

### 7.12.1 Safe prediction: Cancun will fail (2010-12-05 22:55)

It's too early to say whether the Cancun climate change summit will be deemed a success or not. By keeping expectations low, the myriad bureaucracies involved will be able to term any agreed string of words a victory. One thing though is certain: in any meaningful sense, Cancun will fail. How can I be so sure? For one thing, it is not concerned with climate change: it is entirely preoccupied with (1) [1]political jockeying and [2]finger-pointing, and (2) greenhouse gas emissions. For another, any agreement or commitment (or, more accurately, declared commitment) will be based on current science; it will not have the capacity to adapt to our rapidly expanding scientific knowledge. Bureaucracies understand top-down, one-size fits all, centralised decision-making. They don't understand diverse, adaptive approaches, and they certainly don't like relinquishing control to people who might be better at actually getting things done than government agencies or their pals who run gigantic corporations. Their real expertise at the international level is in making declarations of intent and organising the transfer of large sums of cash from taxpayers in the rich world to such corporations and third-world elites.

So is there anything positive I can suggest? I've talked and written about [3]Climate Stability Bonds for many years now. As far as I know, nobody's thinking about issuing them. Yet they are the only instrument that I've heard of that can address the doubts (genuine or otherwise) about whether climate change is happening, the huge uncertainties over its likely effects and the best ways of dealing with it, and our rapidly expanding scientific and technological knowledge. Even more important, they are the only suggestion I've seen that will subordinate all policies and all activities and intervention to what we actually want to achieve, rather than to the supposed means of reaching it: a stable climate. That's a versatile and adaptive goal, which can encompass plant, animal and human health, and physical, social and financial targets and ranges.

Current policy, including Cancun, will focus on net emissions of those gases thought to be greenhouse gasses. That's not the same as climate stability. So, in the unlikely event of an agreement in Cancun with which the signatories will actually comply, you can be sure that in any meaningful terms the summit will fail.

### 7.12.2 What drives policy? (2010-12-09 08:43)

What does drive policy? Ideology, soundbites, emotion, personality, and institutional inertia are all prime motivators. Another is the desire to be associated with glamour. As the UK

Government looks at spending £30 billion of taxpayer funds, which it can ill afford, on [1]high-speed rail, it's all too easy to see the appeal of the grandiose, at the expense of the public, the environment...well, everything really.

The macho culture of local and national politics means that councillors, county surveyors and politicians want to be associated with grand projects: building a bypass, or a bridge, or a tram or fast train line. [2]Car Sick: solutions for our car-addicted culture, Lynn Sloman , 2006

Transport is typical policy-as-if-outcomes-are-irrelevant territory. You might think that poverty, housing, health and education are more obvious policy areas: in which government intervention can bring about meaningful improvements in wellbeing for society's most disadvantaged people. You might also think, with me, that if it's worth spending billions of pounds to upgrade rail links that will shave a few minutes off journey times, then the private sector should be bear all the risk. But no, politicians feel they must get in on the act.

A Social Policy Bond regime wouldn't put up with such wasteful nonsense. Transport is a means to various ends, not an end in itself. Government should target those ends, and let motivated investors in Social Policy Bonds work out the best ways of achieving them. Clarity, in particular about the distinction between means and ends, is missing from today's policymaking environment. The result is we get lumbered with expensive, futile projects, while those things that government should be doing - and that only government can do well - are too often neglected.

### **7.12.3 Going where government cannot go (2010-12-13 11:30)**

In many policy areas, government does about a good a job as we could expect any single agency to do. Government does well when it's clear what sort of action is required, and when it alone has the organising capacity and authority to get things done. These are generally areas where the problems are obvious, have obvious causes, and where the ways of solving them have been tried, tested and (by and large) successful. Much of the low-hanging fruit has been picked. In most developed countries sanitation is universal or at least widespread, as are literacy and basic health, education and housing. But there are still serious problems, which our current political system seems incapable of addressing.

Perhaps most important are the potentially catastrophic events, often man-made, which our political system is adept at postponing into a fast-approaching future. But, as well, and equally as significant to many, are those policy areas where government has done a lot, but is trying to do more - and failing. And, because it's still trying, it has crowded out initiatives from others, so that the problems remain unsolved.

Take crime, for instance. Most of the heavy lifting has been done. By the standards of

even 100 years ago rates of almost all crime are low. But crime still blights many lives and we could perhaps open up crime prevention to diverse, adaptive approaches, of the sort that government cannot follow. Similarly with infant mortality, domestic violence, basic education, health and, more broadly, poverty. Government probably can't do much more than it's already doing so long as it monopolises the actual attempts to alleviate these problems. The single agency, top-down approach tends to be inflexible, incapable of adapting to differing or rapidly changing circumstances.

Government can't solve these problems, but it can tax its population under the pretext of trying to do so. And that's where Social Policy Bonds could enter the picture. Rather than try to reduce crime still further (or raise literacy to 100 percent, or whatever), which it is not doing efficiently, it could contract out the achievement of these goals to the private sector. Under a bond regime it would still be aiming for the same goals, and it would still be the ultimate source of revenue for funding their achievement, but it would be investors in the bonds who would actually achieve them. They would be motivated by the consequent rise in the value of their bonds, as they help achieve the targeted goal.

The same reasoning applies at all levels, and to problems, such as the ending of war or the avoidance of catastrophe, where government hasn't even picked the low-hanging fruit.

For more about Social Policy Bonds, click [1]here. For the application of the Social Policy Bond principle to catastrophe, click [2]here.

#### **7.12.4 Government doesn't do diversity (2010-12-18 05:44)**

Discussing some of the perils of the internet, Nicholas Carr mentions Frederick Taylor's system of scientific management. It brings great efficiency advantages to manufacturing, but took away the employee's need to:

'make his own decisions about how he did his work. ... After Taylor, the laborer began following a script written by someone else. ... The messiness that comes with individual autonomy was cleaned up, and the factory as a whole became more efficient, its output more predictable. Industry prospered. What was lost along with the messiness was personal initiative, creativity, and whim. Conscious craft turned into unconscious routine. Nicholas Carr, [1]The Shallows (page 218)

The trade-off probably works in society's favour when the productivity gains are sufficiently great, and when employees have other outlets for their creativity. Where society stands to lose, though, is when ostensibly scientific scripts are applied inappropriately, and when there is no possibility of their being superseded either by better scripts, or adaptive behaviour. I think this applies to much of current policymaking, where we commonly see approaches that have been tried, tested and found to be inefficient or useless being applied again and again

to social and environmental problems.

This need not be a total disaster, so long as there remains in the policy arena some approximation of the 'creative destruction' that characterises perfectly competitive markets. But, sadly, that condition applies less and less to our more serious global or national problems. Government wants to apply its monopolistic approach not only to those areas, such as provision of public services, where that can work well, but also to challenges, like climate change, that urgently demand diverse, adaptive approaches. Government at all levels increasingly takes away our autonomy and writes the script on our behalf. This tendency is partly a fear of litigation where, so long as you can prove that you've ticked all the boxes, you are covered. But it's also simple inertia, whereby government agencies react rationally to the incentives to enlarge their powers.

One remedy might be Social Policy Bonds, whereby government can still set targets and raise the revenue necessary to achieve them. But it can disengage from actually achieving them and from stipulating how they shall be achieved. For complex problems, where our current knowledge is scanty, and where a mosaic of different approaches is going to be necessary, we need to encourage 'creative destruction': that is, experimentation, with the termination of failed trials. We need, in short, diverse, adaptive approaches, of the sort that government (or any single, large organisation) cannot take. A bond regime, where highly motivated investors would always be on the lookout for better ways of doing things, could be the way forward.

### **7.12.5 Lies, damned lies, and policymaking (2010-12-30 09:05)**

An ethical doctor decides to examine, discreetly, a patient who is being looked at by other doctors:

[S]he's concerned that, like many patients, he'll end up with prescriptions for multiple drugs that will do little to help him, and may well harm him. "Usually what happens is that the doctor will ask for a suite of biochemical tests—liver fat, pancreas function, and so on," she tells me. "The tests could turn up something, but they're probably irrelevant. Just having a good talk with the patient and getting a close history is much more likely to tell me what's wrong." Of course, the doctors have all been trained to order these tests, she notes, and doing so is a lot quicker than a long bedside chat. They're also trained to ply the patient with whatever drugs might help whack any errant test numbers back into line. What they're not trained to do is to go back and look at the research papers that helped make these drugs the standard of care. "When you look the papers up, you often find the drugs didn't even work better than a placebo. And no one tested how they worked in combination with the other drugs," she says. "Just taking the patient off everything can improve their health right away." David H Freedman, quoting Dr Athina

Tatsioni in [1]Lies, Damned Lies, and Medical Science, 'The Atlantic', November 2010

A potential difficulty with Social Policy Bonds is that they rely, almost entirely, on meaningful correlations between measured variables and that which society wants to target: most likely, some component of well-being. It's a difficulty, because people can game the system, complying with the letter, but not the spirit, of any defined target-setting.

What's not so obvious is that it's an even bigger problem under current policymaking regimes. In our industrial societies, with their large, complex economies, government bodies and non-governmental organizations have extremely complicated tasks. Increasingly, and of necessity, government already relies on numerical indicators to manage its resource allocation. and largely supplanted families, extended families, and communities in supplying a range of welfare services to a large proportion of their populations. .

But this use of indicators is relatively recent, unsystematic, unsophisticated and incoherent. Indicators such as the number of medical tests performed, or the size of hospital waiting lists don't measure what matters to people or are prone to manipulation. Even when numerical goals are clear and meaningful they are rarely costed , they are almost always too narrow, and they are largely chosen to mesh in with the goals and capabilities of existing institutional structures. Those broad targets that are targeted with some degree of consistency tend to be economic aggregates, such as the inflation rate, or the rate of growth of Gross Domestic Product — which has come to be the de facto indicator par excellence of rich and poor countries alike. But GDP's shortcomings as a single indicator of the health of an economy [2]are serious, and widely known. Government would do better to target ends rather than means: social and environmental outcomes that are meaningful to natural persons, as against government agencies and corporate bodies, rather than growth rates or other abstract economic indicators.

It would appear that the choice will increasingly be between (a) the current de facto targeting of per capita GDP along with an almost random array of narrow, easily manipulated indicators that have no necessary relationship to societal goals, and (b) the targeting of consistent, transparent, mutually supportive indicators that represent meaningful social outcomes, under something like a bond regime.

Social Policy Bonds are not perfect, but they still, I believe, would be better than the current system.

# 2011

## 8.1 January

### 8.1.1 The gap widens (2011-01-03 09:04)

Another year, and the gap between policies and meaningful outcomes continues to widen, as does the gap between policymakers and the people they are supposed to represent. Much of the problem lies in an almost total refusal by policymakers to be open about the costs of their policies. The environment and future generations look like being the most grievous victims. Policies that benefit the rich, large corporations and the present generation of voters at the expense of everyone and everything else are always likely to be made under the current regime, where policymaking is so complex there need be no transparency about who are to be the real winners and losers. Policy goals are unstated, vague, uncosted or mutually conflicting and there is no follow up as to the success or failure of particular initiatives.

Social Policy Bonds offer a transparent alternative. Being entirely focused on outcomes that are meaningful to ordinary people, they are far less likely to be hijacked by corporations and their lobbyists, because outcomes are accessible to all - unlike the arcana of current policymaking .

So where are Social Policy Bonds going? They have been in the public arena now for more than twenty years, and I know of nobody who's actually issued any. I see my present role as one of maintaining my websites and making my work available to all, while standing by in case anybody does want advice. Right now I'm working on updating my [1]book (a little) so that it can be marketed a bit more effectively.

---

### 8.1.2 The unimportance of being right... (2011-01-10 11:48)

...if your organisation is a monopoly. Discussing a [1]book by Richard Aldrich about about the UK's

intelligence agency, Government Communications Headquarters, Bernard Porter write:

The list Aldrich gives of  
GCHQ's

...failures of prediction doesn't make for comfortable reading: the Korean War; the Russian atomic bomb; the Soviet invasion of Czechoslovakia; the

Yom

Kippur

war; the rise of Middle Eastern terrorism...; the overthrow of the shah of Iran; the Falklands invasion; the end of the Cold War; the attack on the Twin Towers; and the non-existence of

WMDS

[in Iraq]. [2]Thank God for Traitors (gated), Bernard Porter, 'London Review of Books', 18 November 2010

Another example of policy as if outcomes didn't matter: these agencies secure funding merely because they secured it in the past. Like [3]agribusiness and wealthy landowners, or large corporations in general, the subsidies these organizations receive go to support their own self-perpetuation. It's the [4]Special Interest State, and ordinary people aren't special interests. We urgently need to re-align policy priorities so that the undoubtedly hard-working and well-intentioned people employed by

GCHQ

and the others, have incentives to do more useful work instead.
